Expanding PrEP in Communities of Color (EPICC) OMB # 0920-1423

Summary of Changes

We are requesting a non-substantive change request to the information collection request (ICR) Expanding PrEP in Communities of Color (EPICC, OMB #0920-1423). The requested changes do not impact the burden table and do not result in an overall change in the scope of data collection. Changes are being made to bolster study enrollment and strengthen data collection efforts which are critical to the final analyses and study outcomes. Changes will also further harmonize this study with the mChoice Study (OMB 0920-1428); both are funded through PS-21-003, PrEP Choice: Increasing the Use of HIV Pre-exposure Prophylaxis in an Era of Choices, and their data will be combined for analysis.

Finally, we are updating the race and ethnicity questions to reflect the new standards announced by the Office of Management and Budget (OMB) on 03/29/2024 (Revisions to OMB's Statistical Policy Directive No. 15: Standards for Maintaining, Collecting, and Presenting Federal Data on Race and Ethnicity, 89 FR 22182).

Study Inclusion Criteria

A change is being requested to harmonize this study's inclusion criteria with the mChoice Study (OMB 0920-1428). This change will specify that non-binary persons, including persons that identify as gender nonconforming and genderqueer are eligible to participate in the study. Making this change will help ensure that we are fully inclusive of the population sought for this study and benefit the overall PrEP Choice Study which will analyze data across both studies to gain deeper insight on PrEP use (i.e. PrEP medications used, adherence and persistence). Current CDC HIV pre-exposure prophylaxis (PrEP) guidelines were informed by studies that included few or no non-binary people¹. The PrEP Choice Study will add to the limited data on PrEP use among non-binary persons and provide information needed to develop more comprehensive PrEP guidance. This change does not impact burden hours or the overall scope of data collection.

Sexual History Screening Question

The change to the study inclusion criteria necessitates a change to the sexual history screening question. Specifically, we will change "sex with a man" to "sex with a person with a penis." Removing gender will be more inclusive to a broader range of gender identities for a participant's sexual partners. Removing gender from the question and replacing it with the anatomical term penis, will also bring the question in line with current language guidance from the Adolescent Medicine Trials Network for HIV/AIDS Interventions². The changes will better acknowledge and respect how participants define themselves and their relationships.

We also propose removing 'anal sex' from the sexual history screening question and replacing it with 'sex'. Current CDC PrEP guidelines note that that patients often do not disclose stigmatized sexual behaviors to their health care providers ³⁻⁷. We believe that some of our respondents may be reluctant to disclose what may be perceived as stigmatizing sexual behavior and, as a result, they are not eligible to participate in the study. Therefore, we propose using the more general term 'sex' in order to minimize any perceived stigma and mitigate any reluctance to respond.

We also propose removing the 12-month time frame from the sexual history screening question in order to bring the question into line with the proposed change to the inclusion criteria described above. Expanding the timeframe in which a participant may have been sexually active will allow us to

be more inclusive of persons who may be in different stages of their lives and sexual relationships. This change will also benefit participants as they will not have to rely on memory in order to respond to a question with a strict timeline. These changes do not impact burden hours or the overall scope of data collection.

Blood Collection Instructions

Next, we propose adding the question 'Have you switched your PrEP medication within the last 3 months of collecting this blood sample?' to the Blood Collection Instructions for dried blood spot (DBS) specimens. This question is needed as some participants may choose to switch PrEP types within the three months prior to completing their DBS collection. If participants did change their PrEP medication during that period, and we were not aware of the change, it could make analysis of the DBS samples more difficult to interpret. The half-life of tenofovir-diphosphate in whole blood is approximately 17 days, thus concentrations reflect the average number of doses taken over the last 6-12 weeks, while the half-life of emtricitabine-triphosphate is shorter (approximately 62 hours), thus reflecting doses taken over the past week⁸. Being aware of any recent switches will help us ensure the accuracy of our analysis. This change does not impact burden hours or the overall scope of data collection.

Tokens of Appreciation (ToA)

We are requesting increases to the Tokens of Appreciation (ToA) for cohort participation in the study. Since implementing the EPICC study, the study team has experienced difficulties getting participants to collect and return DBS specimen kits and complete the full complement of enrollment activities. The change in ToAs more appropriately compensates participants for these study activities that require more time and effort.

To encourage more participants to complete and return DBS kits, we propose increasing the ToA for participants who return baseline and 6-month kits from \$25 to \$50. We also propose a \$50 bonus token for participants who successfully return the first three DBS kits (baseline, 6-month, and 12-month). Lastly, we propose increasing the ToA for the final, 18-month DBS kit from \$50 to \$75. These amounts are slightly higher than the incentives offered in the Prepared, Protected, emPowered (P3) study, which began enrollment in 2019°. P3 study DBS retention rates at 3 and 6 months were 63.4% and 66.3% respectively. The main outcome for the EPICC study is based on the analysis of DBS samples; therefore, it is essential that our DBS retention rates exceed the rates in the P3 study.

To encourage participants to complete all enrollment activities, we propose offering a \$50 ToA for attending the optional study onboarding visit. Since implementing the EPICC study, the study team has found that participants were opting out of the onboarding visit instead choosing to complete onboarding activities on their own. As a result, some participants did not fully complete all required onboarding activities and were the never fully enrolled. We anticipate that offering a ToA for completing the onboarding visit will increase visit attendance thereby reducing the number of people who begin, but never fully complete, enrollment activities. These changes do not impact burden hours or the overall scope of data collection.

Sexual Orientation and Gender Identity (SOGI)

We have also revised the SOGI questions on the Provider Pre Focus Group Survey (Att 4p) so that they match the SOGI questions on the Cohort Screener (Att 4f Aim 2a Cohort Screener). The SOGI revisions to the Cohort Screener were approved by OMB on 02/16/2024. The revisions to the SOGI questions on the Provider Pre Focus Group Survey were inadvertently omitted from that request, therefore, updating now. Study stakeholders have recommended that the SOGI questions be harmonized

throughout the study for consistency. Updating the framing of these questions aligns with "Recommendations on the best practices for the collection of sexual orientation and gender identity data on federal statistical surveys" released by the White House in January 2023. ¹⁰ This change does not impact burden hours or the overall scope of data collection.

Other Changes

In addition to the proposed changes detailed above, we are also revising the SSA and SSB to reflect changes in CDC project staff. We are revising the list of participating clinics to reflect the departure of two clinics from the study and we specify satellite clinic locations for existing study clinics. We are also correcting a few omissions and grammatical and mathematical errors. These changes do not impact burden hours or the overall scope of data collection.

The proposed changes affect the following attachments, and are included with this request:

- Att 4f_Aim2aCohortScreener (English/Spanish; Tracked and Clean)
- Att 4l_Aim2aCohortBloodCollectionInstructions (English/Spanish; Tracked and Clean)
- Att 4p_Aim 2b Provider Pre-Focus Group Survey (Tracked and Clean)
- Att 5b_Aim2aCohortConsent (English/Spanish; Tracked and Clean)
- SSA (Tracked and Clean)
- SSB (Tracked and Clean)

| was added to the Blood Collection Instruction form. |
| Page 6: A new question about medication switching |

This question was added to identify participants who may choose to switch PrEP types during the course of the study. Due to differences in the half-life of PrEP medications, the specimens are more difficult to interpret if analysts are unaware the participant switched medications. The addition of this question will help to ensure the accuracy of the analysis.
