1. The per unit voltage base for these boundaries is the nominal operating voltage (e.g., 120 kV, 161 kV, 230 kV, 315 kV, 735 kV, etc.).
2. The values in the table represent the minimum time durations allowed for specified voltage excursion thresholds.
3. When evaluating volts per hertz protection, either assume a system frequency of 60 Hertz or the magnitude of the high voltage boundary can be adjusted in proportion to deviations of frequency below 60 Hertz.
4. Voltages in the Quebec Interconnection boundaries assume positive-sequence values.

Evaluating Protection Settings:

The voltage values in the Attachment 2B voltage boundaries are voltages at the high-side of the GSU/MPT. For resources with multiple stages of step up to reach interconnecting voltage, this is the high-side of the transformer that connects to the interconnecting voltage. When evaluating protection settings, consider the voltage differences between where the protection is measuring voltage and the high-side of the GSU/MPT. A steady state calculation or dynamic simulation may be used.

If using a steady state calculation or dynamic simulation, use the following conditions when evaluating protection settings:

- a. The most probable real and reactive loading conditions for the unit under study.
- b. All installed generating plant reactive support (e.g., static VAR compensators, synchronous condensers, capacitors) equipment is available and operating normally.
- c. Account for the actual tap settings of transformers between the generator terminals and the high-side of the GSU/MPT.
- d. For dynamic simulations, the automatic voltage regulator is in automatic voltage control mode with associated limiters in service.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

Draft 3 of PRC-024-4 is posted for final ballot. Non-substantive corrections were identified during the last additional ballot. This draft includes those corrections.

Completed Actions	Date
Standards Committee accepted revised Standard Authorization Request (SAR) for posting	April 19, 2023
Standards Committee approved waivers to the Standards Process Manual	December 13, 2023
25-day formal comment period with initial ballot	March 27 - April 22, 2024
15-day formal comment period and additional ballot	June 18 – July 8, 2024

Anticipated Actions	Date
Final ballot	September 25 – September 30, 2024
Board Adoption	October 8, 2024

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

None

A. Introduction

1. **Title:** Frequency and Voltage Protection Settings for [Synchronous Generating, Type 1 and Type 2 Wind Resources, and Synchronous Condensers](#)
2. **Number:** PRC-024-~~43~~
3. **Purpose:** To ~~assure set that~~ protection ~~of such that~~ [synchronous generating, type 1 and type 2 wind resource\(s\), and synchronous condensers do not cause tripping remain connected](#) during defined frequency and voltage excursions in support of the Bulk [Electric Power](#) System (BES).
4. **Applicability:**
 - 4.1. **Functional Entities:**
 - 4.1.1 Generator Owners that apply protection listed in Section 4.2.1 [or 4.2.2](#).
 - 4.1.2 Transmission Owners [that apply protection listed in Section 4.2.2](#).
 - ~~4.1.24.1.3~~ [Transmission Owners](#) (in the Quebec Interconnection only) that own a BES generator step-up (GSU) transformer or main power transformer (MPT)¹ and apply protection listed in Section 4.2.1.
 - ~~4.1.34.1.4~~ [Planning Coordinators](#) (in the Quebec Interconnection only)
 - 4.2. **Facilities²:**
 - 4.2.1 Frequency, voltage, and volts per hertz protection (whether provided by relaying or functions within associated control systems) that respond to electrical signals and: (i) directly trip the generating resource(s); or (ii) provide signals to the generating resource(s) to ~~either trip or cease injecting current~~; and are applied to the following:
 - 4.2.1.1 [Bulk Electric \(BES\) synchronous generating resource\(s\)](#).
 - 4.2.1.2 BES GSU transformer(s) [for synchronous generators](#).
 - 4.2.1.3 High-~~side~~ of the [synchronous](#) generator-connected unit auxiliary transformer³ (UAT) installed on BES generating resource(s).
 - 4.2.1.4 Individual dispersed power producing [type 1 or type 2 wind](#) resource(s) identified in the BES Definition, Inclusion I4.

¹ For the purpose of this standard, the MPT is the power transformer that steps up voltage from the collection system voltage to the nominal transmission/interconnecting system voltage for dispersed power producing resources.

² It is not required to install or activate the protections described in Facilities Section 4.2.

³ These transformers are variably referred to as station power UAT, or station service transformer(s) used to provide overall auxiliary power to the generating resource(s). This UAT is the transformer connected on the generator bus between the low side of the GSU and the generator terminal.

4.2.1.5 Elements that are designed primarily for the delivery of capacity from multiple synchronous generators connecting to a common bus or the individual dispersed power producing type 1 or type 2 wind resources identified in the BES Definition, Inclusion I4, to the point where those resources aggregate to greater than 75 MVA.

4.2.1.6 MPT⁴ of multiple synchronous generators connecting to a common bus or MPT of individual dispersed power producing type 1 or type 2 wind resource(s) as identified in the BES Definition, Inclusion I4.

4.2.2 Frequency, voltage, and volts per hertz protection (whether provided by relaying or functions within associated control systems) that respond to electrical signals and: (i) directly trip transmission connected synchronous condensers; or (ii) provide signals to trip transmission connected synchronous condenser and are applied to the following:

4.2.2.1 BES synchronous condensers

4.2.2.2 BES step-up transformer(s) for synchronous condensers.

4.2.2.3 High-side of the synchronous condenser-connected unit auxiliary transformer (UAT).

4.2.2.3 Exemptions: Protection on all auxiliary equipment within the synchronous generating, type 1 or type 2 wind resource, or synchronous condenser Facility.

5. Effective Date: See the Implementation Plan for PRC-024-~~43~~.

⁴For the purpose of this standard, the MPT is the power transformer that steps-up voltage from the collection system voltage to the nominal transmission/interconnecting system voltage for dispersed power producing resources

B. Requirements and Measures

- R1.** Each Generator Owner [and Transmission Owner](#) shall set ~~its~~ applicable frequency protection⁵ in accordance with PRC-024-4 Attachment 1 such that the applicable protection does not cause the [generating resource Facility to which it is applied to](#) trip ~~or cease injecting current~~ within the “no trip zone” during a frequency excursion with the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- Applicable frequency protection may be set to trip ~~or cease injecting current~~ within a portion of the “no trip zone” for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.
- M1.** Each Generator Owner [and Transmission Owner](#) shall have evidence that the -applicable frequency protection has been set in accordance with Requirement R1, such as dated setting sheets, calibration sheets, calculations, or other documentation.
- R2.** Each Generator Owner [and Transmission Owner](#) shall set its applicable voltage protection⁶ in accordance with PRC-024-4 Attachment 2, such that the applicable protection does not cause the [generating resource Facility to which it is applied to](#) trip ~~or cease injecting current~~ within the “no trip zone” during a voltage excursion at the high~~;~~ side of the GSU or MPT; subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*
- If the Transmission Planner allows less stringent voltage protection settings than those required to meet PRC-024-4 Attachment 2, then the Generator Owner may set its protection within the voltage recovery characteristics of a location-specific Transmission Planner’s study.
 - Applicable voltage protection may be set to trip ~~or cease injecting current~~ during a voltage excursion within a portion of the “no trip zone” for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.
- M2.** Each Generator Owner [and Transmission Owner](#) shall have evidence that applicable voltage protection has been set in accordance with Requirement R2, such as dated setting sheets, voltage-time boundaries, calibration sheets, coordination plots, dynamic simulation studies, calculations, ~~or~~ other documentation.

⁵ Frequency, voltage, and volts per hertz protection (whether provided by relaying or functions within associated control systems) that respond to electrical signals and: (i) directly trip the [synchronous generators, type 1 or type 2 wind resource\(s\), or synchronous condenser\(s\)](#); or (ii) provide signals to ~~the generating resource(s) to either~~ trip ~~or cease injecting current~~ [the same Facilities](#).

⁶ [Ibid](#)

- R3.** Each Generator Owner [and Transmission Owner](#) shall document each known regulatory or equipment limitation⁷ that prevents [an applicable generating resource\(s\) its Facility](#), with [applicable](#) frequency or voltage protection from meeting the protection setting criteria in Requirements R1 or R2, including (but not limited to) study results, experience from an actual event, or manufacturer’s advice. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*
- 3.1.** The Generator Owner [and Transmission Owner](#) shall communicate the documented regulatory or equipment limitation, or the removal of a previously documented regulatory or equipment limitation, to its Planning Coordinator and Transmission Planner within 30 calendar days of any of the following:
- Identification of a regulatory or equipment limitation.
 - Repair of the equipment causing the limitation that removes the limitation.
 - Replacement of the equipment causing the limitation with equipment that removes the limitation.
 - Creation or adjustment of an equipment limitation caused by consumption of the cumulative turbine life-time frequency excursion allowance.
- M3.** Each Generator Owner [and Transmission Owner](#) shall have evidence that it has documented and communicated any known regulatory or equipment limitations that resulted in an exception to Requirements R1 or R2 in accordance with Requirement R3, such as a dated email or letter that contains such documentation as study results, experience from an actual event, or manufacturer’s advice.
- R4.** Each Generator Owner [and Transmission Owner](#) shall provide its applicable protection settings associated with Requirements R1 and R2 to the Planning Coordinator or Transmission Planner that models the associated [Facility-generating resource\(s\)](#) within 60 calendar days of receipt of a written request for the data and within 60 calendar days of any change to those previously requested settings unless directed by the requesting Planning Coordinator or Transmission Planner that the reporting of protection setting changes is not required. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*
- M4.** Each Generator Owner [and Transmission Owner](#) shall have evidence that it communicated applicable protection settings in accordance with Requirement R4, such as dated e-mails, correspondence or other evidence and copies of any requests it has received for that information.

⁷ Excludes limitations caused by the setting capability of the frequency, voltage, and volts per hertz protective relays [applied to the synchronous for the generating, type 1 or type 2 wind resource\(s\), and synchronous condenser\(s\)](#). This does not exclude limitations originating in the equipment protected by the relay. ~~This also does not exclude limitations of frequency, voltage, and volts per hertz protection embedded in control systems.~~

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Generator Owner [and Transmission Owner](#) shall keep data or evidence Requirement R1 through R4; for [five](#) years or until the next audit, whichever is longer.
- If a Generator Owner [or Transmission Owner](#) is found non-compliant, the Generator Owner or Transmission Owner shall keep information related to the non-compliance until mitigation is complete and approved for the time period specified above, whichever is longer.

1.3. Compliance Monitoring and Assessment Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	N/A	N/A	N/A	The Generator Owner or Transmission Owner failed to set its applicable frequency protection so that it does not trip or cease injecting current according to Requirement R1.
R2.	N/A	N/A	N/A	The Generator Owner or Transmission Owner failed to set its applicable voltage protection so that it does not trip or cease injecting current according to Requirement R2.
R3. D. Regional Variances

D.A. Variance for the Quebec Interconnection

~~This Variance extends the applicability of Requirements R1, R3, and R4 to Transmission Owners in the Quebec Interconnection that own a BES GSU or MPT and apply protection listed in Section 4.2.1, Facilities. This Variance also replaces Requirement R2 of the continent-wide standard in its entirety and adds a new requirement, Requirement D.A.5., applicable to Planning Coordinators in the Quebec Interconnection.~~

~~In Requirements R1, R3, and R4, all references to “Generator Owner” are replaced with “Generator Owner and Transmission Owner.”~~

This Variance replaces continent-wide Requirement R2 in its entirety with the following:

D.A.2. Each Generator Owner and Transmission Owner shall set its applicable voltage protection⁸ in accordance with PRC-024 Attachment 2Aa, such that the applicable protection does not cause the ~~generating resource~~Facility to which it is applied to trip within the “no trip zone” ~~or cease injecting current~~ during a voltage excursion within the “no trip zone” at the high-side of the GSU or MPT, subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- For newly designated strategic power plants, applicable protections must comply with the high voltage durations for such plants within 48 calendar months of the notification made pursuant to Requirement D.A.5. During this transition period, voltage protections must at least comply with the high voltage durations for “all power plants”.
- Applicable voltage protection may ~~The generating resource(s) are permitted to~~ be set to trip ~~or to cease injecting current~~ during a voltage excursion within a portion of ~~bounded by~~ the “no trip zone” of PRC-024 Attachment 2Aa for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.
- If the Transmission Planner allows less stringent voltage protection settings than those required to meet PRC-024 Attachment 2Aa, then the Generator Owner or Transmission Owner may set its protection

⁸ Frequency, voltage, and volts per hertz protection (whether provided by relaying or functions within associated control systems) that respond to electrical signals and: (i) directly trip the synchronous generator(s), type 1 or type 2 wind resource(s), or synchronous condenser(s); or (ii) provide signals to trip the same Facilities.

within the voltage recovery characteristics of a location-specific Transmission Planner's study.

- ~~• Inverter based resources voltage protection settings may be set to cease injecting current momentarily during a voltage excursion at the high side of the MPT, bounded by the "no trip zone" of PRC-024 Attachment 2a, under the following conditions:~~
 - ~~○ After a minimum delay of 0.022 s, when the positive sequence voltage exceeds 1.25 per unit (p.u.) Normal operation must resume once the voltage drops back below 1.25 p.u at the high side of the MPT.~~
 - ~~○ After a minimum delay of 0.022 s, when the phase to ground root mean square (RMS) voltages exceeds 1.4 p.u., as measured at generator terminals, on one or multiple phases. Normal operation must resume once the positive sequence voltage drops back below the 1.25 p.u. at the high side of the MPT.~~

M.D.A.2. Each Generator Owner and Transmission Owner shall have evidence that applicable voltage protection has been set in accordance with Requirement R2, such as dated setting sheets, voltage-time boundaries, calibration sheets, coordination plots, dynamic simulation studies, calculations, or other documentation.

This Variance adds the following Requirement:

D.A.5 Each Planning Coordinator shall designate, at least once every five calendar years, the strategic power plants that must comply with Attachment 2A and notify, within 30 calendar days of its designation, each Generator Owner or Transmission Owner that owns facilities⁹ in the strategic power plants. *[Violation Risk Factor: Medium] [Time Horizon: Long-term planning]*

M.D.A.5 Each Planning Coordinator shall have evidence that it designated, at least once every five calendar years, strategic power plants in accordance with Requirement D.A.5, Part 5 and shall have dated evidence that each Generator Owner or Transmission Owner has been notified in accordance with Requirement D.A.5, part 5.2. Evidence may include, but is not limited to: letters, emails, electronic files, or hard copy records demonstrating transmittal of information.

⁹ Facilities in the strategic power plants include facilities [with synchronous generator\(s\)](#) from the generator up to and including the MPT or GSU.

Violation Severity Levels

This Variance adds a VSL for D.A.5 and modifies the VSL for R2 as follows:

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
D.A.2.	N/A	N/A	N/A	<p>The Generator Owner or Transmission Owner failed to set its applicable voltage protection so that it does not trip or cease injecting current in accordance with Requirement D.A.2.</p> <p>OR</p> <p>The Generator Owner or Transmission Owner set its applicable voltage protection in accordance with Requirement D.A.2 but, for strategic power plants, failed to do so within 48 months of notification.</p>
D.A.5.	N/A	The Planning Coordinator designated strategic power plants at least once every five calendar years but notified each Generator Owner or Transmission Owner that owns	The Planning Coordinator designated strategic power plants at least once every five calendar years but notified each Generator Owner or Transmission Owner that owns	The Planning Coordinator failed to designate, at least once every five years, the strategic power plants that must comply with Attachment 2Ae.

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
		facilities in the strategic power plants between 31 days and 45 days after its designation.	facilities in the strategic power plants between 46 days and 60 days after its designation.	OR The Planning Coordinator failed to notify, each Generator Owner or Transmission Owner that owns facilities in the strategic power plants or notified them more than 60 days after the its designation.

Figure 1: Eastern Interconnection Boundaries

Figure 1

** The area outside the "No Trip Zone" is not a "Must Trip Zone."*

Table 1: Frequency Boundary Data Points - Eastern Interconnection

High Frequency Duration		Low Frequency Duration	
Frequency (Hz)	Minimum Time (Sec)	Frequency (Hz)	Minimum Time (sec)
≥61.8	Instantaneous ¹¹	≤57.8	Instantaneous ¹¹
≥60.5	$10^{(90.935-1.45713*f)}$	≤59.5	$10^{(1.7373*f-100.116)}$

¹⁰ The figures do not visually represent the “no trip zone” boundaries before 0.1 seconds and after 10,000 seconds. The Frequency Boundary Data Points Table defines the entirety of the “no trip zone” boundaries.

¹¹ Frequency is calculated over a window of time. While the frequency boundaries include the option to trip instantaneously for frequencies outside the specified range, this calculation should occur over a time window. Typical window/filtering lengths are three to six cycles (50 – 100 milliseconds). Instantaneous trip settings based on instantaneously calculated frequency measurement is not permissible.

¹⁰Voltage at the high-side of the GSU or MPT.

Table 1

Attachment 2: Voltage Boundary Clarifications – Eastern, Western, and ERCOT Interconnections

Boundary Details:

1. Unless otherwise specified by the Transmission Planner, the per unit voltage base for these boundaries is the nominal transmission system voltage (e.g., 100 kV, 115 kV, 138 kV, 161 kV, 230 kV, 345 kV, 400 kV, 500 kV, 765 kV, etc.).
2. The values in the table represent the minimum time durations allowed for specified voltage excursion thresholds.
3. When evaluating volts per hertz protection, either assume a system frequency of 60 Hertz or the magnitude of the high voltage boundary can be adjusted in proportion to deviations of frequency below 60 Hertz.
4. Voltages in the boundaries assume RMS fundamental frequency phase-to-ground or phase-to-phase per unit voltage.
5. For applicability to PRC-024, the “no trip zone” ends at 4 seconds.

Evaluating Protection Settings:

The voltage values in the Attachment 2 voltage boundaries are voltages at the high side of the GSU/MPT. For generating resources with multiple stages of step up to reach interconnecting voltage, this is the high side of the transformer with a low side below 100kV and a high side 100kV or above. When evaluating protection settings, consider the voltage differences between where the protection is measuring voltage and the high side of the GSU/MPT. A steady state calculation or dynamic simulation may be used.

If using a steady state calculation or dynamic simulation, use the following conditions when evaluating protection settings:

- a. The most probable real and reactive loading conditions for the [synchronous generator, type 1 or 2 wind resources, or synchronous condenser unit](#) under study.
- b. All installed [wind resource generating plant](#) reactive support (e.g., static VAR compensators, synchronous condensers, capacitors) equipment is available and operating normally.
- c. Account for the actual tap settings of transformers between the generator terminals [or the collector station](#) and the high side of the GSU/MPT.
- d. For dynamic simulations, the [synchronous generator or condenser](#) automatic voltage regulator is in automatic voltage control mode with associated limiters in service.

Table 2

Attachment 2Aa: Voltage Boundary Clarifications – Quebec Interconnection

Boundary Details:

1. The per unit voltage base for these boundaries is the nominal operating voltage (e.g., 120 kV, 161 kV, 230 kV, 315 kV, 735 kV, etc.).
2. The values in the table represent the minimum time durations allowed for specified voltage excursion thresholds.
3. When evaluating volts per hertz protection, either assume a system frequency of 60 Hertz or the magnitude of the high voltage boundary can be adjusted in proportion to deviations of frequency below 60 Hertz.
4. Voltages in the Quebec Interconnection boundaries assume positive-sequence values.

Evaluating Protection Settings:

The voltage values in the Attachment 2a voltage boundaries are voltages at the high side of the GSU/MPT. For generating resources with multiple stages of step up to reach interconnecting voltage, this is the high side of the transformer that connects to the interconnecting voltage. When evaluating protection settings, consider the voltage differences between where the protection is measuring voltage and the high side of the GSU/MPT. A steady state calculation or dynamic simulation may be used.

If using a steady state calculation or dynamic simulation, use the following conditions when evaluating protection settings:

- a. The most probable real and reactive loading conditions for the unit under study.
- b. All installed generating plant reactive support (e.g., static VAR compensators, synchronous condensers, capacitors) equipment is available and operating normally.
- c. Account for the actual tap settings of transformers between the generator terminals and the high side of the GSU/MPT.
- d. For dynamic simulations, the automatic voltage regulator is in automatic voltage control mode with associated limiters in service.

Technical Rationale

Project 2020-02 Modifications to PRC-024 (Generator Ride-through)

PRC-024-4 – Frequency and Voltage Protection Settings for Synchronous Generators, Type 1 and 2 Wind Plants, and Synchronous Condensers

General Rationale

The drafting team proposes to modify PRC-024-3 to retain the Reliability Standard as a protection-based standard with applicability to only synchronous generators, synchronous condensers, and type 1 and 2 wind plants. This proposal is a consequence of both the different natures of synchronous and inverter-based generation resources and several recent events exhibiting significant IBR ride-through deficiencies. The behavior of rotating synchronous generators during faults and other disturbances on the transmission system is well established and understood in comparison to IBR generation. The disturbance ride-through vulnerabilities of synchronous generators are pole slipping instability and undervoltage dropout of critical plant auxiliary equipment, leading to tripping of a generator. Pole slipping (or loss of synchronism) can be managed by active power dispatch constraints or stability System Operating Limits, and is outside the scope of Project 2020-02. Undervoltage dropout of critical auxiliary equipment is also outside the scope of Project 2020-02 because of complexities associated with auxiliary systems and how such equipment behaves under low voltage conditions. The Project 2020-02 Standard Authorization Request (SAR) notes that auxiliary equipment has not posed a ride-through risk and the SAR specifically excludes modifications in PRC-024-3 for auxiliary equipment.

Over-frequency protection, under-frequency protection, over-voltage protection, and under-voltage protection may or may not be applied to synchronous generating units. If applied, settings should be coordinated between the needs of generating unit protection and the no-trip zones within PRC-024-4 attachments. Coordination of generating unit capabilities, voltage regulating controls, and protection is addressed within PRC-019-2. Excitation and governing controls affect synchronous generator ride-through behavior to some degree but because of progressive improvement, standardization, and level of maturity of these controls, they are rarely a cause of unnecessary tripping during disturbances. In addition, there are other existing NERC standards to prevent unnecessary tripping of the generators during a system disturbance such as PRC-025-2 “Generator Relay Loadability” and PRC-026-2 “Relay Performance During Stable Power Swings”. For these reasons, there is no need to impose actual disturbance ride-through requirements on synchronous units but only to include restrictions for frequency and voltage protection setting ranges as maintained in PRC-024-4.

Rationale for Applicability Section (4.0)

Functional Entities (4.1)

The functional entity responsible for setting frequency, voltage, and volts per hertz protection for synchronous generators, type 1 and 2 wind plants, and synchronous condensers is either the Generator Owner ~~(GO)~~ or Transmission Owner ~~(TO)~~. Planning Coordinators ~~(PC)~~ are retained as applicable entities only in the Quebec Interconnection. Modifications are proposed in PRC-024-4 to expand functional entity

applicability to include “Transmission Owners that apply protection” because of the inclusion of synchronous condenser applicability in section 4.2.2.

Facilities (4.2)

Applicability Facilities subparts in Section 4.1.1 were modified to restrict PRC-024-4 to synchronous generators and type 1 and 2 wind plants. Section 4.2.2 was added to cover synchronous condensers and associated equipment.

Rationale for Requirements R1 through R4

Modifications were made to Requirements R1, R2, R3, and R4 to include the Transmission Owner as a functional entity applicable to each requirement because of the addition of synchronous condensers.

Modifications were made to Requirements R1, R2, R3, and R4 to include language for type 1 and 2 wind plants and synchronous condensers and to remove language that relates to inverter-based resource (IBR) functionality since IBRs will be addressed in a new standard PRC-029-1.

Violation Risk Factor and Violation Severity Level

Justifications

Project 2020-02 Modifications to PRC-024 (Generator Ride-through)

PRC-024-4

This document provides the standard drafting team's (SDT's) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-024-4. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to BulkPower System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to BulkPower System instability, separation, or a cascading sequence of failures, or could place the Bulk-Power System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System. However, violation of a medium risk requirement is unlikely to lead to Bulk- Power System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the BulkPower System, or the ability to effectively monitor, control, or restore the BulkPower System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Power System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor and control the Bulk-Power System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk-Power System, or the ability to effectively monitor, control, or restore the Bulk-Power System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards

FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC’s Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC’s definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC’s overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a “binary” type requirement must be a “Severe” VSL.

Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

The VRF did not change from the previously FERC approved PRC-024-3 Reliability Standard.

VSLs for PRC-024-4, Requirement R1			
Lower	Moderate	High	Severe
N/A	N/A	N/A	The Generator Owner or Transmission Owner failed to set its applicable frequency protection so that it does not trip according to Requirement R1.

VSL Justifications for PRC-024-4, Requirement R1	
<p>FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>The requirement adds a functional entity. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.</p>
<p>FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p> <p><u>Guideline 2a</u>: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p><u>Guideline 2b</u>: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>The proposed VSLs are binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>

VSL Justifications for PRC-024-4, Requirement R1

<p>FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p>The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.</p>
<p>FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>	<p>Each VSL is based on a single violation and not cumulative violations.</p>

The VRF did not change from the previously FERC approved PRC-024-3 Reliability Standard.

VSLs for PRC-024-4, Requirement R2			
Lower	Moderate	High	Severe
N/A	N/A	N/A	The Generator Owner or Transmission Owner failed to set its applicable voltage protection so that it does not trip according to Requirement R2.

VSL Justifications for PRC-024-4, Requirement R2	
<p>FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance</p>	<p>The requirement adds a functional entity. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.</p>
<p>FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p> <p><u>Guideline 2a</u>: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p><u>Guideline 2b</u>: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>The proposed VSLs are binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>

VSL Justifications for PRC-024-4, Requirement R2

<p>FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement</p>	<p>The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.</p>
<p>FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations</p>	<p>Each VSL is based on a single violation and not cumulative violations.</p>

The VRF did not change from the previously FERC approved PRC-024-3 Reliability Standard.

VSLs for PRC-024-4, Requirement R3			
Lower	Moderate	High	Severe
The Generator Owner or Transmission Owner documented the known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2 and communicated the documented limitation to its Planning Coordinator and Transmission Planner more than 30 calendar days but less than or equal to 60 calendar days of identifying the limitation.	The Generator Owner or Transmission Owner documented the known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2 and communicated the documented limitation to its Planning Coordinator and Transmission Planner more than 60 calendar days but less than or equal to 90 calendar days of identifying the limitation.	The Generator Owner or Transmission Owner documented the known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2 and communicated the documented limitation to its Planning Coordinator and Transmission Planner more than 90 calendar days but less than or equal to 120 calendar days of identifying the limitation.	The Generator Owner or Transmission Owner failed to document any known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2. OR The Generator Owner or Transmission Owner failed to communicate the documented limitation to its Planning Coordinator and Transmission Planner within 120 calendar days of identifying the limitation.

VSL Justifications for PRC-024-4, Requirement R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement adds a functional entity. Therefore, the proposed VSLs do not have the unintended consequence of lowering the level of compliance.

VSL Justifications for PRC-024-4, Requirement R3

<p>FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties</p> <p><u>Guideline 2a</u>: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent</p> <p><u>Guideline 2b</u>: Violation Severity Level Assignments that Contain Ambiguous Language</p>	<p>The proposed VSLs are binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.</p>

Standards Announcement

Project 2020-02 Modifications to PRC-024 (Generator Ride-through)

Final Ballot Open through September 30, 2024

[Now Available](#)

A final ballot for **PRC-024-4 - Frequency and Voltage Protection Settings for Synchronous Generators, Type 1 and Type 2 Wind Resources, and Synchronous Condensers** is open through **8 p.m. Eastern, Monday, September 30, 2024.**

The **Implementation Plan for Project 2020-02 Modifications to PRC-024 (Generator Ride-through)** applies to both **PRC-024-4** and **PRC-029-1**. The Implementation Plan was posted on September 17 with the re-ballot of **PRC-029-1** and is open for final ballot through **8 p.m. Eastern, Monday, September 30, 2024.**

Balloting

In the final ballot, votes are counted by exception. Votes from the previous ballot are automatically carried over in the final ballot. Only members of the applicable ballot pools can cast a vote. Ballot pool members who previously voted have the option to change their vote in the final ballot. Ballot pool members who did not cast a vote during the previous ballot can vote in the final ballot.

Members of the ballot pool(s) associated with this project can log into the Standards Balloting and Commenting System (SBS) and submit votes [here](#).

- Contact NERC IT support directly at <https://support.nerc.net/> (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.
- Passwords expire every **6 months** and must be reset.
- The SBS **is not** supported for use on mobile devices.
- Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.

Next Steps

The voting results will be posted and announced after the ballots close. If approved, the standard will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For information on the Standards Development Process, refer to the [Standard Processes Manual](#).

For more information or assistance, contact Director of Standards Development, [Jamie Calderon](#) (via email) or at 404-960-0568.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

Final Draft of PRC-029-1 is posted for a formal comment and additional ballot.

Completed Actions	Date
Standards Committee accepted revised Standard Authorization Request (SAR) for posting	April 19, 2023
Standards Committee approved waivers to the Standards Process Manual	December 13, 2023
25-day formal comment period and initial ballot	March 27 – April 22, 2024
15-day formal comment period and additional ballot	June 18 – July 8, 2024
15-day formal comment period and additional ballot	July 22 – August 12, 2024
14-day formal comment period and additional ballot	September 17 – September 30, 2024
Final Ballot	None Required
Board adoption	October 8, 2024

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Ride-through: The plant/facility remains connected and continues to operate through voltage or frequency system disturbances.

A. Introduction

1. **Title:** Frequency and Voltage Ride-through Requirements for Inverter-based Resources
2. **Number:** PRC-029-1
3. **Purpose:** To ensure that IBRs Ride-through to support the Bulk Power System (BPS) during and after defined frequency and voltage excursions.
4. **Applicability:**
 - 4.1 **Functional Entities:**
 - 4.1.1. Generator Owner
 - 4.2 **Facilities:**
 - 4.2.1. Bulk Electric System (BES) IBRs
 - 4.2.2. Non-BES IBRs that either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV.

Effective Date: See Implementation Plan for Project 2020-02 – PRC-029-1

Standard-only Definition: None

B. Requirements and Measures

- R1.** Each Generator Owner shall ensure the design and operation is such that each IBR meets or exceeds Ride-through requirements, in accordance with the “must Ride-through¹ zone” as specified in Attachment 1, except in the following conditions: *[Violation Risk Factor: High] [Time Horizon: Operations Assessment]*
- The IBR needed to electrically disconnect in order to clear a fault;
 - The voltage at the high-side of the main power transformer² went outside an accepted hardware limitation, in accordance with Requirement R4;
 - The instantaneous positive sequence voltage phase angle change is more than 25 electrical degrees at the high-side of the main power transformer and is initiated by a non-fault switching event on the transmission system³; or
 - The Volts per Hz (V/Hz) at the high-side of the main power transformer exceed 1.1 per unit for longer than 45 seconds or exceed 1.18 per unit for longer than 2 seconds.
- M1.** Each Generator Owner shall have evidence to demonstrate the design of each IBR will adhere to Ride-through requirements, as specified in Requirement R1. Examples of evidence may include, but are not limited to dynamic simulations, studies, plant protection settings, and control settings design evaluation. Each Generator Owner shall retain evidence of actual disturbance monitoring (i.e., sequence of event recorder, dynamic disturbance recorder, and fault recorder) to demonstrate that the operation of each IBR did adhere to Ride-through requirements, as specified in Requirement R1. If the Generator Owner choose to utilize Ride-through exemptions that occur within the “must Ride-through zone” and are caused by non-fault initiated phase jumps of greater than 25 electrical degrees, then each Generator Owner shall also retain evidence of actual disturbance monitoring (i.e., sequence of event recorder, dynamic disturbance recorder, and fault recorder) data to demonstrate that the IBR failed to Ride-through during a phase jump of greater than or equal to 25 electrical degrees, and documentation from their Transmission Planner, Reliability Coordinator, Planning Coordinator, or Transmission Operator that a non-fault initiated switching event occurred.
- R2.** Each Generator Owner shall ensure the design and operation is such that the voltage performance for each IBR adheres to the following during a voltage excursion, unless a documented hardware limitation exists in accordance with Requirement R4. *[Violation Risk Factor: High] [Time Horizon: Operations Assessment]*
- 2.1.** While the voltage at the high-side of the main power transformer remains within the continuous operation region as specified in Attachment 1, each IBR shall:

¹ Includes no tripping associated with phase lock loop loss of synchronism.

² For the purpose of this standard, the main power transformer is the power transformer that steps up voltage from the collection system voltage to the nominal transmission/interconnecting system voltage for IBRs. In case of IBR connecting via a dedicated Voltage Source Converter High Voltage Direct Current (VSC-HVDC), the main power transformer is the main power transformer on the receiving end.

³ Current blocking mode may be used for non-fault initiated phase jumps greater than 25 degrees in order to prevent tripping.

- 2.1.1** Continue to deliver the pre-disturbance level of Real Power or available Real Power⁴, whichever is less.⁵
 - 2.1.2** Continue to deliver Reactive Power up to its Reactive Power limit and according to its controller settings.
 - 2.1.3** Prioritize Real Power or Reactive Power when the voltage is less than 0.95 per unit, the voltage is within the continuous operating region, and the IBR cannot deliver both Real Power and Reactive Power due to a current limit or Reactive Power limit, unless otherwise specified through other mechanisms by an associated Transmission Planner, Planning Coordinator, Reliability Coordinator, or Transmission Operator.
- 2.2.** While voltage at the high-side of the main power transformer is within the mandatory operation region as specified in Attachment 1, each IBR shall exchange current, up to the maximum capability to provide voltage support, on the affected phases during both symmetrical and asymmetrical voltage disturbances, either under⁶:
- Reactive Power priority by default; or
 - Real Power priority if required through other mechanisms by an associated Transmission Planner, Planning Coordinator, Reliability Coordinator, or Transmission Operator.
- 2.3.** While voltage at the high-side of the main power transformer is within the permissive operation region, as specified in Attachment 1, each IBR may operate in current blocking mode if necessary to avoid tripping. Otherwise, each IBR shall follow the requirements for the mandatory operation region in Requirement R2.2.
- 2.3.1** If an IBR enters current blocking mode, it shall restart current exchange in less than or equal to five cycles of positive sequence voltage returning to a continuous operation region or mandatory operation region.
- 2.4.** Each IBR shall not itself cause voltage at the high-side of the main power transformer to exceed the applicable high voltage thresholds and time durations in its response as voltage recovers from the mandatory or permissive operation regions to the continuous operation region.
- 2.5.** Each IBR shall restore Real Power output to the pre-disturbance or available level⁷ (whichever is lesser) within 1.0 second when the voltage at the high-side of the main power transformer returns from the mandatory operation region or

⁴ "Available Real Power" refers to changes of facility Real Power output attributed to factors such as weather patterns, change of wind, and change in irradiance, but not changes of facility Real Power attributed to IBR tripping in whole or part.

⁵ Except if this would occur during a frequency excursion. The Real Power response should recover in accordance with the primary frequency controller.

⁶ In either case and if required, the magnitude of Real Power and reactive current shall be as specified by the Transmission Planner, Planning Coordinator, Reliability Coordinator, or Transmission Operator.

⁷ "Available Real Power" refers to changes of facility Real Power output attributed to factors such as weather patterns, change of wind, and change in irradiance, but not changes of facility Real Power attributed to IBR tripping in whole or part.

permissive operation region (including operating in current blocking mode) to the continuous operation region, as specified in Attachment 1, unless an associated Transmission Planner, Planning Coordinator, Reliability Coordinator, or Transmission Operator requires a lower post-disturbance Real Power level requirement or requires a different post-disturbance Real Power restoration time through other mechanisms.⁸

- M2.** Each Generator Owner shall have evidence to demonstrate the design of each IBR will adhere to requirements, as specified in Requirement R2. Examples of evidence may include, but are not limited to dynamic simulations, studies, plant protection settings, and control settings design evaluation. Each Generator Owner shall also retain evidence of actual disturbance monitoring (i.e., sequence of event recorder, dynamic disturbance recorder, and fault recorder) data to demonstrate that the operation of each IBR did adhere to performance requirements, as specified in Requirement R2, during each voltage excursion measured at the high-side of the main power transformer. Regarding R2.1.3, R2.2, and R2.5, the Generator Owner shall retain evidence of receiving such performance requirements, (e.g., email exchange, contract information) if the Transmission Planner, Transmission Operator, Reliability Coordinator, or Planning Coordinator has required the Generator Owner through other mechanisms to follow performance requirements other than those in Requirement R2 (e.g., ramp rates, Reactive Power prioritization).
- R3.** Each Generator Owner shall ensure the design and operation is such that each IBR meets or exceeds Ride-through requirements during a frequency excursion event whereby the System frequency remains within the “must Ride-through zone” according to Attachment 2 and the absolute rate of change of frequency (RoCoF)⁹ magnitude is less than or equal to 5 Hz/second, unless a documented hardware limitation exists in accordance with Requirement R4. *[Violation Risk Factor: High] [Time Horizon: Operations Assessment]*
- M3.** Each Generator Owner shall have evidence to demonstrate the design of each IBR will adhere to Ride-through requirements, as specified in Requirement R3. Examples of evidence may include, but are not limited to dynamic simulations, studies, plant protection settings, and control settings design evaluation. Each Generator Owner shall also retain evidence of actual disturbance monitoring (i.e., sequence of event recorder, dynamic disturbance recorder, and fault recorder) data to demonstrate the operation of each IBR did adhere to Ride-through requirements, as specified in Requirement R3, during each frequency excursion event measured at the high-side of the main power transformer.
- R4.** Each Generator Owner identifying an IBR that is in-service by the effective date of PRC-029-1, has known hardware limitations that prevent the IBR from meeting Ride-through criteria as detailed in Requirements R1-R3, and requires an exemption from specific

⁸ Except if this would occur during a frequency excursion. The Real Power response should recover in accordance with the primary frequency controller.

⁹ Rate of change of frequency (RoCoF) is calculated as the average rate of change for multiple calculated system frequencies for a time period of greater than or equal to 0.1 second. RoCoF is not calculated during the fault occurrence and clearance.

Ride-through criteria shall:¹⁰ [*Violation Risk Factor: Lower*] [*Time Horizon: Long-term Planning*]

- 4.1.** Document information supporting the identified hardware limitation no later than 12 months following the effective date of PRC-029-1. This documentation shall include:
 - 4.1.1** Identifying information of the IBR (name and facility number);
 - 4.1.2** Which aspects of Ride-through requirements that the IBR would be unable to meet and the capability of the hardware due to the limitation;
 - 4.1.3** Identification of the specific piece(s) of hardware causing the limitation;
 - 4.1.4** Technical documentation verifying the limitation is due to hardware that would need to be physically replaced to meet all Ride-through criteria, and that the limitation cannot be remedied by software updates or setting changes; and
 - 4.1.5** Information regarding any plans to remedy the hardware limitation (such as an estimated date).
- 4.2.** Provide a copy of the information detailed in Requirement R4.1, except for any material considered by the original equipment manufacturer to be proprietary information, to the associated Planning Coordinator(s), Transmission Planner(s), Transmission Operator(s), Reliability Coordinator(s), and the Compliance Enforcement Authority (CEA) no later than 12 months following the effective date of PRC-029-1.¹¹
 - 4.2.1** Provide any response for additional information requested by the associated Planning Coordinator(s), Transmission Planner(s), Transmission Operator(s), Reliability Coordinator(s), and the CEA to the requestor within 90 days of the request.
 - 4.2.2** Provide a copy of the acceptance of a hardware limitation by the CEA to the associated Planning Coordinator(s), Transmission Planner(s), Transmission Operator(s), and Reliability Coordinator(s) within 90 days of receiving the acceptance.¹²
- 4.3.** Each Generator Owner with a previously accepted limitation that replaces the hardware causing the limitation shall document and communicate such a hardware change to the associated Planning Coordinator(s), Transmission Planner(s), Transmission Operator(s), and Reliability Coordinator(s) within 90 days of the hardware change.

¹⁰ The exemption requests for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.

¹¹ To the extent the original equipment manufacturer considers any material to be proprietary, the Generator Owner is required to share this proprietary material only with the CEA.

¹² Acceptance by the CEA is verification that the information provided includes all information listed in Requirement R4.1.

4.3.1 When existing hardware causing the limitation is replaced, the exemption for that Ride-through criteria no longer applies.

M4. Each Generator Owner submitting for an exemption for an IBR that is in-service by the effective date of PRC-029-1, shall have evidence of submission to the CEA consistent with the information listed in Requirement R4.1. Each Generator Owner shall have evidence of communicated copies of each submission in accordance with Requirement R4.2 and to the associated entities described in Requirement R4.2. Acceptable types of evidence for submittals include, but are not limited to, meeting minutes, agreements, copies of procedures or protocols in effect, or email correspondence. Acceptable types of evidence for a hardware limitation may include, but is not limited to damage curves provided by the original equipment manufacturer. Each Generator Owner that receives a request for additional information under Requirement R4.2.1 shall have evidence of providing that information within 90 days. Each Generator Owner that replaces hardware at an IBR that is directly associated with an accepted exemption and that hardware is the cause for the limitation, shall have evidence of communicating the hardware change to the associated entities described in Requirement R4.3 within 90 days of the hardware replacement.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Generator Owner shall retain evidence with Requirements R1, R2, and R3 in this standard for 36 calendar months or the date of the last audit, whichever is greater.
- Each Generator Owner shall retain evidence with Requirement R4 in this standard for five calendar years or the date of the last audit, whichever is greater.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Generator Owner failed to ensure the design capability of each applicable IBR to Ride-through in accordance with Attachment 1, except for those conditions identified in Requirement R1.	N/A	N/A	The Generator Owner failed to ensure each applicable IBR adhered to Ride-through requirements in accordance with Attachment 1, except for those conditions identified in Requirement R1.
R2.	The Generator Owner failed to ensure the design capability of each applicable IBR to adhere to performance requirements during voltage excursions, as specified in Requirement R2, unless a documented hardware limitation exists in accordance with Requirement R4.	N/A	N/A	The Generator Owner failed to ensure each applicable IBR adhered to performance requirements during voltage excursions, as specified in Requirement R2, unless a documented hardware limitation exists in accordance with Requirement R4.
R3.	The Generator Owner failed to ensure the design capability of each applicable IBR to Ride-through in accordance with Attachment 2, unless a documented hardware limitation exists in accordance with Requirement R4.	N/A	N/A	The Generator Owner failed to ensure each applicable IBR adhered to Ride-through requirements in accordance with Attachment 2, unless a documented hardware limitation exists in accordance with Requirement R4.

Attachment 1: Voltage Ride-Through Criteria

Table 1: Voltage Ride-through Requirements for AC-Connected Wind IBR ¹³

Voltage (per unit) ¹⁴	Operation Region	Minimum Ride-Through Time (sec)
> 1.20	N/A ¹⁵	N/A
≥ 1.10	Mandatory Operation Region	1.0
> 1.05	Continuous Operation Region	1800
≤ 1.05 and ≥ 0.90	Continuous Operation Region	Continuous
< 0.90	Mandatory Operation Region	3.00
< 0.70	Mandatory Operation Region	2.50
< 0.50	Mandatory Operation Region	1.20
< 0.25	Mandatory Operation Region	0.16
< 0.10	Permissive Operation Region	0.16

Table 2: Voltage Ride-through Requirements for All Other IBR

Voltage (per unit) ¹⁶	Operation Region	Minimum Ride-Through Time (sec)
> 1.20	N/A ¹⁷	N/A
> 1.10	Mandatory Operation Region	1.0
> 1.05	Continuous Operation Region	1800
≤ 1.05 and ≥ 0.90	Continuous Operation Region	Continuous
< 0.90	Mandatory Operation Region	6.00
< 0.70	Mandatory Operation Region	3.00
< 0.50	Mandatory Operation Region	1.20
< 0.25	Mandatory Operation Region	0.32
< 0.10	Permissive Operation Region	0.32

¹³ Type 3 and type 4 wind resources directly connected to the AC Transmission System.

¹⁴ Refer to bullet #4 below.

¹⁵ These conditions are referred to as the “may Ride-through zone”.

¹⁶ Refer to bullet #4 below.

¹⁷ These conditions are referred to as the “may Ride-through zone”.

1. Table 1 applies to type 3 and type 4 wind IBR or hybrid IBR that include wind, unless connected via a dedicated Voltage Source Converter - High Voltage Direct Current (VSC-HVDC) transmission facility.
2. Table 2 applies to all other IBR types not covered in Table 1; including, but not limited to, the following facilities:
 - a. IBR, regardless of their energy resource, interconnecting via a dedicated VSC-HVDC transmission facility.
 - b. Other IBR or hybrid IBR consisting of photovoltaic (PV) and BESS.
3. The applicable voltage for VSC-HVDC system with a dedicated connection to an IBR is on the AC side of the transformer(s) that is (are) used to connect the VSC-HVDC system to the interconnected transmission system.
4. The voltage base for per unit calculation is the nominal phase-to-ground or phase-to-phase transmission system voltage unless otherwise defined by the Planning Coordinator, Transmission Planner, or Transmission Owner.
5. The applicable voltage for Tables 1 and 2 is identified as the voltage max/min of phase-to-neutral or phase-to-phase fundamental root mean square (RMS) voltage at the high-side of the main power transformer.
6. Tables 1 and 2 are only applicable when the frequency is within the “must Ride-through zone” as specified in Figure 1 of Attachment 2.
7. At any given voltage value, each IBR shall Ride-through unless the time duration at that voltage has exceeded the specified minimum Ride-through time duration. If the voltage is continuously varying over time, it is necessary to add the duration within each band of Tables 1 and 2 over any 10 second time period.
8. The specified duration of the mandatory operation regions and the permissive operation regions in Tables 1 and 2 is cumulative over one or more disturbances within any 10 second time period.
9. The IBR may trip for more than four deviations of the applicable voltage at the high-side of the main power transformer outside of the continuous operation region within any 10 second time period.
10. Instantaneous trip settings based on instantaneously calculated voltage measurements with less than filtering lengths of one cycle (16.6 millisecond) are not permissible.
11. The “must Ride-through zone” is the combined area of the mandatory operating regions, the continuous operating regions, and the permissive operating region. All area outside of these operating regions is referred to as the “may Ride-through zone”.

Attachment 2: Frequency Ride-Through Criteria

Table 3: Frequency Ride-through Capability Requirements

System Frequency (Hz)	Minimum Ride-Through Time (sec)
> 61.8	May trip
> 61.2	299
≤ 61.2 and ≥ 58.8	Continuous
< 58.8	299
< 57.0	May trip

1. Frequency measurements are taken at the high-side of the main power transformer.
2. Frequency is measured over a period of time (typically 3-6 cycles) to calculate system frequency at the high-side of the main power transformer.
3. Instantaneous or single points of measurement may not be used in the determination of control settings.
4. At any given frequency value, each IBR shall Ride-through unless the time duration at that frequency has exceeded the specified minimum ride-through time duration.
5. The specified durations of Table 3 are cumulative over one or more disturbances within a 10-minute time period.

Figure 1: PRC-029 Frequency Ride-through Requirements

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

Draft 4 of PRC-029-1 is posted for a formal comment and additional ballot.

Completed Actions	Date
Standards Committee accepted revised Standard Authorization Request (SAR) for posting	April 19, 2023
Standards Committee approved waivers to the Standards Process Manual	December 13, 2023
25-day formal comment period and initial ballot	March 27 – April 22, 2024
15-day formal comment period and additional ballot	June 18 – July 8, 2024
15-day formal comment period and additional ballot	July 22 – August 12, 2024

Anticipated Actions	Date
14-day formal comment period and additional ballot	September 17 – September 30, 2024
Final Ballot	None Required
Board adoption	October 8, 2024

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Ride-through: The plant/facility remains connected and continues to operate through voltage or frequency system disturbances.

A. Introduction

1. **Title:** Frequency and Voltage Ride-through Requirements for Inverter-based Resources
2. **Number:** PRC-029-1
3. **Purpose:** To ensure that IBRs Ride-through to support the Bulk Power System (BPS) during and after defined frequency and voltage excursions.
4. **Applicability:**
 - 4.1 **Functional Entities:**
 - 4.1.1. Generator Owner
 - 4.2 **Facilities:**
 - 4.2.1. Bulk Electric System (BES) IBRs
 - 4.2.2. Non-BES IBRs that either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV.

Effective Date: See Implementation Plan for Project 2020-02 – PRC-029-1

Standard-only Definition: None

B. Requirements and Measures

- R1.** Each Generator Owner shall ensure the design and operation is such that each IBR meets or exceeds Ride-through requirements, in accordance with the “must Ride-through¹ zone” as specified in Attachment 1, except in the following conditions: *[Violation Risk Factor: High] [Time Horizon: Operations Assessment]*
- The IBR needed to electrically disconnect in order to clear a fault;
 - The voltage at the high-side of the main power transformer² went outside an accepted hardware limitation, in accordance with Requirement R4;
 - The instantaneous positive sequence voltage phase angle change is more than 25 electrical degrees at the high-side of the main power transformer and is initiated by a non-fault switching event on the transmission system³; or
 - The Volts per Hz (V/Hz) at the high-side of the main power transformer exceed 1.1 per unit for longer than 45 seconds or exceed 1.18 per unit for longer than 2 seconds.
- M1.** Each Generator Owner shall have evidence to demonstrate the design of each IBR will adhere to Ride-through requirements, as specified in Requirement R1. Examples of evidence may include, but are not limited to dynamic simulations, studies, plant protection settings, and control settings design evaluation. Each Generator Owner shall retain evidence of actual disturbance monitoring (i.e., sequence of event recorder, dynamic disturbance recorder, and fault recorder) to demonstrate that the operation of each IBR did adhere to Ride-through requirements, as specified in Requirement R1. If the Generator Owner choose to utilize Ride-through exemptions that occur within the “must Ride-through zone” and are caused by non-fault initiated phase jumps of greater than 25 electrical degrees, then each Generator Owner shall also retain evidence of actual disturbance monitoring (i.e., sequence of event recorder, dynamic disturbance recorder, and fault recorder) data to demonstrate that the IBR failed to Ride-through during a phase jump of greater than or equal to 25 electrical degrees, and documentation from their Transmission Planner, Reliability Coordinator, Planning Coordinator, or Transmission Operator that a non-fault initiated switching event occurred.
- R2.** Each Generator Owner shall ensure the design and operation is such that the voltage performance for each IBR adheres to the following during a voltage excursion, unless a documented hardware limitation exists in accordance with Requirement R4. *[Violation Risk Factor: High] [Time Horizon: Operations Assessment]*
- 2.1.** While the voltage at the high-side of the main power transformer remains within the continuous operation region as specified in Attachment 1, each IBR shall:

¹ Includes no tripping associated with phase lock loop loss of synchronism.

² For the purpose of this standard, the main power transformer is the power transformer that steps up voltage from the collection system voltage to the nominal transmission/interconnecting system voltage for IBRs. In case of IBR connecting via a dedicated Voltage Source Converter High Voltage Direct Current (VSC-HVDC), the main power transformer is the main power transformer on the receiving end.

³ Current blocking mode may be used for non-fault initiated phase jumps greater than 25 degrees in order to prevent tripping.

- 2.1.1** Continue to deliver the pre-disturbance level of Real Power or available Real Power⁴, whichever is less.⁵
- 2.1.2** Continue to deliver Reactive Power up to its Reactive Power limit and according to its controller settings.
- 2.1.3** Prioritize Real Power or Reactive Power when the voltage is less than 0.95 per unit, the voltage is within the continuous operating region, and the IBR cannot deliver both Real Power and Reactive Power due to a current limit or Reactive Power limit, unless otherwise specified through other mechanisms by an associated Transmission Planner, Planning Coordinator, Reliability Coordinator, or Transmission Operator.
- 2.2.** While voltage at the high-side of the main power transformer is within the mandatory operation region as specified in Attachment 1, each IBR shall exchange current, up to the maximum capability to provide voltage support, on the affected phases during both symmetrical and asymmetrical voltage disturbances, either under⁶:
- Reactive Power priority by default; or
 - Real Power priority if required through other mechanisms by an associated Transmission Planner, Planning Coordinator, Reliability Coordinator, or Transmission Operator.
- 2.3.** While voltage at the high-side of the main power transformer is within the permissive operation region, as specified in Attachment 1, each IBR may operate in current blocking mode if necessary to avoid tripping. Otherwise, each IBR shall follow the requirements for the mandatory operation region in Requirement R2.2.
- 2.3.1** If an IBR enters current blocking mode, it shall restart current exchange in less than or equal to five cycles of positive sequence voltage returning to a continuous operation region or mandatory operation region.
- 2.4.** Each IBR shall not itself cause voltage at the high-side of the main power transformer to exceed the applicable high voltage thresholds and time durations in its response as voltage recovers from the mandatory or permissive operation regions to the continuous operation region.
- 2.5.** Each IBR shall restore Real Power output to the pre-disturbance or available level⁷ (whichever is lesser) within 1.0 second when the voltage at the high-side of the main power transformer returns from the mandatory operation region or

⁴ "Available Real Power" refers to changes of facility Real Power output attributed to factors such as weather patterns, change of wind, and change in irradiance, but not changes of facility Real Power attributed to IBR tripping in whole or part.

⁵ Except if this would occur during a frequency excursion. The Real Power response should recover in accordance with the primary frequency controller.

⁶ In either case and if required, the magnitude of Real Power and reactive current shall be as specified by the Transmission Planner, Planning Coordinator, Reliability Coordinator, or Transmission Operator.

⁷ "Available Real Power" refers to changes of facility Real Power output attributed to factors such as weather patterns, change of wind, and change in irradiance, but not changes of facility Real Power attributed to IBR tripping in whole or part.

permissive operation region (including operating in current blocking mode) to the continuous operation region, as specified in Attachment 1, unless an associated Transmission Planner, Planning Coordinator, Reliability Coordinator, or Transmission Operator requires a lower post-disturbance Real Power level requirement or requires a different post-disturbance Real Power restoration time through other mechanisms.⁸

- M2.** Each Generator Owner shall have evidence to demonstrate the design of each IBR will adhere to requirements, as specified in Requirement R2. Examples of evidence may include, but are not limited to dynamic simulations, studies, plant protection settings, and control settings design evaluation. Each Generator Owner shall also retain evidence of actual disturbance monitoring (i.e., sequence of event recorder, dynamic disturbance recorder, and fault recorder) data to demonstrate that the operation of each IBR did adhere to performance requirements, as specified in Requirement R2, during each voltage excursion measured at the high-side of the main power transformer. Regarding R2.1.3, R2.2, and R2.5, the Generator Owner shall retain evidence of receiving such performance requirements, (e.g., email exchange, contract information) if the Transmission Planner, Transmission Operator, Reliability Coordinator, or Planning Coordinator has required the Generator Owner through other mechanisms to follow performance requirements other than those in Requirement R2 (e.g., ramp rates, Reactive Power prioritization).
- R3.** Each Generator Owner shall ensure the design and operation is such that each IBR meets or exceeds Ride-through requirements during a frequency excursion event whereby the System frequency remains within the “must Ride-through zone” according to Attachment 2 and the absolute rate of change of frequency (RoCoF)⁹ magnitude is less than or equal to 5 Hz/second, unless a documented hardware limitation exists in accordance with Requirement R4. [*Violation Risk Factor: High*] [*Time Horizon: Operations Assessment*]
- M3.** Each Generator Owner shall have evidence to demonstrate the design of each IBR will adhere to Ride-through requirements, as specified in Requirement R3. Examples of evidence may include, but are not limited to dynamic simulations, studies, plant protection settings, and control settings design evaluation. Each Generator Owner shall also retain evidence of actual disturbance monitoring (i.e., sequence of event recorder, dynamic disturbance recorder, and fault recorder) data to demonstrate the operation of each IBR did adhere to Ride-through requirements, as specified in Requirement R3, during each frequency excursion event measured at the high-side of the main power transformer.
- R4.** Each Generator Owner identifying an IBR that is in-service by the effective date of PRC-029-1, has known hardware limitations that prevent the IBR from meeting Ride-through criteria as detailed in Requirements R1-R3, and requires an exemption from specific

⁸ Except if this would occur during a frequency excursion. The Real Power response should recover in accordance with the primary frequency controller.

⁹ Rate of change of frequency (RoCoF) is calculated as the average rate of change for multiple calculated system frequencies for a time period of greater than or equal to 0.1 second. RoCoF is not calculated during the fault occurrence and clearance.

Ride-through criteria shall:¹⁰ [*Violation Risk Factor: Lower*] [*Time Horizon: Long-term Planning*]

- 4.1.** Document information supporting the identified hardware limitation no later than 12 months following the effective date of PRC-029-1. This documentation shall include:
 - 4.1.1** Identifying information of the IBR (name and facility number);
 - 4.1.2** Which aspects of Ride-through requirements that the IBR would be unable to meet and the capability of the hardware due to the limitation;
 - 4.1.3** Identification of the specific piece(s) of hardware causing the limitation;
 - 4.1.4** Technical documentation verifying the limitation is due to hardware that would need to be physically replaced to meet all Ride-through criteria, and that the limitation cannot be remedied by software updates or setting changes; and
 - 4.1.5** Information regarding any plans to remedy the hardware limitation (such as an estimated date).
- 4.2.** Provide a copy of the information detailed in Requirement R4.1, except for any material considered by the original equipment manufacturer to be proprietary information, to the associated Planning Coordinator(s), Transmission Planner(s), Transmission Operator(s), Reliability Coordinator(s), and the Compliance Enforcement Authority (CEA) no later than 12 months following the effective date of PRC-029-1.¹¹
 - 4.2.1** Provide any response for additional information requested by the associated Planning Coordinator(s), Transmission Planner(s), Transmission Operator(s), Reliability Coordinator(s), and the CEA to the requestor within 90 days of the request.
 - 4.2.2** Provide a copy of the acceptance of a hardware limitation by the CEA to the associated Planning Coordinator(s), Transmission Planner(s), Transmission Operator(s), and Reliability Coordinator(s) within 90 days of receiving the acceptance.¹²
- 4.3.** Each Generator Owner with a previously accepted limitation that replaces the hardware causing the limitation shall document and communicate such a hardware change to the associated Planning Coordinator(s), Transmission Planner(s), Transmission Operator(s), and Reliability Coordinator(s) within 90 days of the hardware change.

¹⁰ The exemption requests for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.

¹¹ To the extent the original equipment manufacturer considers any material to be proprietary, the Generator Owner is required to share this proprietary material only with the CEA.

¹² Acceptance by the CEA is verification that the information provided includes all information listed in Requirement R4.1.

4.3.1 When existing hardware causing the limitation is replaced, the exemption for that Ride-through criteria no longer applies.

- M4.** Each Generator Owner submitting for an exemption for an IBR that is in-service by the effective date of PRC-029-1, shall have evidence of submission to the CEA consistent with the information listed in Requirement R4.1. Each Generator Owner shall have evidence of communicated copies of each submission in accordance with Requirement R4.2 and to the associated entities described in Requirement R4.2. Acceptable types of evidence for submittals include, but are not limited to, meeting minutes, agreements, copies of procedures or protocols in effect, or email correspondence. Acceptable types of evidence for a hardware limitation may include, but is not limited to damage curves provided by the original equipment manufacturer. Each Generator Owner that receives a request for additional information under Requirement R4.2.1 shall have evidence of providing that information within 90 days. Each Generator Owner that replaces hardware at an IBR that is directly associated with an accepted exemption and that hardware is the cause for the limitation, shall have evidence of communicating the hardware change to the associated entities described in Requirement R4.3 within 90 days of the hardware replacement.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Generator Owner shall retain evidence with Requirements R1, R2, and R3 in this standard for 36 calendar months or the date of the last audit, whichever is greater.
- Each Generator Owner shall retain evidence with Requirement R4 in this standard for five calendar years or the date of the last audit, whichever is greater.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Generator Owner failed to ensure the design capability of each applicable IBR to Ride-through in accordance with Attachment 1, except for those conditions identified in Requirement R1.	N/A	N/A	The Generator Owner failed to ensure each applicable IBR adhered to Ride-through requirements in accordance with Attachment 1, except for those conditions identified in Requirement R1.
R2.	The Generator Owner failed to ensure the design capability of each applicable IBR to adhere to performance requirements during voltage excursions, as specified in Requirement R2, unless a documented hardware limitation exists in accordance with Requirement R4.	N/A	N/A	The Generator Owner failed to ensure each applicable IBR adhered to performance requirements during voltage excursions, as specified in Requirement R2, unless a documented hardware limitation exists in accordance with Requirement R4.
R3.	The Generator Owner failed to ensure the design capability of each applicable IBR to Ride-through in accordance with Attachment 2, unless a documented hardware limitation exists in accordance with Requirement R4.	N/A	N/A	The Generator Owner failed to ensure each applicable IBR adhered to Ride-through requirements in accordance with Attachment 2, unless a documented hardware limitation exists in accordance with Requirement R4.

< 0.50	Mandatory Operation Region	1.20
< 0.25	Mandatory Operation Region	0.16
< 0.10	Permissive Operation Region	0.16

Table 2: Voltage Ride-through Requirements for All Other IBR

Voltage (per unit) ¹⁶	Operation Region	Minimum Ride-Through Time (sec)
> 1.20	N/A ¹⁷	N/A
> 1.10	Mandatory Operation Region	1.0
> 1.05	Continuous Operation Region	1800
≤ 1.05 and ≥ 0.90	Continuous Operation Region	Continuous
< 0.90	Mandatory Operation Region	6.00
< 0.70	Mandatory Operation Region	3.00
< 0.50	Mandatory Operation Region	1.20
< 0.25	Mandatory Operation Region	0.32
< 0.10	Permissive Operation Region	0.32

¹³ Type 3 and type 4 wind resources directly connected to the AC Transmission System.

¹⁴ Refer to bullet #4 below.

¹⁵ These conditions are referred to as the “may Ride-through zone”.

¹⁶ Refer to bullet #4 below.

¹⁷ These conditions are referred to as the “may Ride-through zone”.

1. Table 1 applies to type 3 and type 4 wind IBR or hybrid IBR that include wind, unless connected via a dedicated Voltage Source Converter - High Voltage Direct Current (VSC-HVDC) transmission facility.
2. Table 2 applies to all other IBR types not covered in Table 1; including, but not limited to, the following facilities:
 - a. IBR, regardless of their energy resource, interconnecting via a dedicated VSC-HVDC transmission facility.
 - b. Other IBR or hybrid IBR consisting of photovoltaic (PV) and BESS.
3. The applicable voltage for VSC-HVDC system with a dedicated connection to an IBR is on the AC side of the transformer(s) that is (are) used to connect the VSC-HVDC system to the interconnected transmission system.
4. The voltage base for per unit calculation is the nominal phase-to-ground or phase-to-phase transmission system voltage unless otherwise defined by the Planning Coordinator, Transmission Planner, or Transmission Owner.
5. The applicable voltage for Tables 1 and 2 is identified as the voltage max/min of phase-to-neutral or phase-to-phase fundamental root mean square (RMS) voltage at the high-side of the main power transformer.
6. Tables 1 and 2 are only applicable when the frequency is within the “must Ride-through zone” as specified in Figure 1 of Attachment 2.
7. At any given voltage value, each IBR shall Ride-through unless the time duration at that voltage has exceeded the specified minimum Ride-through time duration. If the voltage is continuously varying over time, it is necessary to add the duration within each band of Tables 1 and 2 over any 10 second time period.
8. The specified duration of the mandatory operation regions and the permissive operation regions in Tables 1 and 2 is cumulative over one or more disturbances within any 10 second time period.
9. The IBR may trip for more than four deviations of the applicable voltage at the high-side of the main power transformer outside of the continuous operation region within any 10 second time period.
10. Instantaneous trip settings based on instantaneously calculated voltage measurements with less than filtering lengths of one cycle (16.6 millisecond) are not permissible.
11. The “must Ride-through zone” is the combined area of the mandatory operating regions, the continuous operating regions, and the permissive operating region. All area outside of these operating regions is referred to as the “may Ride-through zone”.

Attachment 2: Frequency Ride-Through Criteria

Table 3: Frequency Ride-through Capability Requirements

System Frequency (Hz)	Minimum Ride-Through Time (sec)
> 61.8	May trip
> 61.2	299
≤ 61.2 and ≥ 58.8	Continuous
< 58.8	299
< 57.0	May trip

1. Frequency measurements are taken at the high-side of the main power transformer.
2. Frequency is measured over a period of time (typically 3-6 cycles) to calculate system frequency at the high-side of the main power transformer.
3. Instantaneous or single points of measurement may not be used in the determination of control settings.
4. At any given frequency value, each IBR shall Ride-through unless the time duration at that frequency has exceeded the specified minimum ride-through time duration.
5. The specified durations of Table 3 are cumulative over one or more disturbances within a 10-minute time period.

New Terms in the NERC Glossary of Terms

This section includes all newly defined, revised, or retired terms used or eliminated in the NERC Reliability Standard. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Proposed New Definition(s):

Ride-through: The plant/facility remains connected and continues to operate through voltage or frequency system disturbances.

Background

The purpose of Project 2020-02 is to modify Reliability Standard PRC-024-3 or replace it with a performance-based Ride-through standard that ensures generators remain connected to the Bulk Power System (BPS) during system disturbances. Specifically, the project focuses on using disturbance monitoring data to substantiate inverter-based resource (IBR) ride-through performance during grid disturbances. The project also ensures associated generators that fail to Ride-through system events are addressed with a corrective action plan (if possible) and reported to necessary entities for situational awareness.

The purpose for this project is based on the culmination of multiple analyses conducted by the ERO Enterprise regarding widespread IBR tripping events. Furthermore, the NERC Inverter-Based Resource Performance Subcommittee¹ has developed comprehensive recommendations for improved performance of IBRs, including the recommendation to develop comprehensive ride-through requirements.

In October 2023, FERC issued Order No. 901² which directs the development of new or modified Reliability Standards that include new requirements for disturbance monitoring, data sharing, post-event performance validation, and correction of IBR performance. In January 2024, NERC submitted a filing to FERC outlining a comprehensive work plan to address the directives within Order No. 901.³ Within the work plan, NERC identified three active Standards Development projects that would need to be filed for regulatory approval with FERC by November 4, 2024. These projects include **2020-02 Modifications to PRC-024 (Generator Ride-through)**⁴, **2021-04 Modifications to PRC-002-2**⁵, and **2023-02 Analysis and Mitigation of BES Inverter-based Resource Performance Issues**⁶.

Project 2020-02

Proposed Reliability Standard PRC-029-1 is a new Reliability Standard that includes Ride-through requirements and performance requirements for IBRs. The scope of this project was adjusted to align with associated regulatory directives from FERC Order No. 901 and the scope of the other projects related to “Milestone 2” of the NERC work plan. The components of this project’s Standard Authorization Request (SAR) that related to the inclusions of new data recording requirements are covered in Project 2021-04 and the proposed new PRC-028-1 Reliability Standard. Components of this project’s SAR that relate to analytics and corrective actions plans are covered in Project 2023-02 and the proposed new PRC-030-1 Reliability Standard.

PRC-029-1 includes requirements for Generator Owner IBR to continue to inject current and perform voltage support during a BPS disturbance. The standard also specifically requires Generator Owner IBR to prohibit momentary cessation in the no-trip zone during disturbances.

PRC-024-4 includes modifications to revise applicable facility types to remove IBR, retain type 1 and type 2 wind, and to include synchronous condensers.

General Considerations

This implementation plan recognizes the urgent need for Reliability Standards to address IBR ride through performance, as demonstrated by multiple event reports of the last decade, while providing a reasonable period of time for entities to develop the necessary procedures and change their protection and control settings to meet the new requirements. The ERO Enterprise acknowledges that there are IBRs currently in operation and unable to meet voltage Ride-through requirements due to their inability to modify their coordinated protection and control settings. Consistent with FERC Order No. 901, a limited and documented exemption process for those IBR is appropriate and included within this Implementation Plan. Other NERC Standards Development projects will be pursued to address ongoing identification and mitigation of any potential reliability impacts to the BPS for such exemptions.

This implementation plan also recognizes that certain requirements (Requirements R1, R2, and R3) call for entities to “ensure the design and operation” of their IBR units meets certain criteria. Design elements may be implemented more expeditiously than operation requirements; the latter of which will require entities to show compliance through use of actual disturbance monitoring data. Therefore, this implementation plan provides staggered timeframes by which entities shall first ensure the design of their IBR units meets the criteria (12 months following regulatory approval). Subsequent compliance with the “operation” elements of these requirements shall become due as entities install disturbance monitoring equipment on each applicable IBR in accordance with the implementation plan for proposed Reliability Standard PRC-028-1 Disturbance Monitoring and Reporting Requirements for Inverter-based Resources.

The ERO Enterprise acknowledges that Generator Owners and Generator Operators owning or operating Bulk Power System connected IBRs that do not meet NERC’s current definition of Bulk Electric System (“BES”) will be registered no later than May 2026 in accordance with the IBR Registration proceeding in FERC Docket No. RR24-2. To ensure an orderly registration and compliance process for these entities, as well as fairness and consistency in the standard’s application among similar asset types, this implementation plan provides additional time for both new and existing registered entities to come into compliance with Reliability Standard PRC-029-1’s requirements for their applicable IBRs not meeting the BES definition. In so doing, this implementation plan advances an orderly process for new registrants while allowing existing entities to focus their immediate efforts on their assets posing the highest risk to the reliable operation of the Bulk Power System.

Effective Date and Phased-in Compliance Dates

The effective dates for the proposed Reliability Standards are provided below. Where the standard drafting team identified the need for a longer implementation period for compliance with a particular section of a proposed Reliability Standard (i.e., an entire Requirement or a portion thereof), the additional time for compliance with that section is specified below. The phased-in compliance dates for those particular sections represent the date that entities must begin to comply with that particular section of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

PRC-024-4

Where approval by an applicable governmental authority is required, Reliability Standard PRC-024-4 shall become effective on the first day of the first calendar quarter that is twelve months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the Reliability Standard PRC-024-4 shall become effective on the first day of the first calendar quarter that is twelve months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

PRC-029-1 and definition of Ride-through

Where approval by an applicable governmental authority is required, Reliability Standard PRC-029-1 and the definition of Ride-through shall become effective on the first day of the first calendar quarter that is twelve months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the Reliability Standard PRC-029-1 and the definition of Ride-through shall become effective on the first day of the first calendar quarter that is twelve months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

PRC-029-1 Phased-in Compliance Dates

Requirements R1, R2, and R3

Capability-Based Elements

Bulk Electric System IBRs

Entities shall comply with the portion of Requirements R1, R2, and R3 relating to the **design** of their BES IBRs to meet the requirements by the effective date of the standard.

Applicable Non-BES IBRs⁷

Entities shall not be required to comply with Requirements R1, R2, and R3 relating to the **design** of their applicable non-BES IBRs until the later of: (1) January 1, 2027; or (2) the effective date of the standard.

Performance-Based Elements (all applicable IBRs)

Entities shall not be required to comply with the portion of Requirements R1, R2, and R3 relating to the **operation** of IBRs to meet the requirements until the entity has established the required

⁷ The standard defines such as IBRs as "Non-BES Inverter-Based Resources that either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV."

disturbance monitoring equipment capabilities for those IBRs in accordance with the implementation plan for Reliability Standard PRC-028-1.

Requirement R4

Bulk Electric System IBRs

Entities shall comply with Requirement R4 for their BES IBRs by the effective date of the standard.

Applicable Non-BES IBRs

Entities shall not be required to comply with Requirement R4 or their non-BES IBRs until the later of: (1) January 1, 2027; or (2) the effective date of the standard.

Retirement Date

PRC-024-3

Reliability Standard PRC-024-3 shall be retired immediately prior to the effective date of Reliability Standards PRC-024-4 and PRC-029-1 in the particular jurisdiction in which the revised standard is becoming effective.

Equipment Limitations and Process for Requirement R4

Consistent with FERC Order No. 901, a limited and documented exemption for some legacy IBR with certain documented equipment limitations are acceptable. Per the Order, these IBRs are

“...typically older IBR technology with hardware that needs to be physically replaced and whose settings and configurations cannot be modified using software updates – may be unable to implement the voltage ride through performance requirements.”⁸

To ensure compliance with Requirement R4 and alignment with FERC Order No. 901, only those IBR that are in operation as of the effective date of PRC-029-1 may be considered for potential exemption. Further, only those IBR that are unable to meet ride-through requirements due to their inability to modify their coordinated protection and control settings may be considered for potential exemption.

⁸ Order No. 901 at p. 193.

Implementation Plan

Project 2020-02 Modifications to PRC-024 (Generator Ride-through) Reliability Standards PRC-024-4 and PRC-029-1

Applicable Standard(s)

Standards Committee and NERC Ride-through Technical Conference

Conference Details

September 4-5, 2024 | 9:00 a.m. – 4:00 p.m. Eastern

Location: The Westin Washington, DC Downtown
999 9th St NW, Washington, DC 20001

Click here for: [Virtual Registration Only](#)

Click here for: [Agenda](#)

Click here for: [Panel Questions](#)

Background

On August 15, 2024, the NERC Board of Trustees (Board) invoked Section 321 of the NERC Rules of Procedure (ROP) to address critical and rapidly growing risk to the reliability of the Bulk Power System associated with inverter-based resources (IBR) in response to FERC [Order No. 901](#) directives. PRC-029-1 (Frequency and Voltage Ride-through Requirements for Inverter-based Resources) is a draft standard designed to establish capability-based and performance-based Ride-through requirements for IBRs during grid disturbances. The draft standard failed to achieve consensus from the Registered Ballot Body over multiple ballots, calling into question whether development would be completed by FERC's filing deadline of November 4, 2024, which resulted in the Board acting under Section 321 of the ROP. Under this special authority, the Board directed the Standards Committee to work with NERC to host a technical conference. This technical conference will address the remaining issues for the proposed Ride-through standard (PRC-029-1). Using input from the technical conference, the proposed Reliability Standard will be revised as appropriate, then put to one more stakeholder ballot. If the standard achieves at least 60% stakeholder approval, the Board may consider it for adoption under this special process. There is a 45-day deadline to complete the process.

Meeting Format

This technical conference will be in-person near the NERC Washington, DC office – location to be announced - with a virtual option available. The technical conference will be recorded and transcribed. Recordings will be made available following the technical conference. Breakfast and lunch will be provided.

Registration

In-person registration has reached capacity. Only virtual registrations are being accepted at this time.

Agenda

A detailed agenda will be provided. Some of the topics to be covered include:

1. the definition of Ride-through,
2. newly proposed criteria for frequency Ride-through performance, and
3. allowable hardware-based exemptions under FERC Order No. 901.

Submittal of Comments

As part of the preparation for the technical conference and to support the decisions by the Standards Committee and NERC, the public is encouraged to provide comments for consideration on the topics identified on the agenda. In particular, any information on hardware-based limitations that would prevent IBR from meeting the proposed frequency criteria within PRC-029-1 is requested. Commenters are advised this information will be used as part of the record of development and should not include information that would be considered Critical Energy/Electric Infrastructure Information (CEII) or proprietary information. Summarized, aggregated, or otherwise non identifying information that can be substantiated with verifiable data, is requested for these submittals. NERC may request follow-ups with individual commenters to review this data through separate and non-public mechanisms.

Include in Comments

1. Indicate if you are representing a NERC registered entity and, if so, which functional registrations.
2. Indicate if you are representing an original equipment manufacturer of IBR.
3. Indicate if your company provided comments through the Standards Development process for Project 2020-02 Modifications to PRC-024 (Generator Ride-through), to allow the team to cross reference previous information. If your entity is part of the Registered Ballot Body, also provide what segment(s) your company is in.
4. Provide comments specific to the proposed frequency Ride-through criteria.
5. Provide comments specific to the proposed Ride-through definition.
6. Provide comments specific to hardware-based limitations that would prevent IBR from meeting the proposed frequency criteria within PRC-029-1.

Instructions for Submittal

Please submit comments via email and include any attachments in PDF to the parties listed below:

- Jamie Calderon, Manager of Standard Development (jamie.calderon@nerc.net)
- Alison Oswald, Manager of Standard Development (alison.oswald@nerc.net)
- Lauren Perotti, Assistant General Counsel (lauren.perotti@nerc.net)
- Todd Bennett, Standards Committee Chair (tbennett@aeci.org)
- Troy Brumfield, Standards Committee Vice-Chair (lbrumfield@atcllc.com)

Comments received after August 27, 2024 will be accepted but may not be reviewed prior to completing the Board directed actions.

Agenda

Standards Committee and NERC Ride-through Technical Conference

September 4 - 5, 2024 | 9:00 a.m.- 4:00 p.m. Eastern

Location: The Westin Washington, DC Downtown
999 9th St NW, Washington, DC 20001

Wednesday, September 4, 2024

8:55 AM - 9:00 AM

Safety Briefing

Event Space Staff

9:00 AM - 9:05 AM

NERC Antitrust Compliance Guidelines and Commission Staff Disclaimer

NERC Staff

9:05 AM - 9:15 AM

Welcome and Opening Remarks – NERC Board of Trustees

Speaker: Rob Manning

9:15 AM - 9:25 AM

Opening Remarks – NERC

Speaker: Mark Lauby

9:25 AM - 9:35 AM

Opening Remarks – FERC

Speaker: David Ortiz

9:35 AM – 9:50 AM

Technical Conference Overview - Standards Committee

Speaker: Todd Bennett (AEC)

Introduction to the conference objectives. Walk through the agenda and expectations for next steps and interactions through any usage of Slido.

9:50 AM – 10:15 AM

Presentation: Summary Review of 901 and Milestone 2

Speaker: Jamie Calderon (NERC)

Summary overview of FERC Order 901, the associated Milestone 2 Reliability Standard projects and details of how those projects interrelate. Includes Q&A.

10:15 AM - 10:30 AM

Morning Break

10:30 AM - 11:15 AM

Presentation: Review of Voltage and Frequency Ride-through Criteria in PRC-029-1

Speakers: Husam Al-Hadidi and Shawn Wang (2020-02 Drafting Team Members)

Drafting Team members will review their approach to drafting PRC-029-1 along with key decisions made throughout the project development. Includes Q&A.

11:15 AM - 12:00 PM

Presentation: Review of Voltage and Frequency Ride-through Criteria

Speaker: Alex Shattuck (NERC)

A detailed review of proposed voltage and frequency criteria in used in the industry. This includes proposed criteria in PRC-024, PRC-029-1, and other criteria options such as IEEE 2800-2022. The presentation will explore the challenges associated with this requirement, particularly for existing generators, and will discuss known issues regarding quality of model data, issues obtaining capability information, and other issues that have been identified in recent NERC disturbance reports and NERC Alert reports. Includes Q&A.

12:00 PM - 1:00 PM

Lunch Break

1:00 PM - 2:00 PM

Panel Discussion: Original Equipment Manufacturer Perspectives on Voltage and Frequency Ride-through Criteria

Moderators: Alex Shattuck (NERC) and Charlie Cook (Duke Energy)

Panelists:

- Thomas Schmidt Grau (Vestas)
- Thierry Ngassa (Power Electronics)
- Scott Karpiel (SMA)
- Dinesh Pattabiraman (TMEIC)
- Samir Dahal (Siemens Energy)
- Arne Koerber (GE Vernova)

This session will focus on the challenges with meeting the proposed voltage and frequency criteria. This session is informed by original equipment manufacturer (OEM) concerns pertaining to the usage of different criteria values for both voltage and frequency, particularly in relation to older generators and FERC Order 901 directives. Panelists will discuss challenges and potential solutions aimed at maximizing Ride-through capability while balancing reliability needs and implementation practicality.

2:00 PM - 2:15 PM

Afternoon Break

2:15 PM – 3:00 PM

Panel Discussion with Q&A: Addressing the Challenges of Voltage and Frequency Ride-through Criteria

Moderators: Howard Gugel (NERC) and Charlie Cook (Duke Energy)

Panelists:

- Mark Lauby (NERC)
- Manish Patel (EPRI)
- Todd Chwialkowski (EDF)
- Andy Hoke (NREL)
- Michael Goggin (Grid Strategies LLC)

During this session, we will talk about the differences in the recommended voltage and frequency Ride-through Reliability Standards compared to other potential criteria. This discussion has been initiated due to concerns raised by stakeholders about using different standard values for voltage and frequency, especially with regards to older generators and FERC Order 901 directives. The panelists will examine possible solutions to find a middle ground between reliability needs and the feasibility of making adjustments to current protection and controller settings.

3:00 PM - 3:30 PM

Slido Polling: Voltage and Frequency Ride-through Criteria

Moderator: Amy Casuscelli (Xcel energy) and NERC Staff

Conference participants will be presented various options through Slido live polling to provide immediate feedback on proposed revisions to PRC-029-1 voltage and frequency Ride-through criteria. The session is intended to collect industry feedback to gauge consensus on definition revisions. The Standards Committee members assigned to revise PRC-029-1 will leverage these polling results as determined by the Standards Committee.

3:30 PM – 3:45 PM | **Parking Lot**

3:45 PM - 4:00 PM

Day 1 Wrap-Up

Board Member – Sue Kelly

Thursday, September 5th

9:00 AM - 9:15 AM

Recap of Day 1 and Introduction to Day 2

Todd Bennett (AEC) and Soo Jin Kim (NERC)

9:15 AM - 10:15 PM

Panel Discussion: Discussion on Frequency Ride-Through Exemptions in PRC-029-1

Moderators: Charles Yeung (SPP) and Alex Shattuck (NERC)

Panelists:

- Howard Gugel (NERC)
- Dane Rogers (OGE)
- Jason MacDowell (ESIG)
- Mark Ahlstrom (NextEra)

This session will focus on the differences posed by the proposed draft which does not include exemptions for hardware-based limitations in meeting frequency criteria. This session is informed by submitted stakeholder concerns pertaining to proposed PRC-029-1 providing no hardware-based limitations for frequency criteria. Panelists will discuss known limitations and what options are available to balance reliability needs with the practicality of implementation for older type IBR.

10:15 AM - 10:30 AM

Morning Break

10:30 AM - 11:00 AM

Presentation: Outlining Objectives of a Ride-through Definition

Speaker(s): Joel Anthes (2020-02 Drafting Team Member)

A thorough examination of the usage of the term "Ride-through" within NERC reports, IEEE, currently active Ride-through Reliability Standards, and other industry usage of this term. This presentation(s) will also review the proposed definition in the current draft of PRC-029-1 and a comparative analysis of other proposed definitions evaluated by the drafting team during development. Special attention will be given to stakeholder comments during the last draft ballot regarding the clarity and scope of terms such as "entire" and "in its entirety." The discussion will also emphasize the critical nature of finalizing a single definition for usage in NERC's Glossary of Terms and associated Reliability Standards.

11:00 AM - 12:00 PM

Slido Polling: Gathering Stakeholder Input on Revised Definitions

Moderator: Amy Casuscelli (Xcel Energy)

Conference participants will be presented various options through Slido live polling to provide immediate feedback on proposed revisions to the Ride-through definition regarding this topic. The session is intended to collect industry feedback to gauge consensus on definition revisions. The Standards Committee members assigned to revise PRC-029-1 will leverage these polling results as determined by the Standards Committee.

12:00 PM - 1:00 PM

Lunch Break

1:00 PM – 1:15 PM

Presentation: Detailed Review of Milestone 2 Implementation Plans

Speaker: Jamie Calderon (NERC)

A comprehensive presentation, on the alignment of implementation plans and effective dates between PRC-028-1 and PRC-030-1, as related to PRC-029-1. The discussion will cover the importance of coordinating timelines to avoid gaps or overlaps that could compromise reliability or complicate compliance efforts.

1:15 PM - 2:00 PM

Panel Discussion: Strategizing Implementation Plans and Effective Dates

Moderator: Charles Yeung (SPP) and Jamie Calderon (NERC)

Panelists:

- Howard Gugel (NERC)
- Sam Hake (AES)
- Manish Patel (EPRI)
- Rhonda Jones (Invenergy)

This panel will discuss additional facts and circumstances to consider when developing strategies to effectively implement Milestone 2 Reliability Standards and aligning Implementation Plans and effective dates between PRC-028-1, PRC-029-1, and PRC-030-1. The discussion will explore the potential challenges and proposed solutions that assist industry in ensuring a smooth transition to these new standards, maintaining compliance, and minimizing the risk of any operational disruptions.

2:00 PM - 2:15 PM

Afternoon Break

2:15 PM - 2:45 PM

Slido Polling: Consensus on Implementation Plans

Moderator: Amy Casuscelli (Xcel Energy)

Conference participants will be presented various options through Slido live polling to provide immediate feedback on proposed revisions to PRC-029-1's Implementation Plan. The session is intended to collect industry feedback to gauge consensus on definition revisions. The Standards Committee members assigned to revise PRC-029-1 will leverage these polling results as determined by the Standards Committee.

2:45 PM - 3:15 PM:

Final Slido Polling: The Proposed Path Forward

Moderator: Amy Casuscelli (Xcel Energy)

A final set of polls will be conducted to gauge participant support for specific solutions discussed throughout the conference and any other recommendations identified. The Standards Committee members assigned to revise PRC-029-1 will leverage these polling results as determined by the Standards Committee.

3:15 PM – 3:45 PM

Parking Lot

3:45 PM - 4:00 PM:

Closing Remarks and Next Steps

Speakers: Sue Kelly (NERC) and Todd Bennett (AEC)

Standards Committee (SC) and NERC Ride-through Technical Conference Bio's

Standards Committee and NERC Leadership

Todd Bennett

Managing Director, Reliability Compliance & Audit Services Associated Electric Cooperative, Inc. and SC Chair

I have been active in the power industry for 23 years and directly involved with ERO initiatives since 2009. My industry background includes 7 years at Sho-Me Power Electric Cooperative which included roles as a transmission facility design engineer and director of power grid operations; and 15 years at AECl working in NERC compliance. My focus while at AECl has been operations, planning, and critical infrastructure protection issues. AECl is registered as a Jointly Registered Organization (JRO) for the following functions on behalf of a diverse set of organizations: BA, DP, GO, GOP, PC, RP,

TO, TOP, TP, and TSP. Resolving issues based on these functional registrations has made me deeply aware of the current reliability issues and challenges that NERC and the industry are facing.

I have participated in multiple NERC & SERC industry groups and was a past chair of the SERC registered entity forum, the current chair of the NERC Standards Committee, and previous co-chair of the NERC Standing Committees Coordinating Group. My current role at AECl is the Managing Director of Reliability Compliance and Audit Services. My professional focus is management of the AECl NERC compliance program, participation in NERC standards development, participation in industry initiatives, monitoring compliance with effective standards, and implementation of an AECl Board approved internal audit work plan.

I obtained a BS in Engineering from the University of Missouri and an MS of Engineering Management from the Missouri Institute of Science & Technology. I am a registered Professional Engineer (PE) and have obtained Certified Internal Auditor (CIA) and Certification in Risk Management Assurance (CRMA) credentials as well.

Troy Brumfield

Regulatory Compliance Manager American Transmission Company and SC Vice Chair

Troy is an employee at American Transmission Company LLC (ATC) his current position is Manager Reliability Standards Compliance. In this role, Mr. Brumfield is responsible for leading the overall development, and directing the activities and execution of ATC's regulatory strategy (2) monitoring ATC's regulatory environment (3) representing ATC at industry committees and trade organization meetings; and (4) working with ATC legal staff to develop regulatory strategies and resolve compliance and enforcement related issues.

Mr. Brumfield is the Vice-Chair of the NERC Standards Committee (SC), Chair of the Standards Committee Process Subcommittee (SCPS) and serves as a member of the Standards Committee Executive Committee (SCEC).

Mr. Brumfield is also a member of the MRO Compliance Monitoring and Enforcement Program Advisory Council (CMEPAC). The CMEPAC provides advice and counsel to MRO's Board of Directors, staff, members and registered entities on topics like the development, retirement, and application of NERC Reliability Standards, risk assessment, compliance monitoring, and the enforcement of applicable standards.

He has served as a chair and contributing member of several NERC Standards Drafting Teams and NERC Initiative Teams. These include NERC Project 2017-07 Standards Alignment with Registration, Guidelines and Technical Basis (GTB) Review Team, Standards Efficiency Review-Phase 1 Team (sub-team chair), Member of NERC Compliance and Certification Committee-ERO Monitoring Subcommittee, Observer and Active participant in the 2018-03 Standards Efficiency Review Retirements project, and Member of MRO NERC Standards Review Forum.

Prior to joining ATC Mr. Brumfield was employed at Wisconsin Energy Corporation (WEC). While at WEC Mr. Brumfield held various leadership roles in the Operations and Engineering-Major Projects work group and the Operations Support group where he was responsible for managing regulatory obligations, standards development, compliance, and asset management. During his time at WEC Mr. Brumfield served as Chair of several generation and distribution regional committees and councils that were tasked with promoting and strengthening governmental and industry partnerships. Mr. Brumfield utilized these committees and councils as a forum to facilitate discussions related to standards interpretation and standards execution by utility and governmental employees focused on the reliable design, construction, operation, and maintenance of electric and gas facilities.

Mr. Brumfield earned a Bachelor of Applied Science in Electronics Engineering Technology. He also earned a Master of Science in Engineering Management from the Milwaukee School of Engineering University

Robin Manning

Board of Trustees Member, NERC

Robin E. Manning was elected to the NERC Board of Trustees in February 2018. Mr. Manning is the chair of the Compliance Committee and serves on the Enterprise-wide Risk and Technology and Security Committees and as the Reliability and Security Technical Committee observer. Prior to joining the Board, Mr. Manning served as vice president of Transmission and Distribution Infrastructure for the Power Delivery and Utilization research sector at the Electric Power Research Institute (EPRI). He had overall management and technical responsibility for the annual research activities conducted by EPRI's transmission and distribution programs in collaboration with its global membership. Prior to joining EPRI, Mr. Manning served as an executive vice president with the Tennessee Valley Authority (TVA) from 2008 to 2014, where he was responsible at different times during his tenure for external relations, shared services, and power systems operations, and served as Chief Energy Delivery Officer. Previously, he served as vice president at Duke Energy, with responsibility for power delivery and gas transmission. Mr. Manning served on the University of Houston Engineering Leadership Board and serves as immediate past president of the North Carolina State Engineering Foundation Board. He is also the president of One Heart Global Ministries, a non-profit ministry organization. Mr. Manning received a bachelor's degree in Electrical Engineering from North Carolina State University where he was recently named to the NC State Electrical and Computer Engineering Hall of Fame. He also holds a master's degree in Business Administration from Queens College in Charlotte, North Carolina.

Sue Kelly

Board of Trustees Member, NERC

Susan (Sue) Kelly was elected to the NERC Board of Trustees in February 2021 and serves on the Finance and Audit, Nominating, Regulatory Oversight, and Technology and Security Committees. Ms. Kelly also serves as the observer for the Reliability and Security Technical Committee and Standards Committee. Ms. Kelly previously served as president and CEO of the American Public Power Association (APPA) from 2014 to 2019, where she led the national trade association serving public power utilities. She came to APPA in 2004 as its senior vice president of Policy Analysis and General Counsel and was responsible for APPA’s energy policy formulation and policy advocacy before FERC, the federal courts, and other governmental and industry policy forums. Ms. Kelly has served on a number of committees, including the Steering Committee of the Electricity Subsector Coordinating Council (2014 to 2019), the Commodity Futures Trading Commission’s Energy and Environmental Markets Advisory Committee (2015 to 2019), the U.S. Department of Energy’s Electricity Advisory Committee (2008 to 2009 under the Bush Administration; 2012 to 2014 under the Obama Administration), and as the president of the Energy Bar Association (2010 to 2011). She was also a member of the Board of Directors of the Center for Energy Workforce Development. She currently serves on the Energy Bar Association’s Masters Council and helped start a virtual mentoring program for Energy Bar Association members. She also serves on the E Source Advisory Board. Ms. Kelly was named one of Washington’s “Most Powerful Women” in the November 2015 issue of Washingtonian magazine in the “Business, Labor, and Lobbying” category. In March 2017, she was honored as Woman of the Year by the Women’s Council on Energy and the Environment. In January 2020, she received Public Utility Fortnightly’s Owen Young Award to honor her exceptional contributions to the electric utility industry. Ms. Kelly earned her bachelor’s degree in Honors Interdisciplinary Studies and Economics from the University of Missouri and her juris doctorate from George Washington University, both with high honors.

Mark Lauby

Senior Vice President and Chief Engineer, NERC

Mark G. Lauby is senior vice president and chief engineer at NERC. Mr. Lauby joined NERC in January 2007 and has held several positions, including vice president and director of Standards and vice president and director of Reliability Assessments and Performance Analysis. In 2012, Mr. Lauby was elected to the North American Energy Standards Board and was appointed to the Department of Energy's Electric Advisory Committee by the Secretary of Energy in 2014. Mr. Lauby has served as chair and is a life member of the International Electricity Research Exchange and served as chair of several Institute of Electrical and Electronics Engineers (IEEE) working groups. From 1999 to 2007,

Mr. Lauby was an appointed member of the Board of Excellent Energy International Co., Ltd., an energy service company based in Thailand. He has been recognized for his technical achievements in many technical associations, including the 1992 IEEE Walter Fee Young Engineer of the Year Award. He was named a Fellow by IEEE in November 2011 for "leadership in the development and application of techniques for bulk power system reliability." In 2014, Mr. Lauby was awarded the IEEE Power and Energy Society's Roy Billinton Power System Reliability Award. In 2020, the National Academy of Engineering elected Mr. Lauby as a member, citing his development and application of techniques for electric grid reliability analysis. He is also a member of the IEEE Power & Energy Society (PES) Executive Advisory Committee, focused on providing strategic support to the PES Board of Directors. Prior to joining NERC, Mr. Lauby worked for the Electric Power Research Institute (EPRI) for 20 years, holding several senior positions, including: director, Power Delivery and Markets; managing director, Asia, EPRI International; and manager, Power System Engineering in the Power System Planning and Operations Program. Mr. Lauby began his electric industry career in 1979 at the Mid-Continent Area Power Pool in Minneapolis, Minnesota. His responsibilities included transmission planning, power system reliability assessment, and probabilistic evaluation. Mr. Lauby is the author of more than 100 technical papers on the subjects of power system reliability, expert systems, transmission system planning, and power system numerical analysis techniques. He earned his bachelor's and master's degrees in electrical engineering from the University of Minnesota. In addition, Mr. Lauby attended the London Business School Accelerated Development Program as well as the Executive Leadership Program at Harvard Business School.

Soo Jin Kim

Vice President of Engineering and Standards, NERC

Soo Jin Kim is the vice president of Engineering and Standards. In this role, she is responsible for providing engineering analysis and support for NERC activities and directing all aspects of NERC’s continent-wide standards development process by providing oversight, guidance, coordination, and industry education around the development of Reliability Standards. Throughout her time at NERC, Ms. Kim has worked on numerous initiatives involving Standards, Compliance, and coordination across the ERO Enterprise. She joined NERC in 2012 as a standards developer and has since served as reliability manager and senior manager of Standards. From 2020 to 2023, she served as director of Power Risk Issues and Strategic Management (PRISM) where she transformed the group into a cross-cutting department that serves as technical advisors to other NERC functions. Under her leadership, PRISM initiated several projects to tackle energy assurance risks, particularly those addressing extreme weather challenges. Most notably, her team was instrumental in the formation of the Energy Reliability Assessment Task Force and the efforts to provide the technical support for registering new inverter-based resources. She also works with the Reliability Issues Steering Committee, and she was an integral leader in planning and executing the 2023 NERC Leadership Summit. Prior to joining NERC, Ms. Kim was an associate at Troutman Sanders LLP in Washington, D.C. in their Energy Practice. At Troutman Sanders, she worked on a variety of Federal Energy Regulatory Commission compliance matters. Prior to attending law school, she was a consultant/business analyst with various consulting firms focused on energy and commodity trading. Ms. Kim has a bachelor’s degree in Economics and English from the University of Georgia and her juris doctor degree from American University, Washington College of Law. She is licensed to practice law in Georgia and Washington, D.C. She also served for five years on the board of the Women’s Energy Network and as co-president for two of those years.

David Ortiz

Director of the Office of Electric Reliability, FERC

David is the Director of the Office of Electric Reliability (OER) at the Federal Energy Regulatory Commission. OER helps the Commission to oversee the reliability and security of the electric grid. OER's responsibilities include oversight of the North American Electric Reliability Corporation in its development and enforcement of mandatory reliability and cybersecurity standards. David leads over 90 staff, including electrical engineers, statisticians, attorneys and analysts. OER's recent accomplishments include: a standard ensuring that the grid can operate through extreme cold weather; standards for securing the supply chain for grid-related cyber systems and protecting the integrity and availability of grid communications; a standard requiring increased grid cybersecurity incident reporting; a rule requiring new generators to be able to provide frequency response, ensuring reliability of the grid as it incorporates more renewable resources; a standard protecting the grid from solar storms; a series of reports documenting utility best practices in grid restoration and recovery; and a series of best practice reports in utility cybersecurity.

From 2013 to 2016, David was a Deputy Assistant Secretary for Energy Infrastructure Modeling and Analysis (EIMA) in the Office of Electricity Delivery and Energy Reliability at the Department of Energy. From 1998 through 2013, David worked at the RAND Corporation, where he built a program of energy policy research and analysis.

David earned his doctorate in Electrical Engineering from the University of Michigan. He graduated from Princeton University.

David lives in Falls Church, Virginia with his wife, Nicole, and two children. He is an avid tennis player, cyclist, home cook, and musician.

Panelists – Original Equipment Manufacturer Perspectives on Voltage and Frequency Ride-through Criteria

Thomas Schmidt Grau

Global Lead for RMS and EMT Development and Strategies for Vestas

Thomas has 15 years of experience in the industry in power plant systems. Started my career in Vestas working on system impact studies. Moved into modeling and became the global lead for all RMS and EMT development and strategies, supporting all markets Vestas is represented in. Nearly 5 years in the US being the Director for our Power Plant Solutions group, having grid accountability across Development, Sales, Construction, and Service. My focus is on supporting renewable growth and ensuring Vestas takes accountability in the renewable transition, especially around models and ensuring the right quality is provided for utilities to carry out reliable studies and ensure grid reliability for a green energy transition.

Scott Karpel

Principal Application Engineer, SMA America

Scott Karpel is a Principal Application Engineer at SMA America, the U.S.-based subsidiary of solar and storage inverter leader SMA Solar Technology AG, headquartered in Germany.

In this role, he provides design and consultation services, as well as technical support, for North American photovoltaic (PV) and storage customers, engineers, developers, owners and utilities. He also is responsible for identifying market requirements with his involvement in inverter-based resources working groups and standards drafting teams to drive product enhancements and bridge any technical gaps in the product offering. He is a subject-matter expert on utility scale renewable energy generation.

Karpel, who joined SMA as an application engineer, has more than 30 years of experience in various engineering disciplines, including architectural engineering, quality engineering, compliance engineering, research and development, hardware engineering and technical support. Previous rolls in the renewable sector include commissioning, field engineering, product management and Director of Applications Engineering for various inverter manufacturers.

Karpel earned a Bachelor of Science degree in electrical engineering, with a focus on energy conversion and power electronics from the University of Colorado, Boulder.

Dinesh Pattabiraman

Development Engineer in the Product Development Group at TMEIC Corporation Americas

Dinesh is currently working as a Development Engineer in the Product Development group at TMEIC Corporation Americas. He is experienced in power electronics hardware, control, modeling and power system dynamic performance studies. In his current role, he supports EMT modeling of TMEIC inverters, helping clients through interconnection studies and compliance with interconnection requirements and resolving inverter performance issues during grid events. Dinesh completed his PhD and M.S. in Electrical Engineering from the University of Wisconsin-Madison and his bachelor's in electrical & Electronics Engineering from

the National Institute of Technology – Trichy, India.

Samir Dahal

Manager of Grid Interconnection and Modeling for Siemens Gamesa Renewable Energy

Samir Dahal is a seasoned electrical engineer who manages grid interconnection and modeling efforts at Siemens Gamesa Renewable Energy, overseeing over 10 GW of onshore projects across the Americas. He has extensive experience leading generator interconnection studies, managing engineering teams, and developing inverter models, previously serving as a Principal Consulting Engineer at Mitsubishi Electric Power Products Inc.

Samir holds a Ph.D. in Electrical Engineering from the University of North Dakota and a Bachelor's degree from NYU Tandon School of Engineering. His expertise spans renewable energy, power systems, and grid integration, supported by a strong research background and multiple academic honors.

Arne Koerber

Product Line Leader for GE Vernova

Dr. Arne Koerber is the Product Line Leader, Controls & Software for GE Vernova's wind business. In this role, he leads product strategy for control and software systems including turbine and plant-level controls, SCADA, farm optimization, grid integration, and condition monitoring systems.

Arne joined GE in 2008 and has held a number of roles focused on system simulation and controls engineering both in Europe and the US including leading Controls & Operability Engineering for GE's Onshore Wind business.

Arne graduated from TU Berlin, Germany with a degree in Engineering Science and holds a PhD in Control Systems from the same University.

Moderator(s)

Alex Shattuck

Senior Engineer, Engineering & Security Integration, NERC

Alex Shattuck is a Senior Engineer in the Engineering and Security Integration department at the North American Electric Reliability Corporation. He contributes heavily on a number of NERC's efforts related to grid transformation including initiatives focused on inverter-based resources, distributed energy resources, integrating security with conventional engineering practices, and emerging technologies. In addition to helping to lead NERC's IBR activities, Alex currently coordinates NERC's Inverter-based Resource Performance Subcommittee and has experience throughout the industry through work as a modeling subject matter expert at an IBR equipment manufacturer, modeling lead at a power engineering consultancy, and as a planning engineer at an Independent System Operator.

Charlie Cook

Lead Compliance Analyst for Duke Energy and SC Member

Charlie Cook is a seasoned Regulator Compliance Specialist with over 25 years of experience in the industry. With a strong background in Internal Controls and Audits, he has participated in numerous assessments of several companies' adherence to regulatory requirements. As a driven and detail-oriented professional, Charlie is dedicated to ensuring that every project achieves the highest level of quality and meets the needs of clients. When not working, Charlie enjoys boating and off-roading and participates in volunteer and charitable fund-raising events as a member of his local Masonic Lodge.

Panelists – Panel Discussion with Q&A: Addressing the Challenges of Voltage and Frequency

[Mark Lauby – Senior Vice President and Chief Engineer, NERC Bio located with the Executive Team](#)

Manish Patel

Technical Executive for Electric Power Research Institute (EPRI)

Manish Patel, PhD, PE is a Technical Executive at Electric Power Research Institute (EPRI) since April 2024. Before EPRI, he was with Southern Company for 17.5 years in various roles, with experience in Protection & Control and Transmission Planning. He is an active member of the IEEE Power System Relaying Committee. He is a registered Professional Engineer in the state of Alabama.

Todd Chwialkowski

Director, Transmission Regulatory and Compliance for EDF Renewables

Todd Chwialkowski is a Director of Regulatory and Compliance for EDF Renewables. He is currently based out of Denver, CO. Prior to this position at EDFR, Todd worked as a Manager of NERC Business Development and NERC Compliance Subject Matter Expert, and Senior Project Manager, Cyber Security, contracting at the Department of Interior, Bureau of Reclamation in their Power Resources Office. He earned an engineering degree from the University of Minnesota, and his MBA from the American Military University. He is a current Certified Information Systems Security Professional (CISSP) and a Certified Information Systems Auditor (CISA).

Andy Hoke

Principal Engineer in the Power Systems Engineering Center at the National Renewable Energy Laboratory (NREL)

Andy Hoke is a principal engineer in the Power Systems Engineering Center at the National Renewable Energy Laboratory (NREL), where he has worked for the past 14 years. He received the Ph.D. and M.S. degrees in Electrical, Computer, and Energy Engineering from the University of Colorado, Boulder, in 2016 and 2013, respectively. Dr. Hoke's expertise is in grid integration of power electronics and inverter-based renewable and distributed energy. His work includes power systems modeling and simulation, advanced inverter controls design, hardware-in-the-loop testing and model development, and

standards development. He has served as Chair of IEEE 1547.1-2020 and P2800.2, which contain the test and verification procedures to ensure DERs and inverter-based resources conform to the grid interconnection requirements of IEEE Standards 1547 and 2800, respectively. He is a registered professional engineer in the State of Colorado.

Michael Goggin

Consultant for Grid Strategies LLC

Michael Goggin has worked on renewable energy, transmission, and reliability issues for 20 years. He has testified in dozens of state regulatory and FERC proceedings on those topics. At Grid Strategies he serves as a consultant for a range of clean energy industry clients. For the preceding 10 years he held various positions at the American Wind Energy Association, now known as the American Clean Power Association. Michael has previously served on the NERC Standards, Operating, and Planning Committees. He graduated with honors from Harvard University.

Moderator(s)

Howard Gugel

Vice President of Regulatory Oversight, NERC

Howard Gugel is the vice president of Regulatory Oversight at NERC. In this role, he is responsible for directing programs and processes to monitor, review, and evaluate program effectiveness of the Electric Reliability Organization (ERO) Enterprise's implementation of risk-based compliance monitoring and enforcement. This includes adherence to the NERC Rules of Procedure, the Compliance Monitoring and Enforcement Program, and approved delegation agreements. He is also responsible for overseeing the ERO's Organization Registration and Certification process. Prior to this, he was vice president of Engineering and Standards at NERC. In this role, he provided engineering analysis and support for NERC activities and directed all aspects of NERC's continent-wide standards development process by providing oversight, guidance, coordination, and industry education of the development of Reliability Standards. He also previously served as the director of Performance Analysis, where he was responsible for the development, maintenance, and analysis of reliability performance metrics, including those in NERC's annual State of Reliability report. This included analyzing various databases of transmission and generations outages to look for statistically significant trends. In 2022, Mr. Gugel was appointed to the Department of Energy's Electric Advisory Committee by the Secretary of Energy. He also serves on the North American Energy Standards Board. Mr. Gugel has more than 34 years of experience in the electric utility industry. Prior to joining NERC, he was a transmission area maintenance manager for Progress Energy Florida, where he managed a staff of field personnel who maintained transmission lines and substation equipment. Prior to that, he was a transmission planning manager, also for Progress Energy Florida. His background includes management experience in operations and energy marketing. He has worked for two investor-owned utilities, a rural electric cooperative, and an energy marketing firm. Mr. Gugel earned his bachelor's and master's degree in Electrical Engineering from the University of Missouri – Rolla. He is a licensed professional engineer in Missouri.

Panelists – Discussion on Frequency Ride-through Exemptions in PRC-029-1

[Howard Gugel – Vice President of Regulatory Oversight, NERC Bio located above](#)

Dane Rogers

Lead NERC Compliance Analyst for Oklahoma Gas and Electric Company (OG&E)

Dane Rogers is a Lead NERC Compliance Analyst for Oklahoma Gas and Electric Company (OG&E). He is responsible for ensuring compliance with current O&P NERC Reliability Standard as well as monitoring new and revised Standards, assessing feasibility and impact, and coordinating Company position for balloting and commenting. He is actively engaged in multiple industry trade groups, serving as the Chair of the Midwest Reliability Organization’s NERC Standards Review Forum (MRO NSRF), and serving on the Advisory Committee of the North American Generator Forum (NAGF).

In addition to his compliance experience at OG&E, Dane has held process and plant engineering positions at a synchronous generating facility as well as an operational reliability engineering position on the distribution system. Dane has also worked as a Quality Manager at a high-speed manufacturing facility owned by AB-InBev.

Prior to earning his BS in Mechanical Engineering from Oklahoma State University, Dane served in the Oklahoma Army National Guard.

Mark Ahlstrom

Vice-President, Renewable Energy Policy for NextEra Energy Resource

Mark Ahlstrom is Vice President of Renewable Energy Policy for NextEra Energy Resources and President of the Board of Directors of the Energy Systems Integration Group. He currently serves on NERC’s Reliability Issues Steering Committee and chairs the SPP Future Grid Strategy Advisory Group, and he previously served on the NERC Essential Reliability Services Working Group and the NERC Integrating Variable Generation Task Force. Today, Mark focuses on rapid grid transformation pathways that are accelerated by the Inflation Reduction Act of 2022 with emphasis on reliability, economics, and innovation. Mark is a senior member of IEEE and a CIGRE member.

A biochemistry and biomedical engineering graduate of the University of Wisconsin-Madison, Mark initially worked as a software engineer at Honeywell Avionics and then as an artificial intelligence researcher at the Honeywell Computer Sciences Center before leaving to be founder of two software companies. In late 2000 he became CEO of WindLogics, a venture-funded computational weather modeling company that applied its technologies to improved understanding of wind energy projects. WindLogics was acquired in 2006 and is now the NextEra Analytics division of NextEra Energy Resources—America’s premier clean energy leader and the world’s largest producer of wind and solar energy.

Moderator(s)

Charles Yeung

Executive Director Interregional Affairs Southwest Power Pool

Charles H. Yeung is Executive Director of Interregional Affairs for the Southwest Power Pool (SPP). Since 2004, he has been responsible for leading SPP in the development of reliability and business standards at the national and continent-wide level. He is also SPP's primary contact to the ISO RTO Council's Standards Review Committee (SRC), a multi-member ISO/RTO group who works closely with ISO/RTO CEOs to formulate regulatory policy and to assess proposals for reliability standards and business practices impacting ISO/RTO reliability and markets.

Mr. Yeung has experience in the engineering and the regulatory side of electric utilities. His first professional employment was in 1988 at Houston Lighting & Power Co, (HL&P, now Centerpoint Energy). There Mr. Yeung worked as a relay protection engineer and engineered transmission protection systems to ensure safe and reliable operations of transmission networks in the HL&P service territory. He also calculated power flow information for transmission service contracts in the 1990's prior to FERC Order 888 for Open Access. In 1995 he began work in the HL&P Regulatory Department where he was involved in creating rules for the formation of ERCOT, the Texas regional transmission organization.

Mr. Yeung is a 1988 graduate of Texas A&M College Station with a bachelor's degree in electrical engineering and is a registered Professional Engineer. He also holds a Master of Business Administration from the University of Houston

Sam Hake

NERC Compliance Engineer for AES Clean Energy

I have been part of the energy sector since 2015. In 9 years, I have had several different roles including NERC Compliance support, Transmission Planning, Asset Management, and P&C Engineering. Currently, I am supporting the NERC Compliance Program at AES Clean Energy as a NERC Compliance engineer. In this role I have experience working with Operations and Planning experts, focusing on the PRC suite of Standards, supporting integration and operation of renewable resources. Prior to joining AES Clean Energy I spent six years at Eversource Energy. At Eversource I had the opportunity to be part of several different departments including NERC Compliance, Asset Management, and Protection and Controls Engineering. Before joining Eversource, I was with Burns & McDonnell for two years working as a Transmission Planning Engineer.

[Manish Patel – Technical Executive for Electric Power Research Institute \(EPRI\) Bio located above](#)

Rhonda Jones

Vice President of Reliability Compliance at Invenergy LLC

As a 14-year NERC Regulatory Compliance leader, she administers Invenergy's NERC Compliance Programs. Her teams are responsible for ensuring 70+ power generation companies, across North America and Canada, are positioned to demonstrate how its strong operational practices adhere with regulations. The effectiveness of the programs is based on the promotion of reliable and safe operations, continuous training and development, interwoven internal controls, standards development participation, and a depth of both regulatory and technical expertise.

Additionally, Rhonda leads Invenergy's RTO/ISO Market Registration & Compliance Program.

Rhonda served as a founder and chair of Black and Brown at Invenergy, an employee affinity group focused on increasing awareness, presence, opportunity, and participation, for people of African ancestry in sustainable energy careers. Rhonda is also a member of Invenergy's DEI Corporate Committee and a contributor to North American Generator Forum efforts.

She holds a BBA in Accounting, an MBA and a Juris Doctorate.

When this change agent takes a break from promoting grid resiliency, she enjoys hosting events, teaching Business Ethics and DEI in the Workplace, and live music.

Jamie Calderon

Manager, Standards Development, NERC

Jamie joined NERC in 2015 as an engineer developing Reliability Assessments and transitioned in 2017 to a senior engineer role with Compliance Assurance. Prior to joining NERC, Jamie served as a Transmission Planning Engineer and Bulk Power dispatcher for the Municipal Electric Authority of Georgia (MEAG). Jamie Calderon received her bachelor's degree of science in Electrical Engineering Technology from Southern Polytechnic State University in Marietta, Georgia.

Standards Committee & NERC Ride-Through Technical Conference

Panel Questions

September 4 – 5, 2024 | 9:00 a.m.- 4:00 p.m. Eastern

Location: The Westin Washington, DC Downtown
999 9th St NW, Washington, DC 20001

Wednesday, September 4, 2024

Panel Discussion: Original Equipment Manufacturer Perspectives on Voltage and Frequency Ride-through Criteria

This session will focus on the challenges with meeting the proposed voltage and frequency criteria. This session is informed by original equipment manufacturer (OEM) concerns pertaining to the usage of different criteria values for both voltage and frequency, particularly in relation to older generators and FERC Order 901 directives. Panelists will discuss challenges and potential solutions aimed at maximizing Ride-through capability while balancing reliability needs and implementation practicality.

Questions:

1. Do you anticipate challenges with your equipment meeting the voltage Ride-through criteria as specified in Attachment 1 of the draft PRC-029?
 - a. If so, do you have an estimate for how many products would be affected?
 - b. How does this estimate change when considering IEEE 2800-2022 criteria?
 - c. How does this estimate change when considering PRC-024 boundaries?
2. Do you anticipate challenges with your equipment meeting the frequency Ride-through criteria as specified in Attachment 2 of the draft PRC-029?
 - a. If so, do you have an estimate for how many products would be affected?
 - b. How does this estimate change when considering IEEE 2800-2022 criteria?
 - c. How does this estimate change when considering PRC-024 boundaries?
3. What documentation is necessary from manufacturers to prove which hardware limitations exist that would prevent your equipment from meeting the criteria in draft PRC-029 Attachments 1 and Attachment 2?
4. What documentation are you comfortable sharing with Generator Owners (GO), Transmission Planners, or NERC?

5. What is the generalized length of time associated with any redesign of current products to meet the criteria specified in PRC-029 without exception?
6. Are there any future or currently in design products able to meet the criteria in PRC-029?

Panel Discussion with Q&A: Addressing the Challenges of Voltage and Frequency Ride-through Criteria

During this session, we will talk about the differences in the recommended voltage and frequency Ride-through Reliability Standards compared to other potential criteria. This discussion has been initiated due to concerns raised by stakeholders about using different standard values for voltage and frequency, especially with regards to older generators and FERC Order 901 directives. The panelists will examine possible solutions to find a middle ground between reliability needs and the feasibility of making adjustments to current protection and controller settings.

Questions:

1. Approximately what percentage of GO portfolios are potentially affected by PRC-029 draft criteria. How does this change if thresholds are lowered to 2800-2022 criteria?
2. What are reasonable solutions to ensure legacy equipment can be compliant with voltage criteria in draft PRC-029 Attachment 1.
3. What are reasonable solutions to ensure legacy equipment can be compliant with frequency criteria in draft PRC-029 Attachment 2.
4. Do you expect equipment to fail to meet the voltage Ride-through criteria as specified in Attachment 1 of the draft PRC-029 due to hardware limitations?
 - a. If so, do you have an estimate for how many products would be affected?
 - b. How does this estimate change when considering IEEE 2800-2022 criteria.
 - c. How does this estimate change when considering PRC-024 boundaries?
5. What considerations are needed regarding software-based maximizations to optimize voltage and frequency Ride-through capabilities?

Thursday, September 5, 2024

Panel Discussion: Discussion on Frequency Ride-through Exemptions in PRC-029-1

This session will focus on the differences posed by the proposed draft which does not include exemptions for hardware-based limitations in meeting frequency criteria. This session is informed by submitted stakeholder concerns pertaining to proposed PRC-029-1 providing no hardware-based limitations for frequency criteria. Panelists will discuss known limitations and what options are available to balance reliability needs with the practicality of implementation for older type Investor-based Resources (IBR).

Questions:

1. What are the financial and practical impacts between hardware-based and software-based solutions?
2. What is the timeline of software-based updates necessary to meet PRC-029 draft criteria? How does this timeline differ from hardware-based updates?
3. Do you expect equipment to fail to meet the frequency Ride-Through criteria as specified in Attachment 2 of the draft PRC-029 due to hardware limitations.
 - a. If so, do you have an estimate for how many products would be affected?
 - b. How does this estimate change when considering IEEE 2800-2022 criteria?
 - c. How does this estimate change when considering PRC-024 boundaries?
4. What difficulties do GOs have when attempting to obtain hardware limitation data from OEM?
5. What difficulties do GOs have when attempting to coordinate their plant to successfully meet the criteria specified in Attachment 2 of the draft PRC-029?
6. Many commenters have said that it would only be fair to grandfather existing facilities and in-construction facilities from ride through requirements due to the costs of retrofitting. Other commenters have said that their facilities have an expected shelf life of up to 30 years, meaning there may be facilities in place in 2050 - when IBR penetration is expected to be much higher - that are not able to comply with requirements NERC wrote in 2024. How should NERC balance the burden on generators who may be asked to incur large retrofitting costs, with the burden on Transmission Owners, Transmission Planners, and end-use customers from poor or unexpected IBR performance?

Panel Discussion: Strategizing Implementation Plans and Effective Dates

This panel will discuss additional facts and circumstances to consider when developing strategies to effectively implement Milestone 2 Reliability Standards and aligning implementation plans and effective dates between PRC-028-1, PRC-029-1, and PRC-030-1. The discussion will explore the potential challenges and proposed solutions that assist industry in ensuring a smooth transition to these new Reliability Standards, maintaining compliance, and minimizing the risk of any operational disruptions.

Questions:

1. Given the complexities of aligning PRC-028-1, PRC-029-1, and PRC-030-1, what strategies would you recommend in synchronizing implementation to avoid conflicts or gaps in compliance? What considerations are needed to prevent potential overlaps or inconsistencies between implementation plans?
2. What do you anticipate will be the most significant challenges when retrofitting or modifying legacy IBR to comply with these new standards? Can you share any practical solutions or best practices that have proven effective in ensuring compatibility and minimizing operational disruptions?
3. With NERC expanding its registration criteria for GO, how should companies approach the integration of new assets or changes in ownership to ensure seamless compliance? What are the key considerations to keep in mind?
4. How do supply chain issues impact the timely implementation of these new standards, particularly in terms of retrofitting existing or new installs? What proactive measures can be taken to mitigate potential risks?
5. What are some of the most challenging aspects of testing and verification in the context of these new standards, especially when dealing with a mix of new and retrofitted IBR? How do you ensure that testing protocols are robust enough to meet compliance requirements without introducing unnecessary complexity or delays?

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

18 CFR Part 40

[Docket No. RM22-12-000; Order No. 901]

Reliability Standards to Address Inverter-Based Resources

(Issued October 19, 2023)

AGENCY: Federal Energy Regulatory Commission

ACTION: Final rule

SUMMARY: The Federal Energy Regulatory Commission (Commission) is directing the North American Electric Reliability Corporation (NERC), the Commission-certified Electric Reliability Organization, to develop new or modified Reliability Standards that address reliability gaps related to inverter-based resources in the following areas: data sharing; model validation; planning and operational studies; and performance requirements. The Commission is also directing NERC to submit to the Commission an informational filing within 90 days of the issuance of this final rule that includes a detailed, comprehensive standards development plan providing that all new or modified Reliability Standards necessary to address the inverter-based resource-related reliability gaps identified in this final rule be submitted to the Commission by November 4, 2026.

DATES: This rule is effective [INSERT DATE 60 DAYS AFTER DATE OF PUBLICATION IN THE FEDERAL REGISTER]

[E-1-RM22-12-000 | Federal Energy Regulatory Commission \(ferc.gov\)](#)

Registered IBRs

- *Bulk-Power System connected IBRs registered with NERC for compliance purposes*

Unregistered IBRs

- *Bulk-Power System connected IBRs not registered with NERC for compliance purposes*

“IBR-DER”

- *Distribution connected IBRs that in the aggregate have a material impact on the Bulk-Power System*

1

**COMPLETED
JANUARY
2024**

Order No. 901 Work Plan
submission

2

**DUE
NOVEMBER 4,
2024**

Standards development and filing to
address performance requirements
and post-performance validations for
Registered IBRs

3

**DUE
NOVEMBER 4,
2025**

Development and filing of Reliability
Standards to address data sharing
and model validation for all IBRs

4

**DUE
NOVEMBER 4,
2026**

Development and filing of Reliability
Standards to address use of
performance data in Operational and
Planning studies

- New Standard: PRC-028-1 Disturbance Monitoring and Reporting Requirements for Inverter-Based Resources
- Data needed by all 901 related Standards
- Requires installation of equipment - phased-in through 2030
- Share data on request

- New Standard: PRC-029-1 Frequency and Voltage Ride-through Requirements for Inverter-Based Resources
- Establish capability-based ride-through criteria
- Establish performance-based ride-through criteria

- New Standard: PRC-030-1 Unexpected Inverter-Based Resource Event Mitigation
- Analysis of performance during a disturbance
- Triggers what is evaluated for ride-through performance

Questions and Answers

Quick Reference Guide: IBR Registration Initiative

August 2024

As part of its [Inverter-Based Resource Strategy](#), NERC is dedicated to identifying and addressing challenges associated with inverter-based resources (IBR) as the penetration of these resources continues to increase. ERO Enterprise assessments identified a reliability gap associated with the increasing integration of IBRs as part of the grid in which a significant level of bulk power system-connected IBR owners and operators are not yet required to register with NERC or adhere to its Reliability Standards.

In response, FERC issued an [order](#) in 2022 directing NERC to identify and register owners and operators of currently unregistered bulk power system-connected IBRs. Working closely with industry and stakeholders, NERC is executing a FERC-approved work plan to achieve the identification and registration directive by 2026. Resources are also posted on the [Registration page](#) of the NERC website.

Key Activities

- NERC’s Board of Trustees approved proposed Rules of Procedure revisions on February 22 and filed them with FERC on March 19.
- FERC issued an [order](#) approving the Rules of Procedure revisions, subject to submitting a compliance filing, on June 27.
- NERC published its [Q2 2024 Quarterly Update](#) on July 11.
- **NEW** NERC submitted its [quarterly work plan update](#) to FERC on August 9.

IBR Registration Milestones

Phase 1: May 2023–May 2024

- Complete Rules of Procedure revisions and approvals
- Commence Category 2 GO and GOP candidate outreach and education (e.g., through trade organizations)

Phase 2: May 2024–May 2025

- Complete identification of Category 2 GO and GOP candidates
- Continue Category 2 GO and GOP candidate outreach and education (e.g., quarterly updates, webinars, workshops, etc.)

Phase 3: May 2025–May 2026

- Complete registration of Category 2 GO and GOP candidates thereafter subject to applicable NERC Reliability Standards
- Conduct specific Category 2 GO and GOP outreach and education (e.g., quarterly updates, webinars, workshops, etc.)

	John Zong	Electric Power Engineers
NERC Staff	Jamie Calderon	North American Electric Reliability Corporation

- **Title:** Revision of relevant Reliability Standards to include applicability of transmission-connected dynamic reactive resources
- **Date Submitted:** Feb 24, 2020 (Revised on February 3, 2022)

- **Title:** Generator Ride-through Standard (PRC-024-03 Replacement)
- **Date Submitted:** April 28, 2022 (revised March 31, 2023)
- **Industry Need:**
- Based on the ERO Enterprise analyzing over 10 disturbances reports highlighting key findings and recommendations
 - A widespread loss of generating resources – solar PV, wind, synchronous generation, and battery energy storage systems (BESS)
 - Multiple IBR experience abnormally tripping, ceasing current injection, or reducing power output with control interactions.
 - The unexpected loss of widespread generating assets poses a significant risk to BPS reliability.
- The existing PRC-024-3 is an equipment settings standard focused solely on voltage and frequency protection and is inadequate to address the IBR performance issues
- The proposed standards project will address this known reliability risk with a more suitable performance-based standard that ensures generating resource ride-through performance for expected or planned BPS disturbances

- Modify PRC-024-3 to retain the Reliability Standard as a protection-based standard, applicable only to synchronous generators, synchronous condensers, and Type 1 and Type 2 wind turbines
- Create a new Reliability Standard (PRC-029-1) to address inverter-based resource (IBR) disturbance ride-through performance criteria
- Coincide with ride-through requirements of IEEE standards but structure to follow language from FERC Order No. 901, which states that “NERC has the discretion to consider during its standards development process whether and how to reference IEEE standards in the new or modified Reliability Standards”

- The comment period and initial ballot for the first draft: 3/27/2024 – 4/27/2024
- The first draft failed the initial ballot and received ~200 pages of comments from different stakeholders
- The drafting team went through a series of meetings to address all the comments in May and early June, including an in-person meeting and dedicated meetings with specific stakeholders, e.g., EPRI
- The second comment period on Draft 2: 6/18/2024 – 7/8/2024
- The drafting team went through a series of meetings to address all the comments in July and issued Draft 3: 7/22/2024 – 8/12/2024
- PRC-024-4 has passed ballot
- Draft 3 of PRC-029-1 failed to pass ballot
- On August 15, the NERC Board of Trustees invoked Rule 321

A. Introduction

- 1. Title:** Frequency and Voltage Ride-through Requirements for Inverter-Based Resources
- 2. Number:** PRC-029-1
- 3. Purpose:** To ensure that ~~Inverter-Based Resources (IBRs) adhere to~~ Ride-through ~~requirements as expected~~ to support the Bulk Power System (BPS) during and after defined frequency and voltage excursions.
- 4. Applicability:**
 - 4.1 Functional Entities:**
 - 4.1.1.** Generator Owner
 - ~~4.1.2. Transmission Owner¹~~
 - 4.2 Facilities:**
 - 4.2.1.** The Elements associated with (1) Bulk Electric System (BES) IBRs inverter-based resources² and (2) Non-BES IBRs that either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV.
 - ~~4.2.2. IBR Registration Criteria~~

- R1.** Each Generator Owner ~~or Transmission Owner~~ shall ensure the design and operation is such that each ~~facility~~ IBR meet or exceed ~~adheres to~~ Ride-through requirements, in accordance with the “must Ride-through³ zone” as specified in Attachment 1, except for the following: *[Violation Risk Factor: High] [Time Horizon: Operations Assessment]*
- The ~~facility~~ IBR needed to electrically disconnect in order to clear a fault; or
 - The voltage at the high side of the main power transformer⁴ went outside an accepted ~~A documented equipment~~ hardware limitation, ~~exists~~ in accordance with Requirement R4; or
 - The instantaneous positive sequence voltage phase angle change is more than 25 electrical degrees at the high-side of the main power transformer and is initiated by a non-fault switching event on the transmission system⁵; or
 - The Volts per Hz (V/Hz) at the high-side of the main power transformer exceed 1.1 per unit for longer than 45 seconds or exceed 1.18 per unit for longer than 2 seconds.

M1. Each Generator Owner ~~and Transmission Owners~~ shall have evidence ~~of dynamic simulations, studies, or other evidence~~ to demonstrate the design of each facility will adhere to Ride-through requirements, as specified in Requirement R1. Examples of evidence may include, but are not limited to dynamic simulations, studies, plant protection settings, and control settings design evaluation. Each Generator Owner ~~and Transmission Owner~~ shall ~~have~~ retain evidence of actual disturbance monitoring (i.e. Sequence of Event Recorder, Dynamic Disturbance Recorder, and Fault Recorder) to demonstrate that the operation of each ~~facility-IBR~~ did adhere to Ride-through requirements, as specified in Requirement R1. If the Generator Owner ~~and Transmission Owner~~ choose to utilize Ride-through exemptions that occur within the “must Ride-through zone” and are caused by non-fault initiated phase jumps of greater than 25 electrical degrees, then each Generator Owner ~~and Transmission Owner~~ shall also ~~have~~ retain evidence of actual disturbance monitoring (i.e. Sequence of Event Recorder, Dynamic Disturbance Recorder, and Fault Recorder) data to demonstrate that the ~~facility-IBR~~ failed to Ride-through during a phase jump of greater than or equal to 25 electrical degrees, and documentation from their Transmission Planner, Reliability Coordinator, Planning Coordinator, or Transmission Operator that a non-fault initiated switching event occurred.

- R2.** Each Generator Owner ~~or Transmission Owner~~ shall ensure the design and operation is such that ~~the~~ voltage performance for each ~~facility-IBR~~ adheres to the following during a voltage excursion, unless a documented ~~equipment~~ hardware limitation
- 2.1.** While the voltage at the high-side of the main power transformer⁶ remains within the continuous operation region as specified in Attachment 1, each ~~facility-IBR~~ shall:
- 2.1.1** Continue to deliver the pre-disturbance level of ~~active-Real pPower~~ or available ~~active-Real pPower~~⁷, whichever is less.⁸
 - 2.1.2** Continue to deliver ~~R~~reactive ~~pPower~~ up to its ~~r~~Reactive ~~pPower~~ limit and according to its controller settings.
 - 2.1.3** Prioritize Real Power or Reactive Power ~~If the facility cannot deliver both active and reactive power due to a current limit or reactive power limit, when the voltage is less than below 0.95 per unit, the voltage is and still~~ within the continuous operation region, and the IBR cannot deliver both Real Power and Reactive Power due to a current limit, unless otherwise specified through other mechanisms by an associated ~~then preference shall be given to active or reactive power according to requirements if required by the~~ Transmission Planner, Planning Coordinator, Reliability Coordinator, or Transmission Operator.

- 2.2.** While voltage at the high-side of the main power transformer is within the mandatory operation region as specified in Attachment 1, each IBR shall exchange current, up to the maximum capability to provide voltage support, on the affected phases during both symmetrical and asymmetrical voltage disturbances, either under⁹:
- Reactive ~~P~~power priority by default; or
 - ~~Active-Real p~~Power priority if required through other mechanisms by anthe associated Transmission Planner, Planning Coordinator, Reliability Coordinator, or Transmission Operator.

- 2.3.** While voltage at the high-side of the main power transformer is within the permissive operation region, as specified in Attachment 1, each ~~facility-IBR~~ may operate in current block mode if necessary to avoid tripping. Otherwise, each ~~facility-IBR~~ shall follow the requirements for the mandatory operation region in Requirement R2.2.
- 2.3.1** If a ~~facility-IBR~~ enters current block mode, it shall restart current exchange in less than or equal to five cycles of positive sequence voltage returning to a continuous operation region or mandatory operation region.
- 2.4.** Each ~~facility-IBR~~ shall not itself cause voltage at the high-side of the main power transformer to exceed the applicable high voltage thresholds and time durations in its response as voltage recovers from the mandatory or permissive operation regions to the continuous operation region.

- 2.5.** Each ~~facility-IBR~~ shall restore ~~active~~Real pPower output to the pre-disturbance or available level¹⁰ (whichever is lesser) within 1.0 second when the voltage at the high-side of the main power transformer returns from the mandatory operation region or permissive operation region (including operating in current block mode) to the continuous operation region, as specified in Attachment 1, unless ~~the~~ an associated Transmission Planner, Planning Coordinator, Reliability Coordinator, or Transmission Operator requires a lower post-disturbance ~~active~~Real pPower level requirement or requires a different post-disturbance ~~active~~Real pPower restoration time through other mechanisms.¹¹

- R3.** Each Generator Owner ~~or Transmission Owner~~ shall ensure the design and operation is such that each ~~facility~~ IBR meets or exceeds ~~adheres to~~ Ride-through requirements during a frequency excursion event whereby the System frequency remains within the “must Ride-through zone” according to Attachment 2 and the absolute rate of change of frequency (RoCoF)¹² –magnitude is less than or equal to 5 Hz/second. *[Violation Risk Factor: High] [Time Horizon: Operations Assessment]*

- R4.** Each Generator Owner ~~and Transmission Owner~~ identifying an facility-IBR that is in-service by the effective date of PRC-029-1, has known hardware limitations that prevent the facility-IBR from meeting voltage Ride-through criteria as detailed in Requirements R1 and R2, and requires an exemption from specific voltage Ride-through criteria shall:¹³ *Lower*] [*Time Horizon: Long-term Planning*]
- 4.1.** Document information supporting the identified hardware limitation no later than 12 months following the effective date of PRC-029-1. This documentation shall include:
- 4.1.1** Identifying information of the IBR (name, facility #, ~~other~~);
 - 4.1.2** Which aspects of voltage ride-through requirements that the IBR would be unable to meet and the capability of the equipment-hardware due to the limitation;
 - 4.1.3** Identify the specific piece(s) of equipment-hardware causing the limitation;
 - 4.1.4** Supporting technical documentation verifying the limitation is due to hardware that needs to be physically replaced or that the limitation cannot be removed by software updates or setting changes, and;
 - 4.1.5** Information regarding any plans to remedy the equipment-hardware limitation (such as an estimated date).

- 4.2.** Provide a copy of the information detailed in Requirement R4.1 to the ~~applicable~~ associated Planning Coordinator(s), Transmission Planner(s), Transmission Operator(s), Reliability Coordinator(s), and ~~to the~~ Regional Entity ~~CEA~~ no later than 12 months following the effective date of PRC-029-1.
- 4.2.1** Any response to additional information requested by the ~~applicable~~ associated Planning Coordinator(s), Transmission Planner(s), Transmission Operator(s), Reliability Coordinator(s), and ~~to the~~ Regional Entity ~~CEA~~ shall be provided back to the requestor within 90 days of the request.
- ~~4.2.14.2.2~~ Provide a copy of the acceptance of an hardware limitation by the CEA to the associated Planning Coordinator(s), Transmission Planner(s), Transmission Operator(s), and Reliability Coordinator(s).¹⁴
- 4.3.** Each Generator Owner ~~and Transmission Owner~~ with a previously ~~submitted~~ accepted limitation request for exemption that replace the ~~equipment~~ hardware causing the limitation shall document and communicate such an hardware ~~equipment~~ change to the associated Planning Coordinator(s), Transmission Planner(s), Transmission Operator(s), and Reliability Coordinator(s) within 90 days of the hardware ~~equipment~~ change.
- 4.3.1** When existing equipment ~~hardware~~ causing the limitation is replaced, the exemption for that Ride-through criteria no longer applies.

Table 1: Voltage Ride-Through Requirements for AC-Connected Wind Facility~~IBR~~¹⁵

Voltage (per unit) ¹⁶	Operation Region	Minimum Ride-Through Time (sec)
> 1.20	N/A ¹⁷	N/A
≤ 1.20 and ≥ 1.10	Mandatory Operation Region	1.0
≤ 1.10 and > 1.05	Continuous Operation Region	1800
≤ 1.05 and ≥ 0.90	Continuous Operation Region	Continuous
< 0.90 and ≥ 0.70	Mandatory Operation Region	3.00
< 0.70 and ≥ 0.50	Mandatory O	
< 0.50 and ≥ 0.25	Mandatory O	
< 0.25 and ≥ 0.10	Mandatory O	
< 0.10	Permissive O	

Table ~~222~~: Voltage Ride-Through Requirements for All Other Inverter-based Resource Facilities~~IBR~~

Voltage (per unit) ¹⁸	Operation Region	Minimum Ride-Through Time (sec)
> 1.20	N/A ¹⁹	N/A
≤ 1.20 and > 1.10	Mandatory Operation Region	1.0
≤ 1.10 and > 1.05	Continuous Operation Region	1800
≤ 1.05 and ≥ 0.90	Continuous Operation Region	Continuous
< 0.90 and ≥ 0.70	Mandatory Operation Region	6.00
< 0.70 and ≥ 0.50	Mandatory Operation Region	3.00
< 0.50 and ≥ 0.25	Mandatory Operation Region	1.20
< 0.25 and ≥ 0.10	Mandatory Operation Region	0.32
< 0.10	Permissive Operation Region	0.32

Attachment 2: Frequency Ride-Through Criteria

Table 3: Frequency Ride-Through Capability Requirements

System Frequency (Hz)	Minimum Ride-Through Time (sec)
<u>≥ 64.0</u>	May trip
< 64 and ≥ 61.8	6
< 61.8 and ≥ 61.5	299
< 61.5 and > 61.2	660
≤ 61.2 and ≥ 58.8	Continuous
≤ 58.8 and < 58.8	660
≤ 58.5 and ≥ 57	299
≤ 57.0 and ≥ 56	6
<u>< 56.0</u>	May trip

Review of Voltage and Frequency Ride Through

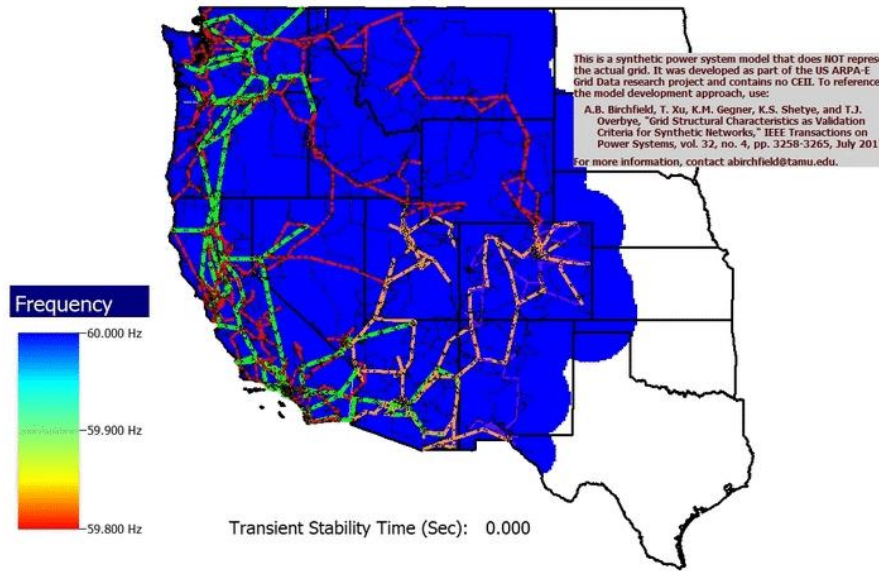

Alex Shattuck, Senior Engineer
NERC Ride-through Technical Conference
September 04, 2024

RELIABILITY | RESILIENCE | SECURITY

- Unexpected events happen often on the bulk power system
 - These events cause varied deviations from nominal in system voltage and frequency
 - Not all unexpected events cause major deviations, but the bulk power system must be prepared to perform reliably when major events occur
- NERC must create effective and efficient criteria to reduce reliability risks

[25,000 Bus Synthetic Grid - Northeastern United States \(tamu.edu\)](http://tamu.edu)

[10000 Bus Synthetic Grid - Western United States \(tamu.edu\)](http://tamu.edu)

[2000 Bus Synthetic Grid - Texas \(tamu.edu\)](http://tamu.edu)

- 10 published major disturbance reports published since 2016 with an approximate total of 15,000 MW
- Numerous wind-related events in ERCOT area that did not trigger event reports
- Winter storms Uri and Elliot stressed system frequency

Reference Number	Disturbance	IBR Reduced (MW)	Year
#1	Blue Cut Fire	1,753	2016
#2	Canyon 2 Fire	1,619	2017
#3	Angeles Forest & Palmdale Roost	1,588	2018
#4	San Fernando	1,205	2020
#5	2021 Odessa	1,112	2021
#6	Victorville & Tumbleweed & Windhub & Lytle Creek Fire	2,464	2021
#7	Panhandle Wind	1,222	2022
#8	2022 Odessa	1,711	2022
#9	Southwest Utah	921	2022
#10	California Battery Energy Storage	906	2023

[Eastern Interconnection System Frequency | Winter Storm Elliott Report](#)

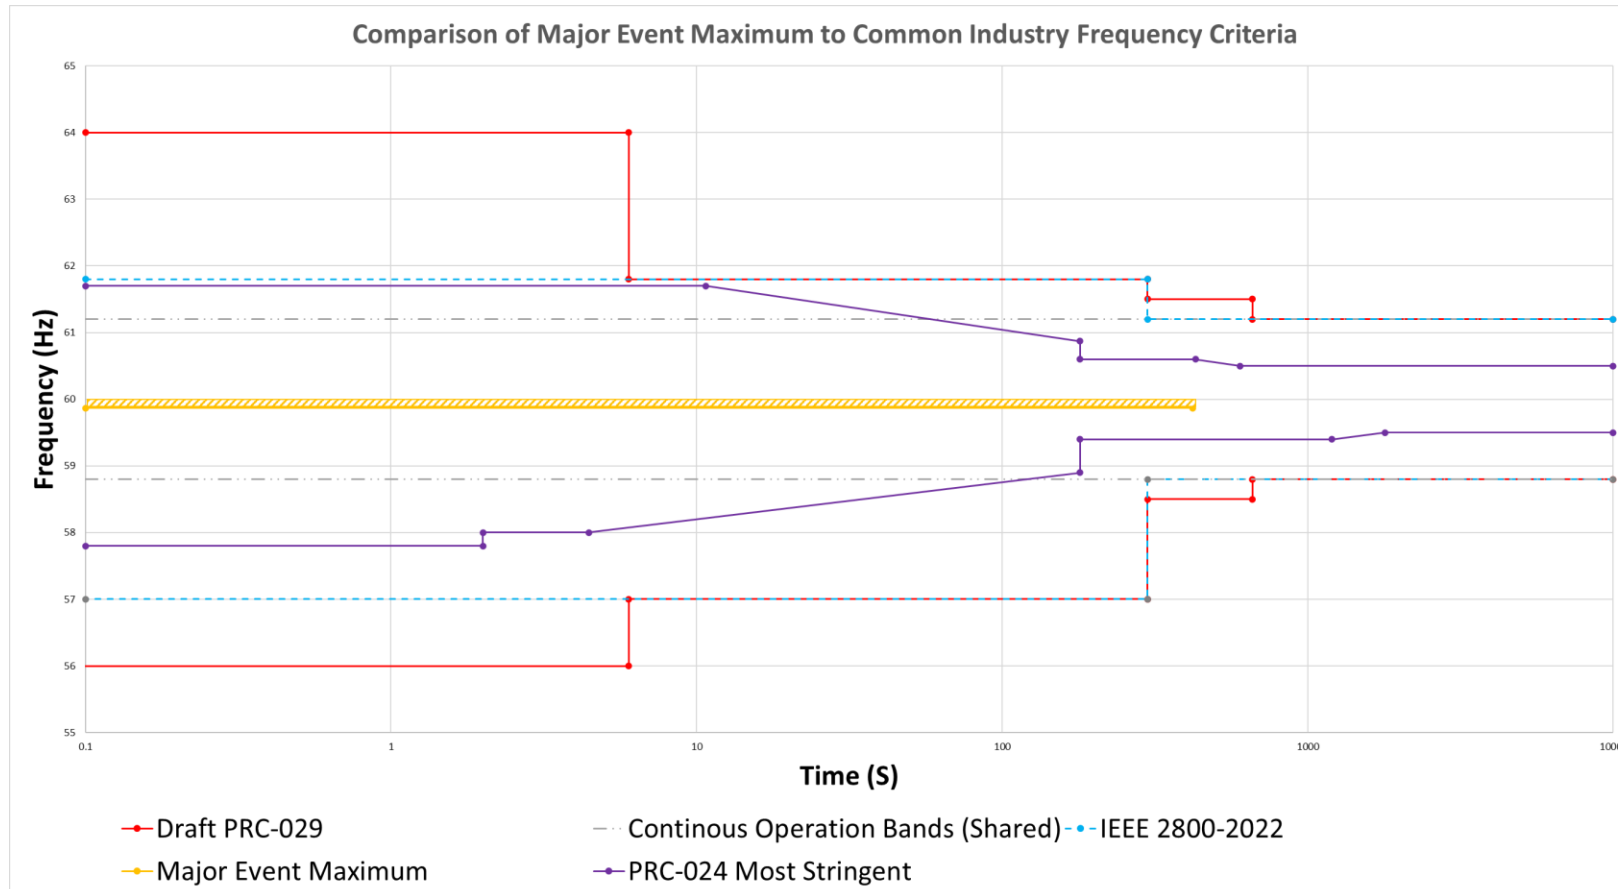

[ERCOT System Frequency | The February 2021 Cold Weather Outages in Texas and the South Central United States](#)

— Draft PRC-029
 - - - Continuous Operation Bands (Shared)
 — IEEE 2800-2022
 — PRC-024 Most Stringent

- All events in published major event reports saw deviations within continuous operation bands in draft PRC-029 and IEEE 2800-2022
- Nearly all frequency-related tripping was due to the use of instantaneous measurements

- Winter storms resulted in significantly more severe frequency deviations
- Winter storm Uri frequency deviation touches PRC-024 criteria but is far from draft PRC-029 and IEEE 2800-2022 criteria

- Analyzed major events and both winter storm Uri and Elliot resulted in frequency deviations **within the continuous operation bands detailed in the draft PRC-029 and IEEE 2800-2022**
- Currently **no “benchmark event”** for frequency and voltage criteria to be based on
- **Branching Paths:** Set protection settings as wide as possible to maximize ride-through capability – **or** – determine *reasonable* criteria that will ensure BPS reliability

- From the March 14, 2023 Level 2 Alert: Inverter-Based Resource Performance Issues
 - *Expand AC voltage protection settings as widely as possible within the inverter equipment capability. Eliminate or minimize the use of inverter instantaneous AC voltage tripping (e.g., zero or near-zero³ time delay using instantaneous peak measurements)*
 - *Inverter frequency protection should be set based on equipment capability. Frequency protection should operate on a filtered frequency measurement over a time window. Eliminate or minimize the use of inverter instantaneous frequency tripping.*
 - Notes 2-3 on Table 3 of draft PRC-029 Attachment 2 address the filtered measurement performance issue
- These recommendations have been repeated in numerous major event reports

Bulk Power System Needs

- Maximum Ride-through Capability
- Effective and efficient reduction of risks

Effective and Efficient Criteria

Technical Capabilities

- Significant lead time necessary to design new equipment
- Hardware Limitations at legacy IBRs
- Diminishing returns at capability extremes

- **Criteria need to be reasonable** when compared to current and future equipment capabilities
- If criteria are outside of current equipment capabilities, **sufficient lead time is necessary** for manufacturers to make necessary design changes and come to market
- Sufficient time is necessary for **testing** to ensure equipment can meet proposed criteria
- **Manufacturer input and evidence is crucial**

Manufacturer input and detailed documentation is critical for determining solutions

Software-based
protection
parameter changes

Small hardware-
based retrofits of
equipment

Significant hardware-
based retrofit or
replacement

- Some amount of legacy IBR may not be able to meet newly proposed criteria
 - Software-based upgrades are a simple path towards compliance with newly proposed criteria
- Additional considerations are needed when software-based upgrades are not sufficient
- Exemptions can allow legacy equipment to remain connected to the BPS while maximizing their capabilities and sharing this data with affected entities
 - Efficacy of exemptions is dependent on:
 - Sufficient documentation detailing a hardware-based limitation
 - Sufficient documentation that software-based protection settings are set at the maximum capability of the equipment
 - Review of the provided documentation to determine the level of risk associated with the documented maximum
 - **Blanket exemptions** without detailed documentation is **not a sufficient solution**

- Data from Level 2 Alert on IBR Performance includes all BPS-connected solar PV and BESS
- Reported data shows significant number of resources with possible software-based solutions
- Reported settings at maximum capability allow the risks of different criteria to be quantified

Table 2.1: Protection Settings Based on Maximum Equipment Capability			
Ride-Through Protection Type	Yes	No	Percent Yes
High Voltage	617	1,399	30.61%
Low Voltage	722	1,209	37.39%
High Frequency	376	931	28.77%
Low Frequency	476	1,021	31.80%
Total	2,191	4,560	32.45%

[NERC Inverter-Based Resource Performance Issues Public Report 2023](#)

Frequency Protection Settings Reported to be set at Maximum Capabilities

- **Challenges for new IBR equipment:**

- Deciding which criteria to design for
- Procuring testing locations to show compliance
- Long lead times for design changes driven by changing requirements
- Ride-through capabilities can become cost prohibitive at extremes

- **Challenges for Legacy IBR Equipment:**

- Hardware-based limitations exist
- Software-based solutions may still not meet new criteria
- Legacy equipment was tested in accordance with applicable requirements at the time of interconnection
 - True capability is “unknown” and retesting legacy equipment may not be feasible
- Coordinating and implementing effective and efficient solutions can be difficult

- **Challenges for new IBR equipment:**

- Deciding which equipment will be needed to meet new requirements
- Obtaining evidence that equipment can meet new requirements
- Communicating technical details necessary to provide sufficient model and facility data

- **Challenges for Legacy IBR Equipment:**

- How to manage facilities with hardware-based limitations
- Assessing the feasibility of software-based solutions can be difficult
- Sometimes challenging to obtain objective capability-based information
- Coordinating and implementing effective and efficient solutions can be difficult

- NERC has **analyzed over 15,000 MW** of unexpected disturbances with very few IBR tripping due to frequency criteria exceedance
 - All analyzed events caused frequency deviations **within continuous operation** bands of draft PRC-029 and IEEE 2800-2022
- NERC recommends to **maximize ride-through** capability
- **Validated documentation on limitations is crucial** for efficient and effective criteria but has proven **difficult to obtain**
- **Manufacturer input on true capabilities of legacy and new equipment is critical**

Outlining Objectives of a Ride-through Definition

Joel Anthes, P.E. – 2020-02 Drafting Team Member
NERC Ride-through Technical Conference
September 5, 2024

Why is PRC-029-1 Including a Definition of Ride-through?

The Project 2020-02 SAR Generator Ride-through Standard (PRC-024-3 Replacement) – submitted April 28, 2022(revised March 31, 2023), includes additions to the NERC Glossary of Terms and directs the drafting team to “define the term ride-through, **as necessary**”.

The drafting team for PRC-030-1 – “Unexpected Inverter-Based Resource Event Mitigation”, under Project 2023-02, requested that the drafting team for PRC-029-1 include a definition for Ride-Through. This was necessary to link their requirement 2 reference to “Document the facility’s Ride-through performance...”

Drafting Team's Goals in Defining Ride-through Were:

- Create a stand-alone definition that could be included in the NERC Glossary that was not tied to or limited by the PRC-029-1 standard.
- Create a definition that could be used within other standards, namely PRC-030-1, to allow them to reference IBR Ride-through performance requirements.

Drafting Team's Goals in Defining Ride-through Were **Not**:

- To create an additional quantitative performance requirement(s) merely by defining the term Ride-through.
- To define the IBR performance necessary to support system reliability (this is instead defined under Requirements 1-4 of PRC-029-1).

Draft 2 Definition: Remaining connected, synchronized with the Transmission System, and continuing to operate in response to System conditions through the time-frame of a System Disturbance.

Draft 3 Definition: The entire plant/facility remaining connected to the Bulk Power System and continuing in its entirety to operate through System Disturbances.

- Removed “synchronized with”, in response to System conditions”
- Added “entire” and “in its entirety”
- Replaced “Transmission System” with “Bulk Power System”

Draft 3 Definition: The entire plant/facility remaining connected to the **Bulk Power System** and continuing in its entirety to operate through System **Disturbances**.

Uses approved NERC Glossary terms:

Bulk-Power System	<p>(A) facilities and control systems necessary for operating an interconnected electric energy transmission network (or any portion thereof); and (B) electric energy from generation facilities needed to maintain transmission system reliability.</p> <p>The term does not include facilities used in the local distribution of electric energy. (Note that the terms “Bulk-Power System” or “Bulk Power System” shall have the same meaning.)</p>
Disturbance	<ol style="list-style-type: none"> 1. An unplanned event that produces an abnormal system condition. 2. Any perturbation to the electric system. 3. The unexpected change in ACE that is caused by the sudden failure of generation or interruption of load.

IEEE 2800 Ride-through Definition: *Ability to withstand voltage or frequency disturbances inside defined limits and to continue operating as specified.*

Drafting Team Comments:

- “Ability to withstand” may not be clearly construed to mean “remaining connected”
- “inside defined limits” is a reference to requirements in a standard, is unnecessary to describe the essence of what it means to ride through, and results in the definition not being stand-alone
- “as specified” is again a reference to requirements in a standard that is unnecessary to describe the essence of what it means to ride through, and results in the definition not being stand-alone

- **Other Ride-through Definition 1:** *Ability to withstand System disturbances inside defined limits and to continue operating as specified.*
 - Very similar to IEEE 2800-2022 definition.
- **Other Ride-through Definition 2:** *Ability to withstand voltage or frequency Disturbances within defined regulatory limits remaining connected, synchronized with the Transmission System, and continuing to operate.*
 - Merges aspects of IEEE and SDT draft 2 definitions; what is meant by “regulatory limits” is not clear.

- **Other Ride-through Definition 3:** *Facilities, including all individual dispersed power producing resources, remaining connected to the electric system and continuing to operate in a manner that supports grid reliability throughout a System Disturbance, including the period of recovery back to a normal operating condition.*
 - Seems more a system level definition than facility level; the phrase “in a manner that supports grid reliability” makes it dependent on what a standard or a description found elsewhere would describe; last phrase underlined is viewed as equivalent to “operate through System Disturbances”

- **Other Ride-through Definition 4:** *Remaining connected, synchronized with the Transmission System, and continuing to operate by delivering power in response to System conditions through the time-frame of a System Disturbance.*
 - Very similar to Draft 2 definition adding only “by delivering power” which will not always be the case with batteries in charging or idle modes
- **Other Ride-through Definition 5:** *The entire plant/facility remaining connected to the Bulk Power System and continuing to operate through System Disturbances.*
 - Similar to Draft 3 definition only removing “in its entirety”

- **Other Ride-through Definition 6:** *The plant/facility remaining connected to the Bulk Power System and continuing to operate through System Disturbances as defined in applicable reliability standards*
 - Removing “entirety” and “in its entirety” could make it possible to qualify partial tripping as ride-through; adding “as defined in applicable reliability standards” makes definition dependent on what such standards would describe
- **Other Ride-through Definition 7:** *The entire plant/facility remaining connected to the Bulk Power System, and continuing in its entirety to operate as specified through the time-frame of System Disturbances.*
 - Draft 3 definition with “as specified” which makes it dependent on a standard and inserting “the time-frame of” which is pretty similar to “through” [System Disturbances]

- **Other Ride-through Definition 8:** *The entire plant/facility remaining connected and continuing to operate through the duration of a frequency or voltage Disturbance in its entirety, from its start to the return to pre-disturbance conditions.*
 - Essentially the same as SDT draft 3 with non-substantive changes and removal of “Bulk Power System”
- **Other Ride-through Definition 9:** *The entire plant/facility remaining connected to the Bulk Power System and continuing in its entirety to operate as specified through System Disturbances inside defined limits.*
 - Same as SDT draft 3 definition adding “as specified” and “inside defined limits” which makes it dependent (not stand-alone)

- **Other Ride-through Definition 10:** *The entire plant/facility (including its dispersed power producing inverters) remaining connected to the electric system and continuing in its entirety to operate in a manner that supports grid reliability through a System Disturbance, including the period of recovery back to a normal operating condition”.*
 - Adding “in a manner that supports grid reliability” makes it dependent on what a standard or a description found elsewhere would describe; substituting “electric system” for “Bulk Power System” counters a draft 3 revision to satisfy other commenters that distribution is off limits to NERC; other additions viewed as non-substantive

- **Other Ride-through Definition 11:** *The plant/facility shall remain connected and in service, maintaining the pre-disturbance equipment configuration in operation, throughout the entirety of the system disturbance and recovery.*
 - Removing “entirety” and “in its entirety” could make it possible to qualify partial tripping as ride-through; other changes viewed as non-substantive.

Detailed Review of Milestone 2 Implementation Plans

Jamie Calderon - Manager, Standards Development
Standards Committee & NERC Ride-through Technical Conference
September 5, 2024

RELIABILITY | RESILIENCE | SECURITY

- Created For:
 - New/Modified Reliability Standards
 - Retiring Reliability Standards
 - New/Modified Definitions
- Ensures no overlap or gap in time between versions

- “Effective Date”
 - Specific Date
 - Time Period after approval by governmental authority
- “Retirement Date”
 - Immediately Prior
- General Considerations
- Other Standard specific

- Often used to avoid everything all at once
- Milestones beginning after “Effective Date”
- Examples:
 - Percentage of Facilities
 - Requirement R1 and then later R2
- Assists Entities in

- New Standard: PRC-028-1 Disturbance Monitoring and Reporting Requirements for Inverter-Based Resources
- **Shall become effective on the first day of the first calendar quarter after the effective date of the Applicable Governmental Authority's order approving the standard**

- **Phased-In Implementation for:**

- Existing BES Inverter-Based Resources (in commercial operation on or before the effective date),
- New BES Inverter-Based Resources
- Existing Non-BES Inverter-Based Resources
- New Non-BES Inverter-Based Resources

- **Existing BES IBR:** 50% of IBR within three years of the effective date of PRC-028-1 and 100% of BES IBR by January 1, 2030
- **New BES IBR:** BES IBRs entering commercial operation after July 1, 2025, but on or before October 1, 2026, entities shall comply with Requirements R1 through R7 by October 1, 2026

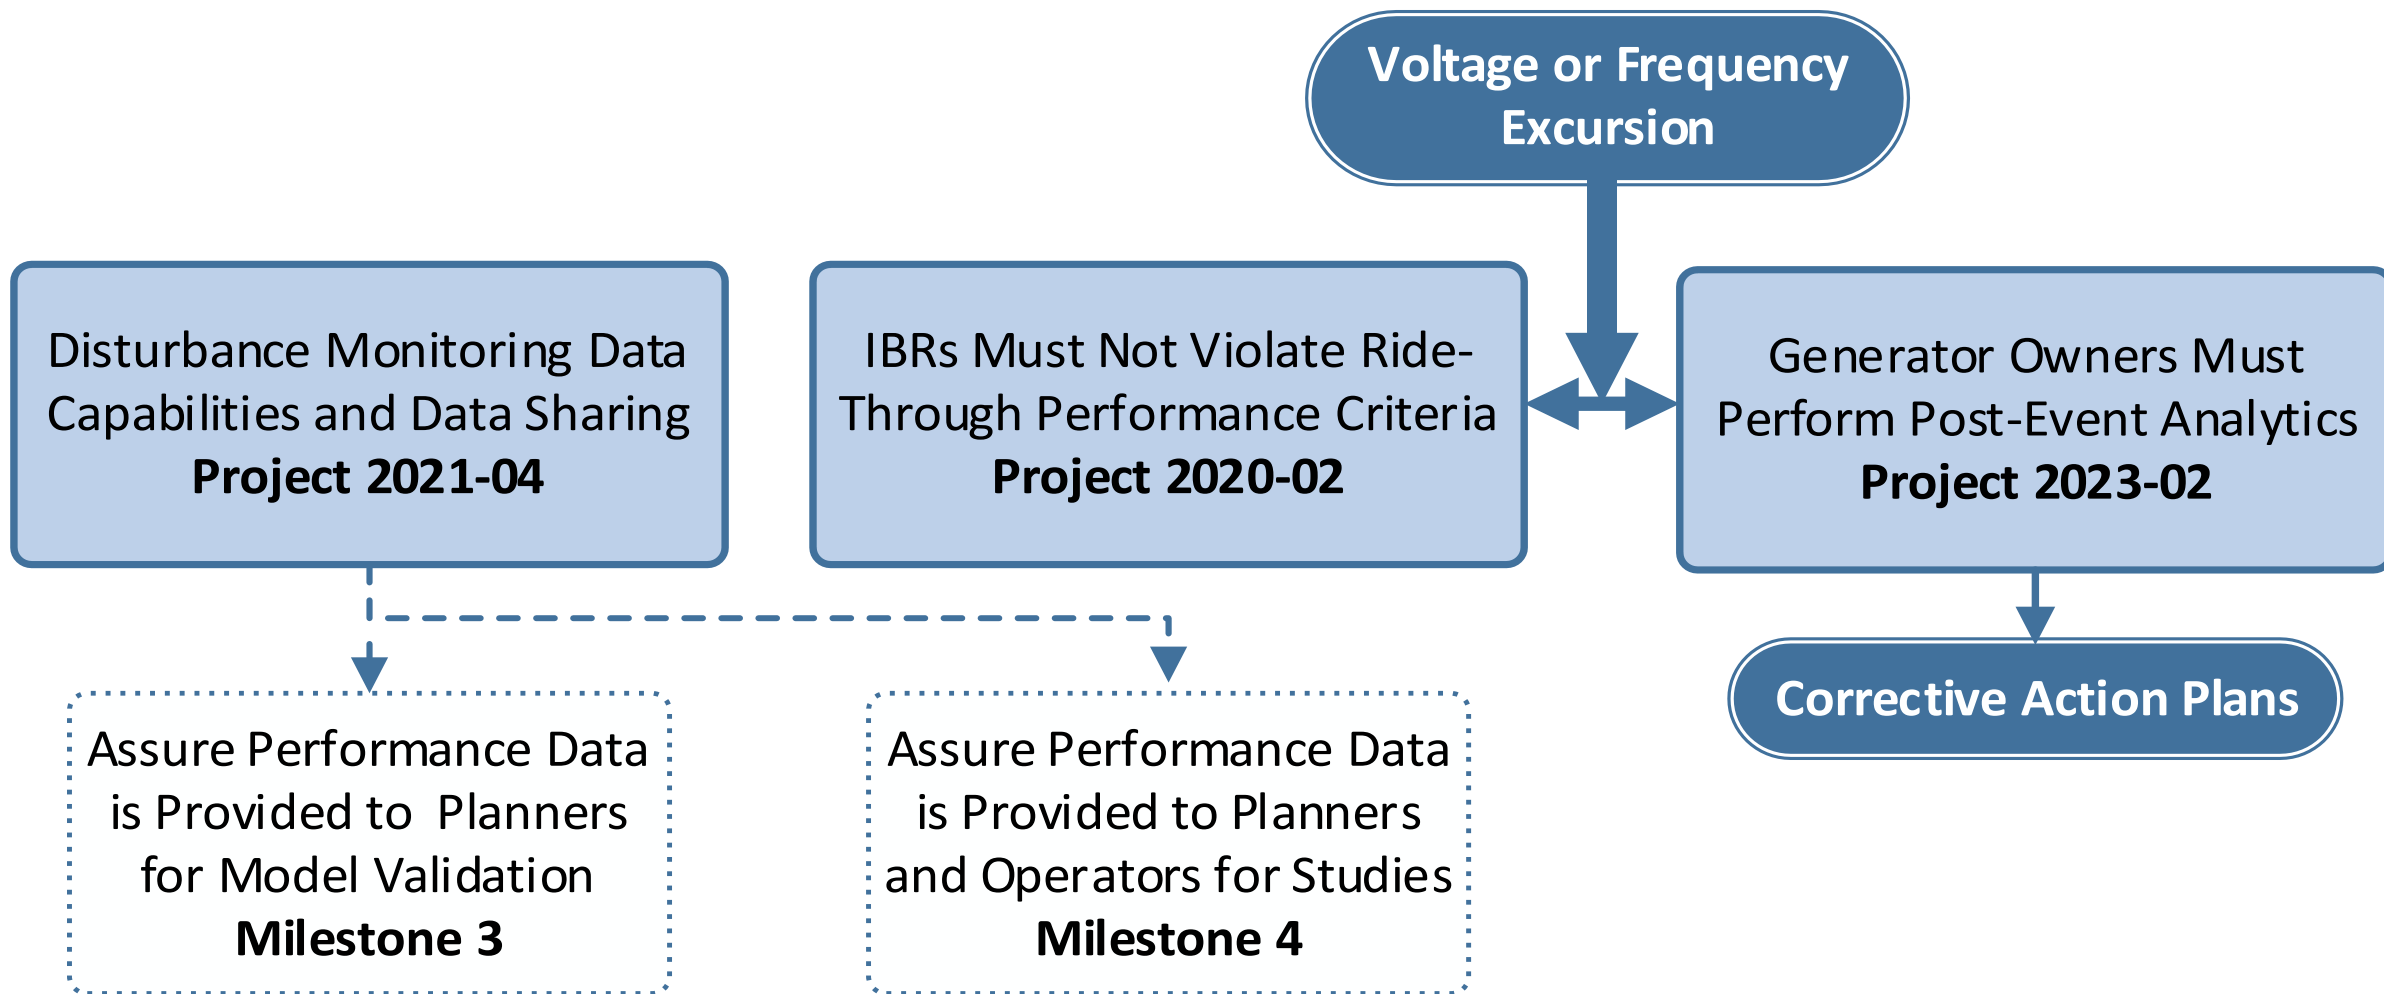

- **Existing Non-BES IBR:** 100% January 1, 2030.
- **Existing Non-BES IBR:** within 15 calendar months following the effective date of the standard or the commercial operation date, whichever is later.
- **Process for Compliance Extensions**

- New Standard: PRC-029-1 Frequency and Voltage Ride-through Requirements for Inverter-Based Resources
- **Shall become effective twelve months after the effective date of the applicable governmental authority's order approving the standard**

- Capability-based ride-through criteria
 - BES IBR: the effective date of the standard.
 - Non-BES IBR: later of January 1, 2027; or the effective date of the standard.
- Performance-based ride-through criteria
 - BES IBR and Non-BES IBR: Align with PRC-028 Implementation Plan dates

- New Standard: PRC-030-1 Unexpected Inverter-Based Resource Event Mitigation
- IP revised in current draft posted for formal comment. Currently under ballot and cannot discuss during Q&A.
- Removed performance-based and capability-based language

- Later of 1) the first day of the first calendar quarter that is twelve (12) months after the effective date of the applicable governmental authority's order approving the standard; or 2) the first day of the first calendar quarter that is twelve (12) months after the effective date of the applicable governmental authority's order approving Reliability Standard PRC-029-1,
- Aligns with PRC-029

MS. WASHINGTON: All right. Good morning. Thank you for attending the NERC Ride-through Technical Conference. As a reminder to all participants, this webinar is public and is being recorded. The registration information was posted on the NERC website and widely distributed. Speakers in the room should keep in mind that the listening audience may include members of the press and representatives of various governmental authorities, in addition to the expected participation by industry stakeholders. Should you wish to ask a question during today's webinar, please use the Q&A feature in the bottom right corner of your screen.

21

22

Please note that there will also be a Slido during today's conference. It's NERC's policy and practice to

1 obey the antitrust laws and to avoid all conduct that
2 unreasonably restrains competition. This policy
3 requires the avoidance of any conduct that violates or
4 that might appear to violate the antitrust laws. Any
5 NERC participant that is uncertain about the legal
6 ramification of a particular course of conduct, or who
7 has doubts or concerns about whether or not the NERC's
8 antitrust compliance policy is implicated in any
9 situation should consult NERC's general counsel, Sonya
10 Rocha.

11 At this time, I will turn the webinar over to NERC
12 Board of Trustee, Mr. Rod Manning.

13 MR. MANNING: That's working. Good morning.

14 PARTICIPANTS: Good morning.

15 MR. MANNING: Welcome, and thank you for being
16 here. Many are here in the room. Many more, I think,
17 are here on the call. I struggle this morning to
18 describe this meeting. I was having a conversation
19 with someone and I would say, it's going to be fun, and
20 then I'd stop and say, well, perhaps it's not going to
21 be fun. It's going to be exciting. Well, perhaps it's
22 not going to be exciting. I think where I ended up

1 with, it's going to be hard. I think that's fair.
2 What we're doing is going to be hard. Perhaps it's
3 evolutionary, I think, certainly evolutionary what
4 we're doing today and tomorrow. Revolutionary? Maybe.
5 Could be revolutionary.

6 We see the transformation of the grid -- we all
7 see the transformation of the grid. It's happening all
8 around us, whether we choose to technically shape the
9 outcome or not. Sometimes I think if we choose to not
10 take any action, the grid will transform itself anyway,
11 but we all know that condition causes the latter to be
12 less than the former, and I don't think any of us agree
13 that that's acceptable, at least from a reliability
14 perspective. None of us find this workable solution, I
15 think going forward, and all of us agree that we need
16 to act with contemplative intention or you wouldn't be
17 here today. We need to think about where we're going
18 with this.

19 I feel like today we meet head on one of our very
20 first transformative decisions. I recently read the
21 book, "The Last Days of Night," written by Graham
22 Moore, and it's a story of Westinghouse versus Edison,

1 a story of invention versus industrialization perhaps.
2 It's a story of AC versus D.C. It's a great read. I
3 highly recommend it if you're part of our industry.
4 It's fascinating. Not everyone would find it fun or
5 exciting. Some might find it hard, but I think if
6 you've got any history in our business, you would
7 really enjoy reading about the early days of the AC
8 versus DC.

9 And as I was thinking about what to talk about
10 this morning, I really thought about, you know, what we
11 are considering over the next couple of days is a giant
12 step towards rendering those prior AC/DC arguments,
13 perhaps not irrelevant, but maybe extraneous. We're
14 taking a big step forward, and it hasn't been easy to
15 get to this point, and it won't be easy to find a
16 pathway forward today and tomorrow. What we are going
17 to do is going to be difficult. It's going to be hard.
18 The good news is we do hard. We have a track record of
19 embracing hard things and wrestling them to the ground.

20 So as we are about to tackle this hard task, it
21 seems to me that there are three things that frame our
22 pathway forward. First of all, the risk is sufficient.

1 The need for voltage and frequency Ride-through
2 criteria has been demonstrated over and over again. The
3 incidents are becoming ever more complex. The
4 potential impacts are becoming ever more predictable.
5 To continue without addressing this issue really causes
6 us to fail to address and remediate the appropriate
7 risk. The risk is sufficient to take action. Second,
8 the technology is sufficient. Now, we will hear more
9 about that today and perhaps tomorrow, but it seems
10 clear that what we want to do can be done with
11 technology that is available. Finally, the time that
12 we have taken so far is sufficient. We have moved
13 through the full measure of process and engagement. We
14 have heard from all fronts, we have taken information
15 from all corners, and now the time has come for us to
16 stop arguing and do something. We began studying this
17 issue, believe it or not, in 2016, eight years ago.
18 The time has come.

19 So there you have it. The risk is sufficient.
20 The technology is sufficient. The time is sufficient.
21 What remains is to just get it done. Hard or easy
22 becomes irrelevant. All that remains relevant really

1 is to chart a pathway forward, the pathway that sees us
2 confidently step into the future of reliability. So
3 that's why I'm here today. I suspect that's why most
4 of you are here today, and I thank you for being here.
5 I thank you for the skills that you bring to the table.
6 I thank you for your engagement, for your knowledge. I
7 thank you for your presence here in the room or on the
8 phone. I thank you for your willingness to seek a
9 solution where those who've gone before us have failed
10 to find a solution. We're going to need all of your
11 skills in the next 30 hours or so. Certainly what
12 we're doing is evolutionary, revolutionary perhaps.
13 The next few hours will write this story for us, so I
14 thank you for being here, I thank you for your time,
15 and I thank you for getting it done. Mark.

16 MR. LAUBY: Ditto. David?

17 (Laughter.)

18 MR. LAUBY: So anyway, good morning, everybody,
19 and that's a wonderful setup for the -- today's
20 meeting. I did want to kind of think about how we got
21 here. And so I talked to my old friend, Faraday, who,
22 in 1980 -- in 1830s, excuse me -- came up with kind of

1 the first machine with a -- with a magnet and a
2 spinning disc, and, you know, we've been making
3 improvements to that from the beginning, DC machines,
4 AC machines. I always want to start thinking about
5 that group, AC/DC, but let's not go there, and the
6 whole system, of course, being synchronized was a big,
7 big chore. And we -- it was really all about managing
8 mechanical energy, you know, taking mechanical energy
9 and moving it, transporting it to where we need to use
10 it, of course, then transforming that to actual work.

11 And when we think about NERC and all the
12 activities that we all work on, it's all about avoiding
13 what we call the evil three, which is the instability,
14 islanding, and controlled -- uncontrolled cascading.

15 In fact, Steinmetz has been quoted saying that we
16 created the largest machine that people have ever built
17 in the -- in the world with the interconnected systems.

18 But, you know, it's kind of like when I'm listening to
19 my 1970s and 1980s tunes on the radio and my daughters
20 say, that's before the turn of the century, dad,
21 because that's not where we are today.

22 You know, we have a significantly new way of

1 generating electrons or exciting electrons, let's put
2 it that way, because they don't really flow. They kind
3 of get excited and bounce off each other. And not all
4 of the transformation here is between mechanical energy
5 to electrical energy, but rather, we're really managing
6 the kind of the characteristics of a new type of
7 resource in this case, solar panels, but even wind,
8 though, at least wind has some mechanical energy. So
9 there's no surprise that, you know, we have some kind
10 of disagreements on the way forward here. It's a place
11 that we haven't been before, and it disrupts a lot
12 of the technology. It disrupts a lot of the -- kind of
13 the rules of thumb that we're used to using and really
14 kind of calls into question some of our fundamental
15 assumptions, so, you know, Ride-through, of course, is
16 just an important part of being able to go through the
17 system events and avoid the evil three, right? And so
18 it's certainly an important characteristic that the
19 system should have to maintain the reliable operation
20 of the system.

21 And we now have high-speed inverters that can
22 really do whatever we want them to do, and we're trying

1 to some -- in some cases try to at least mimic the
2 characteristics that we need. But they have other
3 characteristics, too, that we can take advantage of,
4 and, in fact, they're critically important to the green
5 transformation of the system, and we see inverters
6 everywhere. Heck, my refrigerator's been out for like
7 four months because I can't get inverters to fix it
8 because they're putting them in cars and they're
9 putting them in solar panels, and I don't have
10 refrigeration. Well, anyway, that's another story. We
11 should buy a new refrigerator, I guess. But this --
12 it's also a part of our -- now our inverter base loads.
13 So how are we going to manage those? How are they
14 going to sustain the reliable operation of the system?
15 All this comes into question. So we are really here on
16 a cutting edge, and, you know, there just -- there's a
17 lot obviously that has to be done, and we really stand
18 at the inflection point of this new system.

19 And I really -- to, you know, Rob's point here,
20 thank you for all the work that you've done to date,
21 how much work you're going to have to do to get us to
22 that next step, an important, I think, inflection point

1 in our industry. So as I mentioned before, Steinmetz
2 was talking about the largest machine that was ever
3 built. We're building the largest computer now, and it
4 will be one that will be fast moving and can provide
5 services that perhaps we never even dreamed of and be a
6 more reliable, more resilient, more secure, and we need
7 everybody's help to get there. So thank you. With
8 that, next, I'll ask David to provide opening remarks.

9 DAVID ORTIZ: Thanks, Mark. Thanks, Rob. It's
10 hard to hear yourself, right, stand right in front of
11 the speaker. So maybe I'll start with a joke, I think.
12 I had a teacher once that said that AC power was
13 invented just so people would have to learn
14 trigonometry.

15 (Laughter.)

16 DAVID ORTIZ: So my name is David Ortiz. I'm the
17 director of the Office of Electric Reliability at FERC.
18 I want to thank Rob for motivating the conference, Mark
19 for his kind of technical insight. I'm here to provide
20 just kind of a little bit of an overview on some of the
21 process concerns and what our role is here, especially
22 since a lot of what's happening is in response to a

1 FERC order. It's important to note, obviously, that
2 I'm a FERC staff member, and these are my opinions and
3 not those of the Commission or any individual
4 commissioner.

5 As you know, Section 215 of the Federal Power Act
6 describes the roles of FERC and NERC. And most
7 specifically, the way it works is that those who run
8 the system, those who build the system, those who plan
9 the system, the ones with the expertise are the ones
10 who develop the standards, you know, with NERC's
11 assistance, and then those are submitted to the
12 Commission for approval and/or directed modification,
13 and that's an important role. And so really, the job
14 is in your hands fundamentally, and that's the way it's
15 been structured in the statute. NERC's rules permit
16 extraordinary action in certain cases, especially with
17 respect to a FERC directive, and that's the reason why
18 we're here because of action that the NERC Board took a
19 few weeks ago.

20 And then I want to note that, you know, I'm here
21 and several other FERC staff members are here, and our
22 role today is fundamentally as observers. We're going

1 to have a really big bite at the apple in November
2 after you complete your work here and NERC submits the
3 standards to us. But the instigating action that kind
4 of brought us here was Order Number 901, which the
5 Commission issued in October 2023, and that directed
6 NERC to develop reliability standards for inverter-
7 based resources in four areas: IBR performance, data
8 and information, model validation, and then planning
9 and operational studies.

10 We gave NERC a really tight timeline for this,
11 and, you know, we're not necessarily sorry about that,
12 but it definitely is really pushing the limits of the
13 processes that NERC has, and we appreciate NERC and all
14 of you working toward those. You know, specifically,
15 we ask that you -- that in NERC, finish the standards
16 and submit those at the Commission for approval on a
17 rolling time -- on a rolling basis in three years.

18 And, you know, as you know, even a standard for which
19 there is essentially no disagreement, just some details
20 to work out, typically takes about a year to develop.

21 And so to actually solve complex technical problems and
22 submit to us a standard is a -- is a pretty high bar,

1 and we understand that. And so, you know, to Rob's
2 point, yes, this is a difficult task that we gave you,
3 and to a certain extent, it's just beginning. You
4 know, perhaps this will be a great conference and this
5 will be a model for the next sets of standards, who
6 knows, but, you know, there's still a lot of work to be
7 done, and I want to thank Jamie for managing the whole
8 endeavor. I'm surprised that she still has hair.

9 And I want to kind of address one thing with
10 respect to Order Number 901. I know that within the
11 discussions that you've been having specifically about
12 this standard, but also about the standards which
13 passed recently, there's been a lot of discussion about
14 the order and language in the order. As a Commission
15 staff member, and especially as an engineer and not as
16 an attorney, I'm not in a position here to interpret
17 the order, but one thing that I can say is that the way
18 the Commission works is that it -- the Commission makes
19 its decisions based upon a record. And that record
20 that we -- that the Commission had in last October was
21 what it -- is what it used in order to make the
22 decisions in Order Number 901. If there is new

1 information that's brought to bear that would cause the
2 Commission to reconsider that, then that's something
3 that the Commission has done in the past, and I presume
4 it would be open to do -- to do in this case.

5 So for example, perhaps there's quantitative data
6 about the capabilities of various inverter-based
7 resources of various vintages, or perhaps there's some
8 operations and planning studies that indicate that
9 certain performance characteristics actually help to
10 maintain reliability as opposed to others that have
11 been proposed already. The more specific information
12 that NERC -- that you provide and that you help NERC to
13 submit in the record, the easier it will be for the
14 Commission to make a decision regarding this standard
15 and any standard, you know. This is just the way that
16 the standards process works and the way that the
17 Commission works.

18 The record, though, that we had indicates that
19 this is something that needs to be done. As Rob said,
20 this is something that NERC has been investigating
21 since 2016 after the Blue Cut Fire disturbance and the
22 -- and not only is this a -- an eight-year-old problem,

1 at least, right? It's one that is -- there's a wave
2 that's coming that's tremendously important for us to
3 get a handle on. And that's the fact that, you know,
4 EIA projects now, and it perhaps -- and this was last
5 year -- perhaps it's changed already -- that fully half
6 of U.S. electricity will be -- electricity will be
7 produced by inverter-based resources by the end of the
8 decade, right? So, you know, not only has it been a
9 long time, but there isn't any time to waste.

10 So I appreciate everybody getting together,
11 looking forward to just observing a productive
12 conversation. Anybody wants to chat with me or staff,
13 we're happy to have that conversation, but really, this
14 is your time to do work, and we're just here to help.
15 So thank you so much, and have a good day.

16 (Applause.)

17 MR. BENNETT: Okay. Good morning, everybody.
18 Okay. So thank you for all the opening remarks from
19 our -- from our three speakers that kind of help set
20 the tone for the meeting today. So now my name's Todd
21 Bennett. I'm chair of the NERC Standards Committee.
22 I'm kind of here to walk through the objectives of the

1 agenda, but, Mark, just so you know, it looks like
2 we're going to do this through some high-voltage rock
3 and roll today, so there's your AC/DC reference.

4 So first of all, thank you to everybody that has
5 been involved in putting this together, so the
6 panelists that volunteered, the NERC staff that helped
7 coordinate a lot of the agenda, the meeting space, this
8 location, all of that, as well as the Standards
9 Committee members, so thank you to all the committee
10 members. For those that may not know, that is a
11 voluntary role, so this is in addition to their day job
12 at their respective companies. So I want to say thank
13 you to each one of those and what they've done to make
14 this successful so far.

15 So let's kick this off, and, you know, our agenda,
16 kind of just to review the agenda, I saw kind of three
17 main objectives that came through the agenda upon my
18 initial review. So the first one is very specifically
19 on communication. So one of the objectives of this
20 agenda was to communicate the technical issues and to
21 level set on those throughout industry, OEMs and any of
22 the other roles that we all play in industry. So we

1 all come here, you know, and we're all going to learn
2 something today probably just a little bit.

3 But then secondly, another objective is
4 collaboration. And so some of the items that really
5 spoke to collaboration on the agenda have to do with
6 the panel discussions. So over the next couple days,
7 there's several panel discussions on various technical
8 issues with this project. In support of those panel
9 discussions, I will say that Standards Committee and
10 NERC did receive multiple sets of very, very technical
11 comment and feedback. So first of all, we welcome
12 that, that it was in great support of this Technical
13 Conference. I do want to assure those that submitted
14 those, that those have been reviewed by NERC Standards
15 Committee, and the information contained therein has
16 been used to formulate some questions for the panel
17 sessions, so thank you for that. That really helps
18 frame the -- frame the discussion.

19 So one thing you should be prepared for is there
20 is a finite amount of time for each one of these panel
21 discussions, so there's between 45 minutes or an hour
22 or so. And there is a preset amount of questions, so

1 there's about 10 minutes allotted for each question to
2 make it through. Panelists may find that there's an
3 opportunity to kind of build on some of the panelist
4 responses before each subsequent panelist. That may be
5 the case. If not, I don't want to, you know, frame
6 your responses at all, but you may be able to make the
7 most of our time and kind of build on some of the
8 responses from before. So just be cognizant of there
9 is kind of a time constraint on some of the panel
10 discussions.

11 And then lastly, consensus. So maybe that's the
12 main objective of this Technical Conference is industry
13 consensus. How do we move forward? It's time to move
14 forward. How do we take some steps forward? So we do
15 have a tool that will help with that. I believe it was
16 mentioned earlier, Slido. I've used it before. This
17 is the app or the technology or the mechanism that will
18 be implemented to issue some polling of the industry
19 after some of the panel discussions. It's also a way
20 to provide feedback during some of the panel
21 discussions, so that is the chat mechanism for this
22 conference. So you won't find that functionality in

1 Webex. It'll come through Slido. So there's more to
2 come on that. There's more discussions -- or sorry --
3 more instructions on how to participate and the
4 appropriate times to participate, so pay attention.
5 More to come on that.

6 And with that, I don't think I have anything else
7 to share. That's my agenda review. And I believe
8 Jamie is ready to review the summary of the FERC Order
9 901 and Milestone 2, so we'll let her get set up here,
10 and I believe she's going to go through a presentation
11 with us.

12 MS. CALDERON: All right. Want to do a quick
13 level set, so we're going to get really deep into the
14 technical details during this conference which is good,
15 it's why we're here, but we don't want to lose the
16 forest from the trees type conversation, so let's take
17 a step back. We're going to go all the way back in our
18 time machine to October of 2023. David Ortiz opened it
19 up for us, given us the -- kind of a little bit of the
20 background on FERC Order 901 coming out.

21 So next slide, please.

22 Quick summary for everyone. The order came out in

1 October 2023. There are four milestones all the way
2 through November of 2026, and they address a wide
3 spectrum of IBR performance-related issues. Everyone
4 here, I'm sure, is familiar with some of the
5 performance issues that are in question. A lot of it
6 has to do with making sure we have an accurate way that
7 we represent them within models, that we're including
8 them within studies appropriately, and that we're also
9 just getting the data to begin with. So we want to be
10 able to leverage the existing standards. It's not
11 always a good idea to just come in and do a tear-
12 down/rebuild when you don't have to, but we want to
13 make sure that we're being able to implement meaningful
14 changes within the standards. So if it requires a
15 little bit of a step-back where a new standard, as
16 we've seen with the IBR performance-related standards,
17 that's one avenue to go to, and the team felt it was
18 appropriate during this -- during these discussions
19 this last year.

20 Next slide, please.

21 So as indicated, there are really four main issues
22 of this data sharing assuring that the data is

1 available. We're talking about high-speed sequence
2 event recorders, fault recorder data, stuff that has
3 not been traditionally needed at conventional
4 generation. So those needed to be installed, and we
5 needed to ensure that the requirements were in place
6 that required the sharing of that data to those who
7 needed it, either for modeling or for doing those
8 studies, or just for situational awareness, being able
9 to monitor the onsite impacts and making sure that that
10 was visible.

11 There's model validation, ensuring that not just
12 once it gets thrown into the model, hasn't been
13 validated. We're looking at also verifying during the
14 interconnection process has the model accurately
15 represented what was as built, if there was design
16 changes that happened during the initial
17 interconnection studies and we're moving into the post
18 commercial operation, and it's not operating the way it
19 was designed to as the way the model practices and
20 simulation, then there's an issue there. So we want to
21 make sure that we're building an effective model
22 validation throughout, planning and operational studies

1 that leverage that. And performance requirements were
2 listed last, but, of course, we get to those first.

3 So next slide, please.

4 Another thing about Order 901 was that it
5 references three different types of IBRs. So just to
6 make sure that we're level setting on what those IBRs
7 are, registered IBRs for the purposes of FERC Order
8 901, that is any IBR that is going to be registered as
9 either, what we're referring to as Category 1 or
10 Category 2. Now, the distinction between registered
11 and unregistered IBR has to do with the earlier FERC
12 Order 2022 that required the expansion of requiring new
13 IBR generator owners to become registered and into the
14 NERC regulatory environment. We're looking at
15 aggregated IBR of 20 MVA and up connected at 60 kV. So
16 this is an expansion of the IBR and generator owners.
17 A lot more people coming on board.

18 In that original Order 2022, it was focused on
19 registered and unregistered within that context. For
20 FERC Order 901, "registered" encompasses both of those.
21 So to be clear, that unregistered IBR is really focused
22 on the not going to be registered, not part of the

1 Category 2 GO/GOPs that would be potentially
2 interconnected at the transmission level. That would
3 be looking at aggregated sets of IBR that will not have
4 generator owners, but will be the responsibility of
5 transmission owners to aggregate and incorporate into
6 their models.

7 IBR/DR, similar conversation only at the DR level.
8 So you're looking at the distribution level IBR,
9 potentially rooftop, not to be confused with having
10 individual model data for each of those, but the
11 aggregated impacts to the distribution provider and
12 ensuring that the distribution provider has at least
13 some estimation for capturing those within their models
14 and knowing the limits of their estimation. So if
15 there's particular issues with acquiring the data,
16 acquiring specific data, that that distribution-level
17 data is at least estimated and being able to continue
18 to be developed over time.

19 How we get that aggregation is going to be a
20 continual conversation, but it's actually not part of
21 the performance requirements in Milestone 2. The only
22 ones that are identified within Milestone 2 are those

1 registered IBRs that are going to be part of the
2 Category 1/Category 2 generator owners. Those would be
3 interconnected at 60 kV and up with the aggregation of
4 20 MVA and up.

5 Next slide, please.

6 Okay. So we are in the first stages of this.
7 Again, it hasn't even been a year since the order came
8 out. So putting this in context, you know, we had to
9 go through some of the motions here. Rule 321 was
10 something that we absolutely did not want to pursue if
11 not needed, and it was determined to be needed in this
12 case. We needed to make sure that we were having a
13 really frank conversation on some of these issues and
14 just an open technical conversation. But we don't want
15 to lose sight of the fact that we have two additional
16 milestones that will equally be exhaustive in terms of
17 scope of work and the amount of time that it's going to
18 be taking to get this together. We don't want to find
19 ourselves in a similar position next year.

20 So this presentation and this whole conference,
21 while we're looking at -- specifically at Ride-through
22 and the very specific aspects, I know we want to get

1 into exemptions and criteria discussions, but we don't
2 want to lose sight of the fact that there's still a lot
3 more that we need to be able to do and within the next
4 two years. So the scope of work for November 4th, we
5 look to be on track. We only have one standard that
6 hasn't passed, and I think we'll be able to get to a
7 solution at the end of this conference.

8 Next slide.

9 Okay. So just to break up the three standards.
10 First Project 2021-04 at a new standard. Again, we
11 decided to break out the IBR versus the conventional
12 generation. So where we had PRC-02 that was focused
13 on, you know, capturing this information, we've created
14 a new standard. This Drafting Team decided to put
15 forward PRC-028, looking at disturbance monitoring and
16 reporting requirements for IBR. This is installing new
17 sequence event recorders, fault-recorded data, and
18 making sure all of that information is being provided
19 through those requirements. So there might be a
20 trigger, such as a request from a planner or operator,
21 for that information. There's a small period of time
22 that that data is just be -- required to be held on an

1 ongoing basis, but we're talking about potentially
2 terabytes of data after just a couple weeks. So
3 there's not a large period of time that that data is
4 required to be preserved unless a trigger is put
5 forward by the planner and operator to initiate that.

6 So we want to get into how these things
7 interrelate as part of this quick presentation, and I
8 see this as part of like the three-legged stool that
9 happens with real-time assessments. You've got data
10 requirements, data-sharing requirements, and then the
11 analysis requirements. The difference here is that
12 we're initiating all three versions of this three-
13 legged stool simultaneously. So this has been a
14 lessons learned for how we do joint standard project
15 development, three different projects working somewhat
16 in tandem. Not everything was done completely. We got
17 some lessons learned, I'll say, and some improvements
18 that we'll make for the modeling aspects as well
19 because there's three projects that will go through a
20 similar type of need to coordinate and collaborate on a
21 single solution.

22 So PRC-028 looks at making sure that the

1 installation of the equipment is done. We'll get into
2 the implementation questions and discussions tomorrow,
3 so I won't go into the Phase 10 implementation through
4 2030, other than to say, for all of 901 -- that's
5 Milestones 2, 3, and 4 -- all have to be fully
6 implemented by 2030. It seems like a long time, but
7 it's not. As we all know, just a standards development
8 project is taking a year or two, acquiring vendors,
9 getting through supply chain issues, making sure you've
10 got contractors onsite for testing and validation.
11 It's going to take a lot of work, and don't start two
12 years from now or three years from now. It's really
13 critical that we start soon and understand the issue
14 soon so we make sure that things are in the works and
15 scheduled and being able to be coordinated with
16 reliability -- or with the regional entities as well.

17 Next slide.

18 For PRC-030 -- did we skip PRC -- did we skip a
19 slide? Thank you. Yes.

20 So Project 2020-02, PRC-024, we're looking at
21 frequency and voltage Ride-through requirements. It's
22 why we're all here today. We're looking at

1 establishing capability-based Ride-through criteria and
2 performance-based Ride-through criteria. So the
3 difference there being the design piece where you have
4 -- whether or not you've communicated what the unit is
5 capable of doing versus how it's actually performing in
6 practice. During a voltage or frequency excursion,
7 what is it actually doing? Does it match? And so we
8 need both of those things in order to be able to align
9 them and make sure that they're the same. There's
10 going to be differences based off of things that are
11 as-built versus as-designed, but we've got to be able
12 to make sure that we're moving forward with
13 comprehensive solutions. That means we need both of
14 these, and that's what PRC-029 does for IBR.

15 PRC-024 was modified slightly. It takes Type
16 1/Type 2 wind. It takes synchronous condensers and
17 synchronous generation. So we're retaining PRC-024
18 with those changes to ensure that those assets are
19 covered. So PRC-029 really focuses on those
20 asynchronous, you know, Type 3/Type 4 wind and PV where
21 we're looking at IBR that need to be looked at a little
22 bit differently.

1 Next slide, please.

2 PRC-030, similar conversation here where there was
3 an IBR version of the standard created, looking at
4 assuring that analysis is being performed. Who was the
5 responsible entities, what were the trigger criteria,
6 and how these things interrelate is that PRC-030 really
7 triggers what is required to be evaluated. So within
8 PRC-028, we talked about how there was disturbance
9 monitoring data that had to be captured, that
10 information needed to be triggered for. We're going to
11 call -- we're going to investigate this particular
12 instance. It's not going to be on the generator owner
13 to know when a disturbance occurs. They're not looking
14 at the wider area view. They may know because of their
15 own operations that might trigger it, but it's going to
16 be on planners and operators, primarily operators, to
17 be able to determine whether or not excursions occurred
18 that requires additional analysis to be able to
19 identify if generators either failed to meet Ride-
20 through or they were able to Ride-through with adequate
21 bandwidth.

22 So PRC-030 is really what ties PRC-028 and 29

1 together. Again, that's that three-legged stool that
2 are all really needed in order to be that single
3 solution.

4 Next slide.

5 So finally, this is just a graphical
6 representation of what I just went through. There's a
7 voltage or frequency excursion that happens on the
8 right and it -- for one, it's looking at the criteria
9 individual generators will be able to tell if they rode
10 through or not. And if that individual analysis
11 doesn't occur because the generator owners didn't know
12 that there was an excursion that occurred, then PRC-030
13 that's over there on the right-most block would be the
14 one that triggers that additional analysis to ensure
15 that it's performed.

16 The data-sharing aspect comes from PRC-028, so
17 that left-most block. It's really going to be the
18 thing that's going to be relied on to perform those
19 analytics, but we got two other boxes down there that
20 are critical, which is Milestone 3 and Milestone 4 are
21 going to require this information. So having that
22 data-sharing capability, the ability to trigger sharing

1 that data is essential for validating models, making
2 sure, again, as performance is being incorporated more
3 into these standards, that we have performance
4 evaluations during model validations and not maybe just
5 five-year stage testing based off of what -- or the
6 unit can do and based on the facts and circumstances at
7 the time that unit is tested.

8 So model validation performance may happen on an
9 ongoing basis, may be triggered on some other aspect
10 of, you know, the operators or planners' criteria or
11 working groups' processes. That's going to be
12 developed within the modeling teams that are focused on
13 Milestone 3, but we won't go into that today because
14 that's obviously a whole other scope of work and we've
15 got a whole year to do it, so we'll put that one to
16 rest. Milestone 4 is taking everything that's captured
17 in terms of the performance data and the models, and
18 then conducting planning and operational studies after
19 that.

20 So next slide.

21 At this point, we'll open it up for any questions.
22 I don't know if there's going to be questions. If we

1 can move to the Slido slide as well. Well, while
2 that's getting ready just to go through how we're going
3 to be doing the Q&A, within the room, we've got two
4 microphones set up, which are between the two hallway
5 the two columns here. If folks have a question to
6 ask in the room during any of the presentations or
7 panels, please line up behind the microphones. We'll
8 alternate between questions in the room and online. So
9 the online Slido is going to be available during
10 presentations. We're going to have the -- those
11 questions locked so there won't be any questions that
12 will be able to be asked at any other time. We're
13 going to close that down and reopen it every time we
14 have a -- the possibility to go to a Q&A.

15 We do have a code and instructions here coming up.
16 There we go. Thank you.

17 So this is going to be the same information that
18 will show multiple times throughout today and tomorrow.
19 You're able to use the QR code if you want to scan on
20 your phone. You are also able to just go to Slido.com.
21 There will be a space to put in an event code. We're
22 using "Ride-through" because why not? So capital

1 "R/hyphen/through." There's no password. You should
2 just be able to get in. We will have moderated -- a
3 moderator looking at the questions to make sure things
4 are on topic, that it's appropriate to the panel that's
5 being presented at that time. So this slide will be
6 shown multiple times, so if you miss this information
7 now, you want to grab a screenshot, please do, but that
8 will be how we go through the Slido Q&A.

9 So if there's any questions online -- not sure if
10 there's any questions online right now. Okay.
11 Excellent. All right. I think we could probably go to
12 the next presentation then, which will be a 15-minute
13 break.

14 (Laughter.)

15 MS. CALDERON: Oh yes, yes. Question in the room?

16 MR. MAJUMDER: Thank you so much, everyone.

17 MS. CALDERON: Oh, just for anyone asking a
18 question, could you please provide your name and who
19 you're with, if you're in the room?

20 MR. MAJUMDER: Absolutely. My name is Rajat
21 Majumder. I work for in Invenergy, which is a
22 renewable energy developer here in the U.S., and I'm

1 also on the Standard Drafting Team of PRC-029. So
2 great presentation, good setup of the meeting.

3 I heard a statement from Rob that -- he made it
4 very firmly that the risk is sufficient, technology is
5 sufficient, so let's get it done, it's not a matter of
6 easy and hard. Absolutely agree with that, but that
7 risk sufficient part should be data driven. Yes,
8 technology is sufficient. Of course there are -- there
9 is gap between what technology can offer now, and
10 that's why we are here today. Otherwise, we would
11 already be having an approval on the standard. What is
12 missing until -- is how the sufficiency of the risk is
13 being established for what technology is shot. So
14 that's what my humble request to the entire team, that
15 as we go through next two days, let's keep that in
16 mind, that whenever we are trying to establish a risk,
17 let's find out what is needed for the reliability of
18 our bulk electric system that we own. Thank you.

19 MS. CALDERON: Okay. Still no questions on
20 online? All right. We'll go ahead and --

21 MS. CASUSCELLI: All right, Jamie. It looks like
22 we do have a couple of questions online.

1 MS. CALDERON: Okay.

2 MS. CASUSCELLI: So first, "does the spoken word
3 during this Technical Conference become part of the
4 NERC/FERC record or only the comments provided in
5 writing?"

6 MS. CALDERON: Oh, yes. So we are recording this
7 webinar or this conference. It will be posted. The
8 transcript as we'll be able to have for our record of
9 developments. Everything here for this conference is a
10 little bit atypical because we're using it as part of
11 the -- our response to invoking Rule 321, so this is
12 going to be part of our full record of development.
13 The questions that are online that are asked, we'll
14 preserve those. We'll be able to add those to the
15 archive of questions, questions in the room. We do
16 have a court reporter in the room, and that's why --
17 one of the reasons we're asking folks to be able to
18 provide your name and who you're with prior to asking
19 questions so we'll be able to ensure that everything is
20 -- everything's captured.

21 MS. CASUSCELLI: All right, a couple more. David
22 McNeill from Certrec is wondering, "Does NERC

1 anticipate the replacement of synchronous generation
2 with IBR-based generation to lessen the severity of
3 frequency events?" We'll probably get through that.

4 MS. CALDERON: Less than the?

5 MS. CASUSCELLI: Less than the severity of
6 frequency events.

7 MS. CALDERON: Not sure I understand that
8 question.

9 MS. CASUSCELLI: It says, "Does NERC anticipate
10 the replacement of synchronous generation with IBR-
11 based generation to lessen the severity of frequency
12 events?"

13 MR. SHATTUCK: Yeah. I mean, I'd say probably
14 not. I mean, the thing we can certainly say is that as
15 we transition towards more IBR and higher penetration,
16 things are going to change. If we do nothing, right,
17 and it's all grid following inverters, and, you know,
18 all the synchronous machines are gone, then things are
19 going to happen that we don't expect. They will
20 probably be worse than what we've seen. Now, if we do
21 this in a thoughtful way and replace those synchronous
22 machines with machines that are, you know, tuned right,

1 with the right parameters or the right capabilities
2 like we're going to talk about today, then we could be
3 relatively certain, you know, if we go forward, that
4 even if the events change their nature, that we're
5 capturing that with our, you know, study work, right?
6 If we do better studies and study what's actually going
7 to happen and study what will come next, then whatever
8 happens as far as the changes that happen, we'll be
9 able to mitigate those as much as we can.

10 MS. CASUSCELLI: All right. Thanks, Alex. I have
11 more. What is the code for Slido?

12 MS. CALDERON: There is -- so the event code is
13 "Ride-through," capital R and then a hyphen. There's
14 no password on top of that. So you're able to enter in
15 additional information as optional, such as your name,
16 so that we're able to respond to that question in chat,
17 but the event code is "Ride-through."

18 MS. CASUSCELLI: And are the preconference
19 comments going to be posted?

20 MS. CALDERON: Okay. The preconference comments
21 that were provided as part of the larger set of
22 comments that we requested from industry, we do not

1 intend to publicly post those. We are collecting those
2 as a matter of our, again, record of development. If
3 we as part of our filing have additional follow-up
4 questions, we might reach out to those individual
5 comment submitters for additional information. If it's
6 additional information that's requested by FERC during
7 our filing, we're going to provide that as well, but we
8 have no intention to post the full comments.

9 MS. CASUSCELLI: All right. Okay. There's more
10 questions. We're getting more into, like, the
11 technical stuff if you want to approach this now or --

12 MS. CALDERON: Yeah, if it's starts getting into
13 the actual frequency or voltage criteria, we'll want to
14 wait for that panel to go because we'll have an OEM
15 panel today and another panel as well.

16 MS. CASUSCELLI: Okay.

17 MS. CALDERON: So as long as it's questions
18 related to kind of the larger Milestone 2 work. Some
19 of this, like, larger conference work stuff is fine as
20 well since this is --

21 MS. CASUSCELLI: Okay. Okay. So we'll just hold
22 a lot of these questions until the end, I think, or

1 later.

2 MS. CALDERON: All right. Well, we'll put a pause
3 now. We'll go ahead to a 15-minute break, and food, I
4 think, is still probably down the way, coffee and water
5 outside, and we'll see you in a bit.

6 (Break.)

7 MR. BENNETT: Okay. So it looks like we're
8 getting started here. Again, I'd just like to say
9 thank you for all the participants so far. Great
10 technical presentation by Jamie to kind of set up this
11 discussion. And then as far as right now, I believe
12 that we have -- I believe that we are entering into our
13 first presentation which is review --

14 (Technical difficulties.)

15 UNIDENTIFIED SPEAKER: Lithium batteries.

16 MR. BENNETT: Okay. This microphone works now.
17 So we're going to enter into our presentation to review
18 the voltage and frequency Ride-through criteria in the
19 PRC-029 standard. So helping us with that are our
20 speakers today, which are our Drafting Team members,
21 but Husam Al-Hadidi and Shawn Wang. So I'll hand it
22 over to you, and thank you for your presentation today.

1 MR. WANG: Thank you. Thank you, everyone. Good
2 morning. My name is Shawn Wang from Enel. I'm the
3 chair of the Standard Drafting Team. Yeah, I'm happy
4 to present the -- some background of this standard
5 development over the past, like, two years.

6 Yeah, maybe next slide, please.

7 Yeah. This slide shows the Drafting Team roster.
8 I really appreciate all the membership, yeah, during
9 the past two years. It's really hard work for the
10 Drafting Team. Yeah, I think everyone actually here
11 today just on behalf of us. Yeah. Actually, some of
12 the membership, yeah, in this room -- in this room,
13 yeah.

14 So yeah, with that, actually, next slide, please.

15 As Jamie, mentioned, the -- she just put the time
16 machine back to 2023, but I will get back even further
17 of this Drafting Team back to 2020 because the project
18 named 2022 -- 2002. Back at that time, actually,
19 there's a SAR from NERC to revise the standard --
20 existing standard PRC-024 to include the dynamic
21 devices into PRC-02024. That project start from 2020.
22 That's the reason why actually this project just

1 grandfather that project to move forward to include --
2 associated with this standard.

3 Yeah. Next slide, please. Yeah.

4 Actually, in 2022, actually, NERC issued another
5 SAR to revise the PRC-0-24-03, actually revise the
6 generator Ride-through standard. The background for
7 this SAR is like from the system events, right, several
8 system events. Actually, after the analysis, actually,
9 we -- the NERC team identified there some missed
10 operations. Actually, the widespread generation loss
11 actually reduced the output, right, from the IBRs from
12 the wind, solar, or even the BES. Actually, the from -
13 - the system event analysis identified there's some
14 reliability risks, yeah, from those abnormal trippings
15 from the IBR resources.

16 From the analysis, actually, the -- one of the
17 issues is identified that the existing PRC-023 -- PRC-
18 024-3, is just equipment protection setting standard.
19 It's not sufficient to cover the IBR units. In that
20 SAR, it's proposed to address those reliability risks
21 to propose a more suitable performance-based
22 reliability standard.

1 Next slide, please.

2 Yeah. The Standard Drafting Team start from
3 actually combined those two SARs and start working on
4 this standard -- the standard to work on this project.
5 Actually, the project start from 2022, I think -- yeah,
6 2023. At that time, actually, after the extensive
7 discussion, I think as mentioned by David and Rob,
8 actually, the Standard Drafting Team realized that
9 there's difference between the synchronous generator or
10 the traditional generator and the IBR units. So
11 approach-wise, actually the Standard Drafting Team
12 decided to revise or modify the PRC-024-3 to retain the
13 reliability standard as the protection-based standard,
14 only applicable to the single generator and the
15 synchronic condenser Type 1 and Type 1 wind turbines,
16 and to create a new reliability-based standard, the
17 PRC-024 -- PRC-029, address the inverter-based
18 resources to Ride-through these system -- voltage and
19 the frequency excursions.

20 Actually, at the time of the last year, actually,
21 the FERC Order 901 came out. Actually, the Standard
22 Drafting Team decided to coincide with the Ride-through

1 standard proposed by the attribute standard -- no,
2 sorry -- the need to understand and follow the FERC
3 Order 901.

4 Yeah. Next slide. Previous one. Go back one
5 slide. Yeah.

6 This slide shows the timeline, actually, for the
7 Standard Drafting Team actually after the -- during
8 the -- more than -- this year, right, after the 901
9 released. Actually, the Standard Drafting Team work
10 very hard after that to meet the timeline, right?
11 Actually, it's very time constrained. Actually, the
12 first draft released in March of this year, and the
13 first comment period run through March 27 to April 27.
14 Actually, the first draft didn't pass the ballot, and
15 they received almost 200 page comments from the
16 stakeholders. The Draft Team were, again, working very
17 hard, went through a series of meetings, including one
18 in-person meeting in Cleveland in May, to address all
19 the comments and release the second draft the -- of the
20 standard.

21 So the second drafting -- the second comment
22 period ran through June 18th to July 8th of this year.

1 Again, actually the -- it didn't pass the -- after
2 received the comments, actually, the Drafting Team set
3 up several meetings and address those comments,
4 actually make revisions to the draft, actually, within
5 very short time duration from July 22nd to August 12th.
6 Then they create the -- make the third draft, but
7 unfortunately, still didn't pass through the ballot.
8 Then on August 15th, the NERC Board of Trustee invoke
9 this Rule 321, so this technical meeting, yeah, yeah,
10 came up. Yeah. So the -- just one thing I want to
11 mention. The PRC-024, the revised PRC-024 passed the
12 ballot, so we just focus on the PRC-029 now.

13 So next slide, please. Yeah.

14 So with that, actually, I will pass the microphone
15 to Husam to describe the current or latest redline of
16 the Draft 3.

17 MR. AL-HADIDI: Good morning. Husam Al-Hadidi
18 from Manitoba Hydro. I'll just -- I'll go through the
19 steps where we were as part of developing this standard
20 with this Draft Number 3. Just I'll go in the progress
21 how we came to this stage from standard from Draft
22 Number 1 to Draft Number 3.

1 First of all, we were having challenging of the
2 IBR definition, which was not there, and it gave us
3 some way -- went through different phases of it, but
4 until it was now approved by NERC, and it was passed
5 the ballot. That's why it's now included in the -- in
6 the standard itself. Also, there was some struggle
7 with the transmission owner. Is it going to be part of
8 applicability or not? And the reason for that is
9 because we -- part of IBR, which is the offshore or any
10 IBRs connected through the water source converter,
11 which was sometime it could be owned by the
12 transmission owner, but after a good discussion and
13 looking at some example here in U.S., we found there is
14 not a case exists, so -- and it was adding some
15 confusion to the stakeholders. So we removed the
16 transmission owner from the applicability part of it,
17 and it's only now applicable for generator owner.

18 Next slide, please.

19 We started first with Draft Number 1, which was
20 six requirement, but we ended up with four requirement
21 in Standard Number 3, and I'll speak about why we have
22 moved some of this requirement or remove it from Draft

1 Number 1. And the first requirement was about the
2 voltage Ride-through, and in the first draft, we were
3 having only -- it wasn't -- it was only event-based
4 analysis. It was not a capability-based standard, but
5 we understood that analysis part, it requires some
6 measurement, and that measurement, it may not be
7 available at the early stage of the implementation of
8 the standard. And we thought it's the right way to go,
9 is just to make sure that the capabilities already
10 exist. And then event-based analysis will -- can
11 confirm that if that's -- if it was how it was designed
12 and it was -- performed as expected.

13 So we included the designing -- the design and
14 operate, and it was -- that wasn't integrated in Draft
15 Number 2, moved away from Draft Number 1, which was
16 only about just operate the IBR, and R1, it just focus
17 on the Ride-through the voltage. And we had two table
18 for this Ride-through, and the two -- the table is one
19 for the wind IBR and other -- and then -- and the
20 second one for other IBR technology. And the reason
21 for that, we want to have as wide as possible voltage
22 Ride-through criteria with understanding that the

1 system short-circuit level and they (inaudible)
2 significantly change. And even the load itself -- IBR
3 load will integrate it a lot on the system, and that
4 the need of Ride-through -- of a larger voltage Ride-
5 through, it'll be expected for ability to mitigate any
6 future risk. For that reason, we were -- we went to
7 the two tables and with understanding some limitation
8 could still exist for the wind technology.

9 And here we have the -- we list some of the
10 exemption from the voltage Ride-through where it could
11 trip for a reason as listed in this fourth bullet. One
12 of them is for (inaudible) protection, and second, we
13 understood there's an exemption, and that exemption may
14 give you a different criteria than what's there in the
15 table. For example, like the 0.9 per voltage. It may
16 -- you may not be able to go for three second. You may
17 be able to go two second for legacy equipment only or
18 legacy IBR. So that's the reason it's one of the
19 exemption there.

20 And also Bullet Number 3, it used to be as a
21 separate requirement in the standard in the first
22 draft, which is the -- which is the positive sequence

1 instantaneous voltage jump. But we said it was -- we
2 thought it may -- it make it more fit to have it as an
3 exemption because really only if unit trip, then if
4 your voltage was -- if your base angle jump more than
5 25 degrees, then you could use it as exemption from the
6 compliance part, and you don't have to worry about it
7 as part of -- if you don't -- if you don't have a
8 protection, if you don't have this trip there, so you
9 don't have to be worried about the compliance and how
10 to present it as a requirement.

11 And also, there was some question about the
12 voltage per hertz, and we said maybe it's good to have
13 some criteria to ensure just in the design because we
14 added the capability and there was a compliance
15 question how to prove that the design can work at the
16 boundaries of the voltage and the frequency at the same
17 time. That's why we included the voltage per hertz
18 exemption criteria here.

19 Next slide, please.

20 This is the measurement. Actually, the
21 measurement were changed somehow to reflect the -- some
22 feedback we got from multiple stakeholder, and I

1 believe to the stage where now it add more clarity. If
2 you have any question, we can answer it at the end of
3 the -- at the end of presentation. But for now, next
4 slide, please.

5 For R2, I said R1 was still a voltage, but Ride-
6 through R2, it went now to focus on the -- focus on the
7 performance of the voltage. And here we split -- based
8 on the table, there is three operating region, which is
9 the continuous, mandatory, and permissive region. And
10 for each region, we presented the performance criteria
11 needed after a disturbance. However, we understood
12 there is a weakness for every system, and you cannot
13 come with some criteria which can fit all.

14 We try to come with as much as possible adding
15 flexibility to the requirement, at the same time giving
16 some guideline for a starting point whenever is needed.
17 So we started with a lot of performance requirements as
18 included and very specified, like it is going to be
19 different how much your reactive power for every
20 voltage there. What's the relationship between the
21 power and reactive power?

22 However, but we understood that could be

1 challenging for some region, and it will not fit -- we
2 cannot come with answer fit all systems. For that
3 reason, we remove some of this language from the
4 standard, and we ended up with some language still
5 there, which is meet the minimum requirement in our --
6 in the Standard Drafting Team opinion, but at the same
7 time, having some added flexibility still there for the
8 TB and for reliability coordinator and planning
9 coordinator to come with their own criteria if it's --
10 if it's going to be different than this, to mitigate
11 whatever reliability issue they have in their system.

12 Next slide, please.

13 For 2.2, this focus on mandatory operation region,
14 where 2.1, it was the continuous within mandatory, and
15 this one is merely saying that we understood there's a
16 reactive -- there is real and reactive power. And we
17 said that's always going to be the fault, is reactive
18 power, it makes sense if you are having a voltage
19 issue, you need to support the voltage system.
20 However, we understood for system -- for other system,
21 it could be real power priority is the need because
22 they may have some frequency issue, and they need to

1 mitigate it or deal with it.

2 So we come -- we wrote it in such a way where there
3 is a flexibility there, but preference or the fault is
4 already provided.

5 Next slide, please.

6 For 2.3, it is actually focused in the -- in the
7 reaction of -- this one in permissive region where it's
8 -- here, it's looking at part of the -- part of the
9 FERC order was that you couldn't use voltage cessation
10 or the blocking of the current. However, we understood
11 that below 0.1, especially positive sequence voltage,
12 if you have your three voltage phases already all below
13 point-zero or close to zero, then it's very hard for
14 the IBR to still continue to produce any power or try
15 to contribute to the system.

16 So for that reason, we said, instead of allowing
17 them to trip, we said, no, don't trip because really,
18 it may, it may not able to provide any support after
19 the fault recovery. So we say you could block if your
20 booster sequence voltage below .1, but at the same
21 time, if you booster sequence goes above .1 within five
22 cycle, you have to reconnect to the system, and you

1 have to start -- continue exchanging current, and you
2 have to meet the requirement as stated in the 2.1 or
3 2.22.

4 For 2.4, it's focused on the -- on the response of
5 the IBR after clearing the fault. It was a concern
6 stated that sometime the -- based on the surface level
7 or the -- or the gain, or the right -- or the recovery
8 time, it may become a little bit -- or even the mode of
9 operation is reactive power, how much reactive power
10 was exchanged, it may cause a high-voltage response
11 after clearing the fault, and that voltage may go
12 outside of no trip zone, and that may cause itself to
13 trip. So we see that it need to be designed or have
14 the capability, and it has to be shown that it has --
15 it could be tuned to be able to maintain the response
16 within no trip zone -- voltage no zone.

17 Next slide, please.

18 For the 2.5, this is for the recovery from the
19 event itself. And for the recovery, as I said, the
20 flexibility is added there. We said it needs to
21 recover, and that was part of the FERC order, within
22 one second. At the same time, it has to recover fully

1 for the pre-disturbance megawatt, and -- but we
2 understood that it may not be able to go to the full
3 megawatt because of some water or some change in the --
4 in the -- in the -- in the capability of the IBR is not
5 for tripping an individual IBR unit. It's only -- if
6 it can -- even if we trip some IBR unit, but it can
7 maintain its power after the disturbance, we say this
8 should be a compliance. It shouldn't be -- have an
9 issue with that, but we understand in some cases you
10 may not be able to cover for 100 percent, and we give them
11 a flexibility, which is going to be provided by their
12 associated transmission planner or operator or
13 coordinator.

14 Next slide, please.

15 This is the fun part, which is R3, which is the
16 frequency Ride-through. We had to struggle with this
17 one, I must say. We understood the system is going to
18 change in the -- right now, the system is going through
19 significant change, and the IBR technology is going to
20 be -- penetration will be increased significantly in
21 the system. And people have not enough experience or
22 exposed to the system to the high-frequency event or

1 low-frequency event. So we try to write something
2 which, in our mind, how it's going -- the system going
3 to behave within the coming four, five, six, 10 years,
4 and what's the availability needs for the system.

5 So FERC stated that you cannot have any exemption
6 criteria. So we will -- we tried to write something
7 which we try to have some frequency requirement there,
8 performance requirement Ride-through, but at the same
9 time with understanding some legacy equipment may not
10 be able to meet some of these requirements. So we
11 wrote it in such a way where we did not have any
12 performance, only Ride-through, so we are not -- there
13 is no primary frequency controller as part of this
14 requirement. You need only Ride-through, and you need
15 to keep connecting and exchanging current, but you
16 don't need to respond to the frequency event as it is
17 because there is no required frequency performance.

18 And the challenge was for the ROCOF, which is 5
19 hertz per second, but we understood it's -- this value
20 cannot -- it's very difficult to calculate during the
21 fault. So we make it very clear that this is not
22 during the fault event. It should be after the fault

1 and should be for really actual load and generation and
2 balance event.

3 So and we come with -- we widened the table beyond
4 even the IEEE 2008 and Ride-through, understanding that
5 the nature of the system will reduce a lot, and we --
6 and the technology are much capable of Ride-through of
7 frequency envelope. So and maybe today we'll hear from
8 some -- OAM about their experience with that. But we
9 widen this range of frequency larger than for the first
10 -- six second larger than IEEE just to make sure that
11 it's -- the future system will be able to have that
12 advantage of maintaining the IBR for longer or larger
13 exertion of frequency.

14 At the same time, also, the load will change
15 significantly. IBR load will be there, and that will
16 make rate of change, interruption of power will be
17 significant, and the rate of change will be
18 significantly, even most likely, more than 5 hertz per
19 second.

20 Next slide, please.

21 The R4, it's -- is the exemption. In this one, we
22 moved in different stages in our -- in our Drafting

1 Team to come to this language where it's in the -- in
2 Draft Number 3. What we have here, we came -- we
3 agreed that an exemption, this is like a temporary
4 requirement because this one only valid for the first
5 year of -- after the -- after the effective days of the
6 standard. So after that, you have one year to apply
7 for exemption for only voltage, which just mean that
8 for R1 and R2. And for this, too, requirement, you
9 could, if -- for legacy equipment, you could do
10 exemption. We list some of the information need to be
11 provided in your submission request for exemption. We
12 understood there is a risk and some assessment need to
13 be there, but -- that could not be explicitly provided
14 in this requirement. But we said it's based on -- the
15 exemption will be guaranteed not based on the risk. It
16 just based on meeting this requirement itself.

17 Next slide, please.

18 Here, we also provided the mechanism and to whom
19 this exemption needs to be submitted. At the same
20 time, we said that how you need to deal with it in the
21 future, if you are -- if your exemption has been -- you
22 replace some of the equipment and if there is any

1 request, additional information from transmission
2 planner or transmission operators or RC for additional
3 information. It could be modeling, it could be other
4 information which may help them to assist the risk and
5 to model or to try to include this as part of their
6 study to understand their limitation within the
7 equipment.

8 Next slide, please.

9 I think here, just the tables of the voltage and
10 the frequency, so we have modified them, and there's
11 not much here.

12 Next slide.

13 The same thing. This is the frequency, as I said.
14 For the first six second, we have increase the level up
15 to 64 hertz in the overfrequency part and to 60 56
16 hertz in the under frequency for six second. Beyond
17 that, we try to match some of the existing IBR
18 standards within the footprint of U.S.

19 Next slide. Thank you.

20 MR. WANG: Yeah. One more thing I want to mention
21 is, like, for the -- at the first draft, right? We
22 also include the transformer voltage, the requirement,

1 along with the attribute and 800 standard. But during
2 the Drafting Team, the development and also the
3 participate of the attribute Standard Team, right? We
4 realized that it's very complex issue at this point,
5 and we just remove the -- remove that requirement and
6 just put the one atom in the attachment of the Table 1,
7 yeah, such that actually, we just try to avoid the
8 instantaneous overvoltage tripping, yeah. That's not
9 allowed, yeah. Just one point we just mention, yeah.
10 Thank you.

11 MR. MAJUMDER: Thank you, Shawn and Husam. Rajat
12 Majumder from Invenergy. I'll go straight to R3, of
13 course. So two primary comments that I would like for
14 the entire room to consider and provide some guidance.
15 One is based on FERC Order 901. Is it true that the
16 FERC Order 901 does not allow weaver to frequency,
17 Ride-through, or 901 is silent on that. It does
18 provide explicit weaver to voltage, right? So I
19 understand that, but I just wanted to touch on that.

20 The second one, which going back to my comment
21 earlier this morning, the sufficiency assessment of the
22 risk should be data driven. And if we look at some of

1 the earlier even that has happened, I fully agree that
2 there has been, even on where large amount of IBR
3 tripped off. Majority of them, if we review the NERC
4 alert carefully were due to wrong settings. So if we
5 try to solve a problem of some equipment settings being
6 wrong with a very broad stroke of making the
7 requirement much more stringent, I do not know if
8 that's the right way of doing things.

9 If we look at, again, on the data that's available
10 based on the Texas Uri event, the FERC report showed
11 the frequency nadir was 59.4 hertz with 50-percent
12 generation trip, then followed by 25-percent load
13 setting. I was in Sigrid, Paris last week. There was
14 a four-hours long session or large disturbance all over
15 the world from both 60 hertz and 50 hertz, and many of
16 them has significantly more IBR penetration in their
17 system compared to here in the United States. I
18 haven't seen any one of them, in 50 hertz, the
19 frequency ever went down below 49.4.

20 So all I'm trying to say that asking for a
21 frequency right requirement thinking it may happen in
22 the future appear, to me, be pure speculation. So I

1 would like the entire room to consider those fact and,
2 again, humbly request to establish the risk sufficiency
3 assessment based on data that's available to us. Thank
4 you.

5 MS. CALDERON: All right. Jamie Calderon with
6 NERC. Just in response to the question, the team was
7 advised with Legal there was no exemptions that were
8 allowed for frequency within FERC Order 901, so that
9 was routinely provided to the Drafting Team through
10 consult. FERC Order 901 doesn't even speak to any
11 types of frequency exemptions. And we're going to get
12 more into that conversation in this afternoon's panel
13 and, of course, with the panel tomorrow morning. So
14 we'll get into more details for that.

15 But also, just as a reminder, we do want to keep
16 the Q&A to questions to either the presenters or the
17 panelists. So please, please try to keep to that so we
18 can ensure that we're allowing time for other people to
19 ask questions.

20 MR. GOGGIN: Thanks. Michael Goggin with Grid
21 Strategies. A question about the frequency Ride-
22 through curves in PRC-029. Can you talk a little bit

1 more about the source of those curves and the technical
2 justification for the relatively wide frequency bands
3 in there?

4 MR. AL-HADIDI: The idea behind that, we looked at
5 -- I come from Manitoba Hydro. Our system, really, the
6 inertia can go very low, and we have multiple event
7 where we -- our frequency -- we have rate of change of
8 almost 8 hertz per second based on our inertia when we
9 -- when we, our tie line is broke from the system. So
10 we understand the event can be very severely, and with
11 low inertia, you need -- you need to Ride-through
12 larger, wider range of band of frequency.

13 And we under -- also the base on this limitation
14 we have right now in BRC 24, it was based on the actual
15 physical limitation on thermal turbine, which is not
16 the case in many cases for -- other than IBR, the Type
17 3, where it have some -- it's still in the integrated
18 system. The other one is already buffered by the
19 inverter itself. So we -- the thought was the
20 opportunity is there. The need of the system will --
21 the inertia will go lower. Even the short sector will
22 be going lower, and that's mean the rate itself can

1 widely spread as a voltage dip where it can impact
2 significant number of load and the load IBR base load.
3 And this all can create a significant movement of the
4 frequency.

5 In addition to that, also, we also understand that
6 the IEEE say that 5 hertz per second. If you look
7 about it, so it'll then take more than one second or
8 less even to go beyond the 65 hertz or even to go 55
9 hertz if you are close to this 5-hertz-per-second rate
10 of change. So it doesn't give a time -- enough time
11 for the IBR to respond for a frequency event. So we
12 said if the technology allowed that, why not to bring
13 it, and the idea that it's not a protection base, it
14 don't even -- in my opinion, the frequency or your
15 protection setting should be based on actual capability
16 and not based on the boundary itself as specified here.

17 So in many cases where we have our equipment, the
18 Ride-through frequency in in many area, like Manitoba
19 Hydro have, we have up to 82 hertz. It has to Ride-
20 through. So this number, in my opinion, was
21 insignificant based on the system need and the system
22 need maybe there in the future. Thanks.

1 MR. PATEL: All right. All right. It's working.
2 So you know, everyone is going to talk about frequency
3 Ride-through and exemption for legacy. I'm not going
4 to talk about it just now. But by the way, Manish
5 Patel, EPRI. Whatever I say or ask are my own opinions
6 and questions. Please don't sue me. I still have two
7 young daughters to send to college.

8 (Laughter.)

9 MR. PATEL: So a couple of general comments.
10 Look, I'm supportive of the standard, but the standard
11 remains completely silent on when IBR is required to
12 Ride-through, for what system conditions. The IBR may
13 be designed today, installed today, commissioned today
14 to Ride-through for a given system condition. Ten
15 years go by, the transmission system has changed upside
16 down. Is IBR still required to Ride-through? I think
17 -- I think it's a -- it's a -- it's a gap that the
18 standard completely remains silent and simply states
19 Ride-through no matter what the transmission system
20 condition is, what the neighbors are doing, and all
21 that kind of stuff, right?

22 The second thing is the way the standard is

1 written right now, if the differential protection on a
2 generator step of transformer mis-operates, then the
3 IBR is out of compliance because it tripped when it
4 shouldn't have tripped. I do not recall exact details,
5 but in 2022, there were 1,200 mis-operations on the
6 bulk electric system, and it's just life happens,
7 right? So there has to be some exemption for things
8 that are beyond control, right, water dripping from the
9 roof in a control house, mouse in a control house
10 chewing up cables, things like that. We talk a lot
11 about what IBR is expected to do in a continuous
12 operation region of the voltage. I think that is
13 probably unnecessary requirement because the whole
14 purpose of the standard is Ride-through when the
15 voltage and frequency are normal. Half of the page of
16 the standard is actually asking for IBR performance
17 when the voltage is almost normal, right, so things
18 like that.

19 I had something else in my mind, but it's
20 slipping. I have opportunity today and tomorrow then.

21 MR. AL-HADIDI: Thank you for the questions.

22 Manish, we discussed some of this one before. So maybe

1 in the first part, which is about the system strength,
2 where it was -- where it was designed, the idea were --
3 the team were, the Drafting Team, that we did not touch
4 the stability part of the IBR. So we said we are -- in
5 the standard itself, we did not speak about the, what
6 you call the rising time or starting time, or is going
7 -- is it going to be stable or not stable. So we
8 understood this can impact the stability, and there's
9 the third phase, which is the Milestone Number 3, which
10 is, you know, about the operation, and that need to be
11 caught at that stage of the analysis, and I believe
12 that will be -- could be advised to revise some of
13 these parameters or re-look at it as part of that --
14 part of investigation.

15 But if it -- if that part provide now
16 recommendation for change of that to maintain for
17 whatever short-circuit level system become because you
18 cannot say that I design today, system have changed,
19 now for reliability, I don't have to do anything about
20 a system change. System event happened, everyone
21 cannot Ride-through, and the system can collapse or
22 reliability issue. So I think that need to be

1 addressed as part of the how the phase three or my
2 phase three of the standard need to look at it, and in
3 that case, we looked at it where it need to be looked
4 at, the stability of the IBR.

5 For the second part, I believe your second
6 question, if I remember was about --

7 MR. PATEL: Mis-operation of protection.

8 MR. AL-HADIDI: Mis-operation, yes.

9 MR. PATEL: Just real-life things.

10 MR. AL-HADIDI: Yes, I fully agree. Where the
11 standard -- we work with the BRC/TRT. As Jamie stated,
12 that these three standard really are -- they were
13 integrated with each other to some level, what our --
14 the Standard Drafting Team at least thought. Maybe it
15 wasn't clear. We'll see how the thing goes. We
16 thought that the BRC 29 provide the criteria itself.
17 However, the assessment itself is done by BRC/TRT
18 because there's even the correction plan. Everything
19 is coming -- going there.

20 In the PRC-030, it was very clear stated that if
21 it was for mis-operation, you don't need to investigate
22 it, and is no -- no corrective action is needed. So it

1 was already exempt by the IBR tripping for -- mis-
2 operation protection was already included, in our
3 opinion, at least in the PRC-030, which maybe this a
4 good point for discussion, if that was really the right
5 way to do it or not, but that's where we are.

6 MR. PATEL: Yeah. So I understand that. The
7 standard has to stand on its own, right?

8 MR. AL-HADIDI: Yeah.

9 MR. PATEL: PRC-030 only talks about the operation
10 of BES under PRC-004. You can have a collector feeder
11 breaker trip because of, you know, real-world issue,
12 and that's not a BES element. If it's not, then it's
13 not part of PRC-030, but PRC-030 criteria is met and
14 PRC-029 criteria are met, right? So I think -- anyhow,
15 there has to be some indication of things in the
16 standard. Right now, the way it is written, voltage
17 was in the mandatory operation region, frequency was in
18 the, you know, mandatory operation region plan
19 disappeared, and there that has -- it's out of
20 compliance. Anyway, we, we can talk --

21 MR. AL-HADIDI: Yeah, yeah, that's a good point.
22 That's a good point.

1 MR. PATEL: Yeah. The last point that I just
2 recall is this whole concept of performance-based
3 standard. I think when the whole idea of performance-
4 based came along, it was not the fact that perform
5 under 24/7, 365, next 25 years, in that manner. It was
6 more about voltage and frequency trip setting. PRC-024
7 is not working. We need to go for performance-based.
8 Performance-based was -- continue to work when the
9 voltage and frequency are within given bends, right?

10 MR. AL-HADIDI: Yeah.

11 MR. PATEL: So this whole concept of performance-
12 based is a little bit misaligned than the original
13 thought five years ago when it came out of IRPTF at the
14 time.

15 MR. AL-HADIDI: No, I agree. Thank you.

16 MR. MAJUMDER: Rajat Majumder. So Husam, when you
17 responded to the other gentleman question, I have heard
18 many will, and you referred to Manitoba system. Now,
19 I'm sure that you might have seen an ROCOF of eight
20 hertz per second. That's shocking, but we cannot take
21 the requirement from a very specific region and
22 generalize it, right? Again, referring back to my

1 SIGRA session, there was a gentleman from South
2 Australia. He presented a lot of experience with a
3 peak load of 3 gigawatt. Now, are we going to take a
4 South Australian event with a peak load of 3 gigawatt
5 and apply that to Eastern Interconnect with 950
6 gigawatt? So when we are creating a reliability
7 standard, we need to be aware of the context of it.
8 Cherry picking and then applying blindly is not the
9 right way to do.

10 Second of all, you mentioned that, well if the
11 design can do it, why not? It's not about just the
12 IBR. We'll have transformer which are not under PRC-
13 029, and I don't want to speak for them because we have
14 enough expertise today within the room. I'm looking
15 forward to the manufacturing panel this afternoon. We
16 have representative from FOSDA, Siemen Gamesa, Hitachi
17 Energy. They are the top at their field. Please hear
18 from them. If you are going to have transformer
19 operating in such a low frequency ban, there are going
20 to be many other issues, unintended consequence. It's
21 going to make the transformer for no apparent reason.
22 That's not the right thing to do, but transformer is

1 not covered within our PRC-029.

2 MR. AL-HADIDI: (Inaudible) versus (inaudible)
3 hertz was addressed by R1, but as I said, let's maybe
4 -- let us leave it -- this topic for further discussion
5 within the industrial, what do you think about the
6 frequency range and if the capability's there or not,
7 and what's was really the concern. But we did not get
8 too many comment from the stakeholder about the range
9 of the frequency. Most of their concern was with the
10 ROCOF and the legacy equipment where it may not able to
11 ROCOF value.

12 MR. MAJUMDER: Yeah.

13 MR. PATTABIRAMAN: Hi. Dinish Pattabiraman from
14 TMEIC, you know, equipment manufacturer. So I have a
15 question broadly on the standard in terms of why the
16 deviations in the standard compared to IEEE 2800
17 language, which has been widely accepted in the
18 industry with the high balloting rate. And there's
19 also about to be a test procedures, IEEE 2800.2 that's
20 going to come for the standard. Why deviate from the
21 language of IEEE 2800, which is widely accepted in PRC-
22 029?

1 MR. AL-HADIDI: We did not -- our intent was not
2 to diverge or to follow IEEE 2800. We started there,
3 but there was a lot of requirement there, and some of
4 it actually to be hard to write it, or maybe to
5 moderate, or make it as part of the compliance itself.
6 So based on that, we looked at the variety of the need
7 for the system and from reliability perspective, that
8 was the intent. And wherever we found the reason to
9 divert from it, we did. And it was also, as you know,
10 it was FERC order, was also constrained in the way we
11 looked at some of the requirements.

12 MR. PATTABIRAMAN: So but in terms of compliance,
13 you know, 2800.2 also offers a variety of test
14 procedures. I'm not sure if there's going to be a test
15 procedure that comes for PRC-029, but the strength of
16 2800 is that it offers these kind of test procedures
17 which different people can study and comply -- and at
18 least study compliance with, whereas deviating from
19 2800 language -- for example, there is a language for
20 phase jump that says that, you know, 25 degrees but
21 initiated by a non-fault, you know, that kind of
22 language was not there in 2800. There are small

1 changes like this throughout the standard, including
2 the frequency Ride-through requirements. So I'm just
3 curious on what the thoughts of the Standard Drafting
4 Committee are on that.

5 MR. AL-HADIDI: As I stated that, yes, there is
6 some slightly different, but I'm also part of the -- of
7 IEEE standard, and it's not -- it's not the perfect
8 standard. And all it mean that there is always need to
9 change, and there was opportunity for us to look at
10 from a bit perspective like the frequency, why it's
11 there. And when we asked the question even why this
12 value was selected was not enough, always a good answer
13 from people who were involved in IEEE standard at that
14 stage.

15 So it's based on the -- your experience, and this
16 is the task of the dd task of the Drafting Team to come
17 and consulted with the industrial and the feedback we
18 got, and based on that, we moved in this direction.
19 Thank you.

20 MR. PATTABIRAMAN: Thank you.

21 MR. WANG: Yeah. For this one, I think two parts
22 I address. Yeah. For the 29th standard, right? I

1 believe most of the -- especially for the voltage part,
2 pretty much align with the IEEE 2800 standard, yeah. I
3 think for frequency part, yes, actually there's some
4 division, right? So for this issue, I think even for
5 this -- even within the Standard Draft Team, that's the
6 ideal -- the approach we adopt so far.

7 For this Technical Conference, one of the main
8 purpose for that -- for this conference is, like, we
9 discuss the frequency part, right? I think for that
10 part, actually, we have that dedicated topic to discuss
11 that one, yeah. If the OEM even for the for BES or
12 even for wind manufacturer, right, if has any not issue
13 or concerns with that -- with that standard or the
14 requirement, yes, we -- the Standard Drafting Team
15 really want to hear the voice, yeah. That's the one --
16 the main for this one.

17 For the second one, for the -- for the testing
18 procedure, right? I know the IEEE standard, the 2800.2
19 is working on that testing procedure. I think it is
20 still ongoing efforts, right? The Standard Drafting
21 Team has very closely participate that -- the working
22 groups. Actually, we just adopt that approach maybe in

1 the future for the -- for NERC standard, right, for 29
2 or even the future, the revisions, yeah, for sure we
3 can adopt that approach in the future. But at this
4 point, I think even for the IEEE 2800.2 is still
5 ongoing efforts, yeah. So that -- I think I just want
6 to bring the attention to the team, yeah.

7 MS. CASUSCELLI: So we've got a number of
8 questions online. I'm just going to interject here.
9 Could you share the evidence or data that NERC has
10 indicating that the bulk power system might experience
11 frequencies up to plus or minus 4 hertz per six
12 seconds?

13 MR. AL-HADIDI: Even we don't -- we cannot present
14 information for even the current -- whatever their IEEE
15 standard, which is the 57 hertz. So the evidence, you
16 don't have an event because once event or under -- or
17 once event is very rare event. When it -- when it
18 happen, you need to have a system, really, which can be
19 very robust and very reliable to deal with it because
20 when it happen, there's a blackout. There is really a
21 big system event to start with. So really, likely the
22 -- where we are right now in the system, based on where

1 we are and hopefully -- and that's where -- that's
2 where our standard is moving, at least hopefully, to
3 prevent us from being to that stage. So no event --
4 there is no event happen to support even any frequency,
5 even 57 hertz, which is there in IEEE standard. It was
6 -- we cannot -- we have no event to support that in
7 overall system. Thank you.

8 MS. JONES: Hello. Rhonda Jones from Invenergy,
9 and just building upon then some -- like, when you look
10 at the 10 system disturbance events that were used in
11 the analysis, it never came below 59. So just curious
12 when the widened bands were established to also -- they
13 considered current-day needs and a little bit of
14 projection or forecasting for future needs. One of the
15 things that I'm trying to work to reconcile is,
16 currently, right now, the interconnection dynamics were
17 considerations when you set -- when the bands were set
18 in the past. And I'm curious how those unique dynamics
19 were considered now just having one big band that
20 covers everything versus consideration for tailoring
21 the bands based on the interconnection dynamics.

22 MR. AL-HADIDI: Let me see if what -- if I

1 understand your question about the reaction of the IBR
2 or to -- how to recover from the frequency itself, and
3 that's why the six second was giving the IBR time to
4 respond to the frequency and try to -- because it has
5 some time response. And in our standard, we did not
6 come with a performance requirement, so it could be
7 performed within four second, five second. It's much
8 faster than synchronous machine to respond to the
9 frequency event, so hopefully that in the future will
10 be able to recover the frequency much faster. That's
11 why we thought the six second itself is the time where
12 it give enough time for the IBR technology to inject or
13 remove power from the system to respond to the
14 frequency event itself. I'm not sure if I got your
15 question. Sorry if I did not get it.

16 MS. JONES: That was part of it, but I think the
17 biggest thing I'm trying to understand is that the mix
18 of generation in a specific interconnection does impact
19 inertia and frequency performance.

20 MR. AL-HADIDI: Yeah.

21 MS. JONES: So I'm just wondering consideration
22 for bands that are more accustomed to the dynamics of

1 an interconnect versus just a broad, no matter where
2 you are, this is what you need to do because there is
3 some benefits to having it tailored in that way. You
4 know, when you look at the events in the East versus
5 the Western interconnect, the evidence is very distinct
6 on where the concentration of some of those misses
7 were, which are primarily contributed to settings,
8 which is human error versus not being able to perform
9 enough. Was just kind of curious about maybe tailoring
10 the curves more to interconnection dynamics and
11 generation mix as opposed to just a one-size-fits-all.

12 MR. AL-HADIDI: That could be an approach we could
13 -- we could use. Actually, there's nothing wrong with
14 that. It's the only thing which -- in my opinion, it's
15 still -- there is a lot of unknown, and we know that
16 systems going to change, and the way it change is going
17 to be more and more sensitive to the frequency event.
18 Load itself is significant. It's going to -- we have
19 too much IBR load technology, which is going to come
20 in, and some of these one actually the trip themselves or
21 remove themselves at certain voltage. If you start
22 removing significant amount of load on and off, that

1 will generate fundamentally very significant frequency
2 change.

3 So really just to be careful where -- we thought
4 we are -- a second part of discussion where the
5 industrial is heading. Is it something which we -- if
6 there is no actual limitation, what's the harm of
7 getting there? There is -- if the cost is reasonable
8 and it meets some reliability in the future and even
9 some into the system, we thought there is maybe no
10 harm. But if that's not case, we'll see how the thing
11 goes with input from the OEM about if there's a concern
12 or not. Thank you.

13 MS. CASUSCELLI: Thank you. One more question
14 from online here. Can you discuss the data requirement
15 in the measures?

16 MR. AL-HADIDI: Sorry. We didn't get the
17 question.

18 MS. CASUSCELLI: Can you discuss the data
19 requirement in the measures?

20 MR. AL-HADIDI: Data requirement is already
21 established in the PRC-028, so PRC-028 established data
22 requirement for the measurement

1 MR. VENKITANARAYANAN: Morning. My name is Nath
2 Venkit, and I'm from GE Vernova, and my question is on
3 the -- on the requirement that inverter-based-resources
4 should not trip on instantaneous overvoltage, which I
5 completely agree with. But the concern is that
6 individual inverter-based resource units, based on the
7 language in PRC-029 -- I believe, it's footnote -- or,
8 you know, Note Number 10 in Attachment 1 -- should have
9 a filtering for one cycle before they trip.

10 Now, I was part of the Drafting Team for IEEE
11 2800, and this was discussed pretty extensively, that
12 standard. IBR-powered electronics do not have that
13 kind of long duration overvoltage capability. So the
14 compromise that was established in IEEE 2800 was that
15 the one cycle filtering requirement was applied for any
16 protection at the plant level that would -- that would
17 disconnect the entire plant. For example, if you had
18 an overvoltage relay, then you would need that kind of,
19 you know, filtering.

20 However, for IBR units themselves, the standard
21 did not just give them a blanket exemption. 2800
22 specified sub-cycle overvoltage Ride-through

1 requirements that individual IBR units had to
2 withstand, right? So it wasn't a requirement to wait
3 one cycle before you trip for any overvoltage, but a
4 more rational requirement for sub-cycle overvoltages.
5 For example, the IBR unit would need to Ride-through
6 and overvoltage of 1.8 per unit for one millisecond.
7 So that's one of the requirements in IEEE 2800.

8 So the way PRC-029 is written, I think we really
9 have only two choices, right? If you have a very large
10 overvoltage that is imposed on power electronics, then
11 you can let the inverter trip, protect itself
12 hopefully, and come back online within a few seconds or
13 a few minutes, or if you don't allow it to trip, then
14 the choice is the inverter gets damaged, then trips and
15 will take several months or years before it can come
16 back online. So I would -- my question is, why is the
17 requirement not more specifically calling out sub-cycle
18 overvoltages for individual units to withstand?

19 MR. AL-HADIDI: We were there first. We have --
20 it used to be in this Draft Number 1. I believe it was
21 R4, we're dealing with the transient overvoltage.
22 However, we were -- basically even -- whatever we see

1 right now in IEEE standard, they are having very
2 difficulties would -- come with some mechanism how even
3 to do the measurement and calculation for this
4 transient overvoltage, and we felt that the industrial
5 is not in the stage where it could have that -- the
6 work based the PRC-028 and how the mechanism, how to
7 calculate it. And it's -- we thought it could be very
8 difficult to come with way to try to be measuring the
9 compliance of that event.

10 The question will come, why the system -- why the
11 IBR is going to see 1.8-per-unit voltage? Is it
12 because of the switching within the IBR itself with
13 some things a design issue, or is it from the system
14 event? If it's from the system event, I don't believe
15 there's any system event. The voltage can go
16 transiently to 1.8 without impacting -- overall, you'd
17 be -- you'd be with the filtering time of even one
18 second one cycle, most likely that will lead to your
19 voltage to be fundamentally above 1.2, and we could
20 trip for the overvoltage.

21 We had a struggle on the technology itself, how to
22 do the measurement, and that's why we feel there is the

1 best way, try to move away from this requirement,
2 become very specific, become challenging to meet the
3 compliance part of it. And that's why we moved away
4 and to remove it. And we compensated with a filtering
5 to ensure that if it's a protection -- transient
6 overprotection, then you have to protect it in this
7 way. But if it was internal issue, you have the
8 arrestors. You have different mechanism to deal with
9 it, able to deal with the overvoltage during -- as a
10 result of a switching within the IBR facility itself,
11 so, and that's part of your design. As a design,
12 that's part of it, but we were mainly concerned about
13 the system event, and we did not see a way where we can
14 capture system event for that reason.

15 MR. WANG: Yeah. I just want to add some
16 background on the -- on that requirement, yeah. So in
17 the IEEE 2800, right, that's the -- that transit
18 overvoltage specify at unit level. That's the --
19 that's the -- I think that's the requirement.

20 MR. VENKITANARAYANAN: It is at the --

21 MR. WANG: Yes. For PRC-029, we didn't talk about
22 the unit level. We just look at the POI, right, or POI

1 in -- along with the IEEE 2800. Another issue, we --
2 the Standard Drafting Team deal with this. For the --
3 actually even the IEEE 2800.2, Subgroup 2 and 3, we had
4 very, very lengthy discussions, yeah. If we supply
5 that at POI, right? So let's do POI, the high set of
6 transformer. Even the -- even the high set of
7 transformer endurance, the experience of that high
8 voltage, right, transient overvoltage, based upon the
9 BOP of the plant, it's very complex. The issue
10 actually to reflect back to the terminal, yeah, right?

11 That's the reason why we -- the Standard Drafting
12 Team facing in the -- for the challenges, right? Even
13 if we apply the highest -- high set of transformers
14 that, say, like 1.8 per unit high voltage, it's very
15 hard to identify what high voltage experience in a
16 terminal. That's one -- another reason we remove that
17 requirement to the Note 10 now, just based upon the
18 previous event analysis, right? We just avoid, say,
19 like, the -- just like (inaudible) suggest one, two
20 points, yeah, just trip off the units. That's the --
21 that's the base -- the rationale at this point, yeah.

22 MR. VENKITANARAYANAN: Right. I understand, but I

1 hope you understand there are only two choices. One is
2 the IBR trips to protect itself and comes back online
3 within a few minutes or seconds, or it gets damaged and
4 still trips and is not able to come back online for
5 several months or years. So with that, I'll end my
6 question. Thank you.

7 MR. AL-HADIDI: The standard didn't go that far,
8 and as I said, we don't have any measurement on the
9 unit itself. Our requirement from PRC-028 is only at
10 the high side of the transformer, so there is no
11 mechanism to come with any compliance requirements for
12 it. That's the reason we're -- where we are right now.

13 MS. CASUSCELLI: All right. So I need to issue a
14 two-minute warning here, so I apologize to those in the
15 room who can't ask their questions. So I'm going to
16 ask one from online here. What measures did the
17 Drafting Team take to ensure that IBR owners do not
18 bear a disproportionate responsibility for system
19 frequency response?

20 MR. AL-HADIDI: You have to Ride-through it. I'm
21 going to say they have to Ride-through it. They need
22 to Ride-through it. So it always need responses, same

1 event, and their equipment needs to stay online, and
2 the standard is not requiring them, as written right
3 now at least, to provide a frequency support or any
4 performance. So no performance compliance is just to
5 maintain -- connect to the system and Ride-through the
6 event itself.

7 MR. HAKE: Hi. Sam Hake with a AES Clean Energy.
8 We're a renewable energy developer, and I'll try and
9 keep this quicker. It's a little bit less of a
10 technical question. So I wanted to focus on the
11 language in R4 that talks about hardware-based
12 limitations. We have some concerns that we have legacy
13 sites that may have -- we may need exceptions based
14 more on modeling information, either availability or
15 quality of the models, in order to demonstrate and
16 determine if sites can be compliant. So the question
17 is, why is there that focus on hardware-based
18 limitations in R4 that seems to exclude some, what we
19 believe, valid software limitations?

20 MR. AL-HADIDI: It's for modeling or for the
21 voltage, Ride-through, you mean to say, because this
22 standard, it doesn't deal with modeling. Maybe I

1 misunderstood your question or maybe I --

2 MR. HAKE: So the language in R4 talks about
3 exceptions for voltage Ride-through --

4 MR. AL-HADIDI: Yes.

5 MR. HAKE: -- based on hardware --

6 MR. AL-HADIDI: Hardware limitation. Yes, you're
7 right.

8 MR. HAKE: Yeah. So my question is why hardware
9 limitations only?

10 MR. AL-HADIDI: Okay. That also came from the
11 FERC order. FERC order stated very clearly that any
12 voltage exemption need to be based on the hardware
13 equipment, not the software. So we tried to -- when we
14 are constrained with some language, so we -- and we
15 understood some -- and you're right. Some software
16 could be very challenging to deal with, but we
17 understood by "software," if something could be dealt
18 with, if it's not really something which you couldn't
19 update different or upgrade your software, it become
20 really hardware limitation at that case.

21 So we left it open, what do you -- what you guys
22 can come with the hardware limitation. In my opinion,

1 if you cannot do anything about your software because
2 it's become hardware limitation where the version of it
3 or the -- is not enough or it's not in capability to
4 upgrade, it could become a hardware limitation, but
5 this is my interpretation. It's not NERC or FERC.
6 That's my opinion. Thank you.

7 MR. HAKE: Right. I appreciate that, and I think
8 that's exactly the concern, right, is that it's open to
9 interpretation.

10 MR. AL-HADIDI: Yes, you're absolutely right.

11 MR. HAKE: Thank you.

12 MR. BENNETT: All right. Thank you, everybody,
13 for the wonderful questions, both in the room and
14 online, but I think it's time -- we need to transition
15 to our next presentation here, but before we do, let's
16 -- our two friends here in the hot seat from the --
17 from the Drafting Team, why don't we just give them a
18 round of applause real quick? They've done a great
19 job.

20 (Applause.)

21 MR. BENNETT: So as they exit the stage, let me
22 just tee this up for Alex. Our next presentation is a

1 very similar subject, another review of voltage and
2 frequency Ride-through criteria. So to walk us through
3 this, this is Alex Shattuck from NERC, and yes, I did
4 pronounce his last name correctly. So, Alex, please
5 help us out with this. Do you need a microphone?

6 (Brief pause.)

7 MR. SHATTUCK: Thank you very much. My plan today
8 was to present a bunch of objective facts. It seems
9 like a bunch of y'all did your homework, and a lot of
10 what I'm presenting, we've talked about through the
11 questions and that kind of thing. So the goal here is
12 to just present some information and some data and some
13 observations without giving any opinions. If I give an
14 opinion by accident, sorry. It's mine only.

15 I will read one recommendation. So I'm not going
16 to give a recommendation, but I'll read a
17 recommendation we've given to tell the story. So I'm
18 going to try to tell a little story here. I was told
19 to keep this high level. We might beep into the weeds
20 a little bit. It's a Technical Conference after all.
21 So with that, let's just start with the first slide.

22 I figured since we're getting it started here,

1 something to look at would be fun. So we're going to
2 start with why do we need Ride-through. Just to tell
3 the story quickly, the GIFs here are from Texas A&M's
4 kind of synthetic grid system. They do heat maps for
5 voltage and frequency Ride-through. They present them
6 with their kind of synthetic grid that they use at
7 their facility or at their university. So this is just
8 to kind of show, when there is a disturbance when
9 something happens, it propagates around. If you look
10 at the heat maps for frequency, it's not just one
11 disturbance. It's moving all around, and it's really
12 -- you can see the differences in what's happening,
13 what deviations are happening based on location, based
14 on the system they're at.

15 And this is just kind of the world we live with,
16 right? Unexpected events, they happen. They're going
17 to happen. They're going to continue to happen. Our
18 job as an industry is to make sure that when they
19 happen, we are -- we've done our homework, right?
20 We've done it, we've done our planning, we've done our
21 interconnection studies, we've done our modeling
22 correctly.

1 Not every unexpected event is a major disturbance.
2 You know, someone hitting a telephone pole -- or sorry
3 -- utility pole and dropping a transformer is not going
4 to cause a massive frequency deviation, but something
5 like a -- an DESO-1 or DESO-2, we've seen, or a Uri,
6 right? We've seen unexpected events cause significant
7 deviations to the point that we have literal processes
8 for tracking these things and reading these things and,
9 again, reports out our disturbance reports.

10 So what do we do? We have to make sure that we
11 reduce risk by making effective and efficient criteria.
12 Efficient is kind of the -- I took this from our little
13 circle. Efficient is the key thing here, right? We
14 could probably make a system that is perfectly
15 reliable, but that's going to be a tank when we might
16 need a Toyota Camry, right? We can -- you know,
17 there's always that kind of how much can you do with
18 something that's reasonable or something that's
19 efficient, and how do you hit your reliability with a
20 certain level of risk averseness, which probably isn't
21 a word, while still making sure that we're not making
22 everyone pay thousands of dollars a month for their

1 power bill.

2 So next slide, please, Levetra.

3 We'll start with just -- or I guess we'll continue
4 with talking about what we've seen so far. Right now
5 we have 10 published major disturbance reports since
6 2016. That's about 15,000 megawatts, and the last four
7 years have been about 10,000 of those megawatts, so --
8 and about twice as many events. So if you look at two
9 windows of time, we've doubled both size, total size,
10 and we've doubled the frequency of these events, which
11 means they're probably -- they're linked a little bit.
12 The observations point to the fact that they're linked
13 to penetration of IBR, right? If you look at the
14 little graph on the bottom left, you can see the
15 events, right? They're happening in areas that right
16 now have some of the highest penetration of IBR. Major
17 disturbances, those reports, those are -- those 10
18 reports are IBR related. There's been a few more of
19 those since those last ones are out. We're in the RFI
20 kind of data collection stage for those.

21 But that's not the whole story, right? There's
22 also different technology. So the major events so far

1 that we've given major event reports for have been
2 solar PV and BES. That's not to say that they're the
3 only folks that have problems, right? Most IBR
4 technology's relatively similar outside of the hardware
5 piece, right? There's software based, software driven,
6 a lot of if I do something wrong parameterizing a PV, I
7 probably make that same mistake, parameterizing a wind
8 turbine in the software parameter sense, and we do have
9 some data to back that up. NERC is working with Texas
10 RE and ERCOT to make a wind report that shows and links
11 to the causes of reduction of those previous
12 disturbances. So that's to say that just because there
13 hasn't been a major disturbance that was a wind -- I
14 guess there was a panhandle disturbance, but there --
15 other than that, there haven't been that many wind-
16 related disturbances.

17 It's not to say that the wind has no risk
18 associated with it. Just preliminary, kind of off the
19 top of my head numbers for that, it was something about
20 80 percent of the multiple thousands of megawatts
21 unexpectedly tripping off wind in Texas, about 80
22 percent of those or 90 percent of those were for the

1 exact same reasons that we presented in all of the
2 solar PV and BES reports. So why are they not showing
3 up? Well, they're kind of, you know, it could be at
4 night, right? The faults happen during the day. Maybe
5 wind isn't operating at full capacity like PV is. If I
6 have a hundred-megawatt PV plant and a hundred-megawatt
7 wind plant in the middle of the day, the wind plant's
8 probably half-ish and the PV plant's at max.

9 So the same disturbance trips both of those off,
10 same size plant, but the event for the PV is twice as
11 big, right, because it's actually operating at max. So
12 outside of those, we also have Winter Storms Uri and
13 Elliot as far as, like, firm data we can pull from, and
14 just those are the Uri and Elliot on the right side
15 here. So if you go to the next slide, please.

16 All right. We'll orient ourselves with what I
17 realized -- it's actually pretty clear. So we'll
18 orient ourselves with what is out there right now, so,
19 and what we're discussing today. So kind of I linked
20 it to PRC-024, PRC-029, the draft criteria right now,
21 and IEEE 2800, and they're all in the same graph here,
22 and it's kind of a mess, right? Part of the mess is --

1 someone brought it up -- PRC-024 four has regional
2 variances for -- different requirements for different
3 areas, right? If you look at, you know, the draft PRC-
4 029 and, you know Quebec's PRC-024 curve, they're
5 pretty similar, but again, that's for a specific system
6 with specific needs.

7 And also the mess of this, it's confusing, right?
8 It's hard to look at that -- you know, if I'm -- if I'm
9 interconnecting a facility, and I want to do it across
10 the United States, and I want to be a developer, it's
11 kind of confusing to know, you know, exactly where to
12 find each criteria, exactly how to do each plant in
13 each area and how we talk to each other. Reviewing the
14 alert data, what we saw a lot of in ERCOT specifically
15 was ERCOT machines have Western interconnection
16 parameters, right, because they're similar developers,
17 and they just put them on that one, right, because
18 they're not the same. Unifying them can help, but
19 there will always very likely need to be some sort of,
20 you know, small variance or something to make sure that
21 everything's reliable for everybody. There likely
22 isn't any one-size-fits-all anything for everybody, but

1 if you have a good starting point, we can adapt that to
2 what we need for reliability. And what I did to kind
3 of help with the rest of the slides and the
4 comparison --

5 If you go to the next slide, Levetra --

6 I realize that's a typo. I wrote "most
7 stringent," but it's least stringent. I took the
8 inside of every curve to basically say if you were
9 following the minimum or the least stringent PRC-024,
10 that's what we're comparing the rest to. And when we
11 talk about the events coming up, that's what we'll use
12 to kind of use for a barometer. And it's much easier
13 to look at these three curves versus, I think it was
14 like nine on the last one.

15 So when you look at this kind of comparison,
16 you'll see that -- a couple observations, right? Draft
17 PRC-029 and IEEE 2800, they share the same continuous
18 operation bands, so both of those standards are saying
19 that for these bands of frequency, continuous operated.
20 So that's an alignment that's good for the rest of the
21 discussion after reading all the comments that we've
22 gotten, but they deviate pretty significantly kind of

1 specifically at the maximums in the short timeline.

2 So, I mean, if you look at kind of farther out in
3 the 200-302nd range, we're not that far off. They're
4 pretty well aligned. It's just this kind of first six
5 seconds where we see the massive deviations both from
6 2800 and from the original PRC-024.

7 So if you go to the next slide, please, we can
8 compare that to our major events.

9 So y'all stole my thunder a little bit here by
10 doing your due diligence, which is great, but none of
11 the major events -- none of the 10 major events we've
12 released reports on were outside even the continuous
13 operation bands. And if you look at the little -- the
14 very small, very skinny yellow rectangle, that is the
15 worst frequency deviation and time out of all of the
16 events, and that's Blue Cut in 2016. And you can see
17 that's well, well within both PRC-024, within the
18 continuous operation bands, and it's well within both
19 PRC 2800 -- or sorry -- IEEE 2800 and the draft PRC-
20 029.

21 So this kind of shows us that for those types of
22 events -- you know, keep in mind that these disturbance

1 events happen somewhere around like system normal,
2 right? So we might not see -- you know, we're not
3 expecting to see a massive crazy change here. The
4 system's about normal when these are happening. So
5 what we get, because operators are doing their jobs
6 well, because we have things to do and procedures to
7 mitigate when these events happen, the deviations
8 aren't that bad, at least from what we've observed.
9 Things will change as we change penetration, but we'll
10 have to assess the risks and how we get there and how
11 we can kind of guess or study or estimate what they
12 will need in the future. So this was system normal,
13 major events. Again, this was the worst case. Very
14 many of them were, you know, in the order of 10 to 30
15 seconds or something like that, so about the same
16 rectangle shape but much, much smaller on the graph.

17 So all I have to say is that when we observe our
18 major disturbances, we've got a little bit of leeway
19 with everything proposed so far. So we're not like
20 right up against anything at the moment, but all
21 solutions seem to be viable as far as riding through
22 the major event reports.

1 So if you go to something on the next slide, which
2 is, you know, not system normal.

3 This Uri and Elliot. They're bigger, right? The
4 rectangles are bigger. Elliot was, again, about the
5 same-ish as the major disturbance reports. So the Blue
6 Cut graph very skinny, not a very large deviation,
7 somewhat long-ish. But the interesting thing is Uri,
8 right?

9 So Uri, if you notice, it kind of kisses the
10 purple curve there, and that corner of the purple curve
11 is actually ERCOT's frequency Ride-through, so we were
12 very close. I'd say folks are starting to put
13 protection things directly on the curve, like we
14 observed quite a bit of in the alert data. We were
15 very, very, very close to seeing additional tripping
16 because of frequency protection on the criteria, so,
17 and if that would've happened, that would be the first
18 time we've observed it.

19 The last slide -- you don't have to go back --
20 what the last slide said -- I said nearly all
21 frequency-related tripping was due to mis-operate --
22 not mis-operations, but incorrectly set parameters,

1 instantaneous measurements. None of those -- I wrote
2 "nearly" on the slide to cover it, but none of those
3 were based on criteria. You can see on the last graph,
4 too, that they weren't anywhere close to the criteria.

5 So at this point in the past, right, the bounds,
6 we haven't gotten close to the bounds of any of things
7 that we're proposing now, except for 2024 in Uri, and
8 Uri was a massive, massive event, right? So maybe
9 we're at a point now with this data that, you know, we
10 might know that we might need to improve upon PRC-024.
11 What we do to improve on 24 comes from all the input
12 we're going to get from our panelists, the OEMs and
13 their capabilities from the system folks in what they
14 want or need or desire, and what kind of information we
15 need to show that, hey, I can't do this and I'm going
16 to prove it to you or not, or what's sufficient proof,
17 or how do we study things moving forward.

18 So all of this can hopefully -- I'm trying not to
19 get into too many details. I want the panelists to
20 tell us all the things from their mouths, different,
21 from them. So this is just to show that if we look at
22 our data, it's not a ticking time bomb. It's maybe a

1 time bomb in construction, right? It's a -- it's not
2 an immediate tomorrow problem, but it's maybe a
3 something we should focus on moving forward. But
4 again, both things we're proposing, or, you know, we're
5 talking about through all the comments, the main topics
6 we're talking about are 2800 and PRC-029. Both of
7 those would have, you know, written through these
8 events.

9 So if you go to the next slide, please.

10 Just to summarize, none of the events we analyzed
11 were outside of the continuous operation bands. And
12 the next bullet is something a little bit interesting,
13 is that because of that, we have no benchmark event,
14 right? When we did the GMD standard, they had -- you
15 know, they say you make benchmark events. So think of
16 an event or look at a past solar or flare event and see
17 what's happened and use it as a basis for, you know,
18 setting up your parameters. So we don't have a
19 benchmark event, right? We've had disturbances. None
20 of them are saying what you have right now is
21 insufficient. So we don't have anything to base that
22 on.

1 So, you know, say we had an event that was exactly
2 the PRC-029 proposed curve, then that's great, right?
3 We say, hey, we saw an event. We witnessed this event.
4 Our bounds need to be outside of this event. So we all
5 say online, well, the operators do their jobs and fix
6 the system. We don't have that. We've also seen --
7 so with that, there's kind of three ways, right? It's
8 a benchmark event, it's doing detailed studies into the
9 future, or it's saying that give us the best you can do
10 until we either hopefully never get a benchmark event
11 or improve our study practices and data practices to
12 have some meaningful forward-looking studies.

13 So looking at the data we're receiving in our
14 Level 2 alerts, both modeling and IBR performance, and
15 kind of the fact that none of the 15,000 megawatts that
16 tripped offline were predicted in the model space, I
17 don't know at the current moment if the industry's
18 ready to say, hey, here's a study I'm going to hang my
19 hat on that says here is the level of frequency Ride-
20 through I can get my system to do and use it as a
21 benchmark event, right? We need to improve our
22 modeling, improve our studies, improve our

1 parameterization, and then maybe we can trust that for
2 something as important as setting these things.

3 So what you can do now is you have kind of two
4 things. Either set your protection settings as wide as
5 possible and show us that with data and not, like --
6 you know, show us that literally if you exceed this,
7 you'll burn, right, or come offline or damage
8 something, or come up somehow with some criteria that
9 happens to be able to be accomplished by everybody,
10 right? So at this point, those are the branching paths
11 we take as far as, like, putting some data-driven
12 decisions there, right? It's maximize --

13 And if you go to the next slide, please.

14 Maximize your settings or use those and feedback
15 and that kind of stuff, just come up with bounds that
16 are reasonable for everybody. Maybe some will be able
17 to meet them, but if we have criteria where the number
18 of folks who can't meet them is a number that we're
19 happy with -- or not maybe happy with, but okay with,
20 you know, operating the grid width, then we're moving
21 the industry forward, right?

22 So this is a recommendation from our Level 2 alert

1 on IBR performance issues, and I'll read this and then
2 I'll tell you where it came from. And so, basically,
3 what we're saying is expand your voltage protection
4 setting as widely as possible and minimize AC
5 instantaneous voltage dripping. So the instantaneous
6 pieces of both of those bullets, there's language in
7 the standard addressing those things. But again,
8 frequency and voltage protection should be based on the
9 equipment capability. We've been saying this in the
10 alert. The reason why it's in the alert is that this
11 is actually a recommendation that was in Blue Cut, the
12 very first disturbance report. It's been a
13 recommendation to expand as much as you can since the
14 first event.

15 So it's very important to maximize your
16 capabilities as you can because, otherwise, you know,
17 you're leaving things on the table, right? It doesn't
18 make any sense to, you know, have a certain frequency
19 Ride-through or voltage Ride-through ability and then
20 set your parameters, you know, 30 percent inside that
21 curve, right? You're not helping anybody on the system
22 for that. So that's why this recommendation is here.

1 This is the recommendation I was reading. It's
2 published, so it's not my opinion, and, again, repeated
3 in basically every disturbance report and the alerts.
4 And it's not in the modeling alert, but it's been
5 repeated, and it's kind of what we're saying is a good
6 path moving forward.

7 So next slide, please.

8 So what do we do, right? You got to balance,
9 right? There's balance between what the system needs
10 to be safe and what you can do with the things that are
11 out there on the system, right? If we combine those
12 two into a -- the Venn diagram I made, hopefully, if
13 you use technical capabilities to inform what you can
14 do to meet bulk power system needs, then you get
15 effective and efficient criteria, right? If the bulk
16 power system says I need 80 hertz per 10 seconds, and
17 the IBR says I can only do 75 hertz per 10 seconds --
18 I'm picking random numbers to not get close to anything
19 we're talking about -- then you got a problem, right?
20 And then you would ask, hey, how many of you folks
21 can't meet this, and you get a number, and if that's
22 the whole system, maybe that's not a good criteria. If

1 it's 10 percent, maybe you can live with that, right?

2 So when we talk about bulk power system needs,
3 what are they, right? Ride through things so that you
4 can fix it, right? Stay online while the operators do
5 their jobs and restore the system, and be effective and
6 efficient when we're reducing risks. So that's all the
7 things in 901 data, modeling studies, all that kind of
8 stuff. Those are the bulk power system needs, very
9 high level and in two bullets only, and then you have
10 to compare those things to how do you get that, right?
11 If I have a new criteria and I see you must meet this,
12 how soon can you put something on my system that meets
13 it, right?

14 That's something that OEMs will talk about, I'm
15 sure, is the development cycle for products, right?
16 Usually requirements inform design of IBR, right? We
17 used to ask for requirements all the time when I was at
18 the OEM, you know, please tell me what you want so I
19 can build it and give it to you. The problem is that
20 takes a while, right? And nd if you keep changing
21 things, right, if we -- if every other year we have a
22 new kind of proposed thing, then it gets kind of hard,

1 right, to make sure we're designing things. And if you
2 keep resetting the cycle every couple years, we're just
3 kind of, you know, we're wasting money, you know, IBRs
4 become more expensive, power becomes more expensive,
5 and it's just kind of a big technical thing the OEMs
6 will really probably correct me on and expand upon.

7 Next, we also have hardware limitations at legacy
8 IBRs. We're going to hear all about that, I'm sure,
9 from all the panelists. The fact of the matter is,
10 some of it -- some of the IBRs won't be able to Ride-
11 through any criteria, right? There are IBR out there
12 on the system now that don't meet PRC-024. There are
13 IBRs that don't meet PRC-028 -- or sorry -- PRC-029.
14 There are IBR out there that don't meet IEEE 2800. So
15 whenever you have a requirement, if you look backwards,
16 there's always going to be some level of equipment that
17 can't meet it, and what do you do about that is kind of
18 the answers -- is one of the answers we're hoping to
19 get from the folks who are talking here.

20 And the last bullet here is that you kind of get
21 some diminishing returns, the capability extremes, and
22 I kind of referenced it a little bit earlier, is if,

1 you know, say we're all buying a car. The speed limit
2 is 50. All the cars I can buy go 50, right? But then
3 someone says, well, you have to have a car that can go
4 a hundred miles an hour. I'm not going to buy a car
5 that can go a hundred miles an hour if the speed limit
6 is 50, right? So the products are going to be designed
7 towards what about their requirements are, and if you
8 really expand those to the bounds of equipment
9 limitations, you know, it might be very expensive to
10 get that last extra hertz, right, or extra hertz of
11 criteria, an extra couple seconds of time.

12 So really, that goes back to the effective and
13 efficient and reasonableness thing, right, is probably
14 if we set some parameters very wide, in a few years
15 after the development cycle, people could meet it, but
16 what does that mean? Is that, like, a \$10 million wind
17 turbine now because, you know, it costs \$2 million to
18 get it to 63 hertz, but, you know, 68 might be some
19 crazy amount of engineering or design and all that
20 extra work. So the balance here is very important, and
21 it starts with the needs. Basically, it starts with
22 the needs, and then you have to balance it with what

1 can I do and what can I do for some reasonable amount
2 of, you know, effort, resources, that kind of thing.

3 Next slide, please.

4 So for new equipment, so I'm going to talk about
5 new equipment, and then we'll go back to legacy stuff.

6 So for new equipment, criteria need to be reasonable
7 when compared to current and future capabilities. So
8 if everybody's designed for one thing right now and we
9 go 10X that, it might not be reasonable, right? If
10 everything's been designed for something, when we
11 change that criteria to expand it, we have to make sure
12 that it's at a level of expansion that keeps the grid
13 safe while also making sure that we're not putting --
14 we're not going to make things cost an extremely large
15 amount of money, right, because we're trying to meet
16 these future capabilities and that kind of stuff.

17 So if criteria are outside of equipment
18 capabilities, like we're -- we know we've gotten some
19 comments about from our written comment submittal, we
20 need lead time, or the industry needs lead time, right?
21 It takes time to build a new inverter. It takes time
22 to do research and testing and all that type of stuff

1 to be able to build something that you can sell to
2 someone to install, and they'll still give me input,
3 but probably five-ish years, you know, a ballpark.

4 And again, testing time, right? So you design it
5 and you build it, and then you test it to make sure
6 that it can do these things. There's not that many
7 test systems in the world that can handle a, you know,
8 a giant wind turbine or a full-sized inverter. So
9 there's lines from major companies to test these
10 things, so that also adds into the lead time necessary,
11 right? You got to build it and you got to test it to
12 show proof that you can do it, right? We're asking for
13 proof of what you can do. You can't do that without
14 testing it and showing you Ride-through.

15 So the bottom bullet is in red, and we're leading
16 into the panel this afternoon, but input from
17 manufacturers is crucial, right? Those are the folks
18 who know what's in the box, right? They know what's in
19 the box, they know how you got to what's in the box,
20 and they know what's possible within the same box and
21 what it means to build a brand new box, right? So
22 their input is very crucial to kind of do the balancing

1 act that we need to do for the efficiency part of that
2 Venn diagram.

3 So next slide, please.

4 So for legacy equipment, we'll go very quick
5 through this because I want to leave some time for
6 questions, but there's a bunch of different things you
7 can do. So the easiest thing, software-based
8 protection change, or software tuning to make your
9 Ride-through a little bit better. For those folks who
10 had a 65-hertz capability and set their protection
11 setting at 63, software change, right? Put it to your
12 capability that's in your software. That is relatively
13 cheap and relatively easy to do. It could be free,
14 sometimes it might not be, but it's significantly
15 cheaper than hardware based.

16 So hardware based has kind of two buckets, right?
17 It could be small, hardware-based retrofits of
18 equipment, maybe a new transformer, maybe something --
19 you know, a new smaller piece of equipment that's going
20 to be more expensive than a software-based solution,
21 but it's definitely going to be cheaper than repowering
22 the whole plant, right? So that kind of nuance in the

1 timeline of resources necessary from left to right,
2 that's going to be very crucial to hear from OEMs,
3 right? What is a small hardware based? What are your
4 thoughts about doing that? Maybe the generator owners
5 could answer that. What are you comfortable with? You
6 know, at what point does a retrofit turn into a
7 repower, right, and at which point does that mean
8 you're not going to operate your facility anymore?
9 Those are the types of balance and things that we need
10 to hear from industry and from the OEMs to give us this
11 information so the Drafting Team can update the
12 language to make sense for all of us.

13 So again, I think this is the second of three
14 times I wrote that. Manufacturer input is very
15 critical, right? Diesel documentation, sharing the
16 documentation, having it ready for folks to read and
17 review, very important.

18 So next slide, please.

19 And this is my engineering slide. There's no
20 pictures, and it's four bullets and, you know, four
21 sub-bullets, five sub-bullets. Figured we'd want one
22 big text wall for us. So are exemptions necessary?

1 I'm going to really leave this up to everyone else to
2 talk about, and I would just keep it real high level.
3 So we all know some amount of IBR may not be able to
4 meet any of the proposed criteria or current criteria
5 because they were installed before current criteria was
6 made. Again, software-based upgrades could be a simple
7 path -- simpler path. Additional considerations that
8 are needed for software upgrades are not sufficient, so
9 if I can't just set it back to whatever, what else can
10 I do? How do we do it? We need to put for that.
11 That's very important.

12 But the third bullet here is that exemptions could
13 allow legacy equipment to remain connected while
14 maximizing capabilities, but then there's like a giant
15 burden of proof for that, right? It's going to take
16 more than someone saying, my manufacturer said they
17 can't, right, and they attested to this, right? That's
18 probably not sufficient as far as documentation, right?
19 We're looking for things like show us a curve that, you
20 know, shows you're going to damage something. Give us
21 documentation that your software-based protections
22 aren't sufficient, right? New software can't go into

1 old equipment maybe sometimes. Maybe it's firmware
2 limited. Maybe they're already set at their maximum
3 capability, right?

4 And then we need someone to be able to review
5 these to assess risk and to basically see if they're
6 true, right? If someone says, hey, I can't do that,
7 and they won't give you any documentation, then it's
8 hard for us to take that as, you know, a firm piece of
9 validated data to make a massive decision, like
10 changing Ride-through parameters for everybody. So
11 what we can say, and I think this is pretty not
12 contentious, is that, you know, blanket exemptions with
13 nothing, right, blanket exemptions for everybody who
14 asks for one is likely not as sufficient solution,
15 right? So exemptions, if we get there, if the input
16 leads us to that path, which they may or may not,
17 they're going to have to come with some data to back it
18 up.

19 So next slide, please

20 So we do have some data. The data is from the
21 Level 2 alert for IBR performance. Keep in mind this
22 was just solar PV and BES, and I realize that the

1 numbers are super small. So the first piece of the
2 data is that about 70 percent-ish of those folks who
3 gave us their frequency protection settings said that
4 they were not based at the maximum hardware capability.
5 So we have reported data that says about 70 percent of
6 the IBRs out there right now can do some sort of
7 software-based something. Is that software based
8 something big enough to meet PRC-029? The
9 manufacturers will tell us. So we do have some room to
10 make some adjustments.

11 What we also have is they gave us their protection
12 settings for their inverters, and I didn't want to
13 give, like, real megawatt values, but I put them in
14 percentages. So this pie chart is all of the settings
15 that were given to us where they said that they were at
16 their maximum capability, and I'm going to walk up here
17 and read it because I can't see.

18 So if you look at this thing, this is the -- all
19 of them are within maximum capabilities, and we start
20 with PRC-024, so this is the small blue chunk. Seven
21 percent of what's been reported to us is within PRC-
22 024, so current requirements, about seven percent are

1 reported inside that. The next biggest chunk, about 32
2 percent of those inverter settings are within 2800,
3 which means that, if the data is true, right, if the
4 data they gave us is right, and they're at their
5 maximum capabilities and that's what they're at, then
6 we got about 30 percent of what's out there right now
7 within 2800, which is somewhat actually in line with
8 the data we got back from some of the folks who
9 submitted that to us in writing with real numbers.

10 So the big chunk is things that are within PRC-
11 029, right? Sixty-one percent of the total maximum are
12 within PRC-029, and that makes sense, right? As you
13 make the curves wider, fewer and fewer equipment are
14 going to be able to meet it, right? So as you make
15 things wider, we'll have to -- we're going to have to
16 deal with a large number of potential hardware-based
17 solutions. And what that number is and where we land
18 in the spectrum of curves is going to be dependent on
19 what we can do, what we're happy with not meeting
20 criteria and what we do with those things.

21 So this is just to kind of quantify and to show
22 that it's very important to pick the right, you know,

1 criteria so that we don't end up with, you know, a
2 circle that says a hundred percent of equipment can't
3 meet it, right? We don't want that at all, but we got
4 to pick -- the onus is on us the Drafting Team and as
5 an industry to pick some criteria that we are happy
6 with the things meeting and happy with the things that
7 can't meet. And potentially, like we've discussed, you
8 know, documenting limitations and providing that as
9 evidence to be used for drafting decisions, right, and
10 that kind of stuff.

11 So next slide, please.

12 I'm going to go very quickly so we have some
13 questions time. So manufacturer challenges, they're
14 going to talk about it in a moment or after lunch. So
15 new IBR, what criteria to build for? How do you
16 procure test locations? Long lead times. And again,
17 at the extremes, right, the capabilities get really
18 expensive, right? The extremes of anything get really
19 expensive. For legacy equipment, hardware limitations,
20 software solutions might not be sufficient, and legacy
21 equipment was tested with applicable criteria in mind,
22 right? So there's actually a decent number of stuff

1 out there that we don't know what the -- we don't know
2 what it can do because it was tested for PRC-024 or
3 slightly more than PRC-024.

4 It's never been tested and it's likely that it's
5 never going to get tested, right? You're not going to,
6 you know, take down a wind turbine and drive it to
7 Europe or maybe been a boat or a plane, right, and put
8 it in a container and test it. So there's a lot of
9 unknown there as well, and coordinating and
10 implementing effective solutions is difficult,
11 obviously, right? We're having this conference. This
12 isn't -- has not been easy for any of us to kind of
13 agree on and get a solution ironed out, so it's
14 difficult for all of us.

15 Next slide, please.

16 So industry challenges: deciding which equipment
17 will be needed to meet new requirements, getting
18 evidence that equipment can or can't meet,
19 communicating technical details to everybody. How do
20 you do that, how do you post them, what are you
21 posting, and that's for new equipment. For old
22 equipment, how do you manage stuff that can't do it,

1 right? How feasible is the software solution? How
2 hard is it to get data? Apparently very hard. We
3 learned through our two Level 2 alerts, both of which
4 had the first ever extensions of deadline, it's hard to
5 get data. And we were asking for things we're talking
6 about today, protection settings, and we gave about 90
7 days, a hundred days for that, and we had difficulty
8 getting protection settings in that time.

9 We've extended the deadline again, so we feel
10 industry's pain. We know it's a thing. It's hard to
11 get data. The data's really specific and really
12 technical. If you ask the wrong question, you might
13 get data that looks good, but it's wrong, right? So
14 it's very difficult to communicate all of that forward
15 between all of us and to get to a solution where
16 probably no one's happy and then we'll know we did the
17 right thing.

18 So next slide, please.

19 So key takeaways, another big red bullet at the
20 bottom. I've said all this before, but
21 manufacturer/industry input, extremely important to
22 know what we can and can't do. We are recommending or

1 we have recommended for eight years now to maximize
2 your Ride-through capability. Documentation that's
3 validated and accurate is difficult to obtain but will
4 be critical moving forward.

5 Next slide. I think that's it. Great. And we
6 have eight minutes for questions, but it's my birthday,
7 Manish. Be nice.

8 (Laughter.)

9 MR. PATEL: Well, where is the party tonight then?

10 (Laughter.)

11 MR. SHATTUCK: We can talk later.

12 MR. PATEL: All right. So, Alex, great
13 presentation. So couple of thoughts. You know, you
14 compared PRC-024 with IEEE 2800. That is absolutely
15 right thing to do. And then another thing we can
16 actually do is actually compare PRC-006, which is under
17 frequency load shed standard, and it requires
18 transmission planner/planning coordinator to design in
19 the frequency load shed programs, such that frequency
20 does not go beyond certain thresholds, right? And as
21 far as the generator Ride-through capability is just
22 outside of those thresholds, we are good, unless --

1 there is a thought out there that, oh, wait a minute,
2 in future we are going to allow transmission
3 planner/planning coordinator to go beyond the
4 thresholds in PRC-006 right now, right? So this is --
5 this is another data point that, okay, if the
6 transmission planner and planning coordinator is never
7 going to allow frequency to go beyond certain
8 thresholds, then what's the point in requiring a Ride-
9 through from a generator, right? Okay.

10 So then you presented hurricane -- not hurricane
11 -- Winter Storm --

12 MR. SHATTUCK: Uri.

13 MR. PATEL: -- Uri, right?

14 MR. SHATTUCK: Mm-hmm.

15 MR. PATEL: So NERC's -- it's a good comparison.
16 I just wanted to point out that that is actually not
17 very appropriate because that event unfolded over many,
18 many, many minutes, right? I think, if I remember
19 right, 30 minutes or so.

20 MR. SHATTUCK: Mm-hmm.

21 MR. PATEL: And actually, NERC System Protection
22 Control Working Group ended up writing a white paper

1 saying, well, look, we cannot design PRC-024 or
2 PRC-006, which is automatic under frequency load shed
3 standard to something that happens over tens of
4 minutes. Those two standards, 006 and 024, are for
5 things happening in matter of seconds where operator
6 has no time to blink, right? So anyhow, that was good
7 comparison, but I think it's a little bit of apples and
8 oranges.

9 So anyhow, going back to we have to look forward
10 -- figure out a way -- for path forward, I think we
11 could take an approach that is taken in PRC-024 and 006
12 that, you know, for certain regions, the requirements
13 are a little bit more stringent than other regions,
14 right? So when we wrote IEEE 2800, those who don't
15 know, I was a vice chair. My middle name is 2800
16 nowadays. I get bad rap quite a bit.

17 (Laughter.)

18 MR. PATEL: And I'm also proud -- I'm also proud
19 sometimes saying that, you know, we didn't know what is
20 the right answer, so we flipped a coin five times and
21 decided which way to go. But so when we wrote IEEE
22 2800, what we did was, well, we don't want to write a

1 standard that is based on most stringent PRC-024,
2 right? We wrote a standard that met two largest
3 interconnections, assuming that for two other regions,
4 there might be a reason to require slightly more Ride-
5 through capability, and those two regions will write
6 their own variance of it, right? So I think that's the
7 option we could consider is can we take different Ride-
8 through capability for different regions. I guess that
9 was not a question, a comment. Thank you.

10 MR. SHATTUCK: Thanks, Manish. Yeah, there
11 certainly is precedent for having different curves.
12 It's in 024, and it is a possible solution to move
13 forward.

14 MR. KAPPAGANTULA: Good morning. I understand I'm
15 standing between everybody and lunch, so I'm just going
16 to make a quick -- a quick comment on one of the slides
17 that you had that talks about software changes are
18 being a little bit cheaper than hardware changes. That
19 that may be true, but just understand that software
20 changes are not necessarily cheap.

21 MR. SHATTUCK: Mm-hmm.

22 MR. KAPPAGANTULA: As an example I could give you,

1 just to make some software changes on one of our
2 battery projects, we got a code of nearly a million
3 dollars, right? And so when we're -- when we're
4 talking about something is cheap, it's probably going
5 to be relative --

6 MR. SHATTUCK: Mm-hmm.

7 MR. KAPPAGANTULA: -- very relative. So I just
8 wanted to point that out that, you know, just because
9 we're saying we can change software on some of these
10 things, that it's going to be cheaper is not true. And
11 then you also have to factor in the points that, you
12 know, if you made a software change, you have to figure
13 out how the rest of the equipment would react to that
14 software change and if the rest of the equipment can
15 actually support, you know, making that software change
16 on just an inverter, for example, right? So I just
17 wanted to make that clear and take into consideration
18 when we're saying, hey, software is really cheap.

19 MR. SHATTUCK: Yeah.

20 MR. KAPPAGANTULA: The other piece also is when
21 you're changing some parameters, that may not
22 necessarily be a software change. So there's a lot

1 that goes into it, so let's not uniformly say that the
2 idea of, you know, we can make a few tweaks here in the
3 software and that's going to just do the job. It's not
4 true. That's what my technical experts are saying.

5 MR. SHATTUCK: Thanks. Yeah, everything was
6 presented as relatives, right? And the OEMs will give
7 us the details after lunch. I don't want to speak for
8 those folks, but they'll give us probably some real --

9 MR. KAPPAGANTULA: No, I'm, I'm looking forward to
10 that, so I would rather hear from them saying, hey,
11 software is not cheap --

12 MR. SHATTUCK: Yeah.

13 MR. KAPPAGANTULA: -- than me just saying --

14 (Laughter.)

15 MR. KAPPAGANTULA: -- yeah, because you can tell
16 us what you charge, too. I'd appreciate that.

17 (Laughter.)

18 MR. ROGERS: Yeah. So real quick question. You
19 showed us the curves that had the, you know, frequency
20 excursion events that we've witnessed within them and
21 plotted, and we touched up against one of them. So
22 that was, you know, the actual, you know, what we

1 witnessed with the frequency. But another part of the
2 -- you know, one of the contentious points of this is
3 the rate of change of frequency.

4 MR. SHATTUCK: Mm-hmm.

5 MR. ROGERS: You know, we're looking at 5 hertz
6 per second in the proposed language. What have we
7 witnessed in these events as far as rate of change, of
8 frequency that, you know, really drives to the need for
9 that 5 hertz per second because, you know, that's one
10 of the issues, especially with the legacy equipment.
11 Rate of change of frequency wasn't even a design
12 consideration. It's not that, you know, it's not set
13 high enough or the parameter's wrong. It wasn't a
14 thing. Whenever a lot of this stuff was built, you
15 know, it just wasn't a consideration. So what are we
16 looking at as far as an actual need based on the
17 evidence for the rate of change of frequency, or is
18 that even something that we have the evidence to speak
19 to yet?

20 MR. SHATTUCK: Yeah, great question. I don't
21 think I have that data. I don't think we have that
22 recorded data. We have the frequency traces, but it's

1 that, like, SCADA data granularity, right? So that's
2 -- a specific data point we don't have at the moment.
3 The only kind of information data points we have on
4 ROCOF is -- that's rate of change of frequency for
5 everyone else -- is, you know, international building
6 standards or equipment standards that are used in a lot
7 of IBR equipment facilities, right, the non-IBR pieces,
8 the transformers, the other pieces of equipment. The
9 data point we have for those are the, you know, the
10 standardized ROCOF requirements, so, like, that's the
11 only thing we really point to because we don't have the
12 data from the actual events.

13 MS. CASUSCELLI: All right. I think we've got a
14 hard stop, but maybe time for one online question. So
15 software expansion study and accurate models are
16 required. How will NERC support when standard models
17 are required and when they are often not able to
18 represent most IBRs?

19 MR. SHATTUCK: Great question, yeah. So I would
20 -- I would like to point everyone to NERC's published
21 that modeling guidance, which says that if you want to
22 do something like a detailed study, right, an

1 interconnection study, a study on your own facility to
2 evaluate your design, for a local reliability study, if
3 I'm Texas -- oh, that's a bad example -- that's a bad
4 example -- if I'm New York studying New York, we are
5 recommending user written models, equipment-specific,
6 manufacturer-specific models, we're aware, right,
7 obviously that many folks can't submit them. They're
8 not allowed. But I would point also to FERC Order
9 2023, which says to submit both the standard library
10 model and a user-defined model. And, you know, we
11 totally recognize that if we're using a standard
12 library model, we're not going to be able to represent
13 most of these things we're talking about, specifically
14 the detailed protections and that kind of stuff.

15 So we're recommending to use those more detailed
16 models specifically for what was in the question,
17 right? We know that what's out there is insufficient.
18 Nothing's been captured, right? Nothing's been
19 predicted, none of the major events. There is --
20 that's why we have a modeling alert out right now,
21 right? The idea is to raise the floor of study work-
22 through, you know, proper use of more detailed models

1 where appropriate, not to say that standard library
2 models have no place anywhere. But if you care about
3 the result, if you want it to be accurate, if you want
4 to be able to take that study and put it into a product
5 or vice versa, you've got to use something more
6 detailed like a -- usually a defined equipment-specific
7 model.

8 MR. MAJUMDER: Rajat Majumder. Thank you so much,
9 Alex. This is music to my ear, but I'll just make a
10 very quick comment. You just said some people may not
11 be able to provide that. The flip side is most of the
12 major ISOs do not allow it. That's the -- that's the
13 problem. I mean, manufacturers are on the -- on the
14 room. They can tell. I haven't had much trouble
15 working with any of the leading manufacturers not being
16 able to provide the model. They can, but their hands
17 are really tied with certain ISOs, and it's going to
18 that direction. We have many problem trying to
19 convince those ISOs that they should use the user-
20 defined model, not rely on the generic model. So
21 please be aware of that. It's not just from the OEM.
22 It is the ISOs who are not allowing it to make that

1 happen.

2 MR. SHATTUCK: Will do that.

3 MR. BENNETT: Okay. So it appears we've come to
4 the end of our discussion for now, so, Alex, thank you.

5 MR. SHATTUCK: Thank you.

6 MR. BENNETT: Great presentation. Very
7 informative.

8 (Applause.)

9 MR. BENNETT: So with that, we're here at noon
10 Eastern Time. We're going to take a one-hour lunch
11 break, so we'll be back at 1:00 Eastern. As for online
12 questions/comments, if we did get them addressed right
13 now, they are going into kind of an archive folder, and
14 we'll circle back to them at another point of our
15 Technical Conference over the next day or two. So
16 they're not gone. They're not forgotten. We have
17 them, and we'll bring them up as appropriate.

18 And with that, I think we'll take a break. Lunch
19 is just around the corner, and we'll be back at 1:00.

20 (Luncheon recess.)

21 MR. BENNETT: Okay. So I'm showing 1:00 here, and
22 it looks like we have most everybody back here in the

1 room. So for our online participants, I think we're
2 getting ready to start.

3 So this will be our first pan of panel discussion
4 of the day on "OEM Perspectives on Voltage and
5 Frequency Ride-through Criteria." So to walk us
6 through that, we have Standards Committee member,
7 Charlie Cook, from Duke Energy, as well as Alex from
8 NERC here to help us through that. So with that, I'll
9 turn it over to the panel.

10 (Sound checks.)

11 MR. COOK: Good afternoon. My name is Charlie
12 Cook. As Todd said, I work for Duke Energy, but today
13 I am here representing the Standards Committee. Alex?

14 MR. SHATTUCK: All right. My name is Alex
15 Shattuck. I'll get my stopwatch ready for everybody
16 because we're going to keep everyone on a two-minute
17 time per question, so making sure we keep track.

18 So my name's Alex Shattuck from NERC. You heard
19 from me just moments ago, and I guess we'll just jump
20 right in if you want to ask -- get us started with the
21 first question.

22 MR. COOK: Yeah. Could we have the panelists,

1 starting down at that end, please introduce yourself?
2 Tell us a little bit about yourself and who you
3 represent today, again, keeping an amount -- I'm sorry
4 -- keeping in mind that we are time limited, so.

5 MR. SCHMIDT GRAU: All right. My name is Thomas.
6 I'm representing Vestas. I've been with Vestas close
7 to 15 years, and I'm heading our Power Plant Solutions
8 Group that covers everything from development, sales,
9 construction, and service, and it includes every single
10 topic related to grid interconnection and reliability.

11 MR. KARPIEL: Scott Karpiel, SMA America. Been in
12 renewables for about 15 years with various different
13 OEMs. Hope to bring kind of a broad spectrum of
14 knowledge and expertise to the panel and the committees
15 here today, and thank you for having me.

16 MR. KOERBER: Arne Koerber. I'm representing GE
17 Vernova, and specifically the wind side of GE Vernova,
18 and we also do other things. I lead the product line
19 team for controls and software, and a lot of the
20 discussion here today was around software and controls,
21 so that's why I'm here. Been with GE 15-plus years in
22 various roles around controls and software.

1 MR. DAHAL: Good afternoon, everyone. I'm Samir
2 Dahal. I represent Siemens Gamesa on source side. I'm
3 responsible for model integration, parameter rises, and
4 for all our (inaudible).

5 MR. PATTABIRAMAN: Hi. My name is Dinish
6 Pattabiraman. I'm a development engineer here at TMEIC
7 Corporation, Americas. I work on modeling of our
8 inverter-based resources, you know, meeting grid
9 requirements for various ISOs, and analyzing grid
10 events and finding solutions.

11 MR. COOK: Thank you. So the way we're going to
12 do this today is I'm going to ask the first question
13 directly to an individual, and then I'd like -- so I'd
14 like the rest of the panels to pay attention and
15 listen, and then if you have anything significant to
16 add to what has been presented already, please do so.
17 We'll give you each chance to comment.

18 So question one says, do you anticipate challenges
19 with your equipment meeting the voltage Ride-through
20 criteria as specified in Attachment 1 of the draft PRC-
21 029, and there are three subparts to that. First of
22 all being, if you do so, do you have an estimate for

1 how many products will be affected? Second part, how
2 does the estimate change when considering IEEE 2800?
3 Third part, how does the estimate change when you
4 consider PRC-024 boundaries? So I'll direct that
5 question first to Dinish.

6 MR. PATTABIRAMAN: So for TMEIC inverters,
7 especially inverters existing in the field, you know,
8 we won't be able to meet IE 2800 at this point. For
9 newer inverters, we'll be able to meet IE 2800
10 requirements. Coming down to PRC-024 requirements,
11 most inverters in the field can meet PRC-024
12 requirements. Newer inverters, obviously, we'll also
13 be able to meet it. But in terms of parameterization,
14 we won't be able to eliminate parameterization for some
15 older generation products.

16 For PRC-029, based on the language that is
17 written, none of our inverters will be able to meet the
18 requirements, especially given that there are
19 requirements such as instantaneous or voltage
20 protection should have at least one cycle of filtering.
21 That's something that we wouldn't be able to meet even
22 for all inverters.

1 MR. COOK: Starting down at the end, anything else
2 to add, specifically, would you or would you not be
3 able to meet the requirements?

4 MR. SCHMIDT GRAU: Repeat that one.

5 MR. COOK: Okay. It says, do you anticipate
6 challenges with your equipment meeting the voltage
7 Ride-through criteria --

8 MR. SCHMIDT GRAU: Yep.

9 MR. COOK: -- as specified in Attachment 1 of the
10 draft PRC-029?

11 MR. SCHMIDT GRAU: No. Only for Type 1 and Type 2
12 turbines, which is very limited install base in U.S.
13 And we do see end of life cycle in the near future and
14 potentially be powered to different projects. For the
15 Type 3/Type 4 turbines, we anticipate to meet the
16 requirements for Ride-through requirements for PRC-029.
17 Those requirements are also aligned with the new design
18 philosophies and also with the IEEE 2800.

19 MR. COOK: Okay. Thank you. Next, please?

20 MR. KARPIEL: So future, current, previous
21 generations of our inverter stations, I have no
22 problems with the voltage Ride-through. The legacy

1 stuff that's going back 10 or so years, clips a little
2 bit of a corner on one of the Ride-through corners, but
3 then with the exemption, it shouldn't be a problem.

4 MR. COOK: I'm Sorry. Could you clarify that
5 about the exemption? What was that statement?

6 MR. KARPIEL: Well, does it not state for voltage
7 that there's an exemption?

8 MR. COOK: Yes. Voltage, yes.

9 MR. KARPIEL: Yes.

10 MR. COOK: Okay. Just want to be clear. Next.

11 MR. KOERBER: Similar to my colleagues here, I
12 think we have to really split this between new products
13 that are under development and the installed base. For
14 new products, plants are generally aligned with IEEE
15 2800, so we're evaluating what's the difference. What
16 impact does that have for the installed base? We do
17 expect that the majority of the installed base does not
18 meet these voltage Ride-through curves. Some cases
19 might be close. In some cases with a project-specific
20 evaluation, voltage drops across the collector system,
21 it might be possible to meet it, but on paper and
22 curves taken strictly as stated, we do expect that the

1 majority of the installed base does not meet those
2 curves. That's on the curve.

3 And then it's important to point out that
4 Attachment 1, Items 9 and 10 have additional
5 requirements that weren't previously requirements.
6 We've already had a quick discussion this morning on
7 the instantaneous voltage and on multiple fault Ride-
8 through, and we do expect both of those to be
9 challenges for the installed base.

10 MR. COOK: Thank you.

11 MR. PATTABIRAMAN: Yeah. We have a similar
12 comment as our colleagues with G. For legacy turbines,
13 we can Ride-through the curves, just the curves, with
14 software, unlimited hardware upgrade, but items listed
15 in 9 and 10, multiple Ride-through instantaneous,
16 that's not something that we've been tested and
17 evaluated, so that would require a thorough
18 investigation from our part. And the testing part,
19 like it has been brought a couple of times, there is a
20 possibility for legacy turbine to be retested against
21 the newest standard is, I don't think that's going to
22 happen.

1 MR. COOK: Okay.

2 MR. PATTABIRAMAN: We will have to ask for
3 exemption on those.

4 MR. COOK: Thanks.

5 MR. PATTABIRAMAN: But for the new lines, we would
6 completely design our product to comply with IEEE 2800.

7 MR. COOK: Thank you.

8 MR. SHATTUCK: So I guess most of us are wind,
9 right, here. So we're missing our estimate
10 participant, but I guess, Dinish, since you're the --
11 (Side conversation.)

12 MR. SHATTUCK: All right. So for y'all's
13 perspective, like, what's the -- kind of similar
14 responses with some varied, you know, actual numbers,
15 but what are the main differences for kind of the
16 failure to meet or challenges between wind and solar,
17 you know, just the technologies as a whole themselves?
18 Like, I guess what are the limiting elements when we
19 say something can't meet one of the requirements? Is
20 it -- is it a software? Is it a hardware? Is it old
21 firmware? Is it a specific piece of equipment?

22 MR. KARPIEL: So for PV and BES, battery energy

1 storage, it's both, right? There's a hardware
2 limitation as to how long the holdup -- the backup for
3 the communications and everything can withstand. So
4 whether they're using a battery, a UPS, a super cap, or
5 whatever they're using to have that buffer installed,
6 so that's a hardware limit -- that could be a hardware
7 limitation.

8 And the other one is parameterization, right, the
9 software that's the firmware that's used in inverter
10 technology. Amongst the experiences that I've had with
11 the different OEMs and legacy products here at SMA is
12 the firmware has a limitation of how far it will allow
13 you to Ride-through in amplitude and time. That's
14 usually set by some other kind of hardware limitations
15 so you don't damage the equipment. So I can't speak
16 necessarily for the wind side of things, but for the
17 inverters, the PDs and better energy storage systems,
18 it's a combination.

19 MR. SHATTUCK: Thank you.

20 MR. PATTABIRAMAN: Just to add to it, yeah, the
21 same. It's pretty similar reasons. It's both software
22 and hardware for at least the Ride-through curves by

1 themselves. In terms of other requirements that are --
2 I think the gentleman from GE also brought this up
3 before -- the instantaneous overvoltage protection,
4 having one cycle of filtering is something our hardware
5 cannot do. You know, IGBTs have very limited voltage
6 handling capability, so having a one-cycle requirement
7 significantly exceeds the capability of our products.

8 MR. SHATTUCK: Thank you.

9 MR. DAHAL: I would like that for wind especially.
10 You have so many components inside the turbine, right,
11 converter/inverter being able to do something doesn't
12 necessarily mean the turbine can hold can do it. So
13 for us, software limitation is there, and there is also
14 hardware limitation. For us to be certain that just
15 because converter can do it, you know, we are not going
16 to be comfortable telling wind turbine as a whole can
17 do it, right?

18 And also, when we are talking about software
19 parameter parameterization, we cannot forget about the
20 models, right? Every time the software gets
21 parameterized or firmware get updated, corresponding
22 model is expected to be provided, and rightfully so,

1 right? For our legacy turbines that have been
2 operating for 20 years and no longer in design phase,
3 models were provided when they were first commissioned.
4 I don't think anybody actually started using those
5 models and providing feedback to us, so we saw no
6 reason to update those models. Like, for the legacy
7 turbine, we do not have any reason to keep them updated
8 since we never got a feedback on a -- if there is any
9 need to be updated. So all of a sudden asking not only
10 to change the parameters, but also provide the model in
11 a reasonable time -- updated model in a reasonable time
12 that works with today's simulation environment, it's
13 going to be a huge challenge. I mean, it can be done,
14 but it's going to take a lot more than six month or a
15 year.

16 We have -- we currently have closer to 15, 16,000
17 units installed, right? Each of those turbine might
18 not have the same firmware. I know it. They don't,
19 right? And also, our customers or the assets owner do
20 have some flexibility on changing the parameter as they
21 deem necessary, you know, based on their field
22 experience or what have you. That information we do

1 not have. So there is significant challenges just to
2 provide a -- you know, to meet the new standard with
3 those software or, you know, hardware parameterized,
4 and I don't want anybody to forget that, you know?
5 Yeah, you can -- we can do it. Parameterizing software
6 can be done in, let's say, a year, but getting our
7 corresponding model will take a lot more than that,
8 yeah, especially validating as well.

9 MR. SHATTUCK: Thank you. The mic was off, but
10 they said, especially validating those models, and I'll
11 ask one more follow-up before we go to the next one.
12 Sorry. Thomas, did you have something?

13 MR. SCHMIDT GRAU: Yep. No, and even if we have
14 the models available, often that's -- to Rajat's
15 comment earlier, ISOs and utilities don't allow those
16 models to be used that is accurately representing
17 studies for the -- evaluating PSE, so that's one of the
18 challenges. We have -- we, to some extent, can do
19 software upgrades and pure parameters with our
20 software, but we are not able to do the evaluation of
21 what parameters are required for that specific site
22 because the utilities often don't allow us to use the

1 right models for that evaluation.

2 MR. SHATTUCK: Thank you, and I'll ask, I think,
3 the last question. The end of this might be a little
4 faster, so we'll dig into some details here. One more
5 detail question. So we talked about kind of the
6 inverter/converter in the turbine in the -- in the
7 inverter. What about balance of plant equipment? So
8 this is a -- you know, it's a resource standard, right?
9 The IBR must ride through, so are there challenges in
10 balance of plant equipment as well?

11 MR. SCHMIDT GRAU: Yes. So if we look at the
12 frequency response, that's where -- there's no design
13 standards as we are aware of, that designs for
14 plus/minus 4 hertz per six seconds. So you will see
15 cooling systems and substations be affected. You have
16 all the different equipment and the turbines being
17 affected. It's not about the inverter. Inverters have
18 some flexibility, but we cannot forget all the
19 auxiliary component sensors, cooling systems, relays,
20 protections, transformers, that is not designed for
21 plus/minus 4 hertz per six seconds.

22 MR. KARPIEL: And let's not forget the medium

1 voltage transformer that comes with the inverter
2 station. Those situations that have high voltage and
3 low frequency, you'll put your magnetics in the
4 saturation, right? Saturation causes heat. Heat
5 causes breakdown. So we have to be looking at the
6 whole picture, the entire balance of plant to ensure
7 that the inverter-based resource unit -- I know there's
8 a lot of talk about what that definition is, but the
9 station itself needs to be able to ride through 299
10 seconds, 660 seconds of this voltage or that frequency.
11 And it has to be looked at by the OEMs going back
12 throughout all the legacy, all the generations of their
13 product, not just the current and future. So there's
14 going to be some gaps that are going to happen in the
15 technology.

16 MR. DAHAL: I also want to bring attention to the
17 concept of repower, right? Like, we're talking about
18 this and talking about repower. The repower that we've
19 seen so far have been efficiency driven, right? So
20 repower happens because you want to get more power out
21 of the old turbine, not necessarily the electrical --
22 new set of electrical performance. We retain the main

1 brain converter/inverter system, cooling system as it
2 is, just change the rotor from the wind side. So just
3 the term, "repowering," doesn't mean what you guys are
4 thinking about repowering, you know. Oh, you repower,
5 you get new set of performances from them, and that's
6 not true at all. The market is not there for that to
7 happen. The repower project that we have done so far
8 has been purely mechanical repower, and it is very
9 essential to consider that as well.

10 MR. SHATTUCK: Thanks. Is that the same for
11 solar?

12 MR. SCHMIDT GRAU: Oh, sorry. Maybe also to add
13 to that, even if you do a full repower in a cell and
14 hub from one OEM to another, it's often older
15 technology that gets installed because the tower, the
16 foundation, and structure is not built for the latest
17 rotor sizes in inverters, so that even if you are able
18 to fully repower, it's still going to be legacy
19 equipment that's going to be repowered.

20 MR. PATTABIRAMAN: Just answering the question on
21 the balance of plant equipment. There are surge
22 registers that are also included in the design of a

1 typical IBR plant. They're typically located at the
2 end of a feeder through wide overvoltages, absorb
3 overvoltages, and so on. And the problem is that these
4 sites are already designed with certain energy levels
5 for these protectors and surge protectors, and any
6 level of higher overvoltage could physically damage
7 these protectors. But that kind of also includes
8 instantaneous overvoltage, like I said earlier, is
9 that, you know, having a one-cycle delay could
10 basically be the difference between damaging and not
11 damaging these arresters.

12 MR. SHATTUCK: Thank you. All right. I think
13 it's time to move on to our next question, which is the
14 same question, but for frequency but just one tiny
15 piece to add in is we mentioned transformer saturation.
16 There's other things that happen when the transformer
17 saturates, like harmonics or SSR, which aren't
18 necessarily this specific Ride-through, but they're not
19 particularly good, friendly phenomenon, so causing that
20 saturation somehow is not always great for the BPS as
21 well.

22 So we'll jump into the next question. Again, it's

1 the same question but frequency. So we'll ask it to
2 Arne, and we'll go down the line, but do you anticipate
3 any challenges with your equipment meeting the
4 frequency rate through criteria, as specified in
5 Attachment 2 of Draft PRC-029, and then the same kind
6 of sub-bullets, yeah, estimates for how many products
7 for 029 and 2800 and PRC-024? So we'll go with Arne
8 first and go down the line, yeah.

9 MR. KOERBER: Yeah. And for us, there's about --
10 preliminary analysis looking into this, we estimate
11 there's about 20 gigawatt of installed capacity. These
12 are some of the oldest units, substantially before
13 2014. That would not meet the frequency Ride-through
14 requirement if comparing against the S-design curve.
15 What it would take, not in a position to comment on
16 this. It's about 20 gigawatts installed capacity, and
17 the answer really doesn't change whether it's IEEE 2800
18 or PRC-024.

19 MR. SHATTUCK: And that's for legacy. It's all
20 -- that's all --

21 MR. KOERBER: Yeah, legacy.

22 MR. SHATTUCK: We'll go down the line. Same path

1 forward, yeah.

2 MR. KARPIEL: So for SMA, the frequency Ride-
3 through requirements are not an issue for our inverters
4 as well as our inverter stations and the magnetics that
5 are on the unit, and that's going back to all -- even
6 our legacy equipment, and it doesn't change, right?
7 The frequency curve for 029 is larger than the 2800 or
8 the 024, so if we can meet 029, we can meet the rest.

9 MR. SCHMIDT GRAU: I might've jumped the gun a
10 little earlier before, but, on the frequency. But for
11 Vestas, we cannot meet the frequency plus/minus 4 hertz
12 per six seconds on our legacy turbines, and that's the
13 installed fleet in U.S., I think around 15,000 units.
14 And it's not in design consideration for any new
15 products, and that's simply coming due to ancillary
16 equipment in the turbine. There's no design process
17 standardization for any, like, sensors, transformers,
18 relays today that is meeting that. It will also
19 potentially have cascading effect causing reliability
20 issues if you have a frequency that is plus-4 hertz,
21 minus-4 hertz for that long duration of other loads and
22 things in the grid going offline. So we don't have it

1 into consideration of design as there's no suppliers in
2 the industry that can meet that today.

3 MR. SHATTUCK: And sorry. You said 15,000 units.
4 Do you have a megawatt estimate for folks?

5 MR. SCHMIDT GRAU: I will find it.

6 MR. SHATTUCK: Okay. Thank you.

7 MR. DAHAL: I second Vesta's response to that.
8 Our legacy turbines cannot meet PRC-029. We have not
9 considered PRC-029, those curve for six second in our
10 new design either. So as of today, we have no product
11 that will meet -- that will comply with PRC-029
12 frequency Ride-through in its entirety. Regarding IEEE
13 2800, we meet our newer turbine and our legacy turbine
14 with some software and hardware modification, mainly
15 software. We will be able to meet IEEE 2800.

16 MR. SHATTUCK: With all legacy or with all your
17 legacy equipment?

18 MR. DAHAL: Except for Type 1 and Type 2.

19 MR. SHATTUCK: Okay. Yeah.

20 MR. DAHAL: Type 2 and Type 4, yes. And then our
21 restrictions comes from -- for whatever was mentioned
22 already. We do not have motors that we can source that

1 will be able to Ride-through all the ancillary
2 equipment, you know. I think if you look at what other
3 IEC requirement, IEC 60034, IEEE 50-1, they all have
4 plus-3/minus-5 requirement for these motors, and that's
5 what -- you know, that is in line with IEEE 2800, and
6 that's what our design philosophy is. And let me also
7 add our -- it'll probably come later, but design cycle
8 -- design-to-market cycle is five years for wind
9 turbine. So any new standard that has that much of an
10 effect needs to be given at least five years, if not
11 more time, to be applicable. And if it's, you know,
12 cost prohibitive or anything like that, then that's
13 going to be another issue.

14 MR. SHATTUCK: Thanks.

15 MR. PATTABIRAMAN: So for older TMEIC inverters,
16 especially thousand-word inverters and before, we have
17 hardware limitations in terms of what can be done in
18 the order. So the typical design that was used was
19 plus or minus 3 hertz. During the time, 5 percent
20 change in frequency was the maximum capability of the
21 equipment. So we may have hardware limitations, such
22 as, like OX equipment, fans, or whatnot for cooling may

1 have some hardware limitations. We are still exploring
2 that. But even on the software side requirements,
3 like, having 5 hertz per second were not part of the
4 design criteria back then, and it would require a
5 significant change in software to achieve 5 hertz per
6 second. It's not a simple parameter change that it
7 could do or a simple software update. There's
8 extensive design.

9 And especially for our older inverters, we have
10 limitations in our control board that would prevent us
11 from downloading new software onto it, or like with
12 excessive new capabilities, so they would require
13 hardware changes to even get some of these software
14 fixes. So they would require a new control board,
15 maybe a retrofit kit for some of these existing
16 inverters and an entire development cycle dedicated to
17 developing new firmware for a new control environment
18 or a development environment, so that would take a
19 significant amount of time and resources. It would
20 probably be less expensive to just repower some of
21 these older inverters with newer inverters.

22 For newer inverters, yes, they have wider

1 capability to meet some of these wider frequency
2 requirements. But we still -- not from OEM
3 perspective, but from a power system perspective, we
4 still don't see the need to have these wide
5 requirements, especially given that none of the
6 existing events or none of the existing studies have
7 pointed to any evidence of wider frequency
8 requirements.

9 MR. SHATTUCK: Thank you. We'll move on to our
10 next question. Oh, Thomas, go ahead.

11 MR. SCHMIDT GRAU: Forty gigawatt.

12 MR. SHATTUCK: Forty gigawatts? Okay. Thank you.
13 Yeah.

14 MR. COOK: Jamie, do we have these comments
15 captured, the responses captured from all of the
16 panelists in writing?

17 MS. CALDERON: Yes.

18 MR. SHATTUCK: We have someone recording, and then
19 we also -- most of them submitted these comments in
20 writing prior to this.

21 MS. CALDERON: Yeah. There was one or two, I
22 think, we were waiting on, but --

1 MR. SHATTUCK: We got them, I think.

2 MR. COOK: Okay. Yeah, that's what I thought. I
3 looked, and I didn't find them all. So if you haven't
4 provided comments, written responses to these
5 questions, please do so. There's a lot of complicated
6 numbers and stuff going back and forth. We have a
7 court reporter somewhere, but she may be -- are you
8 getting all this?

9 COURT REPORTER: (Off mic comment.)

10 MR. COOK: God bless you.

11 (Laughter.)

12 MR. COOK: Okay. Thank you. Next question,
13 Question Number 3: what documentation is necessary
14 from manufacturers to -- I'm sorry -- to prove which
15 hardware limitations exist that would prevent your
16 equipment from meeting the criteria in Draft PRC-029,
17 Attachments 1 and Attachment 2? Go ahead. Yeah.

18 MR. KARPIEL: There would have to be some kind of
19 a declaration, obviously, from the manufacturer stating
20 that you don't meet this requirement or that
21 requirement due to this hardware limitation, this
22 software limitation. We're not going to share our IP,

1 obviously, but we do need to provide indication of what
2 portion of the standard that it's not going to meet,
3 why it's not going to meet that rather -- if that's --
4 this unit doesn't have enough buffer in that -- the
5 buffer doesn't have enough energy to Ride-through zero
6 volts for X seconds, this is why there's no space
7 available to install a UPS or something of that nature.
8 It's going to be basically our responsibility to put
9 together a declaration, like I said, and with examples,
10 curves, graphs pointing to certain specific hardware
11 components that are not available for -- because
12 they're not available on the market to provide back to
13 the GOs and then back to the TOs.

14 MR. COOK: And how would you envision that being
15 presented as like this -- here's all the model numbers,
16 here's what they can and can't do, and issue that
17 generically or based on requests from a specific
18 generator owner?

19 MR. KARPIEL: We would probably do it on a
20 specific request because the inverters themselves have
21 different hardware configurations. We'd have to go
22 look at that specific project's build to understand

1 what is or is not included in that machine and what
2 generation it is so that we can accurately provide
3 detailed information regarding the equipment that's in
4 that plant.

5 MR. COOK: Thank you. Just pass it over to your
6 left.

7 MR. SCHMIDT GRAU: Oh, we echo that as well. I
8 think for frequency, it has to be a declaration.
9 There's a lot of things that cannot be studied in any
10 study world on it, specifically of all the auxiliary
11 equipment, and in the turbine there's also all the
12 rotating part -- motors, your motors, et cetera.

13 For voltage evaluation at planned -- sorry --
14 point of interconnect, I think it's really important,
15 again, come back to the OEMs are required to provide
16 adequate models and also that the industry is allowing
17 to use them because then you can do the proper
18 evaluation. That's both for legacy and also future.
19 We look at these graphs and they're very static on a
20 PowerPoint, but the voltage will dynamically change
21 based on your current injection profiles, your site-
22 specific tuning, your nearby generation, so it's not

1 enough just with the document. We also need to do the
2 adequate design analysis for it.

3 MR. KOERBER: Just to add what was said,
4 especially for wind turbines, these Ride-through
5 capabilities are really complex system-level
6 interactions. It's often not there's one voltage that
7 goes above the one limit, that this one component
8 limits. It's many auxiliaries, many systems that
9 interact on Type 3 wind turbines, these interactions
10 with the hardware side, the loading side, and it's not
11 as simple as here's the one limit. And proving that
12 something can't be done in a system that involves
13 multiple software systems, it's actually really hard.
14 Like, how can we as a manufacturer of equipment and
15 then say, this can't be done, we don't know how to do
16 it. That's a very hard thing for -- to attest to,
17 right?

18 We will provide the capability of the turbine.
19 This is what the turbine can do. Here's the testing.
20 Here's the evidence that we have. But showing that
21 something can't be done, it's a risk, but also it
22 involves opening up our entire design process. What

1 are our design limits? What are our margins? There's
2 a lot of IP involved, and we don't see us being in a
3 good position to provide documentation on capabilities,
4 on limitations beyond what's the stated, published
5 product-level capability. It's speculation, and it's a
6 very unbounded problem. There's a lot of things you
7 can do with modern software -- modern software systems
8 if you had all the time and all of the funding in the
9 world to solve this problem.

10 So declaring this can't be done, maybe for some
11 small sub-problems, it can be done, but generally, we
12 see significant challenges, not technical challenges,
13 but just how we -- how we handle providing this
14 documentation. What can we actually sign up to say
15 this is impossible, and what happens if someone does
16 it? What happens if we are wrong when we declared this
17 can't be done?

18 MR. DAHAL: Yeah, I completely second that, and I
19 would like to add that each turbine needs to be
20 evaluated on its own. We will not be able to provide a
21 -- forget about the fleet level, right? We have 20
22 models so far with various power-rated power output

1 from them. So we won't be able to provide, let's say,
2 20 different statements saying our -- this fleet can do
3 this. It has to be per turbine based, as has been
4 indicated, seeing what is inside the turbine, what
5 component was resourced, and what kind of documentation
6 we ourselves have that can be used to provide you all
7 with what you need. So that exercise, again, will be
8 very timely. You know it will take time.

9 And also, I'd also like to highlight the fact that
10 just because, let's say, converter can do it doesn't
11 mean the turbine can do it. Again, I'd like to
12 highlight that because every change in the parameter
13 requires load and control analysis to see if tower can
14 sustain if there is enough vibration, if there is
15 enough harmonic generated. And all that study needs to
16 be done for every change in parameter when it comes to
17 frequency and voltage, and that exercise is very time
18 consuming as well. And for legacy units, I mean, that
19 won't be able -- we won't be able to do that either,
20 you know. So there is a lot of nuance than just
21 saying, oh, it's a simple software upgrade, then you'll
22 be able to do it. That's not the case.

1 MR. COOK: Thank you.

2 MR. PATTABIRAMAN: Generally, I agree with most of
3 what was said, would be able to provide some
4 documentation on capabilities that are already
5 published. But in terms of new capabilities, we would
6 have to undergo investigation, and we would probably
7 provide a document on our company letterhead signed by
8 the appropriate officer on the capabilities of the
9 equipment.

10 MR. SHATTUCK: Go ahead.

11 MR. KARPIEL: So a comment. The five of us up
12 here are employed by highly successful OEMs. There has
13 to be a consideration taken for those OEMs that haven't
14 been so successful.

15 MR. SHATTUCK: Thank you, and I guess the next
16 question bled into this one, but -- and we'll start
17 from Thomas and come back down the line. But I guess a
18 follow-on to that last question is -- and I think the
19 answer is -- y'all touched on it, but, you know, what
20 documentation are y'all comfortable with sharing,
21 right, with someone like the -- a transmission planner
22 or NERC or, you know, your utility or entity, because

1 it sounds like there's a clash of IP and sharing
2 information, right? But we also have to make sure that
3 BPS is reliable, right? So there's got to be some
4 maybe middle ground of IP and/or justification or
5 something we can all be comfortable with on both sides,
6 but I'm interested to hear what y'all are comfortable
7 with and what that might look like. Yeah, Thomas.

8 MR. SCHMIDT GRAU: Yeah. I think a lot of it was
9 said already on that part, but to reemphasize, I think
10 all OEMs, at least I can speak investors here, we
11 provide some kind of general description and
12 specification that we stand within, and all third-party
13 components we source has to comply with that. Some
14 might be slightly better, some might not meet -- will
15 just meet the specification on it, so I think that
16 documentation is key to keep and also to trust. There
17 might be declarations, like rate of change of
18 frequency, that you cannot simulate, where you have to
19 have some declaration, where we have to look at site
20 measurement, where we have to do some attestations
21 around that. I think that also aligns with some of the
22 FERC orders.

1 And then I will go back to the modeling again. We
2 see the recommendation for EMT models, detailed models.
3 They will most likely or they have to live up to those
4 specifications and then trust that and implement that
5 in the study phase to get a more detailed instead of
6 looking at paper, basically.

7 MR. KARPIEL: Yeah, I agree with you a hundred
8 percent. Without an NDA in place, it's a fine line of
9 what the OEMs are going to be willing to share publicly
10 and openly, so, but we're going to have to find that
11 line and provide enough information that a decision can
12 be made.

13 MR. KOERBER: Yeah, very similar comments. We're
14 generally comfortable sharing existing product
15 capabilities. This also includes existing optional
16 features that operators may or may not have used and
17 implemented on their turbines. This is fully-designed
18 capability, product specifications, comfortable sharing
19 this. We also have very consistently provided, let's
20 say, indicated fleet demographics as part of NOGRR245
21 for ERCOT. How many turbines are impacted by what
22 curve? And we generally plan to do so to help you kind

1 of run scenarios. What's the impact? What would
2 happen if we do that, generally reasonably, and we plan
3 to continue doing that.

4 We really ask for an understanding, is that we --
5 like, it's very hard for us to publicly commit on
6 capabilities that haven't been developed yet. It's
7 just not solid practice because we don't know what
8 issues we will encounter. The only way of doing it is
9 sharing IP, so that's where we see the biggest
10 challenge is on kind of speculating for the future,
11 informed speculation, but --

12 MR. DAHAL: I agree. I completely agree with
13 that. Our customers should already have, like,
14 whatever VRT set points, you know, FRT set points, all
15 the curve, all the reactive power capability document,
16 all the simultaneities that we call for (inaudible).
17 You know, if the frequency varies more than one person,
18 you will need to sacrifice active or reactive power or
19 both. All those documentation, they should already
20 have it, and we regularly provide that.

21 Like, when it comes to unit model validation like
22 ERCOT requires for the new project, we provide the

1 report to go with those as well. But any standard
2 needs to adequately address what kind of test needs to
3 be completed, in what manner, in what setting, with
4 what margin, and what kind of report are they expecting
5 at the end of the day. But it can't be open-ended and
6 ask us to, you know, provide all the -- all the, you
7 know, documentation when there is -- the requirement is
8 so vague. And obviously we can't speculate on the
9 future requirement. Nothing gets designed anticipating
10 the future needs. You kind of touch bases whenever
11 it's designed.

12 During the first year of the design is where we
13 reach out to our customer and everybody and say tell me
14 your requirement, right? And then after second year,
15 that practice is closed, and we are solely focused on
16 designing whatever the feedback we got. So you cannot
17 retroactively, like, for the ROCOF of 5 hertz per
18 second, even if we have the product right now, there is
19 no way for us to go back for the product that we are
20 currently entering the design phase to implement that.
21 We are already too late on that. We need to keep that
22 in mind as well.

1 MR. SHATTUCK: Thank you.

2 MR. PATTABIRAMAN: Very similar comments. The
3 documentation we can share is often based on our
4 judgment internally and what the capabilities of the
5 inverter are. Even with an NDA, the information we
6 share is often very limited because of IP issues. So
7 yeah, that's essentially what we can share.

8 MR. SHATTUCK: Thank you. Before we go to the
9 next question, maybe suggest that the other panels, we
10 kind of hit on this topic and kind of understand the
11 other side of what would -- what they would be
12 comfortable with -- well, whoever they're representing
13 would be comfortable with getting, and, like, you know,
14 feelings on NDAs and all that kind of stuff and
15 process. So, like, we heard you, all sides, and now
16 maybe next panel we can hear from what we're
17 comfortable with as evidence, and maybe we'll meet in
18 the middle. We can go to the next question now.

19 MR. SCHMIDT GRAU: Sorry. Maybe quick comments on
20 the evaluation. I think that's really key for this as
21 well because we have seen a lot of this evaluation for
22 it done in the past with PRC-024. People basically

1 take our specification and plot the curves on top in
2 Excel of the -- of the curve and say, oh, we're
3 compliant or not compliant. That's so far from the
4 truth, and I think that's also why we see some of these
5 requirements, to some extent, go overboard on
6 capability because we might not understand what is
7 truly needed. And I think we as OEMs also have the
8 obligation to help providing guide with that adequate
9 information so we can understand the limitations of the
10 equipment. And, yeah, it's a great step to talk about
11 it today, but I think that's really important as part
12 of the documentation is how to evaluate it, if you're
13 compliant or not. If that's not specified and clear,
14 understand that, we won't know what to provide.

15 MR. SHATTUCK: Thank you.

16 MR. COOK: Next question, Question 5, what is the
17 generalized length of time associated with any design
18 of current products to meet the criteria specified in
19 PRC-029 without exception?

20 MR. KARPIEL: So we had one number here as five
21 years. It could also last longer. I also think it's
22 important to understand is it economical to redesign a

1 complete turbine. If we have designed a turbine today
2 and it'll be installed five to 10 years from now, if
3 that platform gets completely obsoleted and we cannot
4 sell it, where does the investment money come to
5 redesign? So we're going to hit a race that we cannot
6 comply with, that every time we have a new standard, we
7 have to obsolete the old turbines. So it's really
8 important for us that we also get some money back to
9 keep investing and improve the products so we don't go
10 into that race for it. So five years and maybe killing
11 the platforms if the standards go in this direction.

12 MR. KARPIEL: So I've been in manufacturing a long
13 time, and you have to understand that we're all lean
14 manufacturers, not only from a manufacturing supply
15 chain standpoint, but also a resource standpoint. We
16 have a roadmap, and our resources are currently booked
17 up for the next couple of years, if not more, going --
18 looking at next-generation products, operations, you
19 know, the sustaining engineering that happens on the
20 existing equipment, future generations, new designs.
21 And then if we have to introduce something new, where
22 does that go in the schedule? You've got design,

1 you've got testing, you've got model validation and
2 certification that has to happen, so minimum five to
3 six years on a new design.

4 MR. KOERBER: And this is going to be a classical
5 "it depends" answer, I think, for just new designs,
6 turbines that are being designed, can they meet all
7 these standards? Some of the numbers that have been
8 mentioned here by my colleagues up here seem
9 reasonable. That's about the right order of magnitude.
10 We generally foresee the biggest challenge for products
11 that are not no longer being manufactured, and when we
12 internally evaluate it, what would a retrofit take?
13 What does it take? We very quickly jumped to internal
14 reasons. We no longer have a prototype. We no longer
15 have a lab. Some of the simulation tools are no longer
16 around.

17 But it's really not just the internal reasons.
18 They are -- that's on us to overcome. It's a question
19 of investment, and it's also external reasons. And on
20 one hand, let's say, supplier relationships for
21 products that we no longer manufacture, we may not be
22 in business anymore with the suppliers of those sub-

1 components, which also have software, which have
2 firmware, which we have to reactivate, which just like
3 you are asking us the questions, what it takes, they
4 will come back to us and say, hey, if there's no
5 business, if you don't need to do a retrofit, we are
6 not supplying to you actively anymore because we're not
7 shipping those products anymore. It's just a whole
8 supply chain that may have to get rebuilt up to even
9 work through the engineering.

10 And then the second external kind of reason that
11 makes this difficult is in our relationship with
12 customers. We manufacture these turbines. We don't,
13 in many cases, operate them. They've been operating
14 10, 15 years. Self-performing customers, they have
15 their own services teams. They have -- may have
16 retrofit those turbines. They may have replaced
17 electronics. They may have replaced actuators. We
18 don't know what state they're in, and they will ask us
19 to guarantee that they meet the Ride-through
20 performance if we do a -- if we do a retrofit. They
21 will also want a warranty that whatever new software,
22 whatever new component we install actually works and

1 doesn't impact the rest of the turbine, as I mentioned,
2 complex mechanical, electrical software system.

3 And then we won't -- we'll have trouble signing up
4 for this without individually turbine-by-turbine,
5 project-by-project, surveying and almost custom
6 designing a solution for an asset that's been running
7 for 15 years. All of this can be overcome, but that's
8 why it's hard to give a timeline and talk about maybe
9 the economics of what it takes to design a retrofit
10 package for a product that no longer ships. And that's
11 where the -- a lot of the uncertainty is coming from.
12 Internal reasons, labs, all of this, it's one thing.
13 It's the supplier and the customer relationships that
14 come on top of it that make this fairly difficult and
15 not very practical.

16 MR. DAHAL: I'd also like to highlight the fact
17 that turbines today has not been like -- you know, we
18 do not design a new product every five years, right?
19 There've been accumulation of the experiences gathered
20 throughout 15, 20 years, right, what worked in year
21 one, what didn't work. We base the design on those
22 components, like our experience, what failed on the

1 field, what do we need to improve. So we are very
2 excited to participate in IEEE 2800 and very static,
3 you know, when it was approved.

4 Now, for OEM, it's, like, there's now one standard
5 that we can design it for and maybe sustain it for
6 relatively longer period of time without having to
7 design to very specific market and have 10 different
8 variation of the product. And now deviating from that
9 just creates that, you know. We have to now face a
10 decision: does it make sense for us to create a new
11 product just to kill it in five years, and what does it
12 mean by killing it? Then you are not getting any
13 modeling support. If you have any issue on the field,
14 good luck. I mean, we're -- like, that's what we are
15 talking about, killing the platform. That's what it
16 means. And looks like whole industry is kind of
17 shifting toward like grid forming/grid following.

18 So I guess everybody needs to sit and think, like,
19 what is the benefit that we're going to achieve? Like,
20 is it worth it for OEM to force them to push back on
21 getting, like, one percent of the capability more
22 versus letting them invest on R&D to come up with new

1 next generation of product, right? So that's also
2 something to keep in mind.

3 MR. PATTABIRAMAN: So I agree with most of the
4 answers said by other OEMs. In terms of timelines, if
5 we start working on it right now, maybe it'll take
6 three years to five years, design retrofit packages,
7 design software in a completely new development
8 environment, create all these packages for our
9 customers. But the other important point is, you know,
10 we also have a roadmap, what we are going to comply
11 with in the next two, three years. And we see 2800
12 being significantly adopted, and our team is working on
13 those requirements right now. We have a product
14 pipeline. We have development resources assigned and
15 whatnot.

16 So what I think these legacy requirements and
17 retrofitting old equipment with new technology is going
18 to do is kind of push out compliance for these newer
19 sites coming in to maybe three further years down the
20 line, you know, which is going to cause even more
21 problems because there are more new resources coming
22 online than there are legacy resources already out

1 there. So not just does it delay existing products or,
2 you know, not just does it delay implementation for
3 legacy, but it also delays existing or new products
4 under development.

5 MR. SHATTUCK: Thank you. We have one more
6 question before we go to online questions, but I think
7 most of it -- most of y'all have already touched on it
8 briefly, so if you could maybe keep them to like 30-
9 second answers, do rapid-fire summary of your already
10 stated responses.

11 So the last question is, and we'll start with
12 Thomas at the end, is, for currently in-design or, you
13 know, future considerations -- or future considered
14 products -- that's not good grammar -- are any of those
15 able to meet PRC-029 criteria? So currently designed
16 -- products that are currently in design or planned to
17 be designed on your roadmaps, like we talked about,
18 that would meet PRC-029.

19 MR. SCHMIDT GRAU: Yep. When I speak today and
20 also talk about it, the PRC-029, I'm solely talking
21 about the 4 hertz per six seconds. We are largely
22 very, very supportive of the standard, but that

1 specific requirement is depending on so many sub-
2 manufacturers, redesign of the cells, different
3 equipments, relays, that there is currently no product
4 available with it. We can't retrofit any legacy
5 turbines for it, and there is no product in design for
6 future to meet plus/minus 4 hertz per six seconds.

7 So that is the limiting factor for Vestas. Again,
8 just want to emphasize that we're greatly supportive of
9 the PRC-029, but that specific requirement will require
10 complete new platform. It will not go into our
11 offshore market, it cannot go into the onshore market
12 either, and there's no design for it.

13 MR. KARPIEL: Fortunate for us, there's no --
14 we're already meeting the requirements. All current
15 and future products will as well. What I would like to
16 say, as you can tell, that not all inverters and
17 inverter stations are created equal, especially the
18 legacy equipment that's out there.

19 MR. KOERBER: Generally, all our new product
20 designs are aligned with 2800, so we're evaluating what
21 it takes. As I've mentioned, several of us, including
22 me, several times, the big concern is around the legacy

1 fleet, not new units. Generally, design power
2 generation equipment, meeting grid codes is a key part
3 of it. There's some specific technical requirements in
4 PRC-029. Some of them were mentioned. Some of them
5 were mentioned in our comments. The one we haven't
6 talked a lot about here that we do see as requiring a
7 bit of a realignment on our side would be multiple
8 fault Ride-through, going from two events to four
9 events in 029, in general aligned to 2800, evaluating
10 what it would take to realign. The stronger concern
11 and most of the comments are really around the legacy
12 fleet, not new developments.

13 MR. DAHAL: I completely agree. Our newer
14 products will comply with 2800, but we do not have --
15 we haven't considered this 64-hertz-per-6-second
16 criteria in any of our currently-being-designed
17 product, so not the new one. We haven't considered
18 that, and I don't think just a -- preliminary analysis
19 doesn't allow us to be able to meet it just because of
20 all the auxiliary motors that are in the turbines.
21 And, you know, we are not going to get any assurance
22 from our vendor that their motor would be able to Ride-

1 through those. So we don't -- we have no product.

2 MR. SHATTUCK: Thank you. Dinish?

3 MR. PATTABIRAMAN: So for products in development
4 in the future, we'll be able to meet 2800. That's in
5 our planned roadmap, but there are at least a few
6 constraints with PRC-029, which limit us from meeting
7 it. Some of these were mentioned before. You know,
8 one of the examples is one-cycle filtering for
9 instantaneous overvoltages, which we won't be able to
10 meet. I heard somebody mention that, oh, greater than
11 1.8 per unit, you know, there's not overvoltage going
12 to occur on the grid side, but things could happen
13 internal to the plant, which could trigger that kind of
14 overvoltage. There could be a resonance condition.
15 There could be a failure of one of the components that
16 could cause a severe overvoltage. There are extensive
17 studies done, called temporary overvoltage studies, to
18 determine how much energy a surge arrester can handle
19 and so on. So the various constraints would limit us
20 from, you know, achieving this one-cycle filtering for
21 instantaneous overvoltages, including inverter
22 protection, inverter components, OX components within

1 the inverter.

2 The other constraint I see being a challenge is
3 the 25-degree phase-jump requirement. The 25-degree
4 phase-jump requirement is also there in 2800, but there
5 is additional wording added here in the PRC-029
6 language, which states 25-degree phase jump initiated
7 by a non-fault event, this is allowed to trip. No
8 other kind of phase jump is allowed to trip, which is
9 something -- which is the first from 2800. Also, it
10 creates complications because the exception only states
11 for phase jumps created by a non-fault event. A lot of
12 fault events are actually going to create phase jumps,
13 you know. The inverters really cannot distinguish
14 between non-fault-initiated or fault-initiated phase
15 jumps.

16 Significant phase jumps. So essentially, the
17 language states that if there is a fault event causing
18 a significant phase jump, like a 90-degree phase jump,
19 the plant is supposed to Ride-through. But that is
20 something that we cannot really ensure, you know, the
21 significant phase jump is going to instantaneously
22 cause the current to jump significantly high and trip

1 the plant. So these are the differences -- the key
2 differences between 2800 and PRC-029, which pose
3 challenges. That's why I mentioned earlier and why the
4 differences between 2800 and PRC-029 when 2800 has been
5 discussed extensively, approved widely by a lot of
6 people, and there's also test procedures coming in with
7 2800.2.

8 MR. SHATTUCK: Thank you. I think at this time we
9 have 10 minutes for Slido questions or questions from
10 the room. We'll let Howard go first. You've already
11 asked a couple, so Howard, you go ahead.

12 MR. GUGEL: Thanks. Howard Gugel, NERC. So I've
13 heard a comment a couple of times today that is a
14 parity issue for me because it's different from what
15 I've heard in the past. So I'm hearing that you as
16 OEMs have accurate models that you've tried to provide
17 to the ISOs and utilities, and they refuse to allow
18 those models to be used. When we talk to ISOs and
19 utilities, they say we can't get accurate models
20 because the OEMs refuse to provide them because it's
21 IP. I don't -- what's the right answer because that's
22 -- we're hearing it from both sides and I don't -- I

1 can't figure it out.

2 MR. SCHMIDT GRAU: We have the models, and we
3 provide them to anyone that requested. So we are, at
4 least from Vesta's perspective, talking with different
5 ISOs. We are reaching out to them proactively saying,
6 can we provide you updated, accurate models? We see
7 very big interconnect projects in in U.S. coming on
8 board, and it's our bread and butter to sell turbines.

9 If we have any incident in the grid, it's going to
10 cause a political storm first, so we need to make sure
11 that the equipment we sell is reliable operating, on
12 the grid, and the best tool we have is for the models.
13 So we are really emphasizing utilities to ask and
14 accept the equipment-specific models, and we also are
15 trying proactively to ask what requirements do you have
16 for usability of our models and tools. There's
17 technology out there that can streamline. SGRET B4 is
18 one thing that can be used for EMT/RMS that will
19 significantly improve for utilities.

20 So we need a mechanism to allow to use the
21 adequate information, and we need ISOs/TSOs to be more
22 upfront with the usability requirements for our models

1 and validation requirements for it. So that's an
2 accountability we have to take on as an OEM, but again,
3 that it's -- we can't afford any reliability issues
4 either, yeah. So for sure, I speak for Vestas here, of
5 course, not for all OEMs. Any concerns, if you heard
6 anything else, please reach out, and we can definitely
7 deep dive into that.

8 MR. MAJUMDER: Hey, Alex, if I may, just as a GO,
9 who has opportunity to work with all of them who are on
10 the podium. To answer your question, Howard, it's
11 easy. Please go ahead and look at the generation
12 interconnection requirement from each of those ISOs.
13 It's documented. They clearly state we will not accept
14 any user-defined model, so you don't have to get your
15 answer based on speculation. It's there, documented.
16 They don't allow it.

17 I have had my fair share with working with all of
18 the ISOs where they would want accurate model, and they
19 are absolutely refusing to work with a user-defined
20 model. And then the question we get, so are you saying
21 your generic model is inaccurate? That puts us in a
22 very difficult position because we cannot say that we

1 have given an inaccurate model, which is not true, but
2 it's what it is.

3 MR. KARPIEL: It's generic, generic by nature.

4 MR. RODRIGUEZ: This is Fabio Rodriguez. I'm a
5 transmission planner for Duke Energy Florida, and a
6 concern about the models, it's very simple. When we do
7 a system impact study, the OEM sends a model. We do
8 the study. We determine what the impact on the system
9 is, and there we go. Then if there is a new model in
10 our interconnection requirements by FAT 002, there is a
11 requirement that if there is a modified change, the
12 model has to be restarted to see what the new system --
13 new impacts are on the system, and that's the -- that's
14 the process.

15 So when you guys come up with a new firmware or a
16 new software upgrade, or, you know, different settings,
17 if there is a modified change, which every utility
18 should have in their interconnection requirements, you
19 know, one of the modified changes, it's a new model.
20 One of the modified changes is, you know, more than
21 five percent in this setting. So if you have that
22 change, the TO, or me as a transmission planner, I

1 cannot accept your model until I do a new study to
2 determine if there is any new impact on the system by
3 those changes, and that's the process that we have.
4 It's a process that should work.

5 So you know, new models are working for any TO.
6 The thing is that they have to be restarted if there is
7 a modified change determined by the utility, by the TO,
8 and they have for -- you know, due to -- I mean, in FAT
9 002, every TO, every utility has to expel what the
10 requirements are or what the -- what they call modified
11 change to trigger the restudy.

12 MR. SHATTUCK: Thank you. I think maybe we'll get
13 back to frequency real quick.

14 MR. COOK: Yeah.

15 MR. SHATTUCK: The modeling piece, just keep in
16 mind, we have -- NERC has published modeling guidance
17 that says if you want accuracy in your studies, use a
18 user-defined model simply. They're in -- they're on
19 the website. They're posted. Just Google "NERC
20 dynamic modeling guidance," and you'll get what we
21 recommend as NERC, and you can read that and adopt them
22 if you want to, adopt the recommendation. So frequency

1 question.

2 MS. CASUSCELLI: Okay. I'm going to interject
3 with a question from the --

4 MR. SHATTUCK: Yes. Thank you.

5 MS. CASUSCELLI: -- from online here. So in order
6 to assess all of the Ride-through defined in the
7 standard, do the OEMs agree that a plant-level EMT
8 study is needed to confirm Ride-through?

9 MR. DAHAL: Absolutely.

10 MR. KARPIEL: Always a plant -- it's always a
11 plant-level model.

12 MR. SCHMIDT GRAU: Yes, EMT plant-level models.

13 MR. DAHAL: Yes.

14 MR. SHATTUCK: So yesses all around? All right.
15 That was easy. No questions like that before that.

16 MR. MAJUMDER: Again, Rajat from Invenergy.
17 Before I ask my question, first of all, I would like to
18 thank Alex for a very insightful presentation that he
19 did before lunch. That's precisely what I was
20 referring since from the beginning, and my apology for
21 being the broken record.

22 So based on Alex's very quantitative presentation,

1 we have seen expanding plus/minus 4 hertz per six
2 seconds has not been established as a sufficient risk.
3 It's clear. We have just heard about all the
4 manufacturers, and especially to Scott's point, that
5 there are probably little less successful manufacturers
6 who are not even around the table. The technology is
7 not there, and they do not see the reason, as of now,
8 because there is no basis of expansion of that.

9 So my question to the Standard Drafting Team and
10 the leadership is, so far no incident that can be
11 pointed has happened because of that expansion. So if
12 the standard goes ahead with this, we are essentially
13 going to go ahead, make all of those plant noncompliant
14 and open the breaker. How is that helping with our
15 bulk electric system reliability, which has not been
16 the reason of any reliability risk. Again, I'm zeroing
17 in in that frequency Ride-through.

18 MR. SHATTUCK: Thank you.

19 MR. AL-HADIDI: Thank you very much. Husam from
20 Manitoba Hydro. So maybe I have few questions based
21 off my involvement in the standard itself. I know I
22 take these standard looking at low frequency 57 hertz

1 for almost five minutes. You guys okay with that, it's
2 not an issue, so you go only 56.1 hertz per six second
3 become an issue or how that really change, because
4 really it's a fluxing issue. It's a time-related
5 issue. So if you can understand five minutes, then
6 what's the difficulties on that for a low frequency?
7 Then I'll go about our frequency, which is normal
8 auxiliaries even for today's surplus machine where,
9 under load rejection, the frequency goes to 70, 80,
10 whatever the case.

11 So it's not -- it's not abnormal for short time,
12 even for current existing synchronous machine, which
13 deal with the same auxiliary to some level, which is
14 the cooling and all that, which can stand for a large
15 frequency deviation for a soft-load rejection. We just
16 open the breaker. What's the difference? Why you guys
17 think it's an -- a big concern? What I think it's --
18 if it's a big concern, we need to consider it, but I
19 just want to understand why this concern become
20 significant, where it's not really that much of a
21 change, at least from where we are right now.

22 MR. SCHMIDT GRAU: I can maybe start. It's the --

1 all the auxiliary equipment in the turbine is not
2 designed or certified for it, for those values. So as
3 mentioned earlier, also, we manufacturers have to rely
4 on manufacturers, and there's no certification, there's
5 no standard for any equipment we can go out and
6 purchase to put into our machines today that will
7 comply with that. So it will require industrial chains
8 across a ton of equipment. We are not talking
9 inverters here only. We are talking everything. You
10 will have equipment in your substation that is not
11 designed to Ride-through, so you might have your
12 substation tripping offline before the turbines. You
13 might have loads nearby that will go offline as well.
14 So the requirements exceeding, to my knowledge, all
15 industrial practices and other design standards.

16 MR. AL-HADIDI: Yeah, but it's already existing.
17 As I said today, load rejection on any generator, it
18 create very large overfrequency or very large under
19 frequency, depend, but it's already -- the document is
20 already there which can Ride-through it, so it's not
21 something which is not manufactured before. I see the
22 standard as saying continuous operation or just

1 integrated operation for certain number, but doesn't
2 prevent it from running. And voltage per hertz is
3 already like exception criteria in the standard. So is
4 it voltage per hertz? Is it what the limitation of the
5 equipment --

6 MR. SCHMIDT GRAU: We are talking frequency
7 plus/minus 4 hertz per six seconds --

8 MR. AL-HADIDI: Okay.

9 MR. SCHMIDT GRAU: -- that there is no standard
10 to, what I at least know, that is designing any
11 equipment or certifying to that.

12 MR. AL-HADIDI: Okay. So it does mean it's only
13 that 57 is okay, and for other frequency up to 62
14 hertz, that's what you guys guarantee, or is this
15 really the -- where we are right now, we need to move
16 to that direction?

17 MR. SCHMIDT GRAU: Ask if it -- we had to do R&D?

18 MR. AL-HADIDI: Yeah. Is it R&D?

19 MR. SCHMIDT GRAU: It's not R&D. It's about we
20 are not able to source equipment that is designed or
21 certified to that for the auxiliary systems.

22 MR. AL-HADIDI: Okay.

1 MR. SCHMIDT GRAU: Today.

2 MR. AL-HADIDI: Does that mean that whenever you
3 guys now are manufacturing, the protection setting is
4 set on the border of this curve and you say --

5 MR. SCHMIDT GRAU: Yes.

6 MR. AL-HADIDI: So that's --

7 MR. SCHMIDT GRAU: We have pretty much maximized
8 out, and also to be able to -- there's always margin,
9 but it's -- we have certification for that equipment.
10 I'll let others maybe also reply, but we are maxed out,
11 at least for the Vestas equipment, where we are with
12 our specification today, and we have done the research.
13 Even with long extension here on the equipment, we
14 can't get signoff from any supplier with any of our
15 auxiliary in the frequency.

16 MR. KARPIEL: So I don't really consider it
17 margin. I consider it a safe operating limit, and then
18 we've already pushed those limits. I'm sure -- I
19 believe we're all saying the same thing, that we're
20 already pushing those operational limits where we feel
21 safe for our equipment.

22 MR. AL-HADIDI: Okay. What about ROCOF? Is 5

1 hertz per second something you -- is it something
2 feasible to do, or it's -- where we are in that 5 hertz
3 per second for legacy or for future design?

4 MR. SCHMIDT GRAU: Vesta's turbines, Type 3 and
5 Type 4, all do 5 hertz per second, yeah. Vesta's Type
6 3 and 4, it's public. You can go in. They comply with
7 the NOGRR245 of August last year.

8 MR. DAHAL: For SDRE, that's true only for new
9 units. We do not provide -- we do not have any proof
10 from our legacy turbines that we can go and do 5 hertz
11 per second. That is only applicable for new ones, not
12 the one that has already been installed.

13 MR. PATTABIRAMAN: Our legacy equipment, there was
14 no requirement for rate of change of frequency at the
15 time these inverters were sold or commissioned. The
16 standard at the time, I think, UL defined maybe 1 hertz
17 per second as a requirement for some of these
18 inverters. And so most of our legacy inverters are
19 tested at 1 hertz per second and safe to operate in 1
20 hertz per second without tripping. Like I said
21 earlier, changing the software, it's not a simple
22 parameter where you can go and update 1 hertz per 5

1 hertz per second. Software has to be changed
2 extensively, and our legacy products don't support
3 that. We would have to change hardware to even change
4 software in some of the legacy inverters.

5 MR. AL-HADIDI: Maybe I'll go to the second -- to
6 the question about transient overvoltage.

7 MR. SCHMIDT GRAU: So I'll just add a comment on
8 the ROCOF first --

9 MR. AL-HADIDI: Sure.

10 MR. SCHMIDT GRAU: -- which I think is important.
11 Avesta's turbine don't have ROCOF protection. It's the
12 equipment, again, that is potentially not able to Ride-
13 through, so I think that's also really important to
14 understand when we evaluate these. I do see ISOs run
15 very detailed, accurate EMT studies for ROCOF. They
16 can do a million hertz per second. The PRC CAP model
17 will never trip because ROCOF is not a protection
18 setting in the turbine. So there is, again, a lot of
19 auxiliary equipment and stuff that is not certified or
20 designed for these things. This is just one example.
21 It's really important to understand that it's just not
22 only inverters. We have a lot of rotating masses,

1 sensors, a lot of things in turbines.

2 MR. COOK: Folks, we have about two more minutes
3 left, so we'll take one more question.

4 MR. AL-HADIDI: Yeah. Just quick question about
5 transient overvoltage. They may help us with this
6 question about transient overvoltage. You guys see one
7 second/one-cycle filter, it's difficult to achieve and
8 may create some damaging issue.

9 MR. PATTABIRAMAN: It's not possible in our
10 inverters.

11 MR. AL-HADIDI: Well, and understanding that the
12 standard is saying that if you need to protect yourself
13 from damage, you could trip, so it's really -- it still
14 is there to cover for that. But the question now,
15 what's your guys' recommendation how to address it in
16 the standard to ensure that transient overvoltage for
17 just a spike, it's not really a noise or anything in
18 the measurement which cause the unit to trip, how we
19 should deal with it in the standard in better way.

20 MR. PATTABIRAMAN: There are two ways. I think
21 one is already the NERC recommendation, which is
22 maximize settings to the extent possible, limit

1 instantaneous -- add additional filtering to
2 instantaneous protection internally, and the other path
3 is to kind of adopt 2800.

4 MR. AL-HADIDI: Okay. Thank you.

5 MR. COOK: We'll take one more from the gentleman
6 that's behind you.

7 MR. HAKE: Thank you. Appreciate that. I'll be
8 quick. This is Sam Hake with AS Clean Energy again.
9 So we heard a lot this afternoon about the challenges
10 in evaluating what we cannot do, obviously relating to
11 equipment limitations. One point or a question that I
12 wanted to ask is if you guys see similar limitations
13 also applying to the concept of maximizing inverter
14 performance. We also hear a lot about that, and in our
15 experience, we've run into a lot of issues when we open
16 these questions about how can we maximize performance.
17 We get similar feedback as to what we've heard about
18 what we cannot do and are we limited. So just curious
19 if anybody has comments on that.

20 MR. KOERBER: Yeah. It's a -- it's a similar
21 concept and some of the -- some of the challenges are
22 similar. Maximize, where's the limit of maximize?

1 Does it mean you have to invest 10 years of R&D into
2 maximizing it? Generally, maximizations are often
3 understood as make sure the settings are right, make
4 sure all already-available optional features are
5 applied. We actually maximize to the capability stated
6 by the OEM. I think that's fairly straightforward, in
7 my own opinion. And where we run into the same
8 challenges that I was talking about earlier is when we
9 are asking us as OEMs to essentially invent something
10 new that gets more capability out of the already-
11 installed hardware. And parameters can change,
12 software can change, but what happens if a sub-supplier
13 firmware needs to change, or in order to update
14 firmware, you need a better processor? Then it quickly
15 spirals. But I would say structurally similar. It's
16 really do we go beyond stated capability, including all
17 already-designed options? Yeah.

18 MR. COOK: Yeah. I don't know if you want to add
19 to that.

20 MR. SCHMIDT GRAU: I want to echo it.

21 MS. CASUSCELLI: All right. We'll do one last
22 question here if that's okay, Todd. Thanks. There's a

1 question remotely here that asks if any of the
2 panelists work with AEMO and provide source code for
3 their models to the AEMO planners and operators and can
4 speak to that.

5 MR. SCHMIDT GRAU: I can speak to that. I think
6 AEMO is a very, very good example of the modeling
7 challenges we are facing here in U.S. providing source
8 code. We simplified that source code significantly.
9 That caused a lot of issues with PSSE studies, showing
10 a lot of false positives, which we also see here in
11 U.S. with the generic and standard library models.
12 AEMO is now moving towards full EMT real-time
13 simulation, probably obsoleting RMS, and I think that's
14 going overboard. And to the point earlier, we are a
15 lot of mature manufacturers here. If we go down that
16 route and we start forcing EMT and so strict
17 requirements, in my opinion, it will not kill, but it
18 will slow down innovation, new players, competition in
19 the market significantly. And that's -- I don't think
20 it's healthy for innovation or for the industry as a
21 whole.

22 MR. KOERBER: Yeah. I assume AEMO -- Australia

1 Energy Market Operator, or is that another AEMO? I
2 interpret this question as being about Australia, one
3 of the most strict grid codes in the world, requires a
4 lot of transparency, is a significant challenge, but
5 it's also very structured. And our experience working
6 with AEMO is they've also been very open in kind of
7 walking the process with us on what's needed. They've
8 been -- they've had several requirements. I commented
9 on MFRT, multiple fault Ride-through, where Australia
10 has probably the strictest requirements in the world,
11 but they're also very open, very technical in working
12 through some of those challenges with the industry.

13 Real code, actual source code, actual product-
14 level code is a challenge so far providing this in
15 compiled form where the code -- the source code is not
16 visible, but the performance actually 100 percent
17 matches. The product has been a way to go,
18 implementation challenges. There's many layers when it
19 comes to working with AEMO. I don't think that's a
20 discussion for here, but yeah, we, we work with them
21 extensively, and it's been a journey.

22 MR. DAHAL: It's not related to that question, but

1 I do like to bring something to attention as well when
2 we're talking about the model AEMO and all. You know,
3 I think Rajat mentioned, like, most of ISO requires
4 generic model. And what we are seeing from OEM side is
5 people are getting so familiar and comfortable with
6 generic model, that they are changing the model
7 significantly when they're submitting, you know, the
8 model of their plan to ISOs and RTOs. That we know
9 nothing about, right? There is a lack of manpower that
10 I don't think anybody has talked about because not a
11 lot of developers are capable of running the study --
12 plant-level study on their own, so they have to
13 outsource that study to somebody. And the market is in
14 such a way that there is a, you know, severe lack of,
15 I'd say, knowledgeable people to run the study.

16 So that model that gets submitted by the OEM to
17 the customer might not be the same model that gets
18 submitted by the customer to the TSO/RTOs as well, so
19 that is also something to keep in mind. Everybody's
20 talking about, oh, OEMs are hiding their control block,
21 we need access to control blocks, we need access to --
22 we need access to that parameter and that parameter,

1 while forgetting the fact that, you know, if you were
2 to use the OEM/UDM model, you'll get a very accurate
3 representation. And if you have to make changes, then
4 you have to come to us. Then we will tell you what is
5 possible and what is not with generic model.

6 Then people get very comfortable using those and
7 not realize that changing parameter might drastically
8 change the behavior of the turbine. And, like,
9 recently, a lot of inquiry that comes to us is after
10 the fact that, oh, your model is not -- your IRMS model
11 is not behaving like EMT model, and when you look
12 through it, it's been completely altered, and that's
13 also the challenge that needs to be addressed. And
14 hold the timeline, six-month applicability, one-month
15 applicability, knowing that plant-level study has to be
16 done and is this feasible amount of time to achieve
17 that, that's also -- that also needs to be considered.

18 MR. SHATTUCK: Thanks, and I think we're out of
19 time, but let's just maybe do one "yes" or "no" at the
20 end. So this last situation was just described, you
21 know, getting a model back that was changed. You have
22 no idea what's in there. We'll go "yes" or "no" from

1 Thomas down. Have you experienced that?

2 MR. SCHMIDT GRAU: Yes, pretty much all sites.

3 MR. KARPIEL: Yes.

4 MR. KOERBER: Sorry. Could you -- can you just
5 restate the question, please?

6 MR. SHATTUCK: So the situation that was described
7 where, you know, you've given a model out and then you
8 get it back later from generator owner, utility, or
9 whomever, and it's different, and you had no idea.

10 MR. KOERBER: I've not personally experienced
11 this, but maybe I'm at a different part of the
12 organization, so I can't comment on that.

13 MR. SHATTUCK: Okay. Thank you.

14 MR. KOERBER: I assume yes, but I can't confirm.

15 MR. SHATTUCK: Finish? You already answered.

16 MR. PATTABIRAMAN: Yeah, I already --

17 MR. SHATTUCK: Yeah.

18 MR. DAHAL: Yeah, absolutely. In fact, we have
19 provided RECA models, and we have received REECC back
20 for some reason.

21 (Laughter.)

22 MR. SHATTUCK: All right, good. I think we're

1 done then.

2 MR. BENNETT: All right. Well, thank you for our
3 well-informed panelists. I think that was very
4 technical. That was very informative. I think that
5 achieved what we were hoping it would achieve today.
6 So I don't know, just them a round of applause. We
7 appreciate you.

8 (Applause.)

9 MR. BENNETT: So with that, I just want to let
10 everybody know there are a number of questions online.
11 We're collating those. We'll get those to the
12 panelists and see if we can get some answers later
13 today. But with that, let's take a 15-minute break,
14 and we'll come back with our last panel of the day to
15 talk about some challenges with the current criteria
16 for PRC-029. Thank you.

17 (Break.)

18 MR. BENNETT: Okay. So it looks like we're
19 getting everybody together back in the room here.
20 We've got our panelists seated and ready. It looks
21 like Charlie's smiling at me. So with that, I guess
22 let's introduce our last panel of the day.

1 So we're going to talk about Addressing the
2 Challenges of Voltage and Frequency Ride-Through
3 Criteria. So to lead us through that is once, again,
4 Charlie Cook from Duke Energy, as well as Howard Gugel
5 from NERC. So take it away.

6 MR. GUGEL: Excellent. I guess before we start,
7 if we could just have everybody just briefly introduce
8 who they are and who they work for.

9 Manish Patel, EPRI.

10 Andy Hoke, National Renewable Energy Lab.

11 MR. CHWIALKOWSKI: Todd Chwialkowski, EDF
12 Renewables.

13 MR. LAUBY: Mark Lauby, NERC.

14 MR. GUGEL: A man who needs no introduction.

15 MR. COOK: Yeah. Once again, I'm Charlie Cook,
16 and I work for Duke Energy, representing the Standards
17 Committee. Thought of a funny, though. I had this mic
18 on when I walked into the bathroom.

19 (Laughter.)

20 MR. COOK: But then I realized, hey, John Belushi
21 did a similar skit on "Saturday Night Live," so I
22 turned it off, so.

1 MR. GOGGIN: Michael Goggin with Grid Strategies.

2 MR. GUGEL: I always think of Lesley Nielson and
3 "The Naked Gun" when he did that same thing, too.

4 MR. COOK: I'd probably do that, too, yeah.

5 MR. GUGEL: I'm afraid of that. I'm Howard Gugel
6 with NERC, and thank you all for participating on this.
7 I promise I won't ask any questions about models during
8 this -- during this panel. But do want to continue the
9 conversation that we had earlier talking about voltage
10 and frequency Ride-through, and the first question that
11 I'll have is specifically, Mark, from NERC's
12 perspective. And that would be, you know, have we
13 identified -- has NERC identified any challenges about
14 understanding and evaluating the impact of generators
15 failing to meet either PRC-029 or IEEE 2800?

16 MR. LAUBY: Models, no.

17 (Laughter.)

18 MR. LAUBY: One of the -- I think one of the
19 challenges is it reminds me of when I used to work in,
20 in Asia, and they'd come to me and say, well, how much
21 coffee do you want, and I'd say, how much did you make.
22 We're almost in that situation now where we're saying

1 to folks, well, you know, please give me this amount of
2 frequency or voltage, and they say, well, how much do
3 you need, and we can't answer the question, even 2800,
4 of course, which is a global standard, right? It's
5 kind of a -- I'll call it a global foundation, but we
6 haven't done the hard work. And what I mean by "the
7 hard work" is, you know, doing the system analysis to
8 understand what are the frequency response that we
9 need. How do we know that what we're putting in the
10 standard is going to ensure that we have sufficient
11 amount of Ride-through, be it voltage or frequency?

12 Now, we have some data, you know, some -- and we
13 had -- you know, that's on some of the -- some of the
14 events that Alex went through, which was helpful,
15 though, of course, we did have substantial amount of
16 spinning machines out there to help us with the
17 frequency when there was a need for frequency, or
18 operators that were taking action, like shedding load
19 to make sure the balance is kept.

20 So I think that's one of the hard parts is having
21 the data and the models and the simulations. We got to
22 get beyond the inverter-based resource and what it can

1 do to getting to what do we need, and then how will --
2 how will we drive the -- a standard to get there, so
3 what's a good starting point? Well, you know, I'll
4 leave it to the Drafting Team and the people -- and the
5 folks here, but, you know, clearly we're -- it's kind
6 of like a golf site, the old flat start. We're going
7 to start someplace, and then over time, we'll find out
8 as this evolves, if we need more or less.

9 There are places -- I talked to Jason -- not there
10 yet -- 2800 would actually cause you problems, voltage
11 collapse problems if you -- if everybody finally went
12 2800. So you got to do this hard work to say, hey, in
13 some places I'm going to have to have less than 2800,
14 and that's okay, it's easy to do that, and some places
15 you're going to need more depending on where you're at,
16 but then that's okay, too. You can do more than the
17 standard, and less, just make sure you have the
18 technical reasons for doing that. So it's not easy,
19 and you need good models and good simulation tools.

20 MR. GUGEL: Yeah. So to -- so to kind of build on
21 that because now we -- I think we kind of see the
22 issue, maybe we could talk about the magnitude of the

1 problem here. So from the rest of the panelists, from
2 your perspective, you know, what percentage of the
3 existing portfolios would be affected by the draft PRC-
4 029 criteria, and how would that change? Would there
5 be less or more affected if you changed that criteria
6 to meet 2800?

7 MR. GOGGIN: I can start. So the numbers I've
8 seen, and, you know, we heard on the previous panel
9 from folks on the wind and solar side it's a
10 significant share of the fleet. The numbers I've seen
11 from developers who will be speaking today and
12 tomorrow, 20 to 50 percent of their fleets, and, you
13 know, again, this is out of a base of several hundred
14 gigawatts. And this is -- I should clarify. I'm
15 talking about the frequency Ride-through requirements
16 in PRC-029.

17 So, you know, 20 to 50 percent of several hundred
18 gigawatts is a hundred-plus gigawatts of existing
19 resources that have major challenges with this, would
20 either require extensive retrofits or complete
21 retirement and replacement of the resources. And, you
22 know, we've heard a lot about the wind, but, you know,

1 anecdotally, we've seen with solar and batteries, I
2 think it's an issue of just, you know, these -- all
3 these plants were designed before the standard was
4 thought of. And so it's very difficult with a few
5 months' notice to go out and find out what the
6 capability of the plant is and, you know, how perform
7 -- just trying to meet this.

8 And so we really don't know, and, you know, I'll
9 come back to, so what is the solution? This is why we
10 don't do retroactive standards. It's really hard to
11 get them right and make sure that they work for
12 existing resources. There's a long history of doing
13 only prospective standards at FERC and NERC, and it's
14 for a good reason, and on the frequency side, we need
15 that. It has to be on the table. Otherwise, this just
16 doesn't work. And I think going forward, IEEE 2800 is
17 what the industry is designing towards. And, you know,
18 if you make that effective, you know, as of the, you
19 know, basically, when the standard takes effect all
20 interconnection agreements signed after that date have
21 to meet that. I think that works for the industry on a
22 going-forward basis.

1 Existing plants, again, weren't designed for 2800,
2 and so, you know, we need this -- it needs to be a
3 prospective standard only on the frequency side. And,
4 you know, just given the magnitude of what's at risk
5 here, a hundred gigawatts taken offline potentially
6 permanently or at least for extensive retrofits, is a
7 major reliability risk. We're doing way more harm than
8 any good we're doing if that's -- if that's going to be
9 the result, so this has to be fixed. So an exemption
10 for existing IEEE 2800 for going forward.

11 MR. CHWIALKOWSKI: I'll go next. EDF, again, EDF
12 renewables, a developer, and I'll go down the path of
13 we've had an opportunity already to do some of our
14 analysis with ERCOT. Now, ERCOT jumped ahead of NERC,
15 and they went forward with their Nodal Operating Guide
16 245, and they're looking at, at this point, forcing us
17 to maximize -- at least analyze the maximization of our
18 sites within the ERCOT region.

19 So we've had a chance to work very closely with
20 the OEMs and try to figure out where do we stand with
21 our current fleet. And I have some numbers for you and
22 I don't mind sharing them, but I'll also ask the other

1 developers in the room please share that information.

2 I know some of you have some numbers, and we aren't the
3 biggest developer out there, but our numbers are also
4 pretty significant. So for us, looking at the new PRC-
5 029, similarly, as we looked at NOGRR245 and IEEE 2800,
6 we're looking at almost 40 percent of our fleet being
7 affected by this and affected in multiple ways, not
8 just frequency alone, not just voltage alone. But when
9 you look at our older fleet, our older turbines in the
10 ground, it's both the voltage and the frequency Ride-
11 through that's an issue.

12 And then looking specifically at ROCOF, looking at
13 the phase-angle jump, looking at multiple excursions,
14 from the OEMs, we're getting the kind of information
15 that says until we test this, I cannot give you a
16 definitive answer. Well, as a developer, I want a
17 definitive answer, right? I want to know how do I
18 respond to the regulator, but I can't get that. And
19 you just heard the previous panel saying that's very
20 tough to come about. How do we test that? The OEMs
21 are my source of truth. If I can't get that
22 information from them, where do I go? What am I

1 supposed to do as a developer or as a generator to get
2 that information to answer the regulator?

3 MR. HOKE: So, you know, I'm not a generator owner
4 or an OEM. I'm a -- I'm a researcher. So I would
5 basically let everybody just listen to what we've heard
6 from the previous panel, what we've heard from these
7 guys up here. It's a pretty significant percentage of
8 the legacy fleet. I'd also comment, I think this has
9 been brought up before, that when we wrote 2800, IT
10 wasn't designed to be retroactive, and so applying it
11 retroactively causes all the problems we've heard
12 about. Now, and I also understand why people want to
13 apply it retroactively, right? We have a big
14 uncertainty in what does the grid need. We're
15 installing solar and wind plants. They're going to be
16 on the grid for 20 years or more, and we don't know
17 what the grid's going to need in that period. And so
18 there's this desire to be a little bit conservative and
19 get as much Ride-through as we can because we might
20 need it.

21 But I think what Mark said at the beginning, let's
22 get something that -- what we can get from industry

1 right now without slowing down the deployment of these
2 plants and without causing, you know, PEP companies to
3 go out of business and get what we can now. And in the
4 meantime, researchers like us will try to figure out
5 what the grid is really going to need and have a better
6 idea of that, and maybe we need to revise it and come
7 back to this in the future. So get the low-hanging
8 fruit now, get a good Ride-through standard now that
9 everyone can be on board with, and then if we need to
10 revise it in the future, we can revise it.

11 MR. PATEL: So I have nothing else left to say
12 really, but I'm looking at some of the notes my wife is
13 sending me right now.

14 (Laughter.)

15 MR. PATEL: Just like how my weekends go before I
16 open my mouth in front of family and friends, you know.
17 So I think Andy mentioned this. When we wrote 2800, it
18 was a forward-looking standard, and some of the
19 requirements in there does not exist today in any NERC
20 standards, right? Phase-angle jump never existed in a
21 NERC standard. ROCOF never existed in a NERC standard.
22 PRC-024, for that matter, is not a Ride-through

1 standard. It is voltage and frequency trip-setting
2 standard.

3 So when we wrote 2800, we had this question: what
4 does grid need and what can IBRs do? And we don't have
5 definitive answer on either of these questions. We
6 tried to find a middle ground somewhere based on
7 engineering judgment, right, a lot of head scratches,
8 and talking to a lot of OEMs about can equipment really
9 do this or not do this. And even then at the time, I
10 remember a very difficult conversation with couple of
11 OEMs on something very specific in the standard, and
12 few OEMs said, Manish, for us to answer this question
13 with any confidence, we have to be able to test our
14 equipment first, and we have never tested our
15 equipment, so we cannot affirmatively say that we can
16 or cannot meet certain requirements, right?

17 So anyhow, we wrote lot of 2800 requirements
18 thinking about future grid. A lot of folks were
19 involved, 400-plus, and they all agreed to some of
20 those requirements. As far as how many GOs or
21 portfolio will be affected by either PRC-029 or IEEE
22 2800, you heard OEMs. I think a couple of numbers

1 stuck to my head was one OEM said 40-gigawatt capacity.
2 Another one said 50 to 60,000 units, right? Fifty to
3 60,000 units. So that's just few examples.

4 I work -- all my career I've worked on
5 transmission side of the business, so I don't know the
6 numbers. But forward-looking standard, applying it to
7 the equipment that was placed in service five, 10, 15
8 years ago, and not having that same equipment in a lab
9 anymore to test it for future new requirements is a
10 challenge.

11 MR. GUGEL: So, and maybe we'll start at the far
12 end and work our way back for this next question. So,
13 and this may be a difficult one to answer, and if you
14 don't have the answer for it, I think that's fine, too.
15 But what would -- what do you think would be the
16 limitations that would need to be fixed, if you will,
17 or changed in order to meet the voltage -- we'll just
18 talk about the voltage criteria -- the voltage criteria
19 that's spelled out in proposed PRC-029? Is there --
20 what hardware do you think would need to be worked on
21 for that, if you will, or what are some reasonable
22 solutions that we could come to, to maybe not even to

1 necessarily meet that, but to come close to what's
2 shown in PRC-029?

3 MR. PATEL: Yeah. I'm sorry if I say something
4 wrong. My friends who are OEMs don't come talk to me
5 at the bar. But I think -- I think again, voltage
6 Ride-through requirements were forward-looking
7 requirements. I think at the end of day, it came down
8 to when we were writing 2800 -- and then PRC-029
9 voltage Ride-through almost mimics the IEEE 2800
10 voltage Ride-through. At the end of day, it came down
11 to a lot of auxiliary equipment, all this wind turbines
12 and, in some cases, BES and solar inverters and then
13 VSC HVDC, right? The IBR definition includes offshore
14 wind plants that it -- that connect to AC transmission
15 system via VSC HVDC converters.

16 So all these are very different technologies, and
17 limitations for one technology might not be the same
18 limitation for another technology, but it seems like at
19 the end of day, a lot of these things came down to a
20 lot of auxiliary equipment that is designed on some
21 other industry standards -- IEC NEMA curves, all that
22 kind of stuff that is sourced by OEMs of wind turbine

1 generators, solar PV BES, and VSC HVDC to go along with
2 their equipment. So it comes down to a lot of
3 auxiliary equipments.

4 MR. HOKE: Not a whole lot more to say there
5 because, I mean, it's sort of summarized pretty well
6 what we've heard from the OEMs in the previous panel.
7 You know, it's equipment specific. Sometimes it might
8 be auxiliary. Sometimes might be that you need some
9 power for the controls at low voltage for a certain
10 amount of time, but -- and sometimes maybe it's a
11 software change. But as we heard, even with those
12 software changes, you have to go back and retest that,
13 so it's not just a matter of updating new firmware.
14 I'm basically just summarizing what we've already
15 heard, so I'll leave it there.

16 MR. GUGEL: Well, maybe I can take us in a little
17 bit different direction then because there's a question
18 that I've had. If we made a switch, it seems like the
19 vast majority of inverters that are at least on the
20 legacy equipment and may be specified for now, tend to
21 be more grid following. If you made a switch to take
22 those inverters to grid forming, would that maybe solve

1 some of the issues that we're talking about for voltage
2 and frequency Ride-through?

3 MR. HOKE: All right. I'll jump in if no one else
4 wants that one.

5 (Laughter.)

6 MR. HOKE: I think you're going to run into a lot
7 of the same issues, and maybe even more issues because
8 now you're not just doing Ride-through, you're also
9 doing a whole different type of low-level control for
10 the inverter. I know that some of the inverters that
11 are out there can be retrofitted to become grid
12 forming. Others need a new inverter to become grid
13 forming. Again, it's a commit-specific question. And
14 the Ride-through issues, that doesn't make the Ride-
15 through issues go away. The Ride-through issues are
16 still there. You still need the auxiliaries to work.
17 You still need the control power to be there. So I
18 don't think it necessarily solves that issue. It's
19 another super important issue to talk about, but I
20 don't know if it necessarily helps with the Ride-
21 through.

22 MR. GUGEL: Good. That's a question that folks

1 have asked me in the past. And, you know, I didn't
2 stay at a Holiday Inn Express recently, so I didn't
3 have a good answer for it, but I thought maybe some of
4 the smarter heads here might have a good one for that.

5 MR. PATEL: I think that question may have some
6 value in terms of what does grid need. Does grid
7 following gives what grid needs versus what grid
8 forming, but I don't think you can compare grid
9 following Ride-through versus grid forming Ride-
10 through, and challenges, and all that kind of stuff. I
11 think that question may have value when we talk about
12 grid needs.

13 MR. GUGEL: Yeah. Just the question that had come
14 up for me was, does the fact that maybe it's less
15 dependent upon the frequency that's provided by the
16 system allow for some different controls that might
17 make the ability to Ride-through different as opposed
18 to looking at the frequency on the system and reacting
19 to that internally into the inverter.

20 MR. PATEL: So I think repeating myself and
21 repeating with everyone else on the previous panel, I
22 think a lot of this limitations is not only the wind

1 turbine or the -- or the inverter. It's a lot of
2 auxiliary equipment, right? Grid forming won't change
3 in the auxiliary equipment. It remains same, so.

4 MR. GUGEL: Right. Okay.

5 (Cross talking.)

6 MR. HOKE: -- for the synchronization issue just
7 real quick there, and maybe grid forming helps with
8 that, but that's just one piece of the puzzle of the
9 Ride-through, right, everything else that everyone else
10 had mentioned.

11 MR. CHWIALKOWSKI: Before we go down that path of
12 grid forming/grid following, let's go back to that
13 previous question of, you know, will hardware fix a lot
14 of these voltage Ride-through issues? And I'll go back
15 to the source of truth, but I also want to -- I also
16 want to expand a little bit upon that because as a
17 generator owner operator, we're being asked that right
18 now, what will be necessary to maximize our turbines
19 down in the ERCOT 4 region, for instance? And I want
20 to explain that process to you a little bit better
21 because this is not a trivial process.

22 We rely on the source of truth, the OEM, to give

1 us that information about the turbine. But that's just
2 the first step because then you take it to the
3 substation, and you start looking at how are we
4 protecting the components of the substation? If I make
5 any change downstream at the turbine level, how is that
6 going to affect my substation? And then once I have a
7 better idea of how that affects the plant on the
8 medium-voltage side and the high-voltage side, then I
9 go back to the -- I hate to say it -- the modeling
10 side, which could take far more time to even go through
11 that process because, again, we look at the source of
12 truth, the OEM for the models. And that could take six
13 months to a year sometimes to get those models from
14 that and then expand the models to the entire plant.

15 Now, if you have a homogeneous system and you have
16 one OEM, one model type, that works out pretty well.
17 You put two model types out there, it gets a little
18 more difficult. Two OEMs each having one model makes
19 it even more difficult. We have a site with three OEMs
20 and multiple model types. It's easily a year to get a
21 model set together to submit. That's the process that
22 we go through, but again, to answer your question, on

1 the hardware side alone for the turbine, the OEM. I
2 mean, if we can't get an answer from them in a
3 reasonable time, that's where we stand.

4 MR. LAUBY: I don't want to hear myself. I think
5 the challenge here, too, is to understand what's the
6 risk. I think some folks kind of mentioned this
7 before. We saw some charts that Alex put up on the
8 current situation based on certain events. If we just
9 ask folks to provide us what they can, and I don't know
10 how you define that, what's reasonable versus
11 unreasonable, and then looking forward, making sure
12 that we stay to one particular standard that we can
13 count on. And realizing that, again, sometimes when
14 you do the technical studies, that you may actually not
15 want to implement a Ride-through criteria that might be
16 like a 2800 or 029. Maybe we need something a little
17 bit shorter. I think -- I think we can stay in front
18 of the risk. I think the main -- the main thing is to
19 ensure that those can -- those devices out there that
20 can provide more within the reasonableness that -- you
21 guys can decide what's reasonable versus unreasonable
22 -- to take advantage of it.

1 There may be some regions, though, or
2 interconnections where that's a real issue for them,
3 and Texas might be one of them. It's a small
4 interconnection, very -- more and more dependent on the
5 inverter-based devices there because they're building a
6 lot of them over a period of time. And so they may
7 have a bit more of a need in certain interconnections
8 versus other interconnections.

9 MR. GOGGIN: I totally agree with that. I think,
10 you know, the need needs to drive this, not the
11 capabilities, and that was a little confusing this
12 morning kind of hearing the -- from the Drafting Team
13 that they kind of -- you know, that their logic was,
14 oh, well, IBRs can do this, so we're going to make
15 them. And that's backwards, it's discriminatory, and
16 it's just not a good standards practice.

17 You should define the need, and I think it's clear
18 that the plus or minus 4 hertz per six seconds is not
19 based on any real need, based on, you know, the charts
20 we've seen this morning and the 10 NERC reports. You
21 know, there's never been a frequency deviation that
22 large, and, you know, just thinking about what would

1 happen. If the frequency is down at 56 hertz, every
2 conventional generator would've tripped off, you know,
3 or at 59 hertz, all the load would've tripped off
4 around then, too. You know, what's the point? What
5 are we trying to achieve here by making IBRs stick
6 around while every -- the entire other power system --
7 rest of the power system goes black?

8 I don't think -- I don't -- I haven't heard any --
9 I've been asking all day. I think -- I don't think
10 anybody has heard a good technical justification for
11 what we're trying to do here. You know, these -- the
12 bounds here are just so far beyond, you know,
13 everything that I think is based in, you know, actual
14 needs, and so what is that need? And yes, it may vary
15 by interconnection, you know, the standard connection.
16 NERC has done analysis showing it's -- you know, even
17 with very high penetrations of inverters, maybe with,
18 you know, extremely high contingencies, you know, 3X,
19 you know, losing 7,000 megawatts in contingency, you
20 still have very tightly-controlled frequency.

21 And with IBRs that have fast frequency response,
22 grid-forming capability, and other things, frequencies

1 are even more tightly controlled with lots of
2 batteries, with, you know, controlled renewables. I
3 think we're moving to a where frequency is even more
4 tightly controlled than it is today. And so let's, you
5 know, first establish that need and then work backwards
6 from that, and then set the requirements based on that.
7 Let's not go with this backwards route of, oh, we can,
8 you know -- we think inverters can do this, so we're
9 going to make them.

10 MR. GUGEL: The only caveat that I would provide
11 -- and sorry, Mark, I'll speak out of turn, and you can
12 clean up for me. The only caveat that I would provide
13 is the examples that were provided this morning and
14 that kind of show some of the events that occurred,
15 were just specifically rated to -- related to inverter-
16 based resource events that we've seen over the last
17 three or four years. It doesn't say that we haven't
18 seen frequency excursions larger than that. It's just
19 that we haven't recently seen those.

20 If you go back in history, we have had in Florida
21 somewhat, fairly large, you know, frequency excursions
22 that have occurred. And we're trying to protect not

1 just for some of the things that we've seen recently,
2 but for events that could occur on the system that are
3 much more drastic than that. We're trying to stay out
4 of that.

5 MR. GOGGIN: Sure, and I was including Uri in
6 that, which was not an IBR. It was a gas event.

7 MR. GUGEL: Well, yeah, but, again, that's just
8 some of the more recent. If you were to go back to
9 some of our more historic legacy issues that maybe got
10 us into why we got our name and our purpose you would
11 see a little bit more of those issues that are there.
12 And, Mark, I think Edison probably had some good
13 comments --

14 MR. LAUBY: Yeah, Edison, and I saw that. No, I
15 think you're right, Howard. I think that -- I don't
16 see this as a discriminatory act. I know the Drafting
17 Team is struggling with what -- with the tools they
18 have and the experiences they have. I think the
19 challenge has been that we're saying throw a ball, but
20 we won't tell them how fast we're throwing it and how
21 far it's got to go because we haven't done the studies.
22 Back in the day when you were adding a generating

1 plant, you ran all sorts of different contingencies,
2 and you made sure that you didn't impact your neighbor,
3 that you had all the models right, and you knew how
4 that thing was going to play within the system. It
5 seems that we haven't done that in some -- in these
6 cases, maybe because there's just so -- the number is
7 so large and has overwhelmed the system.

8 But we have to get back to, to your point, what do
9 we need and how do we tune the system, and that
10 includes the in grid-forming inverters. How are we
11 going to tune the system so the controls work together
12 and provide the self-healing smart, you know,
13 resilient, reliable grid that we envision this is going
14 to result in? Thank you.

15 MR. PATEL: So may I add something real quick? I
16 think -- I think we have been focusing -- so we're in a
17 football season, so let me give you an analogy. My
18 team lost the football game over the weekend. I'm glad
19 I'm here so I can forget about all that. But they were
20 -- they're a pretty good defensive team, but they
21 couldn't move the ball on offense. You can't win the
22 game, right? So we are talking about Ride-through

1 capability, this frequency deviation for this time.

2 And there is -- a big other side of it is that, what
3 does IBRs do, or any other resources do, when the
4 frequency is abnormal for certain amount of time?

5 The new IBRs probably can respond much faster
6 during frequency deviation, right? Battery energy
7 storage can respond much faster. I think -- I think we
8 can put some solutions together for the system where
9 the frequency's arrested before it goes too low or too
10 high, right? I don't think we have to only focus on
11 plus or minus 4 hertz per six seconds, or whatever
12 other hertz per 299 second, the other piece, which is
13 not part of PRC-029 right now, which is okay. But I
14 think there are other ways to make sure that the system
15 together holds, right, and the frequency arrested, and
16 it turn around back to 60 hertz in a -- in a timely
17 manner.

18 MR. GUGEL: Yep. Charlie, I've kind of dominated
19 the questions here. Have you -- have you got anything
20 you'd like to add at this point?

21 MR. COOK: No, keep going.

22 MR. GUGEL: Okay. You know, one of the -- and I'm

1 going to go off script here. It's not even a question
2 that we've got here, but one of the things that we saw
3 in the past was an issue with sampling frequency, and
4 the fact that -- sampling frequency. So the issue that
5 may be harmonics or subharmonics may be affecting what
6 the inverter or other equipment sees as being a
7 frequency or voltage excursion, how do we solve that
8 problem? Is it -- is it -- I mean, it'd be very easy
9 to in my mind to say, okay, well, I'll just get some
10 sort of a frequency smoothing device or sampling issues
11 or whatever. But is there -- is there some way that we
12 can maybe address that and come away with a feeling
13 that we're actually sampling what's occurring on the
14 system and not getting influenced by harmonics that
15 might be out there?

16 MR. HOKE: That's not in the script, but we can
17 say a little bit about it. So right now, Manish and I
18 and a whole bunch of other people in this room are
19 writing IEEE 2800.2, which is the procedures to verify
20 conformance IEEE 2800. And from a really high level,
21 what that does is it takes an IBR unit, which is an
22 individual turbine or an inverter, and do some tests,

1 whether that's in a lab or in a field or even in a HIL
2 setup. And just doesn't try to make sure that it can
3 do any certain thing, but just make sure that its
4 behavior matches its model. And then you take that
5 model or that IBR unit, which is now verified to match
6 the behavior of the -- of the device itself, and you
7 build a plant-level model, and you do a couple -- a few
8 simulations, fairly simple simulations, really, on
9 that, to make sure that it meets the behavior and --
10 that you need for my IEEE 2800, for example, or from
11 whatever other source requirements document you're
12 looking at.

13 And so you can use a process like that to verify
14 whether a plant is going to trip, for example, when
15 there's a phase jump and confuse that phase jump with
16 the frequency change and trip. If you can then play a
17 phase jump through that plant model, and if it's going
18 to confuse -- if it's going to get its PLL confused
19 and think, oh, whoops, the frequency's 72 hertz, I'm
20 going to trip, it's going to fail that test. So you
21 can use a process like that.

22 You would also see it in the testing phase 2

1 because you would've put a similar event through the
2 event -- through the actual hardware inverter or
3 turbine, and you would've seen, oh well, that turbine
4 didn't behave how we hoped it would. And so I think
5 through that sort of a process, which, you know, like I
6 said, right now we're writing this in 2800.2, but these
7 are processes that manufacturers are already using.
8 Manufacturers are already testing their devices, not
9 exactly using the procedure we're writing because we're
10 writing them now, but they're also validating their
11 models against their hardware, at least I believe all
12 the manufacturers that we saw up here this morning are.
13 And so that's one approach to that question is sort of
14 a testing -- combination of testing and modeling, I
15 guess, would be the short answer.

16 MR. GUGEL: Okay.

17 MR. LAUBY: One thought I had on this is, what
18 we're getting to is, you know, inverters themselves
19 have wonderful characteristics of being able to move
20 very quickly. And so we need to be able then to ramp
21 up our sampling or monitoring very quickly because they
22 need sometimes to act at the speed of light to protect

1 themselves. So I think, you know, the -- I think that
2 the sampling rates have to increase or monitoring rates
3 need to increase so that then the remedial actions and
4 mitigations can take place, and also, that that
5 information can flow to other inverters in the area.
6 I'm going off, this is the reason why, and, of course,
7 then they can act accordingly, too.

8 MR. CHWIALKOWSKI: I'm going to add to Mark's
9 comments because I think this is a great place to
10 digress, as an example, PRC-028, for instance, asking
11 for additional data. I don't know of a single
12 developer generator that would say we want less
13 reliability. That's not the case. That is absolutely
14 not the case. And looking at PRC-028, looking at
15 ERCOT's NOGRR255, looking at IEEE 2800 Table 19, we
16 know this is not easy. This is hard. This is not easy
17 stuff. It will cost money, but it's -- you know, even
18 though it's hard, we're willing to do that because we
19 think data is the answer to move forward, to move
20 prospectively through some of these requirements
21 because having the right data will help us make better
22 decisions in the future.

1 Yes, it's hard, yes, we're willing to do it, yes,
2 we have a understanding, but it's not wholly understood
3 yet what kind of equipment we'll have to retrofit out
4 in the field to get this data, but we're willing to do
5 it. That's where we come from, and that backs up your
6 comments, too, Mark.

7 MR. COOK: So there's question from the script
8 that I'd like to have addressed right now, and it's
9 Question Number 3. And it says, what are reasonable
10 solutions to ensure legacy equipment can be compliant
11 with the frequency criteria in Draft PRC-029 Attachment
12 2?

13 MR. GOGGIN: Yeah, I can offer some thoughts
14 there, and I think it's instructive to go back to Order
15 901 from FERC. They pointed to the language that's in
16 PRC-024 that has equipment limitation exemption
17 process, and, you know, there are some things similar
18 in the current draft of PRC-029 for the voltage-related
19 requirements. I think that's what is needed for these
20 existing resources.

21 You know, I think we heard on the last panel that
22 there needs to be reasonable accommodation for, you

1 know, using declarations or attestations or something
2 like that in cases where it's just not practical to
3 test because, you know, the OEM that built a piece of
4 equipment is no longer there, or, you know, it's no
5 longer supported by the manufacturer, or just, you
6 know, you just -- in many cases you can't physically
7 test for these things. You have to run simulations and
8 kind of guess what it was, and that's -- you know, I
9 think that's -- again, it's why we don't do retroactive
10 standards. In many cases, proving a negative
11 retroactively is extremely challenging. And so there
12 needs to be some reasonable accommodation, yeah. We
13 don't want to have a blanket exemption, but at the same
14 time, like, you know, there has to be understanding of
15 the realities of how you can validate this.

16 And, you know, I think, again, having this
17 equipment limitation in there is essential. You know,
18 there's a massive cost potentially incurred here if we
19 don't have an exemption for the existing resources.
20 And with, you know, no real upside reliability, it's
21 just going to be, you know, a hundred-plus gigawatts
22 taken offline.

1 And, you know, I think, you know, we've heard
2 about, you know, what Order 901 says. I think having
3 exemption for frequency is entirely consistent with
4 FERC's directive there. If you read it contextually --
5 I have a little insight here. I'm not -- obviously, I
6 don't work at FERC and I'm not a lawyer, but FERC was
7 responding to comments that I helped ACP CIA write when
8 it talked about the exemption for voltage Ride-through.
9 And we'd had a back-and-forth in the NOPR, the notice
10 of proposed rulemaking, with FERC about the voltage
11 requirements, and basically we said, you know, there
12 might be some challenges with existing resources, and
13 then FERC was basically saying, okay, you can have an
14 exemption for existing resources that would have to
15 replace hardware to meet the voltage requirement.

16 FERC was silent on frequency Ride-through
17 requirements because we weren't talking about that in
18 the comments that we were submitting. FERC was clear
19 that they were okay with exemptions for resources that
20 would have to replace their equipment, and, you know,
21 FERC's logic is there's not a lot of these, they're
22 going to be replacing their equipment anyway as

1 inverters age out, and, you know, we're repowering the
2 wind fleet anyway, and so there's no reliability risk
3 here, so we can have these exemptions.

4 That logic all applies for frequency Ride-through,
5 and so I think, you know, there's very clear logic from
6 FERC as to why there should be an exemption process
7 that looks like what's in PRC-024. And FERC actually,
8 again, pointed to PRC-024 when they were directing NERC
9 how to set up this exemption process.

10 MR. GUGEL: Yeah. I would even extend on what you
11 said earlier, not only looking at reliability benefit,
12 but reliability deficit for the retirement of, you
13 know, hundreds of gigawatts of energy that's out there.
14 You know, that should be taken into account, too, so I
15 think -- I think that's a really good point.

16 MR. LAUBY: I would add to that, I think it's
17 important that we understand -- we planning engineers
18 understand what is the state of the network. What is
19 the state of the generators in the sense that when I do
20 my studies and I have an overfrequency, I know which
21 ones are going to go out and which ones are going to
22 hang on. I also want to understand the implications of

1 the ones that go out on the ones that did stay on, and
2 do they create more of a frequency issue. So I think
3 going through the process of -- you know, going through
4 the attestations and understanding the state of the
5 generators that are on the network, plus, of course,
6 those that we're adding, that when we do our system
7 studies, we'll have a much clearer picture of really
8 where we stand.

9 MR. GUGEL: Yeah. I think, not to get too far off
10 topic here, and we want to go to the questions online
11 and in the room. I think one of the things that today
12 has pointed to is the fact that we need to have these
13 same conversations about models as we get into the next
14 phases of 901. And I think it's going to be very
15 crucial that we get us in the room again and talk about
16 those issues through that. With that, let's see if we
17 have any questions here in the room or online.

18 Bueller?

19 (Laughter.)

20 MR. YEUNG: Yeah, I'm on. I had to get clearance
21 from Jamie first before I asked this question because
22 I'm a -- I'm a moderator for tomorrow. But today my

1 question is solely from the ISO/RTO perspective. My
2 name is Charles Young with Southwest Power Pool, and
3 I'm not sure if there's many other RTOs in the room
4 here today, so I thought -- I want to raise this issue.

5 First of all, I want to point out what Mark said.
6 I'll call that Letter A. Mark mentioned this expanded
7 frequency response provides a lot of automation and
8 adds resiliency to the grid. So that's very important
9 knowing that the proliferation of IBRs is jeopardizing
10 some of that stability, you know, operating in the
11 unknown states, right? The second thing is what Manish
12 said, and I'll call that Letter B. Manish mentioned
13 very clearly PRC-024, it's not a Ride-through standard.
14 It's a -- basically a frequency limitations-settings
15 standard to prevent, you know, resources from dropping
16 offline during conditions or the where the grid is, you
17 know, in excessive frequency declines or rises. So as
18 an operator, as an ISO/RTO operator, I'd like to get to
19 Letter A, Mark's model, the future resiliency and
20 automation, produce light things to work and not have
21 to intervene to avoid Letter B, you know, this relay
22 operation when frequencies are either excessive or

1 high.

2 So how does an ISO do that? How do -- how do we
3 get resiliency without getting into PRC-024 operations?

4 The only tools we have as operators is operator
5 intervention, and that can be a range of things, right?

6 We can reconfigure the grid, we can put resources on
7 resources online, and, as an RTO, it could be out of
8 merit, more than likely out of merit, or we can do
9 curtailments of those assets we believe are at risk.

10 So that's our choice. I'm not hearing a lot today
11 about the operator's tools and how these benefit the
12 operator.

13 MR. LAUBY: I left it on this time just in case.
14 I think the way to get to it, of course, as a -- I'm
15 thinking operational planning drop, right? You got to
16 -- like you say, we got to model this stuff. We got to
17 know -- we don't want to be running the system in
18 unstudied states, so we need the information on what
19 the expectations are. How are they going to behave?
20 Every one of these plants, how are they going to be
21 behave under certain system conditions so that when we
22 study them ahead of time, you can pre-position yourself

1 rather than kind of go, oh, surprise, guess what,
2 another thing happened and another thing happened.

3 The idea that we need a unique models for every
4 one of these, I hope we can get around that, but at
5 some point or another, at least being able to
6 understand that during certain events, what your
7 expectations are going to be. And that feeds right
8 into your IRO standards about contingencies that you're
9 going to run on your system because you have a certain
10 expectation that when a line-to-ground fault comes on,
11 you're going to lose 500 megawatts of solar voltaic,
12 and so then you got to make sure you're ready for that,
13 as opposed to running blind.

14 Of course you can haul the planners in later on if
15 you want and say, hey, you got to fix this. That's in
16 the planning stage, right? And that's when you start
17 getting into, well, what the standard is and what's --
18 what equipment we're going to be acquiring going
19 forward. But I think you're -- right now, you're
20 right. You're kind of running a little bit blind
21 because you don't have the models, and you don't have
22 the knowledge of how those devices are going to perform

1 during certain events. You're kind of learning on the
2 fly.

3 MR. PATEL: So real quick, Charles, I think that's
4 a million-dollar question that we don't know the answer
5 to. I mean, you asked the question from ISO/RTO
6 perspective, but if you think -- I used to be a
7 transmission owner or protection control engineer until
8 recently, and, you know, to protect my system, I need
9 to know what the system will look like or what the
10 system will be able to provide in terms of falcon or
11 what type of falcon, and then I can set a protection.
12 But I think it's a million-dollar question that we
13 don't know the answer to yet. Thinking of 24/7, 365
14 days a year and then 20 years out in future, right, you
15 have very different operating scenarios when you go
16 through different days, different months, different
17 years, so.

18 MR. CHWIALKOWSKI: I'll add one thing to that,
19 also, just to answer your question. I think to help
20 you out, we do need better modeling, no question, but
21 better data also is important. I mean, that's two of
22 the things that I think are very important that we can

1 look at retrospectively versus prospectively, where we
2 have the technical capability and it's also
3 commercially reasonable. That's where you establish
4 that balance, right, of going down that path. And I'm
5 going to quote Alex from earlier this morning where he
6 mentioned, you know, what is it that we should focus on
7 moving forward? I think a couple of solutions are
8 right there, right in front of us -- better data
9 collection and then better modeling -- and for that, we
10 need our source of truth, the OEMs. So, Alex, you're
11 there.

12 MR. SCHMIDT GRAU: So Thomas, Vestas, here. Just
13 kind of a segue of this as well. Grid forming, grid
14 following, at least from Vesta's perspective, is the
15 same hardware. That's different software at current
16 states. So I think it's also important to understand
17 when we talk about the PRC-029, for me, that's a
18 capability requirement. It's not about how the plant
19 has to perform. It's an envelope on it, and with these
20 tools of we're going to get data, better modeling, and
21 so on, what is the kind of vision to start developing
22 some more direct performance requirements on how to do

1 -- because what are we going to do as an OEM? What
2 should we design our control for if the frequency goes
3 to 58 hertz for hundred milliseconds or 200
4 milliseconds or 300 milliseconds?

5 I don't -- I don't see that kind of in the
6 performance on the standards today, and that also
7 creates a lot of different implementation possibilities
8 and different behavior on it. So I'm looking for some
9 direction on performance requirements and how that
10 should look like.

11 MR. GUGEL: I'll take the first step on that.
12 Nice for the compliance guy to jump in here, I know,
13 and you're all fading. You know, I really would look
14 to the technical experts to develop some reliability
15 guidelines around that. You can kind of think of what
16 we -- what we set up at NERC for reliability standards
17 as being the guardrails, if you will, the extremes.
18 But I think once you operate within that, then really
19 you're looking toward your technical experts to decide
20 what should be a best practice. And I'm going to use
21 air quotes there because everybody's hates to do that
22 because they're public utility commissions, hold to

1 them the different things. But, you know, when you're
2 within that, there's probably better ways to operate
3 and less better ways to operate. I don't think, at
4 least from our perspective, we wouldn't define that in
5 a reliability standard, but instead, that would be more
6 operating practices. Any other thoughts from the --
7 from the panel here on that?

8 MR. PATEL: So real quick, I think -- I think -- I
9 think what you mentioned is very important, but I think
10 the answer to some of those questions will be system
11 dependent, right? A 200-megawatt solar on a 500 KV
12 system can perform a little bit differently than a 50-
13 megawatt on a 46 KV system, right? So I think it's
14 very difficult to standardize how to utilize some of
15 those performance requirements. I think it'll go based
16 on system studies and need of the grid, and all that
17 kind of stuff. So maybe your reliability guideline,
18 that kind of provides an educational material to
19 engineers about how to utilize some of those
20 capabilities, but I think standardization is too early
21 for something like that.

22 MR. SCHMIDT GRAU: It makes perfect sense because

1 I think it's very important to, you know, as you said,
2 Manish, also, we should have the equipment, try to
3 correct the frequency before we hit the envelopes, and
4 that, for me, goes in into some of the performance. I
5 know we have extremely fast sampling from a plant
6 level. I can talk more on that in one-on-ones, and
7 that sometimes turns out to be very negative as well.
8 In Texas where you have a very small deadband of
9 frequency, we sometimes go in and out of frequency
10 control 25 times in four seconds, you know. So we're
11 re reacting too fast because there's a performance
12 requirement stating you're not allowed to have any
13 artificial delay on your response, so we just like bang
14 in and out, in and out constantly.

15 So that's where some of these performance and
16 understanding is also faster is not always better. We
17 also have to slow down things, and that's where we need
18 to balance it.

19 MR. GUGEL: You probably also have situations
20 where you have units fighting each other, right --

21 MR. SCHMIDT GRAU: Yeah.

22 MR. GUGEL: As they're popping in and out, they're

1 actually reacting to each other on that too, which --

2 MR. SCHMIDT GRAU: Ask Todd about that with his
3 three OEMs in one plant.

4 MR. COOK: Yeah, excuse me. Scott, you stood up
5 while ago, and I didn't recognize you. I apologize.
6 Do you have a question or did it get answered or asked?

7 MR. KARPIEL: (Off mic comment.)

8 MR. COOK: Okay.

9 MR. GUGEL: I tried to lead us there, but, you
10 know.

11 (Laughter.)

12 MR. VENKITANARAYANAN: Nath Venkiti, GE Vernova.
13 My question is, I think there is a general intent to
14 try and align PRC-029 somewhat to IEEE 2800, you know,
15 not exactly. But like, the Ride-throughs curves seem
16 to have a basis in IEEE 2800, but there are also some
17 substantial differences, and I wanted to understand if
18 those substantial differences are intentional or if
19 they might actually be accidental. I'll give you some
20 examples.

21 Like for example, IEEE 2800 has an MFRT
22 requirement, and it starts off with a paragraph, and

1 the first bullet under that paragraph says that the IBR
2 shall not be required to withstand more than four
3 consecutive voltage dips. Okay. That first bullet was
4 picked up in PRC-029. Now, IEEE 2800 then goes on to
5 say in the second and third and fourth bullets that if
6 the voltage dip is less than 50 percent, then it only
7 needs to withstand two consecutive voltage dips and not
8 four. So those subsequent bullets were eliminated from
9 PRC-029, and that kind of raises a question in my mind
10 as to whether this is really intentional or accidental.

11 Another example, IEEE 2800, the example that I
12 brought up this morning about the one-cycle Ride-
13 through requirement for transient overvoltages. Now, I
14 heard that there is -- there's kind of -- some kind of
15 intention behind that, but accidentally, what that has
16 done is impose a requirement that the IBR units
17 withstand any transient overvoltage that is less than
18 one cycle, an infinite magnitude of that voltage that
19 is less than one cycle, right? That's exactly what
20 it's been translated to.

21 Other examples: IEEE 2800 said wind turbines,
22 which a typical wind turbine with its blade at its

1 12:00 position can be -- an offshore wind turbine can
2 be as tall as the Empire State Building. So IEEE 2800
3 said, if you have mechanical resonances during MFRT
4 events, then the wind turbine is allowed to trip to
5 protect itself from those resonances. That part is not
6 in PRC-029. Another example IEEE 2800 says V over F,
7 for -- right? For V over F, it said -- it referenced
8 certain equipment standards for auxiliaries and said if
9 you go outside the envelope of V over F or F over V
10 capabilities as specified in those standards for those
11 auxiliary equipment, then you're allowed to modulate
12 reactive power so as to adjust voltage and try to stay
13 within those limits so that you don't trip. That
14 requirement was f eliminated from PRC-029.

15 So again, I'm just asking for the view of this
16 panel is, do you think this is intentional or maybe
17 accidental?

18 MR. GUGEL: So at the risk of providing a non-
19 answer, I'm not sure that this panel could speak to
20 that because they weren't on the Drafting Team. They
21 weren't the ones that made the decision on that. I
22 think that would be a good question to have the

1 Drafting Team and then also the Standards Committee as
2 they're looking at making this modification. But I
3 don't know that this panel could speak to the intent as
4 to whether or not it was intentional or not.

5 MR. VENKITANARAYANAN: Okay. Yeah, I didn't find
6 another forum to ask the question, so I just wanted to
7 see if there was any -- if this --

8 MR. PATEL: May I -- may I? So with all due
9 respect to Husam and Shawn, I'm not a member of the
10 Standard Drafting Team, but I joke that I'm an honorary
11 member because I'm equally vocal as an observer --

12 (Laughter.)

13 MR. PATEL: -- and they value the input that
14 encourages me to talk. I think -- so consecutive
15 voltage dip and transient overvoltage are the biggest
16 nightmares of my life. I'll remember it until I'm
17 dead. The Clause 7 in 2800 -- that is voltage and
18 frequency Ride-through -- is a good 20-page material
19 that was written by a lot of folks very carefully, and
20 PRC-029 is, what, three page requirements document? So
21 we went into 2800 and picked up few tables and few
22 statements and put it into PRC-029.

1 I think that's the risk, right? This 20-page
2 story in 2800 became a three- or four-page writeup in
3 PRC-029 with all the measures and every other fluff
4 that needs to go into the NERC standard, right, and
5 that's actually the problem. I do agree with you,
6 Nath. I think we have to be very careful that when we
7 go and pick some bits and pieces from 2800 and put it
8 somewhere else, we have to make sure that the dots are
9 connected appropriately so there is no ambiguity or
10 unintentional consequences.

11 MR. VENKITANARAYANAN: Thank you.

12 MR. MAJUMDER: I'll just offer this to answer
13 Nath's question that it was not accidental. I'll leave
14 it there. Whether it -- whether or not it was
15 intentional, I would not get into that. But what I
16 would offer is the standard of thinking needs to
17 understand models are very important, but let's not
18 make reliability standard only thinking of PSCAD and
19 PSSE. It way beyond PSCAD and a PSSE. It's a physical
20 equipment, everything Nath just said. Those insights
21 are extremely important, so I'm so glad that in
22 Technical Conference, we have great participation from

1 the OEMs who are sharing their insight.

2 This is one, in my mind, is a missing piece. The
3 Standard Drafting Team needed to consider that what are
4 the physical insight. Going into a PSCAD model and
5 changing from 1.7 to 1.8 can be done in seconds, but
6 the consequence of changing that 1.7 to 1.8 does not
7 happen instantaneously. There is a massive process
8 that is there, and even in the model, not just mention
9 about the mechanical resonance, not a single PSCAD
10 model would capture this. We have issue of temperature
11 rise on a DC chopper, which model is capturing that?

12 So therefore, when we get a question like, okay,
13 let's find out what hardware element, I think the
14 previous panel said many times it's not -- you cannot
15 just put your finger one specific hardware element,
16 that's the reason. It can be a very complex
17 combination, so it's not only just an IP. Of course IP
18 is an issue, but the outcome of so many complex element
19 creating a trip, it is -- it is not easy. So let's
20 think beyond modeling space, let's think from an
21 equipment perspective, and listen to all these expert
22 while we are making further decision. Thank you.

1 MR. BENNETT: Okay. Thank you. I don't think
2 we're terminating this panel just quite yet. I think
3 we can take a couple questions from online and give
4 them an opportunity to participate?

5 MS. CASUSCELLI: Yeah. Yeah. Thanks, Todd.

6 MR. BENNETT: Okay.

7 MS. CASUSCELLI: I'll ask a couple of questions
8 from online. So most of the discussion so far has been
9 for land-based resources. Are there different voltage-
10 related concerns for offshore wind?

11 MR. GOGGIN: I'm not going to get into the
12 technical details. I would note part of the reason why
13 I have mentioned the need to have the standard apply
14 prospectively from the signing of the interconnection
15 agreement and not being placed in service as it is in
16 the current draft is because of the long lead time for
17 offshore wind, but also, you know, other land-based
18 wind, you know, and solar and batteries also can have
19 long lead times between, you know, when they sign the
20 interconnection agreement and -- I'm sorry -- when
21 they, you know, start developing the project and, you
22 know, buy equipment and develop settings and things

1 like. And so, you know, having the requirements take
2 effect for plants in service as is in the current draft
3 would not work for these longer lead assets. And so
4 that's -- you know, that's necessary to, you know, set
5 the requirements and have them take effect based on
6 resources -- signing the interconnection agreement
7 after the date, you know, the implementation of the
8 standard.

9 MR. LAUBY: I was talking to my friend from EDF
10 here because they have a lot of offshore and, you know,
11 many times the collector systems are DC, and one would
12 have to do the study work to see if that has any
13 implication. But certainly they're more rugged
14 offshore than they are onshore, but that might be one
15 study that needs to be done, see if there's
16 implications of the AC-to-DC collection and the --
17 another set of inverters there.

18 MR. GUGEL: Probably interconnection methods would
19 be another way of looking at it, whether or not it's
20 radial or whether or not it's connected at multiple
21 points, because a radial one would have different
22 voltage issues, I would think, than something that

1 would be more of a network connection.

2 MS. CASUSCELLI: All right. Thank you. One more
3 from online. The OEM panels do not seem to represent
4 all of the vendors, and so how does NERC plan to
5 address the different IBR technologies that were not
6 represented on the panels?

7 MR. GUGEL: I guess a good answer wouldn't be
8 we're just going to make up some stuff for the rest of
9 it.

10 (Laughter.)

11 MR. GUGEL: No. So there's -- this is still a
12 very public process, and I know the Drafting Team in
13 the past has tried to reach out to OEMs to get as much
14 information as they can. I'm hoping that we have even
15 more OEM representation online at this point. I know
16 that the Drafting Team and others would welcome any
17 comments and any input that you would have from your
18 perspective on that, too. Certainly from active OEMs,
19 we know there's also some that, you know, are no longer
20 in production. It'd be very difficult to get
21 information from those, but kind of information that
22 can be provided to help further a knowledge about what

1 is out there on the system and what is going to be
2 projected out there in the future would be very much
3 welcomed.

4 MR. GOGGIN: I would just chime in that this is
5 all the more reason to not do retroactive standards.
6 It's extremely challenging to make sure that those
7 standards work for everything that's out there,
8 including the stuff that was built decades ago by
9 somebody that no longer exist, and prospectively to use
10 2800 because it's what the industry is designing
11 towards, and so that process has already played out.
12 You know, Order 901, we're having to do this very
13 quickly and that approach of not retroactive and IEEE
14 2800 prospectively is the safest way to avoid causing
15 major unintended problems.

16 MR. GUGEL: Yeah. So I understand the concern,
17 but we have many standards that are retroactive
18 standards when they go into place. So I understand
19 that we need to -- we need to have a concept and a --
20 and a -- and a -- and a -- and a context of how this
21 all fits in, but just because something is a legacy
22 piece of equipment doesn't mean it needs to have

1 reliability issues and reliability constraints placed
2 around it as it operates on the system because it can
3 affect reliability just as importantly as things that
4 are placed in the future.

5 MR. GOGGIN: Yeah, I don't disagree with that. I
6 think, you know, again, if we do have concerns about
7 existing resources, we should start with the, you know,
8 reliability needs and work backwards from that and
9 design a solution. You know, this is an extremely fast
10 process, and we need to be careful we're not causing
11 unintended problems in this process. We can -- if
12 there are real reliability concerns that are left on
13 the table I think there's an opportunity to come back
14 and address those later. But I think there's much
15 greater upside -- or downside risk of, you know, taking
16 off -- unintentionally taking off large amounts of
17 operating resources and causing a reliability problem
18 than there is in, you know, maybe missing a reliability
19 problem that might emerge at some point in the future,
20 then we can fix that later.

21 MR. PATEL: May I -- may I say a few things? I
22 think I agree in general that legacy equipment cannot

1 be detrimental to the reliability of the system, right,
2 but I think we also need to look at a little bit bigger
3 picture. I wanted to mention this when Alex was
4 presenting earlier today, is that all the disturbance
5 reports that have come out in last seven, eight years,
6 those were because of something like momentary
7 cessation or incorrect measurement of frequency, things
8 like that, a spontaneous reaction of controls to system
9 disturbance.

10 When we are talking about frequency Ride-through,
11 I think we are talking about plus or minus 4 hertz per
12 six second. So I think if we fix some of those issues
13 that were actually brought up, right, in disturbance
14 reports then -- and then we make sure that the new IBRs
15 do provide frequency response in a manner that we don't
16 actually get to the boundaries, right, I think -- I
17 think we'll have our problem solved.

18 MR. GUGEL: I think potentially that's the case,
19 yes. The only caveat that I would provide to that is,
20 we continue in every one of these disturbances to see
21 more things that come up, and I think being reactive
22 for each one of these is not really a long-term

1 solution for reliability. I think, instead, if you set
2 the parameters and then -- I hate to use the word
3 "force," but have generator owner, operators, OEMs,
4 others go out and validate that they can perform within
5 those parameters, then you don't get into the situation
6 where you fix one problem, and then a year later, you
7 have another issue that occurs on the system that is
8 somewhat related, but not exactly the same as what that
9 previous one was. I think that's the concern that, at
10 least we've seen from NERC, is that yeah, we go out and
11 fix things as they happen, but you can't just continue
12 to be reactive. We need to at least draw a line in the
13 sand and say, these are the performance parameters that
14 need to be met.

15 MR. LAUBY: Yeah, I agree with you Howard, and
16 again, this gets back to handwaving. We got to get
17 beyond handwaving and actually do the hard work, do the
18 modeling, do the simulations. I don't know if what you
19 say is true or not until I see the runs, so we can't do
20 it heuristically. We got to understand what the risks
21 are that are mounting on the grid and how do we
22 mitigate them, and what's the pathway to the end state.

1 So I agree with you a hundred percent, Howard.

2 MR. HOKE: One other quick comment on that, though
3 -- so I see the -- I see both sides of this. Like, I
4 see wanting to go back and fix some of the older stuff,
5 at least the stuff that can be fixed, without going to
6 extreme measures, but I also see the side of, we want
7 to get a Ride-through standard through in a reasonable
8 time frame because in the meantime we're installing
9 even more legacy stuff day by day. And so maybe
10 there's a path where we separate those two things, just
11 put that idea out there, where the legacy -- the legacy
12 retroactive stuff maybe is separate from the -- from
13 the forward-looking stuff.

14 MR. GUGEL: It might be a good conversation for
15 some of our panels tomorrow, I think that'll be good,
16 yeah.

17 MR. BENNETT: That's kind of what I was thinking,
18 also, on this is maybe this is a good spot to break for
19 today. I will let everybody know that we have
20 collected many questions online. And today, I think
21 we're going to run out of time to do the Slido polling
22 and kind of go through that exercise, but tomorrow

1 there'll be an opportunity for that, and I think we're
2 going to circle back to some of our online themes
3 tomorrow once we have -- can maybe discuss that a
4 little bit more internally. So I think with that, how
5 about we give everybody a round of applause for this
6 great panel.

7 (Applause.)

8 MR. BENNETT: So yes, not just this great panel,
9 but everybody today. This was very informative, this
10 was a great session, and I do think we have maybe just
11 a couple small things here at the end. Sue Kelly's
12 with us today. She is our -- first of all, she's a
13 NERC Board member, and she is the liaison to the NERC
14 Standards Committee. And do you have any remarks to
15 share here at the end of the day?

16 MS. KELLY: I do.

17 MR. BENNETT: Would you like to come over here and
18 share them or share from over there?

19 MS. KELLY: (Off mic comment.)

20 (Laughter.)

21 MS. KELLY: I just want to thank everybody who
22 came today, both virtually and in person, and I want to

1 thank the Standards Committee members who are doing all
2 of this work on top of their day jobs. Very much
3 appreciate that. And I want to thank the Drafting Team
4 because I know they've spent countless hours working on
5 these issues, and I appreciate those who came today to
6 explain the decisions they made and why they made them.
7 We owe them our thanks.

8 I want to talk a little bit about what I've heard
9 today. This is a scary thing for me to be doing it,
10 but I'm going to do it anyway. First, I think the more
11 information that we have, the better, and the earlier
12 that we have it, the better. I think that's one of the
13 things. A lot of stuff is coming out today that if we
14 had had earlier would've been better.

15 David Ortiz noted that FERC issued Order 901 based
16 on the record before it. They did what's known as
17 notice and comment rulemaking. They gave notice, they
18 took comments, and then they made a decision based upon
19 the comments that they'd gotten. And in retrospect,
20 there might be some people who wish they'd been more
21 active earlier on in that docket at FERC, and there's a
22 lesson there. That lesson is be there or be square.

1 You really need to participate both at FERC, and now
2 we're obviously following onto the work that FERC
3 assigned us, so it's important to be active earlier
4 rather than later.

5 Second, what I heard is that the role of the
6 original equipment manufacturers is crucially
7 important. They need to be part of the dialogue. I'm
8 glad they came today and spoke about their concerns,
9 and I hope they stay engaged. We heard a lot about the
10 inability to comply with certain of the proposed
11 requirements of PRC-029. I hope they, in turn, leave
12 today with a better understanding of our need at NERC
13 to ensure that their equipment does not contribute to
14 reliability events in the future. And more and more of
15 it is going to be installed, so that issue becomes more
16 and more important.

17 Third, I loved Alex Shattuck's Venn diagram. I
18 love Venn diagrams from sixth grade. It's one of the
19 few mathematical concepts I was able to absorb. How
20 much future Ride-through performance should we demand
21 from our resource base, and how much are we going to
22 have to pay to get that? We cannot use today's

1 regional grids and generation mixes to decide how much
2 is enough because, again, as David pointed out this
3 morning, we're anticipating a very quick ramp-up in
4 IBR-based resources. And so the ground is shifting
5 under our feet, and the requirements are going to have
6 to shift as well.

7 The conservative reliability-based response is to
8 do what I would call the Ride-through standard
9 equivalent of belt and suspenders to, you know, make
10 sure eight ways to Sunday that we are covered on
11 reliability, but that could come at a very high cost,
12 so we have to balance those things as we go through
13 this. We also need to consider the issue of legacy
14 generation, as was just referred to, and the efficiency
15 and effectiveness calculus that Alex laid out for us
16 may be different for these resources than for new ones.

17 So I'm going to be thinking about all this
18 tonight, and I'm sure you will as well. Hopefully
19 we'll have another productive day tomorrow. We'll be
20 back 9:00 tomorrow, and I will note that breakfast and
21 lunch are up one level -- this is my most important
22 duty -- up one level in River Birch A, and there will

1 be signage to direct you. Breakfast will be available
2 at 8:00. I hope to see everybody there. Thank you
3 very much for your time and attention and deep thinking
4 today.

5 (Applause.)

6 MR. BENNETT: So with that, Sue shared my
7 logistical information, so I believe we're adjourned
8 for the day. So thank you very much, Sue.

9 [Whereupon, at 3:49 p.m., the Technical Conference
10 was adjourned, to reconvene at 9:00 a.m., Thursday,
11 September 5, 2024.]

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

(NERC)

Standards Committee and NERC Ride-through

Technical Conference

Thursday, September 5, 2024

9:01 a.m.

1 PARTICIPANTS

2 SHAHIN ABDOLLAHY, MPR Associates

3 MARK AHLSTROM, NextEra Energy

4 SYED AHMAD, FERC

5 MELISSA ALFANO, Solar Energy Industries Association

6 HUSAM AL-HADIDI, Manitoba Hydro

7 JOEL ANTHES, Pacific Gas and Electric

8 ROMEL AQUINO, Southern California Edison

9 JOHN BABIK, JEA

10 REBECCA BALDWIN, Spiegel & McDiarmid/TAPS

11 CHRISTIAN BECKMANN MENIG, Siemens Gamesa Renewable
12 Energy

13 TODD BENNETT, AEC, NERC

14 KELSI BOYD, NERC

15 TROY BRUMFIELD, American Transmission Company

16 ADAM BURLOCK, TransAlta Corporation

17 JAMIE CALDERON, Invenergy, NERC

18 JOHNNY CARLISLE, Southern Company

19 AMY CASUSCELLI, Xcel Energy, NERC

20 TODD CHWIALKOWSKI, EDF Renewables

21 KEVIN CONWAY, Western Power Pool

22 CHARLIE COOK, Duke Energy

1 PARTICIPANTS (continued)

2 MIGUEL COVA ACOSTA, Vestas

3 SAMIR DAHAL, Siemens Gamesa Renewable Energy

4 MIKAEL DAHLGREN, Hitachi Energy

5 JOEL DEMBOWSKI, Southern Company

6 GERARD DUNBAR, NPCC

7 NANCY E. BAGOT, Electric Power Supply Association

8 MOHAMED EL KHATIB, Invenergy

9 PAMELA FRAZIER, Southern Power Company

10 SEAN GALLAGHER, SEIA

11 ANDREW GALLO, ERCOT, Inc.

12 MICHAEL GOGGIN, Grid Strategies

13 HOWARD GUGEL, NERC

14 THOMAS SCHMIDT GRAU, Vestas

15 MARK GREY, EEI

16 SAMUEL HAKE, AES

17 JOSH HALE, Southern Power Company

18 JOE HENSEL, Minnkota Power Cooperative, Inc.

19 ANDY HOKE, NREL

20 KATIE IVERSEN, AES Clean Energy

21 RHONDA JONES, Invenergy

22 SRINIVAS KAPPAGANTULA, Arevon Energy

1 PARTICIPANTS (continued)

2 SCOTT KARPIEL, SMA

3 SUE KELLY, NERC Board of Trustees

4 FRANK KENNEDY, Alliant Energy

5 SOO JIN KIM, NERC

6 ARNE KOERBER, GE Vernova

7 BHESH KRISHNAPPA, SEIA

8 MARK LAUBY, NERC

9 DOMINIQUE LOVE, NERC

10 JASON MACDOWELL, ESIG

11 RAJAT MAJUMDER, GE Vernova , NERC

12 ROB MANNING, NERC Board of Trustees

13 HAYDEN MAPLES, Evergy

14 DAVID MARSHALL, Southern Power Company

15 ARISTIDES MARTINEZ, NextEra Energy

16 AL MCMEEKIN, NERC

17 PATTI METRO, NRECA

18 THIERRY NGASSA, Power Electronics

19 LATIF NURANI, American Public Power Association

20 KAREN ONARAN, ELCON

21 MOHAMED OSMAN, NERC

22 MANISH PATEL, Electric Power Research Institute

1 PARTICIPANTS (continued)

2 DINISH PATTABIRAMAN, TMEIC Corporation Americas

3 LEVETRA PITTS, NERC

4 RYAN QUINT, Elevate Energy Consulting

5 SAM RAMSEY, ACP

6 ROBERT REEDY, DOE Solar Technologies Office

7 FABIO RODRIGUEZ, Duke Energy Florida

8 DANE ROGERS, OG&E

9 THOMAS SCHMIDT GRAU, Vestas

10 RUCHI SHAH, AES Clean Energy

11 ALEX SHATTUCK, NERC

12 JOHN SKEATH, NERC

13 TRAVIS SMITH, EEI

14 EWGENIJ STARSCHICH, Siemens Energy, Inc.

15 JEB STENHOUSE, Invenergy

16 KYLE THOMAS, Elevate Energy

17 VAIDHYA VENKITANARAYANAN [Nath Venkit], GE Vernova

18 BORIS VOYNIK, FERC

19 QIUSHI WANG, AES Clean Energy

20 XIAOYU [SHAWN] WANG, NERC

21 TIFFANY WASHINGTON, NERC

22 CHARLES YEUNG, Southwest Power Pool

P R O C E E D I N G S

6

MR. BENNETT: Okay. Good morning, everybody, and welcome to Day 2 of our technical conference. We've seen a lot of familiar faces here back in the room, and I think we're starting to fill up online. So just want to welcome all of our online participants as well as those in the room.

12

As far as major notes this morning, I don't have a lot to add other than I'd just like to encourage our participants to continue the momentum from yesterday and the engagement from yesterday. It was top notch, and I can tell you there was a lot learned from it, and it provided a lot of good data points to help the Standards Committee move forward. So with that, Soo Jin, do you have anything you'd like to add?

20

MS. KIM: All right. I will be very brief. I just want to say thank you so much for everyone that participated yesterday. I think yesterday was a really

22

1 great day. I think that we got a lot accomplished, and
2 I think we heard from a lot of different voices that I
3 think filled in a lot of the gaps for the different
4 issues that we saw come through on the comments with
5 regards to the standard.

6 I would be really remiss if I did not thank the
7 people who put this event together. I cannot tell you
8 what a tremendous task it was to get this type of a
9 conference put together in just a few weeks. So Jamie
10 Calderon, first, I want to thank you because I don't
11 know if everyone understands under her leadership,
12 we've done so much work. And we've had to coordinate
13 with so many different departments and had to bring so
14 many people together just getting these panels
15 together, just getting everyone informed, putting
16 together this agenda, it was under her leadership, so I
17 just want to thank you for that.

18 Also, we have a tremendous staff here at NERC, and
19 so Levetra, Tiffany, Wanda. Also, the staff that could
20 not be here today: Alison Oswald, Nasheema Santos. I
21 can't -- the list goes on and on about how many people
22 had to come together to make this event happen. All of

1 your hard work is so greatly appreciated, and we know
2 we could not have done this event without the
3 tremendous effort that came together in just a very
4 short amount of time. And when I say everyone was
5 working late at night, early in the mornings, just to
6 make sure that this event came through very seamlessly,
7 not only in person, but online, we owe them a
8 tremendous gratitude.

9 And then I, also, for the other departments that
10 are contributing, the engineering staff, Alex Shattuck,
11 J.P. Skeath, all of the other engineers that have put
12 together a tremendous amount of technical input,
13 provided a lot of advice, thank you for being here.
14 Howard and Mark, thank you for your leadership and also
15 being here today. Robin, Sue, thank you so much for
16 your participation and all of your remarks because,
17 again, it has been a very collective and collaborative
18 effort, and I think that we are moving forward, and
19 we're making a lot of progress. Also, I just would
20 like to thank the SC members. We did get some
21 volunteers here to lead this SC effort. It is not just
22 a NERC effort: Todd, Amy, Troy, Charles, everyone

1 who's volunteered, thank you so much because after
2 today, there's going to be a tremendous amount of work
3 to get a next draft put together.

4 I just want to remind everyone of our charge.
5 When the Board invoked Rule 321, there are several
6 obligations that we have to meet. And so I just want
7 to remind everyone that we are addressing this
8 particular project. I know based on the comments that
9 have been coming in, many people would like to see an
10 expanded effort. There are some comments asking us to
11 open up other standards. I just want to say that we
12 have to focus on this Ride-through issue. That is the
13 next task. That is what's going out for ballot. We
14 won't be opening any other standards, and we will be
15 focusing on the particular issues that we had to
16 address with regards to Rule 321, and that is with
17 Ride-through.

18 We get one more ballot, and again, tomorrow starts
19 the new drafting effort. It will not be just a blank
20 sheet of paper. We're taking into account all of the
21 comments. Nothing that has been submitted online or
22 submitted to NERC staff is lost. And so I know that we

1 had a limited amount of time, and there's some
2 consternation with regards to submitted questions.
3 Everything is being reviewed. We are taking a
4 tremendous amount of time to walk through all of the
5 comments. And this is also a very transparent and
6 public process, and so we are very committed to that,
7 not just as a department, but as NERC. And so I just
8 want everyone to be very assured that if there's any
9 concerns, please reach out to me, and we will make sure
10 that comments are addressed. We were -- or have to
11 walk through the process with you again.

12 And the last thing I just want to say is that as
13 we are required to under Rule 321, this will go out to
14 Ballot One more time, and we have to conclude this
15 effort by the 30th. And so I just want to remind
16 everyone, we are under a very tremendously tight
17 deadline, and so by the 30th, we have to conclude this
18 process in order to present something to the Board in
19 October at an open call for adoption.

20 And with that thank you so much for all of your
21 time. I look forward to today's discussions, and I
22 thank you again for being here and online.

1 (Applause.)

2 MR. BENNETT: Okay. Thank you so much, Soo Jin,
3 for those sentiments and kind words and details about
4 the path forward, so thank you so much.

5 So moving right on into our agenda today, I see we
6 have a panel discussion on Frequency Right Through
7 Exemptions in PRC-029. So today, I believe Charles is
8 going to be -- help us be a moderator that as well as
9 Alex from NERC, so I believe that if we want to get our
10 panel together, we can commence.

11 (Pause.)

12 MR. YEUNG: Okay. Good morning. My name is
13 Charles Yeung. I'm with the Southwest Power Pool. I'm
14 a member of the Standards Committee, also vice chair of
15 one of their subcommittees, the Project Management of
16 Standards Projects.

17 Yesterday we heard quite a bit about the frequency
18 Ride-through requirements and how they differ from, of
19 course, PRC-024 and also the IEEE 2800-2022. Today's
20 panel, we're going to be talking about what was left
21 out of the current draft, which is exemptions from
22 frequency Ride-through requirements. So as I mentioned

1 yesterday, we heard quite a bit about a lot of the
2 obstacles and challenges to meeting PRC-029 frequency
3 Ride-through. So today, our panelist is assembled to
4 talk about, you know, what exemptions would have as far
5 as an impact on how the industry can move forward as
6 far as IBR Ride-through requirements. So Alex, you
7 want to ask the first question, and we can down the
8 panel?

9 MR. SHATTUCK: Sure. Yeah, we'll get started, and
10 we'll probably just ask one and do follow-ups as we go
11 down the line. So our first question today is -- for
12 the panelists is, what are the financial and practical
13 impacts between hardware- and software-based solutions?
14 And Mark, you can us get started.

15 MR. AHLSTROM: Sure. Mark Ahlstrom. I'm
16 representing NextEra Energy. You know, I think we have
17 to be careful not to underestimate the impacts of, you
18 know, the complexity and the effort of software as well
19 because, as we know, with all the emphasis on modeling
20 and getting all the analysis done, you know, even doing
21 a software upgrade, you know, it takes a lot of
22 engineering analysis, working with every --, you know,

1 every OEM for the various pieces, not just wind
2 turbines or the solar inverters themselves, but the
3 balance-of-plant issues, you know, coming up with an
4 engineering redesign creating the models, verifying the
5 models.

6 And as I -- as I wrote in my comments, you know,
7 that has to be done on a plant-by-plant basis. Every
8 plant is different. Even if you're using the same OEM
9 for a particular wind turbine, for example, you might
10 have different converters. We've got more than 10-plus
11 converters in our NextEra fleet, you know, so it takes
12 a lot of effort. And then, you know, literally, you're
13 talking about having to go out, even for software, to
14 many dozens of plants and many thousands of turbines.
15 And I did put in my written comments by the way, that
16 -- if you'd like to see them, I'd be happy to share
17 them with anybody even if -- I don't know if NERC is
18 going to post them or not, but I'm happy to share them
19 where we went through the entire fleet and looked at
20 the impact, and we'll get to that for the various
21 curves in a bit.

22 But I think software impacts are reasonable to

1 bring up to 2800 compliance. I think you have to allow
2 a couple years to do that because it's a complicated
3 process. The hardware upgrades are an order of
4 magnitude more difficult because all of the engineering
5 with that, and also, like, with wind turbines, you have
6 some up-tower things, you know, you can't --, you know,
7 it can be much more expensive. But both of these are
8 complicated processes, and we should not underestimate
9 the impact of either of them.

10 MR. MACDOWELL: Yeah. Thanks, Mark. You kicked
11 us off well. Good morning, everyone. Jason MacDowell
12 here. I actually wear two hats in industry. I've been
13 with GE Vernova's Consulting Services for the last 25
14 years, and, really, you think of GE Vernova as an OEM.
15 Certainly GE Vernova is an OEM. We have a lot of OEM
16 stakeholders here and participants that you heard from
17 yesterday. I work in a group that really focuses more
18 on systems integration, working not only as an OEM, but
19 more representing system operators and system
20 integration.

21 But the hat I'm wearing today is the second role I
22 play in industry as the chief system integration

1 officer of the Energy System Integration Group. Just
2 like Mark, we have multiple roles, and Mark
3 representing ESIG as well in some of this -- the
4 industry work that he's doing as president of the board
5 there as well.

6 So I wanted to just build on what Mark was saying
7 relative to the cost implications, and I think, Mark,
8 you alluded also to schedule implications, which is the
9 next question. And I think, you know, we all recognize
10 that any upgrades that are needed, whether it be
11 software or hardware, is more than just toggling a bit
12 or just installing a part. There's a lot of rigor from
13 a manufacturer's point of view, and all the way across
14 the chain with the developers, the plant owners,
15 equipment owners, the system operators, the utilities
16 that needs to be done to accommodate any changes
17 relative to what we'll call standard application
18 products, right?

19 And, you know, when there -- if there's a need for
20 a software upgrade or a hardware upgrade, in order to
21 account for that and understand the implications of the
22 benefits of those changes and, ultimately, the impacts

1 on their -- on the performance of what they will do to
2 the grid and to the plant design, as Mark alluded to,
3 is looking at the overall implication to the fleet,
4 looking at the overall implication to that set of
5 products. That includes a lot of engineering analysis.
6 It includes a lot of analysis on the implications of
7 the overall integration of the wind turbine or the
8 solar inverter and the solar system or the plant for
9 that matter. But it also includes a substantial amount
10 of effort to really understand the implications in
11 terms of modeling.

12 And then there's the open question of when you do
13 the modeling, you got to validate, but what are the
14 aspects that you need to validate that may cause a
15 material change, right? And no doubt any
16 software/hardware implications that we have are to
17 improve the performance, but there are still -- there's
18 the reality that the system operators and the utilities
19 do have processes for interconnection and material
20 change clauses, that if you do change something for the
21 better or otherwise, if you make any upgrade, there is
22 a process to reevaluate that from a system impact point

1 of view, right? So I think those are all of the
2 considerations and costs that go into system upgrades
3 and what's needed on existing products.

4 For implications on new products, there's a new
5 product, I would say, introduction or integration and
6 new technology integration evaluation that all system
7 -- all OEMs will need to do and be able to communicate
8 that through models, through documentation, and that
9 takes time as well. So it's -- again, any changes that
10 are made are made deliberately to look at how the
11 product will respond and what is the implication of
12 those changes relative to the lifecycle of the
13 equipment and the -- and also the impact that that
14 would have on the rest of the grid.

15 As Mark also alluded to, any of those changes,
16 particularly around frequency, really depends on the
17 technology, and it depends on the overall design. So
18 it's not as easy as a broad sweep to say, oh, that one
19 change to meet a wider band of frequency Ride-through
20 is going to have this implication on this product for
21 this amount of time. It really depends on the overall
22 design.

1 There's probably, and I'm reaching out a little
2 bit, and I would love to hear some feedback from my OEM
3 colleagues because this is ultimately an OEM question
4 about the cost implications. But really the -- one of
5 the biggest implications, especially on, you know, a
6 system like a wind turbine and also, you know, other
7 aspects like solar inverters and what have you, is
8 looking at the impact of frequency deviation on
9 auxiliaries, right? And those auxiliaries are not --,
10 you know, are not necessarily implicitly modeled in a
11 lot of the system models when we look at the overall
12 performance.

13 And I tell you know, I was on the first PRC-024
14 Drafting Team back in 2007 when we started this journey
15 long time ago, and on -02 as well, and that was the
16 first time that I had experienced, you know, the NERC
17 drafting team process where FERC mandated through Bob
18 Snow, and, Mark, I think you remember Bob, you know,
19 his comments there well, that we needed to have a
20 standard that was completely technology agnostic.

21 At that time, the Ride-through curves on both
22 voltage and frequency were more difficult. At the time

1 we had a lot of debate about what is fair, what's
2 reasonable, what's capable, what does the system need
3 relative to the technology at that time, over a decade
4 ago. And it was far more constraining for synchronous
5 machine technology, especially on frequency relative to
6 inverter-based technology even at that time. And I
7 think that's also the case today where we have
8 frequency deviations that are a lot more sensitive on
9 rotating equipment that are not inverter based than the
10 inverter based. And I think we have to keep that in
11 mind, too, about when we go down the path of looking at
12 the costs relative -- the cost of compliance relative
13 to what the system performance will be, and how each
14 resource will be, you know, integrating and looking at
15 their -- the individual performance.

16 We're engineering a system. We're not engineering
17 one piece of the system in a bubble, and I think, you
18 know, that's a big consideration around the cost of
19 compliance relative to what we expect from renewables
20 to Ride-through compared to the rest of the system. So
21 I'll leave it at that.

22 MR. ROGERS: Maybe to take just a little bit of a

1 different course because that explains some of the
2 technical difficulties at a high level pretty well.
3 Maybe look at what the actual practical impacts are
4 going to be and financial impacts for the -- for the
5 GOs and how that -- how that has to be considered to
6 some extent.

7 What we've heard a lot today is we don't quite yet
8 know what it's going to take, especially for these
9 legacy -- you know, these much older legacy and even
10 some of the stuff, you know, built in the past decade,
11 what it's going to take to be able to allow those to
12 meet the requirements as set forth in the current
13 draft. We just don't know. What is that cost going to
14 be? Again, we don't know. We don't even know if it's
15 possible in some instances.

16 So right now with this, you know, and looking
17 specifically at the discussion around exemptions for
18 frequency Ride-through, if passed today as written, we
19 don't know what the impacts -- reliability impacts
20 specifically, but also cost impacts, to eventually the
21 end users, what those reliability impacts are going to
22 be to the bulk power system. We have no idea, and that

1 hasn't been quantified yet. Does frequency Ride-
2 through capability, ROCOF, everything, all these
3 technical issues that have been discussed, do they need
4 to be considered, especially moving forward?

5 Absolutely. I don't think anyone in this room saying
6 that that's not the case. But right now, where we sit
7 today, if the standard was to pass as written, we don't
8 actually know what the reliability impacts of the bulk
9 power system would be, and there's a chance that it
10 could be a net negative. And I think that's something,
11 when you're looking at a reliability standard, you have
12 to take very heavy into account.

13 So I think I'll just leave it at that. There's
14 some really excellent discussion about the technical
15 aspects that I'm not going to be able to talk, so -- or
16 top. So I think that's just really my takeaway is
17 right now, when we're looking at financial and
18 practical impacts, we don't know what those are going
19 to be, and especially with the practical impacts, we
20 don't know what the scope of that's going to be. We
21 don't know how bad it's going to hurt. Thank you.

22 MR. GUGEL: So Howard Gugel, vice president of

1 regulatory oversight at NERC. Not sure I can really
2 opine on the financial and practical impacts of these,
3 but I just want to opine a little bit on an area that I
4 can, and that's the reliability impacts. You've heard
5 that a little bit earlier.

6 You know, we're in a situation even today where in
7 some of the markets, there are times when 99 percent of
8 the energy being absorbed by the consumer is being done
9 by inverter-based resources, green resources. If in
10 those scenarios we have frequency excursions that take
11 those offline, nobody's going to ask after the fact
12 what were the financial and practical impacts? They're
13 going to say, why didn't you guys solve this problem
14 before we got into it? And that's -- I'm not saying
15 NERC. I mean, that's going to be industry as a whole,
16 that we need to make sure that we've got that on --
17 that in our focus.

18 So, but I think also you've got to take that into
19 account with what are the practical and financial
20 implications of that. I'm not saying that you throw
21 that out the door. I'm just saying that if we get into
22 a scenario where we are almost entirely being provided

1 energy by inverter -based resources, and we know that
2 there's an issue with frequency Ride-through or voltage
3 Ride-through, and we haven't addressed somebody's --
4 that we're going to have a lot of questions that we'll
5 have to answer at that point. So just, I think we need
6 to take that reliability impact into account when we
7 think about the practical and financial impacts.

8 In addition, you know, we -- you heard yesterday
9 that projections are at this point that potentially by
10 the end of the decade, we're going to be at about 50
11 percent of resource that will be inverter-based
12 resources overall, not just at certain times of the
13 year. And so we need to ensure that the traditional
14 benefits and reliability impacts that have been
15 provided by synchronous generators can still be
16 provided on the system. So you've got to look at that
17 impact there also.

18 MR. YEUNG: Alex, do you have any other comments
19 or questions for the first question?

20 MR. SHATTUCK: Nope. Nope. We can move on to the
21 next one.

22 MR. YEUNG: Okay. So thanks, Panel. Obviously a

1 lot of unknowns on costs, especially from Dane, his
2 comments, but of course, the other dimension of
3 implementation and compliance to PRC-029 is how long
4 does it take, so the next question is about a timeline.
5 So what is the timeline of this one, specifically about
6 software-based updates, necessary to meet the PRC-029
7 frequency Ride-through requirements, and how does that
8 differ with hardware based? Yesterday we heard some
9 comments that even if it's a software-based solution,
10 there could be limitations or requirements for hardware
11 upgrades as well. So the question is, how long does it
12 take to do software updates for PRC-029, and does that
13 differ from hardware?

14 Also, I'd like to add one more dimension based on
15 a lot of the discussion we said yesterday. This
16 question is asking about meeting PRC-029 criteria, but
17 if you can also add whether that changes, whether it's
18 2800-2022 criteria instead of the PRC-029 criteria. So
19 you want to go this way?

20 MR. GUGEL: I don't think I can opine on that
21 because, again, that's kind of outside of my bailiwick.

22 MR. ROGERS: Yeah. Again, the technical aspects

1 are going to be better handled by the two gentlemen to
2 my right here. But one thing, again, I think that I
3 can speak to is, you know, from our discussions with
4 our -- with our OEMs, is the uncertainty on this.
5 We've been told, you know, it may be possible for some
6 of the equipment, especially with legacy equipment,
7 it's a -- it's a big unknown if there are going to be
8 software updates that are possible. And if there's
9 hardware updates, I mean, to some extent, when you --
10 when you use the term, "hardware," eventually it is
11 going to be possible, right, if you go far enough up
12 and build enough things out, you change enough things,
13 you're going to get there. But at what point does that
14 become, you know, much more like a repower and not an
15 update? Not certain on that.

16 But again, I think the primary concern, at least
17 from where I sit, is the uncertainty around this and
18 the inability -- the inability for us to know if
19 software-based updates are going to be available for
20 these, if hardware updates are going to be available
21 for these, not necessarily just the timeline, but are
22 they going to exist? And then if they do exist, what

1 is the timeline, and I don't have answers for that,
2 again, back to the uncertainty.

3 MR. MACDOWELL: So the reason I'm pausing here is
4 because I think, as always, the answer depends. It
5 depends on the nature of the upgrade and whether it's
6 software or hardware based. Like I alluded to and what
7 I just said earlier, it's more than just toggling a bit
8 or just installing a part, right? There's a lot of
9 rigor that needs to go into evaluations on the overall
10 equipment, on the integration design, on the modeling,
11 on the validation, on, you know, evaluating if you need
12 to do anything more from the interconnectivity point of
13 view. So, you know, the question I think was aimed at
14 how much -- how much time does it take manufacturers to
15 decide how to -- how to change things from a software
16 or hardware perspective, but we really need to look at
17 the overall picture of the implication to actually get
18 that deployed and to get it in place so that, you know,
19 the implication of that software or hardware changes
20 realized on the grid.

21 Software changes obviously tend to be a bit
22 quicker than hardware upgrades as a general point of

1 view, but not always, right? It depends on the amount
2 of analysis that's needed. Generally, with frequency
3 responses, as I said before, we're looking more
4 probably at some of the evaluations on impact on the
5 auxiliaries and not, and then that brings up the
6 question, well, how do we represent that at all in our
7 capabilities and modeling? And that's typically,
8 generally through the Ride-through curves and the
9 protection that's applied to fundamental frequency
10 phaser domain models, and maybe in a little bit more
11 detail in EMT models, right?

12 But to generate those curves, it sounds simple,
13 right? They're just a bunch of stepped-based curves
14 that are overlaid with the frequency and the voltage
15 profiles that the models are given. But it takes a
16 good deal of effort to actually generate those curves,
17 or at least look at the impact of any changes that are
18 happening and see whether there is an -- you know, a
19 need to reevaluate the curves themselves. And that is
20 in a series of systemic, design-based modeling, and
21 also, if needed, testing, depending on the upgrade.

22 So that whole process can take on the order of

1 weeks to months, sometimes even longer, depending on
2 the implication, for a software upgrade. For a
3 hardware upgrade, it could take on the order of years,
4 right, to go through the overall testing and capability
5 implications on the turbine and on -- you know,
6 ultimately leading up to the modeling and impact on the
7 rest of the grid. So I think it's not an overnight
8 thing. It's something that needs to take in careful
9 consideration on, you know, ultimately how long it's
10 realistically going to take to get this overall
11 capability deployed, not just changing, you know, the
12 software or hardware in the equipment itself.

13 MR. SHATTUCK: Okay. Before we move on, just to
14 make sure we compare the things we talked about
15 yesterday, but do you have any kind of thoughts, Jason
16 the difference between a timeline for meeting 029 draft
17 language and 2800?

18 MR. MACDOWELL: Yeah. I don't have any specific
19 things yet because we haven't done the evaluation
20 specifically relative to everything we have, and,
21 again, I'm speaking on behalf of ESIG --

22 MR. SHATTUCK: Yep. Mm-hmm.

1 MR. MACDOWELL: -- not on behalf of GE Vernova.
2 But generally, you know, and many of you know Julia
3 Matevosyan, chief engineer at ESIG, who's been very,
4 very much in the NERC/IRPS -- you know, with you, Alex,
5 in the leadership of IRPS. This has been a central
6 discussion overall, not only with PRC-029, but Ride-
7 through, and there's a lot of discussion and debate
8 about the overall implications of that. And I think,
9 so going back to the discussion that you and I had,
10 Mark, maybe even last week, you need to do the
11 analysis, right? There needs to be a set of studies to
12 look at what specific things are you trying to fix?
13 What are the specific issues that we know that are out
14 there?

15 And I'll caveat this, Alex, with your question to
16 say you did a really nice job outlining what is the
17 real issue in your presentation yesterday morning,
18 looking at all the events that have happened, the
19 frequency deviation on those NERC events that are
20 primarily driven by other things outside of the
21 implication on frequency, right? You have momentary
22 cessation. You have all of these questions about how

1 solar will respond. In some cases, there was a little
2 bit of wind in that, but it was mostly solar
3 responding. The frequency deviation due to those
4 events that were on the order of a gigawatt to maybe
5 gigawatt and a half had very little implication in
6 terms of the grid frequency itself, so it wasn't a
7 frequency Ride-through issue really at all. It was
8 other things that needed to be coordinated and modeled
9 and taken care of.

10 So I would say, let's look at the issues that
11 we're really trying to resolve, understanding what the
12 real implications are, and then try to solve those
13 instead of having a theoretical what if this happens.
14 And, you know, let me take a step back in PRC-029:
15 what would really cause a frequency deviation that
16 would be that big? You would have to have a very, very
17 large deficit of instantaneous generation tripping
18 offline, very large power plants, likely not renewables
19 at this point, maybe could be if you had gigawatt class
20 renewables, but it could be large nuclear plants. It
21 could be a large part of the grid tripping offline that
22 would cause, you know, an underfrequency or a large

1 load like data centers, multiple gigawatts tripping
2 offline, causing an overfrequency. Could be a large
3 HBDC station tripping offline that caused that event.
4 It's really not renewables that would be the cause of
5 it, but we want to make sure that in those cases, that
6 we don't have a disproportionate of any type of
7 generation tripping offline causing a further
8 reliability risk, right?

9 So those are the types of analyses that we need to
10 be doing. What are the design basis events that we see
11 today? What are they -- what are they looking forward?
12 And I really think that, you know, as we transition
13 from a world that has a lot of synchronous machines
14 today -- large nuclear, large coal to renewables --
15 those design basis events from that perspective are
16 going to get a little bit smaller. But with the data
17 centers that we're seeing and all these large loads
18 that are integrated, those design basis events may be
19 causing us to get bigger. So let's look at that,
20 understanding what the frequency deviations are and try
21 to solve for that, and understand what the implications
22 are across all the fleet. And I think that would be

1 much better placed to understand the system.

2 Now, the last thing I'll say about PRC-029, and I
3 will say something about GE -- put my GE hat on just
4 for a second. Several years ago, GE Consulting was
5 commissioned to do a study for the Wind Energy
6 Institute of Canada, backed by the renewable -- the
7 Canadian regulator, and worked with David Jacobson,
8 worked with all his system utilities across the board
9 to understand what was the impact. And the big thing
10 that we took away from that is that Manitoba and Quebec
11 had very large and wide frequency bands in their Ride-
12 through characteristics because there are very specific
13 system needs for that. They have large HBDC
14 connections in remote parts of the grid that, on
15 purpose, really created the need for these wide
16 frequency Ride-through capabilities.

17 And the Canadian grid codes for those provinces
18 tackled that, but generally in most other places around
19 -- all of the interconnections across North America
20 don't need that wide frequency ban. It's covered by
21 the grid codes there, but we want to make sure that
22 we're looking at fit for purpose across -- a need

1 across all of North America. And then if there's any
2 specific needs in any region, making sure those regions
3 have the protections in place to suit those particular
4 needs as needed.

5 MR. SHATTUCK: (Off mic comment.)

6 MR. AHLSTROM: Sure. I actually think we do have
7 pretty good emerging evidence about the size of the
8 elephant with regard to costs and effort and the
9 difference between the 029 curves and the 2800 curves.
10 Now, NextEra, of course, has a lot of solar and
11 storage, but -- in addition to wind, but we've been in
12 wind a long time. And I'll give specific numbers
13 actually for Question 3 in terms of the exact
14 difference in terms of megawatts and turbines for 029
15 curves and IEEE 2800 curves.

16 But let me just start by saying that we've done a
17 thorough analysis of -- based on the information we had
18 available from our OEMs and everything on the plants.
19 NextEra has Type 3 and 4 wind turbines. We have 27
20 gigawatts, 150 plants with 13,700 turbines using 14
21 major turbine models with sub-model configurations in
22 addition, four wind OEM models, and more than 10

1 converters. These go back as far as the early 2000s.

2 You know, and based on discussions with the OEM so
3 far, our estimate is that, you know, using the 029
4 curves, I'll just mention here briefly and I'll go into
5 details on the difference with others later, 66 percent
6 of those turbines would require a hardware exemption
7 with the current PRC-029 curves. Now, that's 22
8 percent of the gigawatts, 66 percent of the turbines
9 because we're talking mostly about older wind turbines,
10 obviously, you know.

11 So as I said, I'll go into details about how
12 that's improved by going to IEEE 2800 or -- and how
13 that compares with PRC-024 in a moment, but, you know,
14 that's what we're looking at here. We understand the
15 hardware impacts of this, I think, quite well. We
16 don't have specific costs because we don't have the
17 quotes on -- from the OEMs and the other components and
18 all that, but, you know, this is a substantial impact
19 that would have hardware requirements, you know.

20 So I guess we'll just go to the next question.
21 I'll give more detail, but, you know, that gives you a
22 side -- you know, we actually -- I think other

1 independent developers out there, other renewable
2 developers are doing a similar exercise. Everything I
3 just mentioned is documented in my written comments,
4 and I'd be happy to discuss it with you in more detail.

5 MR. SHATTUCK: Thanks, Mark. So yeah, we'll --

6 MR. GUGEL: Real quick, that there was something
7 that I could weigh in on the points that I heard. And
8 Jason, if I could, with all due respect, I do
9 understand wanting to look at actual scenarios and
10 things, but part of what we're charged with doing and
11 part of what our industry is charged with doing is
12 considering what-if scenarios.

13 Our reliability coordinators and our transmission
14 operators need to understand predictably how units are
15 going to occur on the system and how they'd be able to
16 do in an emergency operation system. If they don't
17 have that, and if what we're saying here is that we
18 really don't understand, in general, how that's going
19 to happen, I am concerned that they're going to be
20 flying blind. So part of what we're doing with PRC-
21 028, 029, and 030 is providing that predictability for
22 them to be able to understand, at a minimum, for units

1 going forward, but also understanding where we're at a
2 place right now, if that makes sense.

3 MR. MACDOWELL: It does. Yeah, completely agree,
4 you know, and I think that forward predictability is
5 complex and it's difficult. And one other thing that
6 we've been really focused on at ESIG and also with GE
7 Vernova with some of the planning work that we're doing
8 with system operators, is really focused in a lot more
9 on integrated system planning to the regard of
10 understanding where are the real pinch points, right?
11 And a lot of the planning that has been historically,
12 and with no fault at all. It's just the systems that
13 have been planned out today have practices that have
14 been in place for decades around understanding where
15 are the system stress conditions on peak load, on light
16 load, maybe a shoulder condition.

17 And those conditions are no longer the biggest
18 risk. There are other risks around peak IBRs that are
19 not associated at all with peak load, light load, or
20 traditional shoulder conditions. There's peak ramping
21 needs relative to the variability and uncertainty of
22 inverter-based resources, variable energy resources.

1 There's limitations on headroom for frequency response
2 and Ride-through. Understanding what those system
3 conditions are and try to solve for those, and what is
4 the frequency deviation and frequency response going to
5 look like in those system conditions? Absolutely,
6 right?

7 So that's what I was saying is, looking at this
8 deterministically and a bit stochastically with
9 integrated system planning saying, what do we expect
10 when we see penetrations of renewables going out to
11 2030, 2040, and understanding what those frequency
12 deviations really will look like, and then what is the
13 resource mix that needs to respond to that and be
14 resilient against that. And that's all I'm saying is
15 use a forward-looking view with integrated system
16 planning to help plan out those scenarios.

17 And perhaps, you know, I have to give credit to
18 the Drafting Team. Being part of NERC drafting teams
19 in the past, I know how difficult it is to balance a
20 lot of these issues when we don't have all the
21 resources to do deep technical studies, right? There's
22 a lot of work that could and should and probably would

1 be done if we had a different organizational structure,
2 but realizing that, you know, the drafting teams have
3 the limitations that they do with the visibility on
4 what's looking forward. But I think this is an
5 opportunity to look forward more, not only for Ride-
6 through, but looking at integrated system planning as a
7 core part of our practice moving forward across
8 utilities, across, you know, NERC requirements in
9 response to Order 901, in response to 2023, in response
10 to 1920. Those are the things that I think we have an
11 opportunity to look a lot better at and really define
12 what problems are we trying to solve. That's all I was
13 saying. Thank you.

14 MR. SHATTUCK: Thank you. Well, we'll get into
15 the detailed question here, Mark.

16 (Laughter.)

17 MR. SHATTUCK: So Question Number 3 here is, do
18 you expect equipment to fail to meet the frequency
19 Ride-through criteria as specified in Attachment 2 of
20 draft PRC-029 due to hardware limitations? And there's
21 sub-questions just to kind of quantify them, but, you
22 know, what's your estimate of products that would be

1 affected? How does this change if you consider 2800,
2 and how does this change when you consider PRC-024?
3 So, you know, any estimates or real numbers or
4 megawatts would be super helpful for kind of
5 quantifying all of this.

6 MR. AHLSTROM: Sure. Well, yes, there are
7 hardware impacts, and I've got the numbers here. So
8 with the PRC-029 as drafted for the wind fleet that I'm
9 looking at here, you know, we'll have to do a similar
10 analysis on solar storage, but it's not quite as
11 substantial there. We estimate that 6 gigawatts out of
12 the 27 gigawatts would require an exemption for
13 frequency Ride-through due to hardware limitations.
14 That involves 9,000 turbines, all four of our window
15 OEMs, and all 10-plus of our converters, so it's quite
16 substantial. It's much significantly improved by
17 moving to the IEEE 2800 curves. That would still be
18 4.5 gigawatts out of the 27 impacted to some extent,
19 6,400 turbines, but just two of the OEMs and two of the
20 converters that would have to be -- have hardware
21 upgrades. How does that change with respect -- you
22 know, if you go to PRC-024? It's only 200 megawatts

1 that would require exemptions, 200 turbines, one OEM,
2 one converter model.

3 So clearly it could be argued -- you know, I think
4 IBRs should actually do what they reasonably can to
5 support the grid. I'm a huge believer in grid
6 services, reliability services, as you know, and that
7 inverters are going to be cornerstone of the future.
8 We, you know, so I'm not saying we shouldn't go to the
9 2800 curves. It could certainly be argued that it's
10 discriminatory, but I get that it's, you know, what can
11 we get out of this technology. But the reality is, you
12 know, with PRC-024, you know, we're basically compliant
13 today with the wind fleet, and I think also with solar
14 and storage, you know.

15 So it could be argued that the technology agnostic
16 fair path would just be to say, look, all legacy stuff,
17 just continue to comply with PRC-024. All new stuff,
18 as soon as we can get the new OEM models out, you know,
19 you comply with 2800 curves. And a good reason, by the
20 way, of complying with 2800 is I think that will be our
21 stepping stone toward grid-forming inverters that we're
22 trying to accelerate as fast as possible, so within

1 hopefully five years or so, you know, we can have a
2 fair number of -- a fair share of those inverters doing
3 grid forming, which would further, you know, support
4 the grid and the grid services and the response to the
5 disturbance there as well. And that provides our
6 pathway forward toward 2050 when, you know, I think the
7 legacy fleet will be a minuscule piece of the IBR fleet
8 at that point, and the IBR will be state-of-the-art,
9 you know, inverters and enough grid forming that we
10 have an extremely good, stable set of grid services to
11 deal with this, in addition to balancing and
12 flexibility and so forth.

13 So I'll leave it there. The difference between
14 PRC-029 as drafted and 2800 curves is significant and
15 has a big cost impact, and certainly on the number of
16 hardware upgrades and the cost and effort to get those
17 done. Thanks.

18 MR. MACDOWELL: Yeah. So I want to parse this
19 answer again with my ESIG hat on. And I think the
20 general consensus of what Mark just said is that the
21 difference between the proposed curves in PRC-029
22 relative to 2800 is substantial. Exactly what are the

1 numbers across the fleet across North America, I mean,
2 I think we still need to evaluate that just because of
3 the evolving nature of the standard. But I think
4 especially on, like you said, Mark, on legacy units,
5 we've been well served with PRC-024 to date. According
6 to what you've said so far with your analysis
7 yesterday, there was no implications that any of the
8 big events that have happened over the past almost
9 decade were due to a frequency Ride-through issue. And
10 for existing units, there's really not an issue that
11 we're trying to solve today.

12 To your point, Howard, what are we trying to solve
13 for in the future, right? We need to evaluate that,
14 but I think the very, I would say, the middle ground
15 that seems to be the most reasonable at this point, we
16 put a lot of thought into the 2800 requirements, as
17 Mark said, and manufacturers are really engaged in
18 getting all of the capabilities built into the new
19 equipment. There are certain areas that are looking at
20 retrofits, and I think some of you know, some of the
21 things that are happening there. But by and large,
22 most of the 2800 capabilities and requirements are

1 achievable with a reasonable amount of effort in terms
2 of the capabilities.

3 Compare that relative to what's proposed in PRC-
4 029, that's a much bigger gap that needs to be overcome
5 with a substantial cost -- potentially a substantial
6 cost and a substantial timeline to that. And I go just
7 back to my points before is, one, there is that
8 substantial amount of effort and cost and time that's
9 relative to what's proposed in PRC-029. We want to
10 make sure that it's a cost that is very well understood
11 and very well spent to understand is it really the
12 problem that we're trying to solve, right? So going
13 back to fleshing that out, when do we need to solve it?
14 Is that really an issue in all systems, or is it an
15 issue in a specific system that we're trying to scale
16 in ways that don't -- doesn't necessarily need to be
17 scaled across interconnections? Well, we can't answer
18 that question yet without having the analysis done to
19 back it up.

20 So going back again to the integrated system
21 planning, evaluating what scenarios would we need any
22 sort of Ride-through capability from any resource, not

1 only inverter-based resources, to me, is a very
2 critical step along the way.

3 MR. ROGERS: Yeah. So again, focusing on -- more
4 on specific impacts, I guess, to generator owners and,
5 you know, speaking for -- you know, my opinion on
6 OG&E's position, as well as a lot of the other GOs who
7 are connected to our transmission system, we have a
8 pretty aging renewable fleet, specifically talking
9 about wind, in our part of the country. And answering
10 the question specifically, do you expect equipment to
11 fail to meet the Ride-through requirement, the criteria
12 in Attachment 2, yes. We have approximately 500
13 megawatts of wind that we own. All 500 would fail to
14 meet the Ride-through criteria in PRC-029 as written.

15 Looking at IEEE 2800 and PRC-024, that shrinks
16 significantly. One thing that does not change, though,
17 is still compliance with PRC-029, even if you were to
18 make the modifications and shrink the -- you know,
19 shrink the Ride-through zone to something a little bit
20 different, is rate of change of frequency. When the
21 equipment that we have installed and many others in our
22 part of the country was built, rate of change of

1 frequency wasn't a design consideration. It wasn't
2 something that was talked about. There were probably
3 some industrial standards that took things into account
4 for specific pieces of hardware, but to try and apply
5 that to the system as a whole and say that it's even
6 capable of -- to state, you know, with the rigor
7 necessary to demonstrate compliance with the
8 reliability standard, that it's capable of performing
9 at any given rate of change of frequency, would be very
10 difficult to generate any such claim and be able to
11 stand behind it.

12 Now, that's not to state that it can't do -- you
13 know, do so. It's obviously withstood frequency
14 changes that have some rate of change of frequency, and
15 it can do so. But what is that, how do you determine
16 it, and then how do you have evidence to demonstrate
17 that you're capable of doing so is a whole nother
18 question. And I'm not -- again, this kind of comes
19 back to the uncertainty. How do you even determine
20 these things for this? You know, us as generator
21 owner, we're in a very difficult position with our
22 resources to try and be able to make these

1 determinations, relying back on the OEMs to some
2 extent. And then when you talk about the difficulties,
3 you know, with projects, hardware and software, and
4 everything else, that the projects were probably kicked
5 off a lot of this stuff in the late 90s -- mid- to late
6 nineties -- with installation had taken place in the
7 early 2000s. Getting those archive designs out, trying
8 to build up what these are actually capable of on
9 things that weren't necessarily considered at the time
10 of building, and then presenting a GO with an estimate
11 on what these things, you know, can actually perform in
12 these -- you know, with these parameters, such as rate
13 of change of frequency or frequency Ride-through
14 capability, how long can we, you know, withstand a
15 whatever, 4 hertz frequency change for -- you know, can
16 we do it for 6 seconds, can we do it for 3 seconds,
17 whatever the case may be.

18 And I'm going to lean back a little bit on some,
19 you know, some different industry experience I have
20 working in manufacturing. So when you start talking
21 about all these legacy components that are in these
22 devices that were built a very long time ago, they were

1 spec'd out to a very specific thing, right? Everybody
2 specs everything out. We gave -- you know, we gave the
3 requirements to the -- to the OEM. The OEM is then
4 going to give those requirements to all their subs.
5 Those requirements are what was built to at the time.

6 There may be variations in components that are in
7 these things that are not necessarily -- we're not able
8 to account for today because they met the requirements
9 that were given to all these subcontractors, everyone
10 that built your parts, but they're still going to
11 perform differently on criteria that weren't accounted
12 for, and that's something that you were going to see
13 across the fleet on a lot of these things. So again,
14 it gets back to this concept of uncertainty with --
15 especially with these legacy equipment. So I want to
16 be very careful to make sure that I'm not saying this
17 looking forward. This is about exemption criteria for
18 things that were built in the past, especially, you
19 know, kind of at the beginning of the transition, so to
20 speak.

21 So when you're looking at these assets that were
22 put in the ground, you know, say circa 2005, there's

1 aspects of this that we can -- we're quite certain we
2 can comply with, especially looking at IEEE 2800 and
3 PRC-024 with the -- you know, with the bands as far as
4 frequency with your curves for frequency Ride-through.
5 But there are other considerations that just aren't
6 necessarily accountable for and that we'd have to rely
7 on the OEMs to some extent to give us that information.
8 And, you know, kind of with some insight I have that
9 some of that information is going to be very, very
10 difficult to state with certainty that, again, meets,
11 you know, again, back to what we're talking about here,
12 reliability standards, that meets the criteria to
13 demonstrate evidence of compliance with a mandatory and
14 enforceable zero defect reliability standard. And
15 that's going to be very, very challenging for a lot of
16 these older assets.

17 MR. GUGEL: Well, that was a little loaded. So
18 I'm going to probably reserve my comments until we get
19 to the legacy thing because I think that's something
20 we're going to have to deal with throughout all this,
21 but very much appreciate the comments that I've heard
22 so far. I'm hoping at some point we get away from the

1 mindset of zero defect and start talking about effects
2 on the system, but yeah, let me -- let me reserve until
3 we get to the legacy issue.

4 MR. YEUNG: Okay. Thank you. Thank you. Can I
5 get a time check, Jamie?

6 MS. CALDERON: We have plenty of time.

7 MR. YEUNG: Okay, because we have three more
8 questions and d

9 MS. CALDERON: There's plenty of time.

10 MR. YEUNG: Okay.

11 MS. CALDERON: (Off mic comment.)

12 MR. YEUNG: Okay. All right. So the next
13 Question Number 4, I think, Dane, you alluded to it.
14 Again, thinking in terms of what kind of exemptions
15 should be allowed for frequency response -- I mean,
16 frequency Ride-through capabilities. The question is,
17 for GOs, what are some of the difficulties you might
18 have in obtaining the data to assess your compliance
19 from the OEMs? You know, what are -- you know, is it
20 available especially for legacy equipment, as you said.
21 And again, the context of this question is about the
22 need for exemptions.

1 MR. AHLSTROM: So again, this comes back to what
2 is currently available on this, and what is currently
3 available is what was provided initially on build. So
4 we know what the -- if you look -- you know, so if you
5 look at a lot of this equipment, it wasn't necessarily
6 even in the -- framed in the context of Ride-through
7 capability. But you're looking at, lack of a better
8 term, tolerance bands, bands of operation this
9 equipment can successfully perform through. You know,
10 and sometimes it's given in, you know, plus or minus
11 percentages. Sometimes it's given in, you know,
12 absolute hertz, whatever the case may be. But that's,
13 you know, that's what we have currently, so as far as
14 the difficulty in obtaining any further information, a
15 lot of that is going to fall back on the OEMs to
16 provide this based on analysis of these -- of these
17 older -- of these older equipment, the -- you know, the
18 components that went into it, how that -- how that
19 stacks up and what the outcome of that is.

20 So I don't think I can accurately speak to, you
21 know, what the -- what the technical challenges are
22 going to be because that's -- you know, that's not

1 something that I'm going to be privy to as far as the
2 efforts that are going to go into performing these
3 analyses or potentially testing, or some combination of
4 both, on these legacy assets to determine what the --
5 what the capabilities are. But for us right now, you
6 know, the difficulty is that, you know, that
7 information doesn't currently exist in a lot of cases,
8 especially for this -- for this very -- you know,
9 relatively speaking, for what we're looking at here,
10 old equipment.

11 MR. AHLSTROM: Yeah. Jason wants me to go next as
12 a GO, and then I can turn it back to him as an OEM in
13 this case, I guess, because, you know, look, this is
14 going to take a highly cooperative, collaborative
15 process between the GOs and the OEMs with regard to the
16 IBR devices we're talking about across the board. And
17 we heard a lot of this yesterday, that, you know, the
18 IBR are still on a very fast learning curve, which
19 means that we're going to continue to see dramatic
20 price improvements where they get cheaper and cheaper,
21 but it also means that they are innovating more on the
22 scale of electronics and software rather than on the

1 traditional scale of generators as we know it, right,
2 which means every three to five years, they're coming
3 out with a whole new generation of inverters, in
4 particular, turbine -- you know, wind turbines.

5 So in other words, the whole -- all of the
6 engineering expertise of the OEMs is devoted to a new
7 product line, as we heard about yesterday, building for
8 that next product version. They don't have, you know,
9 their development engineering staff looking at the
10 older devices. They're looking at what the next one is
11 going to be. They've retired the test bench on all
12 this stuff once they've done that and taken that old
13 version out of production. As those of you who go
14 through the interconnection process, no, we have a
15 problem with -- you know, I wouldn't call it a problem.
16 It's an opportunity, I think, with IBRs that, you know,
17 if you had -- if you're delayed for several years to
18 get through the interconnection queue, by the time we
19 actually get our, you know, our GIA, the model of
20 equipment we may have thought we were going to use is
21 no longer in production. We have a better one
22 available, but it's different, you know, with different

1 models and so forth.

2 But that's the reality, and that's the advantage
3 of IBRs is that they're innovating to respond to what
4 the grid needs and what the market needs faster than
5 we've ever done with conventional resources. But that
6 does create this challenge that, you know, how do you
7 -- especially with retrofits, I mean, you have to -- I
8 think, by the way, it's beneficial to have a hardware
9 exemption process to encourage everybody to immediately
10 get started on looking at what are the impacts with
11 their OEM, you know, rather than just you get to the
12 compliance period where, okay, here's what I can do.
13 And then you say, well, that's -- you know, we think
14 you could do more, and then you have to go back and go
15 to the OEM again, and it just delays the process and
16 delays the implementation actually.

17 So I think 2800 with an exemption process makes a
18 lot of sense, but you have to be sympathetic that, you
19 know. We're not -- it's not easy to get the
20 engineering talent back on this. And then we got to
21 balance a plant, you know, the plant models that have
22 to -- or the GO's responsibility with some other

1 consultant or other in-house experts, you know. It's a
2 big deal to figure this out, you know.

3 So I think I'll leave it there, Jason, and let you
4 take a, you know, next crack at it. But the logistics,
5 the -- you know, the process of doing this and getting
6 those retrofits out to the field, you know, it involves
7 the OEMs as well as the GOs, and it's highly
8 complicated. You know, you don't -- it's not a slam
9 dunk, whether it's software or hardware.

10 MR. MACDOWELL: Yeah. That's why I had him go
11 first. Well put, Mark, you know, and I completely
12 agree, and nd to me, you know, the question is well
13 founded about what the challenges are. I think it
14 certainly goes beyond just documentation. And
15 documentation is one element of it to look at what
16 those legacy units are capable of, and then, you know,
17 also realizing that those legacy units were designed to
18 a particular fit-for-purpose form earlier mentioned.
19 And now we're looking at a, you know, a situation where
20 we need to have, you know, looking forward, a much
21 broader set of capabilities than that equipment was
22 necessarily designed for or tested for, modeled for,

1 integrated for. And this is where that communication
2 comes in very -- in a very deep way as needed between
3 GOs, OEMs.

4 And I'll also say, from an OEM perspective, and
5 Arne pointed this out yesterday in the OEM discussion,
6 is that it's not only the OEM, but it's really a matter
7 of all of the packaging of all the components, all the
8 equipment, all the -- all the auxiliaries that the OEM
9 has to pull together in the wind turbine, in the solar
10 and battery resource, right, and any other resource for
11 that matter. Same thing with gas turbines, right, or
12 steam turbines. There's a whole bunch of complex
13 systems behind the fence that have to be coordinated.

14 And a big deal about that documentation and
15 capability understanding is that some of those legacy
16 units are sourced with equipment from companies that
17 maybe don't exist anymore or that have substantially
18 changed. So it trickles down or trickles up, however
19 you want to think about it, to understanding how do you
20 go back and reevaluate those legacy systems for, you
21 know, all the components that maybe don't have
22 companies are around anymore, or at least don't have

1 documentation for that old -- that older equipment, and
2 that may not exist anymore, right? So it is -- it is
3 more complicated.

4 You know, if we were to have a test bench that we
5 could test for that old equipment, that would be easy,
6 but it's not easy to take an existing piece of
7 equipment that's been in the ground 15 years or more
8 and pull together a complete test regime that typically
9 is done in a lab environment where you have a lot of
10 capability to replicate the grid. And many of, you
11 know NREL, CGI, and there's other test facilities that
12 are out there for this purpose. That lab environment
13 and type testing environment is there, fit for purpose
14 for performing thousands of tests under very specific
15 conditions. How do we replicate that in the field to
16 renew the capability that we want to do with a piece of
17 equipment that's in the ground, and, you know, and we
18 need to retest for another purpose that it was never
19 meant to do. So I think those are some of the biggest
20 challenges, right? It's not only about documentation.
21 It's about the entire testing and modeling process it
22 takes again, to show, hey, how could we be compliant or

1 not?

2 Now, that said, it's not that everything is going
3 to be all incredibly difficult. If it's a small change
4 that's needed, we can do some sort of analysis in some
5 cases and say, okay, we'll have a sense whether it's --
6 it has a big impact or not, but there still needs to be
7 that evaluation. And that evaluation, if you take any
8 OEM's fleet at tens of thousands to hundreds of
9 thousands of units, you know, depending on who, where,
10 what, how, it really does get, you know, a substantial
11 amount of effort that's needed in that with resources
12 that are fully focused on meeting the needs of the
13 requirements, PRC-024, PRC-029, whatever it happens to
14 be, IEEE 2800, on new units alone. And we don't have
15 an unlimited number of resources to look at both, so I
16 think that's the balance we need to strike. Thank you.

17 MR. SHATTUCK: Thanks, Jason. I think you're
18 last, right?

19 MR. MACDOWELL: Was I last? Okay.

20 MR. SHATTUCK: It seems like the last question
21 might be a bigger discussion, and we probably covered a
22 lot of the next question. So I would say let's maybe

1 be mindful of our time for this next question so we can
2 spend it on questions from the group and the final
3 question. So we'll go with our fifth question, which
4 is, what difficulties do generator owners have when
5 attempting to coordinate their plant to successfully
6 meet criteria specified in Attachment 2 of the draft
7 PRC-029? I think we all alluded to a lot of this so
8 far, so yeah, just keep it -- be mindful.

9 MR. AHLSTROM: Yeah, very, very briefly. I think
10 the bottom line is all of the OEMs we're talking about
11 are global OEMs, part of the global supply chain. As
12 we heard yesterday, none of them have a product in plan
13 that would be compliant with the PRC-029 curves. 2800?
14 Yes, you know. So I think you have to look at this
15 from a supply chain on a global basis. If anything,
16 we're trying to move toward global unified IEEE-IEC
17 standards, I think, for IBRs in the future because of
18 this global supply chain nature. And, you know, not
19 complying with 2800 is not going to fly in terms of
20 being able to get the equipment we need and be in
21 production with this. And I don't -- I don't think the
22 advantage, if there isn't one, you know, justifies the

1 disruption in that and how much that would slow down
2 and increase costs for the U.S. market on those
3 products as well. So it's just really not a -- not a
4 starter for me.

5 MR. MACDOWELL: I think I probably addressed this
6 in my last comment as well. So I would like to maybe
7 take the opportunity to talk a little bit about a
8 related subject on exemptions, particularly, because I
9 do think there's a big benefit to the exemption
10 process, specifically, in terms of the fact that
11 exemptions will get you a level of documentation,
12 right, and understanding maybe what the gaps are, and I
13 think that is valuable. Exemptions also take effort,
14 right? Exemptions do take a certain amount of
15 capability to actually look into what the difference
16 maybe would be relative to what the old products are.
17 So it's not that you get a free pass even if you get an
18 exemption, but what you do get out of an exemption is
19 at least an understanding of maybe where the gaps are,
20 right?

21 And that in itself for planners, for GOs, and OEMs
22 is valuable to understand what are the gaps in the

1 performance that we see today based on the models that
2 were provided and integrated of the plant at that time,
3 relative to meeting a certain requirement, like the
4 Ride-through of PRC-029. So I think that's my plug for
5 at least considering and having an exemption process in
6 place for frequency Ride-through that allows us
7 visibility as to why we can't meet something.

8 MR. ROGERS: No, I think that was -- that was
9 quite well stated. You know, as far as the
10 difficulties in attempting to coordinate the plant, you
11 know, it goes very much hand in hand with what we
12 talked about previously, having all the necessary
13 information, having the necessary parameters, and, you
14 know, knowing all these things from your plant, top to
15 bottom, to be able to run the appropriate studies and
16 determine, you know -- you know, are they coordinated
17 appropriately as per the draft standard.

18 I think, again, everything that was just stated
19 was very spot on as far as the need for exemption and
20 what that allows, and the benefits that that does
21 provide as far as, you know, having not just a blanket
22 write-off, you know, can't meet it/move on type

1 exemption, but having something where you really fully
2 document the known capabilities of the plant. You also
3 document the unknown capabilities because, you know, it
4 -- as we stand right now, and maybe this changes as
5 OEMs, you know, are able to develop more information on
6 these legacy pieces of equipment, that'll shrink. But
7 right now, there are some unknowns, and documenting
8 those unknowns are -- you know, would be very
9 beneficial as well for anyone who's attempting to
10 assess the reliability of the system as a whole. And,
11 Howard, to get to your point just a minute ago about,
12 you know, moving from that mindset of zero defect,
13 mandatory enforceable, to looking at the impacts of any
14 particular thing on the reliability of the bulk power
15 system as a whole, I think the exemption criteria
16 really does help with that because it allows for what
17 information we do have, especially right now. What
18 information do we have today right now that, by the
19 time that this -- you know, this standard gets filed
20 with FERC and then becomes effective, you know, we'll
21 have -- we'll probably have more information. The OEMs
22 are probably going to determine some things, but we're

1 still not going to have it all. But that will allow
2 for whatever in information we do have to start
3 immediately flowing, and I think there is real benefit
4 for that.

5 You know, Alex, some of the stuff that he talked
6 about yesterday with those studies and everything, it
7 allows for further examination within -- with that new
8 information on where the risks are, what are we seeing,
9 what's causing these issues, what other things -- you
10 know, what systemic things do we have? Are there
11 things specific to this location that we can -- that
12 can be mitigated outside of this very specific issue of
13 frequency Ride-through, and what things can be done to
14 address those more systemically? And so sorry, I
15 rambled a little bit, got a little bit off topic, but
16 building off of what the previous commenter said here,
17 I think that that's -- you know, there's a lot of
18 benefit in that.

19 MR. GUGEL: Yeah, I would agree, and certainly, at
20 least personally, I'm a supporter of trying to figure
21 out some way of finding an exemption that would work.
22 I think as we get into the next question, we'll

1 probably get into some of the more technical details on
2 that, and hopefully they haven't started the vat of tar
3 with the feathers out there for me when we get to that
4 topic. We'll see.

5 MR. YEUNG: Okay. Thank you, Panel. Our last
6 question hopefully will wrap up a lot of the things
7 that have been discussed, and I believe it will be based
8 on this last -- the responses to this last set of
9 questions. Last question, it's kind of lengthy. I
10 don't know if everybody has the actual wording, so I'm
11 going to read through it as clearly as I can, and then
12 kind of give a little kind of a summation about what
13 the question's asking for.

14 So the question is, many commenters have said that
15 it would only be fair to grandfather existing
16 facilities and those in construction facilities -- the
17 ones that are already in the pipeline -- grant them
18 exceptions from Ride-through requirements due to the
19 cost of retrofitting, and we've heard a lot of that.
20 Other commenters have said that their facilities have
21 an expected shelf life of up to 30 years, meaning
22 there may be facilities in place well into 2050, and at

1 that time, IBR penetration is expected to be much
2 higher, the system will have changed, and that they are
3 not able to comply with the requirements that are
4 written today, these PRC-029 requirements. So how
5 should NERC balance the burden on generators, the cost
6 burdens, who may be asked to incur large retrofitting
7 costs with the burden on the transmission owners, the
8 planners, in my case, operators, who like certainty,
9 and the end use customers from poor or unexpected IBR
10 performance?

11 So in a nutshell, that question is asking about
12 really the -- there's going to be a lot of industry
13 costs, effort to meet the frequency Ride-through
14 criteria, but there needs to be a balance between those
15 costs and the benefits they have to the system
16 reliability.

17 MR. GUGEL: Yeah, I would agree, and this is the
18 point at which I'll be able to lean in, I think, a
19 little bit more. I do think we've got to carefully
20 construct some exemption criteria because it only makes
21 sense. The last thing we need to be doing is retiring
22 additional capacity out there when we know the margins

1 are already tight at this point. So that's -- you
2 know, to me that's off the table.

3 I think where it becomes a little bit more
4 difficult when you start sharpening your pencil is how
5 do you define "legacy?" If I've got a piece of
6 equipment that's been out there for 15, 20 years, and I
7 do a software upgrade or a hardware upgrade, and have
8 the ability at that point to make a change, is it still
9 considered to be a legacy piece of equipment? Would I
10 be required to make sure that I can meet the new -- the
11 new requirements, whatever they are, that we set up for
12 PRC-029? You know, at what point does a piece of
13 equipment no longer meet the definition of "legacy,"
14 but it has enough new pieces of equipment that it's --
15 that it's considered to be something that should be
16 brought up to speed?

17 And then the other, I think, complicating thing
18 that we have here is, you know, there is a significant
19 amount of generation that's in the queue right now,
20 especially offshore wind. There's some sites out there
21 that they're talking about being larger than 2
22 gigawatts connecting onto the system, which is just --

1 I mean, it's huge. First time I heard about that, my
2 eyes glossed over and I got very panicky. Would that
3 be considered to be in construction at this point if
4 it's in the queue, or would -- you know, would it also
5 be that we need to take those generating units and make
6 them comply with PRC-029? Those are the questions that
7 I think we need to struggle with.

8 At some point, we need to draw a line in the sand
9 say, no new generation that's put in place, IBR based,
10 can be put in that doesn't meet this criteria. And
11 whatever the criteria that's developed eventually for
12 PRC-029, you know, we need to make sure that we've got
13 a date certain that says after this point, nothing new
14 can go on the system that doesn't meet the performance
15 requirements that we have in this. That's just my
16 personal opinion. I know that creates a lot of
17 documentation issues for generator owners, for OEMs,
18 and trust me, it's going to create a lot of issues for
19 the auditors as they go out trying to figure out what's
20 what. But it's the right thing, in my opinion, to do,
21 both making sure we have the exemptions for existing
22 facilities, but then also making sure we've got a line

1 in the sand that says, we know going forward that these
2 units will be able to perform in a certain way.

3 MR. ROGERS: No, I think that was very well said.
4 You know, there's really nothing to disagree with that.
5 You know, I think we need to be careful, though, kind
6 of looking at the question specifically, when we start
7 using terms like "grandfathering in" and then, you
8 know, "cost of retrofitting," and things of that
9 nature. So grandfathering in, specifically, maybe I
10 would disagree with that concept, right? Like, if you
11 look at something and it was built prior to whatever,
12 you know, it's good, right? Just wave a hand, bless it
13 off and we're done with it, and I don't think -- I
14 don't think that's the case. I think, again, it gets
15 back to these very detailed exemptions. You provide
16 all the information you can about your equipment, and
17 you do the best that it can do to provide these
18 services, right, this frequency Ride-through, this
19 voltage Ride-through, this, you know, withstanding rate
20 of change of frequencies. You ensure that it can do
21 the best that it can do. You know, it's not just it's
22 old, well, let it run, it's good, that's fine.

1 So I think, you know, we need to be careful
2 whenever -- you know, and speaking as a GO, we need to
3 be careful when we look at concepts like this. We need
4 to make sure that the equipment in the ground is
5 performing at the best that it can do. Now, then I
6 think you also need to stay away from terms, or
7 potentially stay away from terms, like we heard a
8 little bit yesterday about like "maximization" and
9 "maximizing capability," and what does that really mean
10 because a lot of this stuff, again, you're looking at
11 very specific design parameters that this stuff was put
12 in the ground with, and you need to ensure that you're
13 operating as such because, otherwise, you're looking
14 at, you know, well, let's push it a little more, let's
15 push it a little more, let's push it a little more.

16 Well, now we're running risk of this equipment,
17 and what's the bigger reliability risk now? Is it this
18 -- you know, and especially in some pockets of the
19 country. And maybe this is actually different in
20 different areas, but, you know, you're looking -- you
21 know, we're out here on where we're located, on the
22 western edge of Eastern Interconnect, and we haven't

1 seen a lot of -- a lot of the same issues that maybe
2 have been witnessed to other places. So if we're
3 performing the best that our equipment can perform, we
4 document our known -- our known issues, and we submit
5 those to the relevant people, who need to perform the
6 studies to see what is actually capable, and what we
7 need to be looking out for, and what else we need to be
8 mitigating, you know, I think that's where this goes.
9 I don't think it's necessarily this grandfathering in
10 clause.

11 Also, when we talk about, you know, balancing
12 burden and retrofitting costs, and, you know, you've
13 got the burden on the TOs and the transmission
14 planners, and, you know, reliability coordinators,
15 whoever the case may be, and you're trying to balance
16 that with the cost of the GO to do stuff. Again, I
17 think at some -- at some point, you got to look at this
18 from a GO perspective. The cost of doing business is
19 providing -- you know, being a reliable partner in the
20 bulk power system. We have to do that, and we have to
21 do that best of our ability. And with this existing
22 equipment, as you've heard many people up here state,

1 that probably involves exemption criteria to some
2 extent. I'm not sure I have much else to add. I think
3 we'll probably get some better feedback specifically
4 from the OEMs on some of this as well.

5 MR. MACDOWELL: Yeah. Thanks, Dane and Howard. I
6 think that was really well said. I think going back to
7 quantifying the problem we're really trying to solve,
8 the easy answer is, you know, don't leave any
9 performance on the table that's easy to extract. If it
10 can, it should, right? A blanket exemption really
11 might have the unintended consequences of leaving some
12 performance on the table, so making sure, though, we're
13 understanding of those plants or those resources that
14 may have limitations. I think the bigger issue is
15 having visibility to when they do or when they don't.

16 And some of the aspects of when these pieces of
17 equipment may not be able to meet some of the
18 requirements, especially like what we're talking about
19 in Ride-through, are not necessarily visible in the
20 models that we have, right? And the model -- and this
21 is not only an IBR issue. This is an issue across
22 power system modeling ubiquitously across the board.

1 Synchronous plants have the same issue. We don't model
2 the auxiliaries in detail in synchronous plants either.
3 We tend to look at the power system's impact of the
4 main power circuit and have a very rough estimate of
5 the Ride-through capability with those simple Ride-
6 through protection curves that are overlaid, that
7 represent a lot of the capability.

8 Let's talk about a thermal unit, for example.
9 It's the protection of the auxiliaries. It's the fuel
10 path in a gas turbine that is very complex, a lot more
11 complex than the auxiliaries in a -- in a -- in a wind
12 turbine or a solar inverter. Those have the same
13 limitations, right? And I think it's that level of
14 understanding that is very important to have in terms
15 of what is the real reliability risk.

16 Another aspect that, you know, going back to the
17 discussion you and I had, Mark, last week, really
18 trying to quantify those conditions that we're trying
19 to solve for, so whatever that happens to be, right?
20 Whatever curves that you land on or whatever system
21 conditions that you're trying to land on, do the
22 homework with understanding what the future system

1 conditions look like, right? Understanding, you know,
2 there are different scenarios of future renewable
3 build-out, future load build-out. Those are the system
4 conditions we're really trying to solve for. Going
5 back to integrated system planning, again,
6 understanding what the implications are for those
7 future conditions, and then understanding the
8 implications of things like Ride-through on that, and
9 having that serve as the guide to determining what
10 those curves really should look like.

11 Some of that was done, to a certain degree, in
12 getting feedback in the process of 2800 from the regard
13 of having a future-looking case or future-looking cases
14 to really get to the point of the problems that we're
15 trying to solve from a system needs point of view,
16 right? And that's why I think the process that we went
17 through in 2800, generally, was -- had a lot of
18 feedback, and it was -- it really serves as a good
19 baseline for the problems we're trying to solve going
20 forward. But that said, I think what's missing in our
21 planning processes today is this viewpoint of doing the
22 system analysis on these future cases to identify all

1 of those system conditions that none of us really have
2 had to plan for up to this point.

3 So I would say that is probably the more -- the
4 bigger need than to really evaluating, hey, are we
5 going to meet PRC-029 curve or not with system
6 equipment? Do we need an exemption or not? Well, you
7 know, that's only getting us halfway to the reliability
8 issue and really mitigating that reliability issue at
9 hand. That's my opinion. Thank you.

10 MR. AHLSTROM: Yeah. This question was added
11 actually to the question list late last week, and my
12 initial impression was that this is a real red herring
13 question. You know, I think it actually applies more
14 to conventional resources than it does to IBRs, to be
15 quite honest. I mean, everything we said -- asked in
16 this question applies to what about the -- you know,
17 the thermal fleet in 2050, right?

18 As I pointed out, you know, we're on a very fast
19 learning curve with IBRs. There's a lot of reasons why
20 even though it -- they may have an engineering life of
21 25 years or so, we're actually replacing inverters much
22 more frequently than that. We're doing a lot of, you

1 know, repowering of wind plants more frequently than
2 that. There's lots of drivers because the technology
3 keeps getting better, more capable, and less expensive.
4 So when we re-contract it or whatever, we'll put in the
5 next version of equipment to get, you know, more energy
6 into the next contract or whatever, you know.

7 There's lots of drivers for this, not just
8 incentives by the way, but other business reasons why
9 we're actually -- like with a battery storage plant. I
10 mean, you're -- almost the entire life of the plants,
11 you're upgrading with additional storage in there to
12 maintain full capacity and, you know, upgrading
13 inverters as well. So equipment is going to be
14 replaced/repowered much more quickly with the IBR fleet
15 than it is with a conventional fleet. When we do
16 replace it, we can't -- we won't be able to buy an
17 inverter that's not compliant if we force the OEMs
18 toward 2800 here and what we're doing here.

19 So without question, you know, I agree with Howard
20 that, you know, when we repower, that we should be in
21 full compliance with that, and I agree with Howard very
22 much that, you know, we also have to look at balancing

1 resources and all that. I think we're going to see a
2 lot of innovation on that from the IBR side as well
3 with the longer duration storage side that we can't
4 predict by 2050. It's not like we're going to stop
5 looking at what new standards are becoming necessary
6 between now and then, you know. We will probably have
7 additional standards that apply to this and additional,
8 you know, things we try to do to improve the fleet,
9 both conventional and IBR.

10 And I must say, this concept and the question
11 about imposing a burden on transmission owners and
12 transmission planners, this is what TOs and TPs do is
13 they -- the reason they get a regulated return and
14 always have in all the decades of thermo fleet is to
15 reliably and economically deliver the energy from the
16 generators to the loads, right? Why would it be any
17 different with IBRs, you know, but I have very little
18 sympathy on this burden part of the question.

19 But, you know, fundamentally, I think, as I
20 pointed out, with the technology going on here and our
21 path toward additional capabilities and IBRs, including
22 grid-forming capabilities. The thing to do is to build

1 your way past this so that the future IBR fleet, which
2 will dwarf the size of the current legacy IBR fleet, is
3 highly capable and will support an entire grid with the
4 grid services and the balancing services and everything
5 we need to maintain reliability, which is what we're
6 all here for. And it serves the IBR interest in no way
7 whatsoever if this creates reliability problems or has
8 any reason why we would slow the deployment of new
9 technologies to the grid.

10 So I'll leave it at that, but, you know -- you
11 know, I don't -- I don't think -- even I don't think
12 that it's wise to be thinking that, well, we have to
13 have a hundred percent IBR fleet by 2050 or anything
14 like. We have to coexist with other resources,
15 including legacy resources, including thermal
16 resources, you know. So I think we can do that, and I
17 think that IBR should be expected to step up to the
18 plate by going PRC-024 to the IEEE 2800 curves, and do
19 what they can with the capabilities, you know, that are
20 reasonable and cost effective, and can be -- can be
21 deployed, and get it out there and do the right thing.
22 So I'll leave it at that.

1 MR. GUGEL: Yeah, Mark, I would kind of add into
2 that that I think that word "burden" was just a little
3 bit misleading there also. We've talked a lot, and I'm
4 going to stray away, I think, a little bit from the
5 panel here, but we've talked a lot about the
6 limitations and stress at that point. There are some
7 really good advantages that inverter-based resources
8 can add to reliability. And I think as we go forward
9 and understand that, the fact that they can react much
10 quicker to system disturbances and be able to dampen
11 those disturbances quicker, we're going to find that
12 there are some advantages those resources have that we
13 could never get out of the conventional fleet.

14 And so I feel a little bit disappointed that, in
15 some respects, we've concentrated on the negative
16 yesterday and today.

17 MR. AHLSTROM: Yeah.

18 MR. GUGEL: There really are some good, positive
19 things that are going to come out of this.

20 MR. AHLSTROM: Yeah, and in my comments, I alluded
21 back to what we did on the ERSTF and so forth. You
22 know, there are quirks of conventional resources that

1 we're very used to because we've been dealing with them
2 for a hundred years, right, you know, like, after a
3 disturbance. Do you really want a really slow
4 responding resource where you have to inject a whole
5 lot of energy to get it back up to 60 hertz? No, you
6 know, that's not an advantage of inertia. The recovery
7 is slow. It's mind-boggling is slow compared to what
8 IBRs can do. In fact, with IBRs, now we have to worry
9 about, well, how fast do you want us to be because we
10 don't want to be too fast. We create instability. I
11 get it, right? But that's what we have to work out is
12 there's advantages of all the technologies. We have to
13 figure out how they fit together for system benefit.

14 MR. MACDOWELL: One thing I'd like to just
15 conclude with, and on a positive note, right? I think
16 we all recognize that there are big challenges that we
17 need to overcome. And these challenges, fundamentally,
18 are the fact that we're a victim of our own success,
19 right, and it's a good thing. The fact that we're
20 seeing a lot of the change that we're seeing in the
21 transformation really going towards meeting bigger
22 goals, to meeting policy needs for planning,

1 decarbonization goals, a hundred percent of something
2 by sometimes, somehow just go do it. Well, the do it
3 part is actually, you know, what we're really
4 struggling with right now. How do we actually make
5 that happen?

6 And I'd like to offer maybe, you know, maybe some
7 platforms of discussion to consider where we can help
8 each other. And those platforms many of you are
9 already engaged in. First of all, want to congratulate
10 the Drafting Team, first of all, for really a job well
11 done and understanding how to wade through all these
12 issues, but also want to congratulate the work done by
13 the NERC IRPS, the Inverter-Based Resource Performance
14 Subcommittee led by Alex, led by Julia Matevosyan, led
15 by Ryan Quinn in the past, and, you know, a lot of
16 input and really great discussion to understand what
17 the issues are and how do we mitigate them.

18 And one of the things that we're doing in ESIG in
19 the Reliability Working Group, specifically, and I work
20 with Mark with ESIG and lead that working group with
21 Julia Matevosyan, is understanding the implications of
22 the gaps today, solving the chicken/egg problem of how

1 do we get the technology that we need in -- not only
2 installed in equipment, but deployed on the grid
3 through requirement standards, markets, mechanisms that
4 will actually get these performance characteristics in
5 the grid, get them deployed. And oh, by the way, we
6 need to keep everyone whole in order to do that. We
7 can't break, you know -- the need to actually have
8 these elements still being profitable enough so that
9 there's investment that wants to continue going forward
10 in these projects. Otherwise, we're going to, to go
11 back to your point, Howard, to have a resource adequacy
12 issue on our hands.

13 So that's the very tight balance, keeping all of
14 these things together, and recognizing that when OEMs
15 build this equipment into the capabilities, they're not
16 building that capability to their immediate customers
17 necessarily, right? The generator owners have a very
18 specific need to install equipment and make money by
19 the revenue that is given simply selling power. And in
20 order to do that, we need to make sure that you can
21 optimize the output and stay online, don't get
22 curtailed.

1 So that's the real genesis of the KPI that the
2 developers really need to maintain, but oh, by the way,
3 we also need to do all of these things to keep the grid
4 stable. So that's a very different element, a very
5 different aspect of how OEMs need to give that new
6 technology to the grid companies, right, which are, you
7 know, fundamentally the customers and the constituents
8 of -- downstream of the generator owners.

9 So really, having that transfer function of
10 technology development from OEMs all the way through to
11 grid owners, operators, developers, that's a transfer
12 function that is becoming more difficult to have,
13 right? But also, we need to do things, to me, in a way
14 today that demonstrates the capabilities of the new
15 technology. And this is where we are with ESIG and the
16 Global Power System Transformation Consortium, where we
17 are looking at the capabilities of implementing grid-
18 forming capabilities and making sure that we have good,
19 sound, robust mechanisms in place to demonstrate those
20 capabilities of grid forming on the grid, showing the
21 benefits through demonstrations across the grid, but
22 also showing that we're not going to have any

1 unintended consequences of oscillations/interactions
2 between the grid-forming technology to the grid-
3 following technology, grid forming to other grid-
4 forming resources, grid forming to synchronous.

5 And those are the types of things I think we need
6 to invest in across the community, across OEMs,
7 developers, system operators, utilities, regulators,
8 and I really want to thank Mark for your participation
9 in that, and, Mark Ahlstrom, for your leadership in the
10 -- in the Council we have in order to institutionalize
11 that. And then that feeds back into the integrated
12 system planning work that we're doing with that as
13 well. So we'd like to invite others that would like to
14 know more about the ESIG and GPST activities about
15 maybe what we can learn together and then have real
16 foundational elements of what problems are we trying to
17 solve and what regulatory impact do we want to have
18 with, you know, understanding how to actually get the
19 deployment of what we need.

20 MR. SHATTUCK: All right. Do we have time for
21 questions. Yeah, I think we have a half hour for
22 questions. We'll do the room and alternate with Slido.

1 Manish has already jumped up.

2 MR. PATEL: So this is not a question. I'm not
3 even sure what I'm allowed to advocate or not as an
4 EPRI employee. I'm still learning that.

5 (Laughter.)

6 MR. PATEL: So this is from -- this is from Manish
7 Patel with couple of degrees in electrical engineering
8 and some experience in industry. But I think --
9 seriously, I think some of this has been submitted as
10 EPRI comments in writing with various drafts of the
11 standard and all that.

12 But let's take a step back. Why are we here at
13 the technical conference, right? So PRC-029, as
14 written, allows exemption for legacy IBRs with hardware
15 limitations, right? We don't know if that poses risk
16 to the system or does not, yet to be determined. If it
17 does pose a risk to the reliability of the system, then
18 we are going to figure out a solution. It may be a
19 solution that calls for, you know, retrofitting IBR.
20 It may be a solution that is out on a transmission
21 synchronous condenser, [inaudible 01:31:07], name it,
22 right? We don't know yet.

1 The only reason we are talking about frequency
2 Ride-through is for two reasons. One, PRC-029 curve,
3 as proposed, are very stringent, and there is no
4 exemption to legacy IBRs. I have worked in the
5 industry for some time now. Number of times fault
6 happens on the system are much more the number of times
7 frequency deviates significantly. Even yesterday, I
8 think Alex's presentation, none of the events caused
9 the frequency to deviate by the magnitude and for the
10 duration that we are talking about in PRC-029, right?
11 But I was a protection engineer for living for some
12 time, and, my god, lightning strikes and line trips,
13 very common. Snake climb somewhere it doesn't need to
14 climb, something trips, right? Voltage sags much more
15 frequently than the frequency deviates from nominal.

16 So PRC-024 went through a revision just about
17 couple of years ago, right? The intent at the time was
18 to clarify that momentary cessation is not allowed.
19 Even then that Standard Drafting Team did not think
20 that we have to widen the frequency curves, right?
21 Just two years ago, we went through 2800 exercise. I
22 mentioned this. I was vice chair. We had no

1 justification that IEEE 2800 frequency Ride-through
2 curve is needed. Where it ended up coming from? IEEE
3 1547? Where it came, 1547? I think California Rule
4 21.

5 So when we were discussing frequency Ride-through,
6 we were thinking about future grid. We don't know. We
7 don't have studies. We talked to a lot of solar folks,
8 and they said, yeah because they have to comply with
9 1547. They will have IBRs that will comply with, you
10 know, frequency Ride-through curves. So then we talk
11 to wind OEMs -- some of them are in the room -- and
12 say, well, look, we would like to keep this simple.
13 1547 already uses this frequency Ride-through curves.
14 Why can't we use it for transmission? After some
15 conversation we landed on that. That sounds like a
16 good idea. So now, two more years go by, and then PRC-
17 029 comes along, and we have an even stringent, right?

18 I tell you, I think what Mark suggested earlier,
19 if we hold all legacy IBRs to PRC-024 Ride-through and
20 all new IBRs to IEEE 2800 Ride-through, then this gives
21 the certainty -- I think Howard mentioned earlier --
22 this gives the certainty to system planners what

1 equipment will be able to do based on in-service date.
2 We have to decide what is legacy and what is not
3 legacy. That's right. That's still -- that's still a
4 question. But I think going forward, to me, it looks
5 like all legacy IBRs, PRC-024, that standard was in
6 effect anyway, right? Those plans are supposed to meet
7 that anyhow. But one has -- even two years ago, the
8 PRC-024 Standard Drafting Team said we need more than
9 PRC-024 curves. IEEE 2800 landed on whatever because
10 of 1547. I just don't see why we need to go one step
11 further. So anyhow, I think that brings a lot of
12 certainty.

13 Now, on a lighter note, IEEE 2800 and PRC-029,
14 it's very difficult for a tongue to say. I think all
15 the powerful people are in the room. Why don't we say
16 IEEE 2800 and PRC 2900. Very easier, you know. Can we
17 renumber the 029?

18 (Laughter.)

19 MR. PATEL: You know, just move zero from front to
20 the back and add one more? It's free.

21 (Laughter.)

22 MR. AHLSTROM: Let me just say, I very much agree

1 with you. I think PRC-024 for legacy assets is
2 actually just fine, and, in fact, with IBRs, right,
3 we're actually looking at it as a Ride-through
4 standard, more stringent than, I say, it's viewed for
5 conventional resources, right? So I agree. I agree.
6 That would be the simplest thing that would save NERC,
7 and all the compliance folks, and all of the OEMs, and
8 all of the GOs a lot of time and effort that could be
9 better used to put, you know, IEEE 2800 into the new
10 generation of equipment more quickly and deploy it more
11 quickly, right? And that was the argument I actually
12 made in my written points.

13 You know, on the other hand, I think the exception
14 process with 2800 is another good approach. It's more
15 time consuming. It's going to slow down. It's going
16 to create, to be honest, a lot more work for NERC,
17 especially with the other non-IBR resources coming in,
18 you know, under the new definitions of who's subject to
19 compliance. That's going to be a lot of work for NERC,
20 I think, you know. So I think you could simplify it by
21 just sticking with PRC-024, but I'm perfectly fine with
22 2800 plus an exemption process as well.

1 MR. GUGEL: Yeah, the only thing that I would add
2 to that, and this point was brought up yesterday, is
3 that 024 is not a Ride-through standard. 024 just does
4 the set points. And so, you know, if you need
5 requirements for Ride-through, you really do have to go
6 a little bit different.

7 MR. AHLSTROM: My point Howard, I think the IBR
8 community actually ends up interpreting it as a
9 performance Ride-through standard, right, because with
10 electronics, what's the difference between protection
11 equipment and IBR is when you really get down to it,
12 right? So all I'm saying is if you applied it as a
13 Ride-through standard to IBR, I think the IBR community
14 would be fine with that, and it would actually would
15 exceed what you're doing with conventionals.

16 MR. GUGEL: The only -- man, I hate to put on my
17 compliance hat.

18 (Laughter.)

19 MR. GUGEL: The only issue that we have there is
20 you've really got two communities in the IBR area.
21 You've got the one that is traditional generator
22 owner/operators that are with traditional utilities and

1 understand NERC standards, and do that application.
2 You've also got now into this organization, financial
3 institutions that would just look at the letter of the
4 law as opposed to what was actually intent behind that.
5 And I think the issue for us is going to become
6 enforcing PRC-024 as a Ride-through standard when it
7 doesn't necessarily state that in the standard, but it
8 just says that your set points and your protection need
9 to be at a certain level.

10 So I agree that the curves for -- as we start to
11 look at things and start to interpret how legacy and
12 future things should go in, I think that,
13 traditionally, most folks have considered PRC-024
14 curves where they want the operating limits to be and
15 the constraints to be on there, other than the fact
16 that there were some that interpreted that curve that
17 if it was outside, it was a must trip as opposed to
18 can, you know. And I think we've gotten that
19 misunderstanding straightened out with most folks.

20 I do think there's still that learning curve, and,
21 potentially, the concern that may be out there that
22 folks that haven't traditionally been in the NERC realm

1 would not interpret PRC-024, the letter of that, to be
2 a performance standard, but instead just a setting
3 standard.

4 MR. AHLSTROM: Agreed. But I mean, couldn't you
5 put the PRC-024 in as the legacy must comply with PRC-
6 024 as compliance -- as a Ride-through standard into
7 PRC-029?

8 MR. GUGEL: Yeah, I think that's potentially a
9 path forward, at least looking for some of those curves
10 and when you're talking about exemptions. I do think
11 there's a potential there, yeah.

12 MR. YEUNG: Okay. We'll take the question from
13 the room.

14 MR. KOERBER: Arne Koerber, GE Vernova Wind. The
15 topic of this panel discussion was exemptions.
16 Yesterday, we mentioned a few things that make it hard
17 for us to sign up for not being able to do something.
18 And to embark on a product development, even if the
19 product is retrofitted, with the sole intent of finding
20 a roadblock where we can't do it.

21 In the discussion today, we went back to a lot of
22 -- we discussed a lot of, oh, we need documentation

1 that allows a -- I don't know -- I'll call it a semi-
2 public design review of why we can't do something, and
3 this is -- this is a real question. I'm not saying
4 this to make a point. Any thoughts from this panel on
5 how you would structure an exemption process that
6 doesn't rely on OEM saying we cannot do this? Like,
7 how would -- how would you structure an exemption
8 process, again, that doesn't -- that doesn't go back to
9 proving something can't be done, which we have concerns
10 with.

11 MR. GUGEL: I'll start with this, and I think some
12 others might be able to lean in on this, too. You
13 know, we struggled through this same issue when we
14 started talking about cold weather and design
15 parameters for units as they get down to extreme
16 temperatures, whether they're low or high. And
17 basically, what it came down to was producing design
18 parameters, what was the unit designed for and having
19 that there. I think if you can pull out that
20 information and say, look, this unit wasn't designed to
21 Ride-through a particular frequency, wasn't designed to
22 Ride-through a particular voltage because this was the

1 specifications for that unit at the time, that would be
2 adequate documentation as opposed to trying to prove a
3 negative. And I'm just speaking for Howard at this
4 point. But I think having the design parameters and
5 that information to lean on is probably the best
6 documentation rather than some sort of a -- of a test
7 that says, hey, look, I tripped, so I know that it
8 can't do that.

9 MR. KOERBER: Just to make sure I understood
10 correctly. So you would be saying all maximization
11 always goes up to the originally-stated capability from
12 potentially many years ago, but there would be no
13 intent to go beyond that?

14 MR. GUGEL: I would say that, yes, that basically
15 -- well, if you did modification to the plant that you
16 knew would take it in a different way, that you'd have
17 that documentation also, but, you know, if a -- if a
18 plant wasn't designed to do X, you can't expect it to
19 perform X today.

20 MR. ROGERS: Now, that last point you got to is
21 kind of what I was going to get to as well, and I think
22 that that would be very important in the documentation

1 process, the exemption process, is not trying to prove
2 the negative. It's stating the positive and it's
3 clearly communicating the positive, and there may be a
4 whole lot of unknowns, especially when I'm talking
5 about, you know, some of the fleets that -- you know,
6 that OG&E owns, the stuff was put in the ground, again
7 like 2005. It was designed in 2000, or, you know,
8 probably '98, '99 is when the design process on a lot
9 of that started. We don't know these things. We
10 wouldn't be able to state these things. And even if we
11 did some type of testing on one of these units, one,
12 may fry the unit, that's bad, what do you do, hook it
13 up to the next one and try the next unit? That sounds
14 like a bad idea.

15 Or if you're able to perform some type of
16 simulation, say you do get enough parameters to do
17 something, is that representative of my fleet? You
18 know, these things have been in the ground for 20
19 years, one of them's been on top of a hill in Western
20 Oklahoma, one's been on the bottom of a hill. The
21 one's been in the shadow of the tower, one's not, you
22 know, I mean, and degradation of electrical components

1 over time is a very real thing. And I think that has
2 to be very clearly communicated, and I'm glad that was
3 brought up so this can go on the record for the
4 Standards Committee and everyone else who's drafting
5 this to understand.

6 It's very important that we don't try to prove the
7 negative with this exemption process. We state the
8 positive. We state what we can do and nothing more.
9 If there are things maybe that the standard talks about
10 that we're not capable of doing, address those
11 specifically as unknowns, you know. Don't leave the
12 fill blank, right? State, you know, this is an
13 unknown. This was not designed with this parameter or
14 with this capability in mind. Does that mean it can't
15 do it? No. That means we don't know what it can do.
16 And I think being -- stating that and being very clear
17 about that is very important for the exemption process,
18 one, to be something that's workable, but also be --
19 provide the maximum value. Thanks.

20 MR. YEUNG: Thanks. We'll go online.

21 MS. CASUSCELLI: All right Thank you. Yeah, we
22 have a number of questions online. So the first one

1 is, if the protection at inverter terminals does not
2 comply, could the GO submit an exception without
3 dynamic analysis. Asking because of
4 effort/availability of models.

5 MR. GUGEL: I want to make sure that I understand.
6 Are you talking -- are they talking about the
7 protection -- the protection system of the units? Are
8 they talking about the design? I'm not sure that I
9 understand. If you're -- if you're talking
10 specifically about the protection system, I would
11 struggle figuring out how a protection system couldn't
12 be modified for that specifically if you're -- if
13 you're just talking about that. If you're talking
14 about how the unit actually performs, that's a
15 different conversation.

16 MS. SHAH: I can probably add some color to this.
17 This coming from one of my SMEs. What we are trying to
18 understand is can we skip the dynamic model effort,
19 especially for operational sites where these models are
20 not available to us easily. That's pretty much what we
21 are trying to understand, that can the EMT modeling
22 part, if we don't have the models, can we skip that

1 when we are submitting exemptions, or we are seeking
2 exemptions on some of those models, which we don't
3 have, are not available from the OEMs.

4 MR. GUGEL: Yeah, I'd have to further understand
5 the requirement for an EMT model in that -- in the
6 exemption, so no. Is that requirement in there for the
7 voltage side for the exemptions?

8 MS. SHAH: Yeah, frequency,

9 MR. GUGEL: And if it's not, I'm not sure --
10 nobody's talked at this point about -- at least I
11 haven't heard anything yet -- about specifics about how
12 that exemption would be designed for the frequency
13 side. So, I mean, it's a good question, but nobody at
14 this point has proposed a requirement or not a
15 requirement for EMT studies.

16 MR. PATEL: May I -- may I chime in real quick?

17 MR. GUGEL: Yes.

18 MR. PATEL: So I think this question is more
19 appropriate for voltage Ride-through capability than
20 frequency, right. So capability frequency shouldn't
21 change a whole lot between the terminals of inverter or
22 wind turbine generator on the high side of the plant.

1 For voltage, there is actually a paper that is up for
2 approval by RSTC, written by NERC System Protection and
3 Control Working Group, that actually shows one method
4 to use instead of EMT model to make sure your voltage
5 settings at inverted terminals. And it does not --
6 does not require EMT. You can do basic power flow. It
7 is a bit conservative and shows, you know, one way to
8 evaluate your voltage settings compared to the
9 requirements of the POM.

10 MR. SCHMIDT GRAU: And also to add, I think it's
11 also important that the OEMs take accountability and
12 provide attestations on that because certain equipment,
13 you can maybe do it for voltage without any studies.
14 But I also know from Vestas product, you will have to
15 do some kind of studies because of so many dynamic
16 factors. And you can have protection settings on
17 voltage that is set way below the PRC-024 or 029 curves
18 in your equipment and still compliant -- comply at
19 plant level.

20 MR. GUGEL: Yeah. I think a positive that comes
21 out of everything that we've talked about for the
22 exceptions process is it forces communication. I mean,

1 you're now basically enforcing a communication between
2 the OEMs, the generator owners, and the transmission
3 side to make sure everybody understands the parameters
4 on that as opposed to maybe assuming things that we've
5 done in the past.

6 MR. SHATTUCK: And just to maybe add to Howard's,
7 you know, through the alert process, we've had quite a
8 bit of difficulty getting the extent of condition of
9 what's out there. And an exemption process like this,
10 again, forces it so then we know what's out there,
11 right? And it's documented and through a really formal
12 process, so it is a benefit. Let's maybe do one more
13 online. We did two in a row? Sorry. You were kind of
14 both. We'll do one more online.

15 MS. CASUSCELLI: All right. I'm going to ask this
16 one. What level of time and effort might be saved by
17 adopting the consensus developed under IEEE 2800 rather
18 than developing new requirements under PRC-029?

19 MR. GUGEL: I think that's something that the
20 Standards Committee and the Drafting Team will have to
21 take under advisement as they go forward, but at least
22 at this point, they've had a couple of rounds of this

1 going out. I think the conversations that we've had
2 yesterday and today are providing some clarity in
3 particular areas that have been raised for some of the
4 questions. And so I think all of this in context is
5 going to be something that would be helpful for them.

6 MR. YEUNG: Let me just -- as a moderator, that
7 was one of our concerns, you know, trying to get some
8 clarity because The Drafting Team will have to -- well,
9 the Standards Committee will have to, you know, make
10 that assessment. I think Mark has some good data, you
11 know, comparative data. Hopefully we can get some more
12 in our process, but that's absolutely something we're
13 going to be looking at, you know. What are the benefits
14 of using 2800 versus 029?

15 MS. SHAH: Thank you. Ruchi Shah from AES Clean
16 Energy. First of all, I want to start with some of the
17 suggestions that were given today about PRC-029, what
18 possibly can be done as a resolution. And in my
19 opinion, what Manish suggested, Mark suggested are
20 great suggestions, something that I'd highly recommend
21 considering as an option to move forward with the
22 standard.

1 A consideration or a question from my end is, as
2 we are discussing how exemptions should be provided, a
3 question that we have is, do we have the manpower from
4 OEM perspective, utilities' or entities' perspective to
5 support these exemption efforts as well, and where we
6 draw the line with legacy. I think at this point in
7 time, as we hear yesterday from the OEMs, if 95 percent
8 of the OEMs cannot meet PRC-029, isn't everything right
9 now considered legacy because we really can't meet PRC-
10 029 with the existing technology? So that's my biggest
11 question. Do we have the manpower? Can we consider
12 everything legacy until we get to a technology point
13 for frequency Ride-through?

14 MR. AHLSTROM: I would -- I would just say that
15 working with the people in NextEra, who do a great job
16 of maintaining a huge fleet, the answer is no. Even if
17 NextEra does not have the manpower to actually do this,
18 we'll find a way to get done what has to be done as we
19 always do. But yeah, the pool of people that really
20 are available to do this, the consultants that are
21 needed to provide the models, you know, the plant
22 models side is very limited. You know, all these

1 things are in very short supply, you know. So that's
2 going to consume -- compliance with this will consume a
3 huge amount of the resources on the OEM plant
4 operations side for at least two years, you know, even
5 if it's software only, right, on the best case.

6 So it's a big lift, but, you know, I do think that
7 that's what has to be done. You know, we'll comply.
8 We'll find a way to do it. But it -- I am concerned
9 that it pulls a lot of the OEM engineering resources
10 away from speeding up the build-your-way-past-this-
11 with-better-equipment side, and it will delay the
12 availability of some of the next generation of the
13 technologies that we most want and would be used for
14 any of the re-power's replacements, you know, to get us
15 to a more compliant fleet more quickly. So I think we
16 have to weigh that, what's the right balance between
17 how much resource do we put into the old installed
18 fleet versus accelerate the new fleet, right?

19 MR. GUGEL: I would provide a -- I don't want to
20 put words in your mark -- in your mouth, Mark, but I
21 think I'd provide a bit of a caveat. That's assuming
22 that you use the existing curves that are provided in

1 PRC-029. Maybe a question back to you would be, if
2 instead the legacy stuff looked more like PRC-024,
3 would you have as much of a manpower issue --

4 MR. AHLSTROM: No.

5 MR. GUGEL: -- of providing that information?

6 MR. AHLSTROM: Oh, no. As I -- as I have
7 documented in my comments here, you know, we have 9,000
8 turbines, four OEMs for the current PRC-029 draft. We
9 have about 6,000 turbines, two OEMs if we go to 2800.
10 And we have virtually nothing if we, say, comply with
11 PRC-024. We got 200 megawatts. I mean, it's one
12 plant, one OEM. It's nothing. So I think that' it's
13 compliant.

14 MR. GUGEL: The caveat there is, it depends,
15 right? Whatever curve you choose on that is going to
16 -- is going to basically determine the amount of
17 manpower that'd be required on the OEM side and on the
18 generator owner side to provide that documentation.

19 MS. SHAH: And I agree with that. I think my
20 question was more, if we go with the existing PRC-029
21 and we have to work towards exemptions, upgrades,
22 that's where I would speak for Clean Energy as well.

1 We are concerned about having the skillsets and the
2 manpower to support this, while we are also at a future
3 looking -- forward looking, how can we ensure this risk
4 is mitigated and we are reliable.

5 MR. MACDOWELL: Yeah, and I think, you know, well
6 said, Mark. I think that the biggest impact on
7 evaluating the capabilities on the GO and the OEM, but
8 there's also, again, with my ESIG hat on, there's also
9 a bigger, broader impact on capability even with the
10 system operators and utilities that have to reevaluate
11 this as well. So there's -- it's not only on the GOs
12 and OEMs, but it's everyone that has to reevaluate
13 that capability that needs to go through the
14 interconnection process again, or even determine
15 whether there's a material change, right?

16 So I think across the board, and I -- from a
17 compliance point of view at NERC, too, there's going to
18 be some sort of impact. So I think whatever can be
19 done to look at what is existing on the ground that's
20 doing well enough to support reliability, not making
21 any changes, really relieves a lot of the stress on the
22 entire ecosystem that we're all fighting for the right

1 resources to be able to do this, whether it be OEMs,
2 developers, NERC, system operators. The pool of
3 resources capable of doing this type of work is very
4 small, right, and I think that that's the practical
5 reality of the issue that we're up against is time/cost
6 versus resources to get this stuff done.

7 MR. GUGEL: Yeah, and I think the good focus for
8 maybe the team that would be developing the next draft
9 on this is, you know, the idea is we want to establish
10 the bar for those units going forward, and then let's
11 figure out what should be done with the legacy. And
12 I'm going to -- I'm going to use air quotes there
13 because I already talked about the issues. But again,
14 what should be done with what's in the ground right
15 now, and let's make sure that at least from the line we
16 draw forward, that we have an expectation that plants
17 behave a certain way.

18 MS. SHAH: And that leads me to my next question
19 about risk prioritization. As we are trying to balance
20 between what we have, the technology challenges and the
21 upgrades or retrofits that we are considering for
22 existing resources, for a ban that is using a scenario

1 as we all learn through the conversations in these two
2 days, that we are not sure if there are any studies to
3 back it up. So should we focus on our efforts to
4 really comply with that ban, or should we really focus
5 on future forward-looking technology where we can
6 invest our efforts and for a better, reliable grid
7 condition, and really use the data from the other
8 performance standards that we are also moving forward
9 with, use that data, understand how this will impact
10 the grid, get more factual data? So something that I'd
11 really recommend the team to consider as we look
12 towards redrafting PRC-029, focus on the bans, consider
13 the exemptions for that.

14 And one last point that I want to recommend to the
15 team is, as we consider the exemptions, and putting my
16 compliance hat on, documentation for the exemptions, we
17 do have OEMs that are not in business anymore. So
18 getting documentation to even submit the exemptions
19 will be a challenge if we can carve out something in
20 the technical rationale in the standard. I know with
21 -- it's hard to put too many caveats in the standard
22 when we are writing it, but somewhere if we can

1 document this, that there could be a possibility. We
2 may not be able to provide a lot of data to support the
3 exemption. What we know is what we know, and that's
4 all. We have no one to collaborate, communicate with
5 to get additional details. That's all.

6 MR. GUGEL: Yeah. Thank you. Yeah, I'm not sure
7 how much of that would be able to be codified within
8 the standard, and I'm not sure how much comfort you're
9 going to get from my saying "trust me." But we
10 understand that this is an issue, and I know that as we
11 look at compliance across the ERO, that we're going to
12 be looking at it from a risk-based lens. So, you know,
13 OEMs that are -- that are out of business and you can't
14 get the documentation is one thing, but hopefully at
15 least you have the original design parameters for the
16 plant itself, and that would provide a lot, I think, of
17 the information going forward.

18 MS. SHAH: Thank you.

19 MR. SHATTUCK: Thanks, and we'll do one last
20 question from Slido.

21 MS. CASUSCELLI: Thank you. How about taking all
22 considerations from yesterday to get a set of

1 classes/types of entities/IBRs, each assigned a
2 compliance threshold, incentivizing upgrading?

3 MR. GUGEL: That sounds like an accounting
4 nightmare.

5 (Laughter.)

6 MR. GUGEL: So, you know, we tried something
7 similar to this in other standards, and I know there
8 are folks online that maybe haven't been as
9 participatory in the standards development process as
10 others have. We have looked at, in some of our
11 protection standards and some of our maintenance
12 standards, doing a percentage increase over a year as
13 to how things are complied. And frankly, it becomes --
14 it becomes difficult to demonstrate X percentage of
15 your fleet/pieces of equipment when that number
16 calculates out to a decimal point, and it just -- it
17 just drives me nuts, and I'm sure it drives a lot of
18 folks nuts on that.

19 Instead, in my opinion, it's better to have that
20 line in the sand that says, look, everything after this
21 particular point needs to be at X, and prior to that,
22 we'll be looking at, you know, the exemptions, the

1 facts and circumstances around that -- those units, and
2 making sure that it fits into the parameters that are
3 described in the standard itself. So I mean, great
4 idea. Sounds good. It's the implementation and the
5 practicality of those that it becomes the devil in the
6 details.

7 MR. SHATTUCK: Thanks. Any other thoughts to
8 close this out? We're at the correct time, and thanks,
9 everyone for participating with our panel, but any
10 closing thoughts from anyone before we all get off the
11 stage here?

12 MR. YEUNG: I'm sorry. I think we heard some
13 really good ideas, particularly the last comment about
14 the exemptions and information. I think that's going
15 to be real key in helping the Standards Committee
16 determine what the exemption process looks like, so I
17 appreciate that. Are we taking one more question?

18 MR. DAHAL: I would like to make some comment.
19 I'm Samir from Gamesa. When we responded to your
20 questionnaires about can you meet PRC-029 as it is
21 written, right, no. Can you meet -- what about IEEE
22 2800? We operated with the assumption that those

1 curves are just curve setting. We did not dive into
2 the performance specification like ROCOF, multiple
3 excursion. So if you were to consider that, no, we
4 cannot meet IEEE 2800. So your response, as Mark said,
5 would definitely vary significantly. So that's
6 something for the committee to take into account,
7 right? We're just talking about those protection
8 points and not the performance. That's the point
9 number one.

10 Point number two on repowers, like I kind of
11 mentioned yesterday, there are different type of
12 repowers. So committee or somebody needs to take into
13 account is the repower mainly mechanical one to
14 increase the efficiency, or it's an electrical one
15 where we swap out the converters. So without that
16 distinction, it will become very convoluted on what to
17 comply with, you know, what standard to comply with.

18 Third point is on software update, model update.
19 Like, so if we said, okay, we can comply with -- for
20 some of the legacy units, depending on the definition,
21 we can expand the protection curve. We know we can do
22 it, but if we have to provide models beforehand, that

1 will delay the implementation process because, like I
2 mentioned, model might not have been updated, depending
3 on what -- how back in the past we want to go. Do you
4 want the advantage right now, or are you willing to
5 wait couple of years for the model to get updated? And
6 it's not just an OEM. You know, we do source our
7 converter from other OEM that we need to reach out and
8 ask them to give us the model that will comply with
9 today's computational lead, right?

10 And then last point that I would like to bring up
11 in the prioritization, like Mark mentioned, like he
12 himself has 10 converter models, right? So we have
13 certain converters on the field that we have in larger
14 quantity than the other, right? So if there is a
15 guidance given, either based on the number of internal
16 capacity, or the reason that you guys from your
17 experience say, okay, this reason is more vulnerable,
18 so we can focus on this reason, make this a prioritize,
19 or based on the number, then that would help us out to
20 allocate our resources. Otherwise, learning from
21 NOGRR, we are getting all OEM, all the operators
22 reaching out at the same time asking for the capability

1 and the model update, and we have to -- we have no way
2 to prioritize. So they would go back on the queue, and
3 then we won't be able to, you know, help them as -- in
4 the most beneficial way.

5 So those are my comments and I want -- I want
6 Drafting Committee and the NOGRR to take -- RTOs to
7 take those into consideration.

8 MR. SHATTUCK: Thank you very much.

9 MR. YEUNG: Okay. So I think we can close this
10 panel. Todd, you want to make some comments?

11 MR. BENNETT: No, Charles, I don't think I have
12 anything else additional, other than to thank the
13 panel. This was a wonderful panel, a lot of great
14 technical insights here. Give them a round of applause
15 for all their efforts here today.

16 (Applause.)

17 MR. BENNETT: And I'm showing 11:05. Let's
18 reconvene at 11:15. Thank you.

19 (Break.)

20 MR. BENNETT: -- portion of the technical
21 conference. So this is last thing between us and lunch
22 here, and that's not a please hurry up. That's a I'm

1 excited to hear about what you have to say.

2 So outlining objectives of a Ride-through
3 definition. I believe we have a couple Drafting Team
4 members here to come speak to us about this, but this
5 states specifically Joel. So, Joel, take it away.

6 MR. ANTHERS: Yes. Good morning still, and I was
7 just telling Husam that this is the perfect time for us
8 to present because hopefully everybody will be hungry
9 and not want to ask us a lot of questions after our
10 presentation.

11 (Laughter.)

12 MR. ANTHERS: But my name is Joel Anthes. I'm a
13 system protection engineer with a Pacific Gas and
14 Electric Company. I'm from California. I'm a member
15 of the Drafting Team for 2020-02 for PRC-029, and I
16 have Husam Al-Hadidi with me, who's the co-chair of the
17 Drafting Team.

18 So I was reading through the description of what
19 I'm supposed to present on, and it says, "a thorough
20 examination of the usage of the term, 'Ride-through,'
21 within NERC reports, IEEE, currently active Ride-
22 through, reliability standards, and other industry

1 usage of the term." So just to be upfront with you, I
2 don't think we could do that in 030 minutes, and I
3 would not be qualified to lead that discussion anyway.
4 My middle name is not "Ride-through."

5 (Laughter.)

6 MR. ANTHES: But what I would like to give you is
7 an overview, the history of the Drafting Team's thought
8 process for how we got from beginning to draft to at
9 least our Ballot Three, our latest proposed IBR Ride-
10 through definition.

11 So if we could go forward a slide please.

12 So I reread the SAR, and the SAR directed us to
13 consider defining the term "Ride-through" as necessary.
14 Now, in our first ballot, we actually took the approach
15 of not defining Ride-through. Our intention, as I
16 understand it, was to really define "Ride-through"
17 within the requirements of the standard itself, rather
18 than to give a comprehensive definition of "Ride-
19 through." But after meeting with the PRC-030 Drafting
20 Team, which defines the triggers for when you
21 investigate Ride-through performance within 029, it was
22 a specific request from them that we go ahead and

1 define the term, "Ride-through, "so that they could
2 index, so to speak, into the requirements of our
3 standard and reference it within their own. So draft
4 two, we began by putting our first attempt at a Ride-
5 through definition.

6 If you could go to the next slide, please.

7 So some of the goals that governed our thought
8 process on this was we wanted to have a definition that
9 could be included in the NERC glossary of terms. We
10 didn't want to unnecessarily tie it specifically to our
11 standard, and then we wanted other standards to be able
12 to refer to that definition when either indexing into
13 our requirements or referring to our requirements. So
14 those were just a couple of goals that we tried to keep
15 in mind while we were drafting it.

16 Next slide, please.

17 So some of our goals were not -- we didn't want to
18 create additional performance requirements just by
19 defining "Ride-through." We wanted to keep the
20 performance requirements of Ride-through within the
21 actual requirements of PRC-029. So something to keep
22 in mind when we look at how we kind of went through and

1 the evolution of our proposed definition is it wasn't
2 intended to be an all-encompassing performance
3 definition, only a definition, very bare bones
4 definition, so to speak, of "Ride-through."

5 Next slide, please.

6 So our first draft, I'm just going to read it:
7 "remaining connected" -- so this is going to be the
8 definition of "Ride-through": remaining connected,
9 synchronized with the transmission system, and
10 continuing to operate in response to system conditions
11 through the time frame of a system disturbance." And
12 then after reading through many pages of industry
13 comments from draft two, we ended up incorporating
14 those comments and tweaking the definition for draft
15 three, which is the latest that we've proposed. And
16 that is a definition of "Ride-through": the entire
17 plant facility remaining connected to the bulk power
18 system and continuing in its entirety to operate
19 through system disturbances.

20 So a couple of things. We ended up removing "due
21 to industry comments were synchronized with" from draft
22 two, and "in response to system conditions." So there

1 was some concern whether it was justified or not.

2 There was some concern with us using -- applying the
3 term and the concept, "synchronized," to inverter-based
4 generation. And there were some who felt that it was
5 not appropriate to use the term, "synchronized,"
6 because we weren't doing a standard for synchronous
7 machines, and we went ahead and removed that term.

8 And "in response to system conditions," that had
9 generated some comment, as I recall, of what are those
10 conditions, what is appropriate response, all of which
11 we weren't trying to define merely through a Ride-
12 through definition. And then we ended up adding the
13 concept of "entire" and "in its entirety" because there
14 was real specific concern, as I recall, from one
15 stakeholder, in particular, that if we -- if we didn't
16 clarify that, then generator owners and operators may
17 consider partial tripping of inverters when considering
18 the R3 requirements for returning to pre-disturbance,
19 real power levels. And so this was an attempt to
20 clarify that. It wasn't -- I'll just leave it at that.
21 It was an attempt to clarify that you couldn't subtract
22 partial tripping when you were required to come back to

1 your pre-disturbance available power after a system
2 disturbance. And then we replaced "transmission
3 system" with "bulk power system," and I think the key
4 there is that we were trying to deliberately exclude
5 distribution-level IBRs, and bulk power system would be
6 exclusive of distribution -- solely distribution-
7 connected IBRs.

8 Okay. Next slide, please.

9 So another thing we attempted to do was to use,
10 wherever possible, NERC glossary of terms, so "bulk
11 power system" is clearly defined. It excludes the
12 local distribution of electric energy. "Disturbance"
13 is clearly defined. It includes abnormal system
14 conditions, perturbations, and frequency deviations.

15 Next slide, please.

16 So one of the things that we referenced, there's
17 this most admirable definition from IEEE 2800, and we
18 drew from the concept of this. I'm going to read it to
19 you. It is, "ability to withstand voltage or frequency
20 disturbances inside defined limits and continue as
21 specified." So I think the main reasons that we didn't
22 directly use this definition is some of the nuances of

1 the language, "ability to withstand," for instance, may
2 not necessarily mean remaining connected to the
3 transmission system. So instead of -- instead of
4 "ability to withstand," we used "remaining connected."
5 "Inside defined limits," we felt that that may
6 unnecessarily tie it to a specific standard. We were
7 attempting to make it a more standalone definition, and
8 similarly with "as specified." Again, that's more of
9 like a standards requirement, a performance requirement
10 you have to then perhaps specify along with your
11 definition of "Ride-through." So those were at least
12 our thought process for avoiding some of those things.
13 That's why we didn't directly use the IEEE definition.

14 Next slide, please.

15 So in response to Ballot Three and Ballot Two, we
16 went through, looked at the comments. Industry
17 proposed 11 different definitions of "Ride-through,"
18 and I read through all of them again last night. And I
19 had a headache, and so I thought I'd like to share that
20 with you.

21 (Laughter.)

22 MR. ANTHES: So I'm not going to -- I'm not going

1 to comment on -- you know, rebut against each one. I
2 think they all have some value in the way industry was
3 thinking, but in general, three things that I saw where
4 they kind of deviated from ours. Some of it was just
5 word order preference. You know, maybe they were
6 trying to say the same thing, but they didn't like the
7 way we worded it. And then two other things that were
8 more significant, at least in my mind, were adding in
9 the concept of in -- adding in the concept to the
10 definition of "Ride-through," that your response needs
11 to be in support of grid reliability, and then also
12 maybe adding back in the concept of your response needs
13 to be as specified within the standard itself. So for
14 number one here, I think that one kind of merged
15 aspects of IEEE 2800's definition with ours.

16 If we could go to the next page.

17 This one here, it seemed to kind of add back in
18 the concept of operation in support of grid
19 reliability. So it says, "Facilities, including all
20 individual dispersed power-producing resources,
21 remaining connected to the electric system, and
22 continuing to operate in a manner that supports grid

1 reliability throughout a system disturbance, including
2 the period of recovery back to a normal operating
3 condition." So again, these are draft comments that
4 were proposed within the industry, comments to the
5 Drafting Team, suggestions from industry for tweaking
6 the Ride-through definition.

7 Next slide.

8 So this one seemed to want to remove, at least in
9 part, the concept of the plant operating in its
10 entirety, Riding-through in its entirety. So
11 "Remaining connected, synchronized with the
12 transmission system, and continuing to operate by
13 delivering power in response to system conditions
14 through the time frame of a system disturbance." The
15 next one, 5, "The entire plant remaining connected to
16 the bulk power system and continuing to operate the
17 system disturbances," very similar, I think, in
18 principle to what we proposed.

19 Next slide.

20 So 6 and 7 here. "The plant facility remaining
21 connected to the bulk power system and continuing to
22 operate through system disturbances as defined within

1 applicable reliability standards." So that one kind of
2 adds back in the concept of within defined limits of
3 the standards within specific operating limits. Seven,
4 "the entire plant facility remaining connected to the
5 bulk power system and continuing in its entirety to
6 operate as specified through" -- oh, I can move on to
7 8.

8 So 8 here: "The entire plant facility remaining
9 connected and continuing to operate through the
10 duration of frequency and voltage disturbances, in its
11 entirety, from the start to the return to pre-
12 disturbance conditions," so it basically removed the
13 reference to the bulk power system. And then 9: "The
14 entire plant facility remaining connected to the bulk
15 power system and continuing, in its entirety, to
16 operate as specified through system disturbances inside
17 defined limits." So that one kind of added back in the
18 concept of defined limits as specified within a
19 standard.

20 Next slide.

21 I think is our last -- second to the last. "The
22 entire plant facility, including its dispersed power-

1 producing inverters, remaining connected to the
2 electric system and continuing, in its entirety, to
3 operate in a manner that supports grid reliability
4 through a system disturbance, including the period of
5 recovery back to a normal operating condition." So to
6 me, that one also kind of added in the concept of you
7 need to operate in support of grid reliability, maybe
8 more of a system-level definition.

9 Last slide, number 11, "The plant facility shall
10 remain connected and in service, maintaining the pre-
11 disturbance equipment configuration in operation
12 throughout the entirety of the system disturbance and
13 recovery." So this one, again, kind of removed the
14 concept of the entire plant operating.

15 So I think the story in my mind of this is that
16 you could probably put a hundred different people in a
17 room and you'd get 120 different definitions. And
18 there's -- I'm not minimizing the input and some of the
19 concerns and some of the things that industry has
20 highlighted, but there -- you know, at least maybe it
21 gives you a feel for what we went through in reviewing
22 all of the industry comments and trying to come up with

1 something simple that met the goals. So I think that's
2 it for -- do we have Q and A now? Okay. Hopefully
3 you're all hungry.

4 (Laughter.)

5 MR. VENKITANARAYANAN: Nath Venkit from GE
6 Vernova. Thank you for going through the background
7 and all the different definitions. I have a comment on
8 the "in its entirety part," and the way I read it is if
9 you have a wind farm with about -- with a hundred
10 turbines, and if you have an event and one of them
11 trips, one out of a hundred trips, then the whole plant
12 is not compliant. Now, as an OEM, I would like to say
13 that this may be impractical. The reason is you can
14 have -- let me give you some examples. You could have
15 a turbine that is losing its wind resource and is in
16 the process of gracefully shutting down. So its rotor
17 RPM has gone below a certain threshold, and then it's
18 counting down to shut down, and that process is a
19 graceful shutdown.

20 Now, during this period, if you have a Ride-
21 through event, then you're not going to gracefully shut
22 down. You're going to shut down, okay? And then it's

1 going to take a few minutes before the turbine comes
2 back up. That's one example. There could be other
3 examples where turbines are -- an individual turbine
4 may be seeing a combination of conditions -- wind
5 gusts, turbulence, whole bunch of other things -- that
6 is causing it to operate in what I would summarize as
7 survival mode, right? So it's over speeding, and it's
8 trying to control that speed. And the whole objective
9 is to not shut down that turbine but to allow it to
10 manage that and come out of that survival mode into
11 normal operating mode. But if you are in that kind of
12 a survival mode and an event happens, that turbine is
13 very likely to trip.

14 So for all these reasons, if you look at IEEE
15 2800, it says that after a fault, when you recover, it
16 is sufficient if you recover to 90 percent of available
17 power because it's possible that some of the inverter-
18 based units will -- would, would trip for some of these
19 conditions.

20 MR. ANTHES: Yeah.

21 MR. VENKITANARAYANAN: So in my mind, requiring
22 that not even a single inverter-based unit under

1 whatever conditions it's operating in -- losing its
2 wind resource, gracefully shutting down, operating in
3 survival mode -- under any of these conditions, if it
4 should be able to recover, that can happen only in
5 theory and not impact this.

6 MR. ANTHES: So if I could interrupt you because
7 I'm going to forget the first part of your answer if
8 you go too much further, but so my understanding is it
9 was not our intention to make a standard that was --
10 absolutely prohibited any tripping of a unit. So as I
11 understand it, PRC-030, our companion standard, is
12 going to define the triggers for when you investigate
13 PRC-029. So I think as they passed, it's a 10-percent
14 reduction in real power, or 20 megawatts is, I think,
15 what they have in there. So if you had a 10-percent
16 reduction in real power or a trip of 20 megawatts, or,
17 I think, if it's your transmission planner operator
18 requests an investigation. So that's my understanding
19 and how I've tried to explain it to my company is that
20 that is the trigger for then assessing your compliance
21 with PRC-029.

22 So I don't think it was our intention in putting

1 in the concept of its entirety to absolutely prohibit
2 any tripping because that doesn't seem reasonable.
3 However, it came -- for better or worse. So the reason
4 it wound up in there is there were specific entities
5 concerned that you could have a disturbance on the
6 event. Twenty percent of your inverters might trip.
7 You're expected to come back to your available active
8 power after the disturbance is cleared. So their
9 concern was, you know, unless we say something about in
10 its entirety, they might go, okay, well, my available
11 power is the 80 percent I have left on, so I'm totally
12 compliant, but they might have lost a significant
13 number of inverters due to the disturbance. So our
14 intention with this, and maybe it wasn't clear enough.
15 I'm thinking based on how many comments we've had like
16 yours, it probably wasn't clear enough. But our
17 intention wasn't to, I believe, absolutely prohibit any
18 tripping, but it was to disallow when you return to
19 pre-disturbance, subtracting things that tripped out
20 from your available active power.

21 MR. VENKITANARAYANAN: Just to add to that to be
22 very clear, a clarification, we don't look at the

1 individual unit, so really, IBR unit was not part of
2 our scope. So really if you have hundreds of IBR unit
3 and you are able to go to -- recover to pre-disturbance
4 megawatt, even if you lose five, 10, 15, as long as you
5 could maintain the pre-level disturbance after the
6 event, you are in compliance with our standard. And we
7 added flexibility that if the TB or RC or whoever want
8 to give you a different level to say, no, recover to 90
9 percent, 95 percent, we couldn't. We said this is
10 going to be system dependent, and we lifted an open
11 flexibility on the standard. So you are not -- there
12 is no requirement for every IBR. You need to recover
13 -- the plant need to recover the pre-disturbance value.
14 So your concern if it's one unit and it's not going to
15 impact the plant --

16 (Cross talking.)

17 MR. AL-HADIDI: It will impact.

18 MR. VENKITANARAYANAN: -- then you have to bring
19 it -- the GO owner has to bring it back to their TB or
20 RC to see does that really need to be exempt from that
21 or how that need to read that. But for now, the
22 standard, it's saying that if you're able to recover

1 from the power, you have no issue. If you don't,
2 there's a TPRC flexibility to provide a different level
3 other than a hundred percent.

4 MR. AL-HADIDI: See, I don't see how that can
5 happen. If you have a hundred turbines, each of them
6 producing two megawatts, and one of them trips, okay,
7 you're not going to recover back to 200 megawatts.
8 You're going to recover 298 megawatts. So, again, I
9 mean I --

10 MR. VENKITANARAYANAN: As I said, this is
11 reliability question. That's why we couldn't determine
12 this -- the number, which is it 95 percent? Is it 90?
13 What's the value? We say the standards require you to
14 -- require you to recover back, and the TPRC, based on
15 their system, they can provide any criteria as needed
16 to support their system. So flexibility is there, so
17 there is flexibility in the standards.

18 MR. AL-HADIDI: Again, I mean, I don't want to
19 argue. I think reliability is important, but having a
20 practical solution is also important. So I think we
21 have to draw a line that you can't have 20 percent of
22 the units tripping, but it's okay if you have two or

1 three units stripping. So somewhere, you know, there
2 should be an element for that. Thank you.

3 MR. ANTHERS: So maybe to your, because I think you
4 had two points in there. One thing that came to mind
5 as you were discussing the scenario of a wind turbine
6 ramping down due to, you know, maybe wind has ceased,
7 and in requirement R3, we do specifically say you have
8 to return to available active power. So if you have --
9 if your available active power is different because you
10 have lost wind or because cloud cover has affected your
11 solar production, we intended to account for that in
12 returning to available active power. But the concept
13 in its entirety was to not allow you to trip a whole
14 bunch of stuff off and go, well, I only had available
15 the stuff that didn't trip, if that makes sense.

16 (Off mic comment.)

17 MR. VENKITANARAYANAN: Yeah. Thank you.

18 MS. CASUSCELLI: Okay. I'll ask one of the online
19 questions. Has the Drafting Team considered adding
20 specific language to align the language clearly with
21 PRC-030/defined the levels similarly?

22 MR. AL-HADIDI: BRCT? I don't remember.

1 Actually, we create this definition to align with BRCT,
2 so that was the intent of adding the definition to the
3 standard, so really, it was mainly -- just really the
4 main intent. So I thought we achieved that objective.

5 MR. GUGEL: Hey. Howard Gugel, NERC. There was a
6 phrase that showed up in several of the definitions
7 that was triggering for me, so I just want to make sure
8 that you have a lens on for it, and it was "remained
9 connected." And sometimes when you start talking about
10 momentary cessation, there's no mechanical disconnect
11 that occurs there, but it's an electronic change. So
12 somehow, as you're looking at this idea of Ride-
13 through, make sure that you take into account it's not
14 just a mechanical change that could occur there, but
15 also any sort of a momentary cessation that might be
16 taken into account.

17 MR. AL-HADIDI: I thought we did for that. We
18 said to "continue exchange current," so we said it's
19 not -- and I believe that's the reason. But reason
20 where we did not add to support the system, it was a
21 reason for, like, for R3. We are not required any
22 performance requirement from the IBR. So we -- if we

1 said that -- if we are now saying you need to support
2 the system, and now there'll be -- it's very hard now
3 to say if you Ride-through or not because if you do not
4 produce enough or change your megawatt to support the
5 system, it could be your Ride-through, but they're not
6 compliant because you did not meet the definition. So
7 that's the reason sometimes we did not adapt some of
8 the suggested language from some of the stakeholder
9 because we felt that it may add more compliance
10 requirement, which we try to avoid to some level.

11 MR. ANTHES: Yeah, and I did read through the SAR
12 again. The concept and the specific terms of "remain
13 connected" were used extensively. And I -- you know,
14 for better or worse, I think a lot of people view
15 "remain connected" as what it's intended to mean, which
16 is you Ride-through, you continue to exchange current,
17 you remain connected.

18 MS. CASUSCELLI: Okay. We've got more online
19 questions. As stated by the panelist from the Drafting
20 Team, it's not reasonable to prevent all tripping.
21 However, this is not how the draft is written. Should
22 this be explicit?

1 MR. ANTHES: Well, again, as I see it, we have
2 three reliability standards. We have PRC-028 for the
3 data acquisition and monitoring, we have PRC-030 for
4 the event triggers, and then we have PRC-029 for the
5 performance. So as I understand it, the triggers for
6 when you evaluate PRC-029 compliance and performance
7 come from PRC-030, and the data that's necessary to
8 evaluate that is recorded based on your recording
9 equipment in PRC-028. You know, maybe PRC-030 and PRC-
10 029 should've been one standard, but they're not, so
11 without reduplicating all of the requirements, I think
12 we tried to compromise and go, okay, these are event
13 triggers in PRC-030.

14 MR. PATEL: So, Joel, we have talked offline, but
15 for everyone's benefit, I think we keep referring that
16 PRC-029 and PRC-030 are connected. That is true, but
17 remember, PRC-030 -- so practicality is that we cannot
18 evaluate each and every Ride-through operation. It's
19 just very difficult. We have other jobs to do. So the
20 way I see this is that PRC-030 has a criteria. If it's
21 met, then you go investigate what happened. That
22 doesn't mean that the plant is not in compliance or in

1 compliance with the PRC-029. If you reduce output by
2 10 percent or 20 megawatt over 4 second -- I think
3 those are the numbers in PRC-030 -- all that means is
4 you go investigate what happened. The answer could be
5 plant did not perform as expected. The answer could be
6 the plant performed as expected. If it did not perform
7 as expected, out of compliance with PRC-029. I think
8 that's where even Nath's point came in, that if one
9 wind turbine tripped offline out of a hundred, you
10 could be out of compliance.

11 MR. AL-HADIDI: Yeah, but you have to remember we
12 do not quantify the number because you could have now 2
13 giga -- 2 giga or 5 giga plant, and now the 20 percent,
14 the 10 percent becomes significant amount of megawatt.

15 MR. PATEL: Yeah.

16 MR. AL-HADIDI: We leave that flexibility, and we
17 were not -- there was a huge push even for us to keep
18 that flexibility to say don't -- multiple people, you
19 won't to recover back to the hundred percent. We say
20 it's system dependent, and only -- we found the best
21 compromise way to deal with it is to leave it --

22 MR. PATEL: Yeah.

1 MR. AL-HADIDI: -- leave that open for the TPRC
2 based on their system need, to keep that exemption
3 because the standard said, yes, they can specify
4 different value than the hundred because we agreed
5 sometime hundred is unachievable target.

6 MR. PATEL: I'm not debating that. I think you
7 debated that enough with Nath. What I'm trying to say
8 is that there is a criteria in PRC-030, and that
9 determines if you're in compliance or not. It's a --
10 it's a -- it's a wrong understanding.

11 MR. AL-HADIDI: No, no, I agree.

12 MR. PATEL: The way the standard is written, PRC-
13 030 criteria is met. You investigate what happened.
14 The outcome of that investigation is plant failed to
15 perform or plant performed as expected. If failed to
16 perform, out of compliance with PRC-029, but the PRC-
17 029 stands on itself, right?

18 MR. AL-HADIDI: Right.

19 MR. PATEL: That's the debate.

20 MR. AL-HADIDI: Right.

21 MR. PATEL: We can talk about Nath's questions. I
22 have the concerns with that, too, but we are not

1 debating. I think let's not link incorrectly the two
2 standards. The only reason for PRC-030 is we cannot
3 investigate each and every Ride-through. We put
4 together a criteria, 10 percent, 20 megawatt, 4 second.
5 If that's met, we'll investigate. Answer could be
6 plant fail to perform, out of compliance with PRC-029.

7 MR. AL-HADIDI: Yeah, absolutely right. Right
8 now, PRC-002 is doing the setting for PRC-024, and it's
9 all the -- all the -- all the compliance part is done
10 with the PRC-002, but we can discuss offline. Thank
11 you.

12 MR. KAPPAGANTULA: One quick question. Can you
13 shed some light on -- oh, Srinivas Kappagantula, Arevon
14 Energy. Can you shed some light on why doesn't the
15 definition specify voltage and frequency disturbance
16 like you had on one of the slides, especially when you
17 looked at the IEEE 2800 definition? It appears to
18 cover over-current type issues for electrically-closed
19 faults. Any context to that would be great.

20 MR. ANTHES: So why we didn't explicitly say
21 voltage and frequency disturbances?

22 MR. KAPPAGANTULA: Yeah. Yeah.

1 MR. ANTHES: Well, I think, you know, as I read
2 the glossary of term definition for "disturbance" that
3 I put up on one of those slides -- I don't know if we
4 could flip back to that. It's probably 10 slides back,
5 so maybe it's not worth the effort, but it does talk
6 about system, perturbations changes to ACE. ACE, in my
7 mind, frequency disturbances, system perturbations
8 would be any electrical disturbance.

9 MR. KAPPAGANTULA: So you're relying on the
10 glossary of terms definition for a disturbance.

11 MR. ANTHES: I think that was our thinking --

12 MR. KAPPAGANTULA: Okay. All right.

13 MR. ANTHES: -- was to lean on the defined terms
14 and the glossary of terms as much as possible.

15 MR. KAPPAGANTULA: Okay. Yeah. In that case, if
16 -- when you're making a definition, maybe capitalize
17 the terms so it is in our glossary of terms.

18 MR. ANTHES: I think we did.

19 MR. KAPPAGANTULA: Okay. All right.

20 MR. ANTHES: We should have.

21 MR. KAPPAGANTULA: Okay.

22 MR. ANTHES: I believe "disturbance" was

1 capitalized --

2 MR. KAPPAGANTULA: Okay. Great.

3 MR. ANTHES: -- and "bulk power system" was
4 capitalized.

5 MR. KAPPAGANTULA: Thank you.

6 MR. ANTHES: Yeah.

7 MR. BENNETT: Okay. So I believe we've hit
8 lunchtime here and we've come to a stopping point for
9 the early afternoon. So thank you to our panelists.
10 That was a great presentation on some very technical
11 terms that we're trying to make it through. And just
12 in addition, I believe we're going to utilize Slido
13 over lunch, so when you get a chance, take a -- take a
14 look. There's a poll out there on this definition.
15 The software will walk you through that. It'll ask you
16 what your favorite one is and see what you support, and
17 maybe give us a data point to see if there's some
18 industry support that'll help foster some decisions in
19 the near future.

20 So with that, I think we are scheduled to come
21 back here at 1:00, after lunch, and we will start up
22 again, so thank you so much.

1 (Off mic comments.)

2 MR. BENNETT: Yeah, there'll be more to come on
3 Slido later. There's going to be some additional ones.
4 So we've -- to make the most of our agenda, we've had
5 to shuffle a couple things around, but there'll be some
6 additional polling later.

7 (Luncheon recess.)

8 MR. BENNETT: Okay. It's a few minutes after 1:00
9 here, and I believe we're going to start to pull our
10 panel together and move on with our afternoon session
11 here.

12 I will say that the Slido poll, it was open over
13 lunch, and we're going to be shutting that down
14 shortly, and we'll review the results of that initial
15 poll here later this afternoon when we get to the other
16 Slido portion of our conference here. And just kind of
17 a disclaimer or a heads up, as the results of those
18 polls, those quantitative results isn't necessarily the
19 path forward on a certain item, but it's definitely
20 helped framing the discussion for some decisions that
21 are going to have to be made over the next week or two.
22 So just please continue for that, and there's a lot of

1 value there.

2 And with that I think, Jamie, I'll have you walk
3 us through Milestone 2 of the implementation plans, and
4 I'll turn it over to you.

5 MS. CALDERON: All right. So detailed, very
6 thorough review, which will actually be a summary in
7 about 15 minutes.

8 Implementation plans are incredibly important.
9 All of the details that are within the standard are, of
10 course, equally important to be able to say what's the
11 measure of compliance? What do I need to do? But the
12 implementation plan holds those details as to when,
13 especially when we have the complication of three
14 different standards coming together that interrelate
15 and have phased-in implementation, compliance
16 extensions. There's a lot to consider here when we're
17 looking at the implementation overall.

18 So the slide, please.

19 So what is an implementation plan? So just
20 starting from the top down, they're created for new or
21 modified standards. They are created for retiring
22 standards. They're created for new or modified

1 definitions. And it's entirely to ensure that there's
2 no overlap or gaps in time between versions, making
3 sure that there's a very clear definition of when
4 something will become effective and when something will
5 need to be complied with.

6 Next slide, please.

7 So the effective date. Key terms within the
8 sections of the IP is that you're going to have an
9 effective date that's listed. You may have more than
10 one. It'll be either a specific date, say, like
11 January 1st, 2027. It may be a time period after
12 approval by governmental authority. So there's going
13 to be six months after the approval by the applicable
14 governmental authority, which, in the U.S., is
15 generally FERC, and, of course, in Canada it's going to
16 be the provincial territories and those governmental
17 authorities.

18 So it could also be something else where you have
19 a time period after another standard becoming
20 effective, which adds a layer of complication. Putting
21 together a Gantt chart of this was something I
22 initially started to do with all three standards, and

1 guess what was unable to accomplish? And that's pretty
2 much because we've got a phased-in implementation plan
3 portion of this as well. So included within the
4 effective dates are those. There's retirement -- a
5 retirement date, which is generally immediately prior
6 to the effective date. So something takes place and is
7 effective on January 1st, retirement date's going to be
8 December 31st, the year before. There's going to be
9 general considerations, things that you need to keep in
10 mind as you're going through implementation, something
11 that might be impacted by another standard, something
12 that needs to be, you know, adhered to or communicated
13 with your regional entity or perhaps another entity
14 within your footprint. All the things that could be,
15 you know, brought into the conversation need to go into
16 that section.

17 And then there's things that are just also just
18 standard specific. In the case with PRC-028, there is
19 actually a whole section for compliance extensions
20 because there are things outside the entity's control:
21 supply chain issues, you're not able to get contractors
22 and testing engineers onsite, but you've made good-

1 faith efforts and you can demonstrate that. Compliance
2 extensions are built into PRC-028's implementation
3 plan, and that's their -- considered as other standard
4 specific.

5 Next slide, please.

6 So phased-in implementation plans, the bane of
7 compliance, which is -- like, Howard was alluding to
8 earlier, where you say 20 percent of these types of
9 units, but then, of course, the number of units you
10 have changes after the couple years, and when do you
11 calculate that a hundred percent benchmark? Is it
12 based off of when the plan was originally initiated, or
13 is it based off of your current as-of-day asset list?
14 It can be very, very complicated, and nuances are
15 something that compliance deal with on a routine basis.

16 So we still do these even despite that because we
17 can't have your entire fleet come into effect all at
18 once. We can, but, you know, we try to avoid that.
19 The idea of not having everything in all at once is the
20 whole reason for having that phased-in implementation.
21 So it'll generally be milestones after the effective
22 date. So within PRC-028, we have 50 percent three

1 years after the effective date, meaning FERC approves
2 it. Three years later, you have to have 50 percent of
3 that complying with PRC-028. And this is where it gets
4 complicated because we can't give an exact date because
5 we can't tell you exactly when it's going to be
6 approved by FERC. Generally, we know when we're going
7 to file it, but then it could be one quarter. It could
8 be the first day after the first quarter. It may be
9 delayed and end up being sometime in the second
10 quarter.

11 So once we have that date, we can provide very
12 clear guidance and a specific date, but it does become
13 difficult to do earlier on in the process as we're
14 seeing with the IBR registration initiative and
15 bringing new Category 2 GOs into the mix. They want to
16 know what and when, and so this kind of gets into the
17 reason as to why we can't give those dates because they
18 are subject to change based off of these trigger points
19 within the process.

20 So examples of, again, of phase-in implementation,
21 percentages facilities. There's also Requirements 1
22 become effective on X date, and then Requirements 2

1 through 7 become effective at a later date. Sometimes
2 these are just due to the nature of how the
3 requirements are written. One may be -- have a
4 process, and then 2 through 7 would implement that
5 process. And so there could be even a combination of
6 that, which we see within the standards that we have
7 for PRC-028, 029, and 030. It's somewhat of a gambit
8 of it, which makes a little bit more complication, but
9 it's why we wanted to have the discussion here today
10 and have a quick panel discussion on as well because
11 being able to comply with these standards is as
12 important as being able to know what's in it and having
13 that criteria very well understood, is being able to
14 build out your compliance program in advance, making
15 sure that these things that are known issues on the
16 front end considerably with supply chain issues.

17 You know, that's been talked about earlier today
18 with having access to sufficient contractors or
19 vendors. If everyone tries to go get that done in one
20 month just prior to the effective date or the approval
21 -- or the -- that final compliance date, it's going to
22 be impossible to achieve just because you're not going

1 to be able to get that. So we want to make sure that
2 there's preparation in this. It's all about planning.

3 Next slide, please.

4 So just overall, PRC-028, it's a new standard.

5 What that means is that there's not a retirement that's
6 coming with it. It's an entirely new standard. And
7 what's in there is "shall become effective on the first
8 day of the first calendar quarter after the effective
9 date of the applicable governmental authority's order
10 approving the standard," which probably March or April
11 1st. Probably April 1st will be the first day of the
12 first quarter after approval, assuming it gets approved
13 in the first quarter. That's, of course, subject to
14 change. If it doesn't get approved in the first
15 quarter, it'll be, of course, down in July, but these
16 types of things become a little bit more complicated.

17 Next slide, please.

18 So within PRC-028 again, we have a phased-in
19 implementation for several things. One is for your
20 existing IBR resources, those that are in commercial
21 operation on or before the effective dates. There are
22 also the new BES inverter-based resources. There's

1 also the non-BES inverter-based resources. These are
2 going to be the existing generators, the existing IBR
3 that meet that new Category 2 designation. There's
4 also going to be new ones coming online as well. So
5 there are four sets of IBR within PRC-028 that you need
6 to be aware of. They each meet this phased-in
7 implementation plan of 50 percent of them by a certain
8 date that are in -- that are in effect, but new ones
9 have their own information.

10 So on the next slide we'll get into that.

11 So for existing IBR, your existing BES IBR, 50
12 percent again by three years after the effective date
13 PRC-028, and a hundred percent of your BES IBR by
14 January 1st, 2030, and that 2030 number is from the
15 FERC order and is non-negotiable. We do have within
16 PRC-028 the ability to have compliance extension,
17 again, for the cases that are outside of your facts --
18 or your circumstances and/or ability to control, things
19 like supply chain issues. Again, there's a potential
20 to go past that 2030, but you do have to be able to
21 demonstrate that.

22 New BES IBRs, so those coming into commercial

1 operation, but might be in the current design phase
2 after July 1st, 2025. That's to give a little bit of
3 buffer for things that are currently iron in the
4 ground, going to be coming online within the next year
5 or two. We want to make sure that we're giving enough
6 bandwidth or lead-way for at least some of those that
7 are currently being developed. But on or before
8 October, 2026 entity shall comply with requirements R1
9 through R7 by October 1st, 2026. So that's going to be
10 the cutoff date for new BES IBR. After that,
11 everything needs to comply.

12 Next slide.

13 Existing non-BES IBR, a hundred percent by 2030.
14 That's just the blanket rule, everything by 2030. But
15 the existing non-BES IBR, within 15 months following
16 the effective date of the standard of the commercial
17 operation date, whichever is later. We've been looking
18 to make sure that there's a really clear consistency on
19 when the Category 2 generator assets are going to be
20 applicable. We have a cutoff date for that compliance
21 -- or I'm sorry -- for that registration date for new
22 registrants by May 2026. So what we've done here is

1 make sure that nothing's going to be held compliant for
2 those Category 2 generator owner assets prior to that
3 initial cutoff date. Try to encourage early
4 registration. Don't want to penalize people for coming
5 on early and becoming compliant with standards early.
6 We want to encourage early compliance, but we're not
7 going to penalize people, you know, prior to that May
8 2026 date.

9 So again, there's the process for the compliance
10 extensions built into PRC-028, and that's intentional
11 and very important to ensuring that we have a strategy
12 that can be implemented. You go after your highest-
13 risk assets first, perhaps the larger units in your
14 fleet first, and then you scale down as you're able.

15 Next slide.

16 For Project 2020-02, we're looking at PRC-029.
17 This also is a new standard. We do have within this
18 project a component that is PRC-024, and that PRC-024
19 piece will have a new version that will become
20 effective and the old version will become retired, of
21 course. But PRC-029 shall become effective 12 months
22 after the effective date of the applicable governmental

1 authority approving the order approving the standard.

2 And on the next slide, this is where the key
3 pieces of information is. There's capability-based
4 requirements. This is design, the ability to do
5 studies to demonstrate your IBR will Ride-through, have
6 the capability of riding through. This is going to be
7 demonstrated through studies. This is going to be
8 demonstrated potentially through EMT evaluations being
9 able to identify and demonstrate that you can meet the
10 Ride-through capability. For BES IBR, it's the
11 effective date of the standard, and the non-BES IBR,
12 again, this is the Category 2, we're talking January
13 2027. And that's in line with we're trying to not have
14 everything come in all at once for Category 2 GOs, so
15 we're staggering those out and we're working with
16 compliance and registration to ensure that happens. So
17 within this batch of standards, we've looked to say
18 January 1st, 2027 is reasonable for these new -- these
19 new -- these new generator owners coming online.

20 So that's the capability-based Ride-through
21 criteria, and this is a little bit of a different
22 phased-in implementation plan where we have a single

1 requirement that has different aspects, one being that
2 design base that you demonstrate through studies, and
3 then it becomes the performance-based criteria that
4 that becomes effective later. So we're looking at --

5 Oh, sorry. One slide previous. Yep. One slide
6 before. No, before. Yeah. Thank you.

7 So performance-based Ride-through criteria is for
8 both BES IBR and non-BS IBR. Nothing new here. Align
9 it with your PRC-028 implementation plan, and that's
10 because within PRC-028, you're installing new
11 equipment, you're working with your vendors, you're
12 working with supply chain, and you're getting that
13 installed. You shouldn't be required to demonstrate
14 performance at a generator that you haven't installed
15 that equipment at yet. The implementation plan for 0-
16 028's already sufficient to demonstrate that you've got
17 the -- you've got the risk resolved by having the
18 monitoring equipment installed and you have the
19 capability of demonstrating what you're doing onsite,
20 how it's performing. And at that point you become --
21 your performance-based Ride-through criteria needs to
22 be demonstrated.

1 And now we can go to the next slide.

2 All right. So for Project 2023-02, new standard
3 again, PRC-030. What we're looking for is -- this is
4 the analytics that base -- work off the same as 029.
5 We have an IP revised and current draft for formal
6 comments, so I actually cannot take questions on PRC-
7 030, but this is a public forum and we can briefly talk
8 about this because it's currently under ballot.

9 But what is in the revised IP? We recently did
10 pass ballot, but due to some necessary conforming
11 changes to make sure that the PRC-030's implementation
12 plan was in line as intended with PRC-029 and PRC-030,
13 it's currently out for ballot just for those conforming
14 changes and some small revisions within the
15 requirements for R2. So the IP is currently out for
16 ballot. We did remove the performance-based,
17 capability-based language from that IP, so now it's
18 only focused on just on the next slide when it becomes
19 effective.

20 So it's later of the first day of the first
21 calendar quarter that is 12 months after the effective
22 dates or approving the standard or the first day of the

1 first calendar quarter that is 12 months after the
2 effective date of the applicable governmental authority
3 order approving Reliability Standard PRC-029. All that
4 to say this is meant to align with your PRC-029
5 rollout, and PRC-029's rollout is meant to align with
6 PRC-028. So these are all tied together for that --
7 for that same basis of performance data criteria and
8 having the analysis that's triggering that data, and
9 having the data installed and that equipment being
10 installed at those sites are all in conjunction and
11 working together. So it's that three-legged stool we
12 talked about yesterday. It's one solution.

13 While there are three different IPs, they daisy
14 chain together intentionally to make sure that we're
15 not putting anyone into a compliance bind by having a
16 gap. If you don't have disturbance monitoring
17 equipment installed, you shouldn't be held accountable
18 for performance that you can't demonstrate. So that's
19 built into the IPs.

20 And at this point, I think we can go to the next
21 slide, which should be -- okay.

22 I did add this in just to -- as a callback from

1 yesterday. We talked about how these tied together,
2 voltage frequency excursion occurs, and so you see
3 these two standards on the right. PRC-029 and 030 tie
4 together, and then on the disturbance monitoring side,
5 PRC-028 on the far left, all to say that all three of
6 these go together, and this is just a visual
7 representation, again, as a callback. If this didn't
8 make sense yesterday, maybe it makes less sense today,
9 but hopefully it makes a little bit more sense. It
10 makes more sense to me than it did when I originally
11 made it, so this is good.

12 But when it gets to making sure that you have an
13 understanding of this, ask questions. Reach out to
14 your regional entity. That compliance staff is there
15 to help provide that guidance, so as these come out,
16 don't guess, of course. I don't think any compliance
17 officer is doing that, but if you have questions or
18 concerns, please raise those, bring those up. The
19 regional entities are there to help. And with that, I
20 think we can go to the next slide and take questions.

21 MR. BENNETT: So, Jamie, on this one, I was just
22 going to ask, would you prefer to have questions on

1 this now or kind of morph into your panel discussion?

2 MS. CALDERON: Let's just do the panel, yeah.

3 MR. BENNETT: And do it all at once.

4 MS. CALDERON: Yeah. Yeah, let's do the panel.

5 MR. BENNETT: Okay. Let's just -- let's just do
6 that. Okay. So it looks like the panelists are
7 starting to make their way to the stage. So this is
8 going to be kind of continuing the conversation on
9 implementation plans and effective dates. And Charles
10 Yeung, our moderator from earlier, is back with us as
11 well as Jamie to help moderate this conversation, and
12 with that, Jamie, whenever you guys get settled up
13 there, please start in.

14 MR. YEUNG: So Jamie kind of recapped where we
15 were, and I think it'd be good to put that other slide
16 back on, her last slide with the three standards. Is
17 that possible? I think that's a good reference for
18 what we're going to talk about on this panel. I need
19 to bring up the questions. Excuse me.

20 (Brief pause.)

21 MR. YEUNG: So let's start with introductions.

22 Maybe we'll start on the end, just who you are, who you

1 represent, please.

2 MR. HAKE: Yeah. Hey, everybody. So Sam Hake
3 here. I'm a NERC compliance engineer with a AES Clean
4 Energy. We're a renewable energy developer.

5 MS. JONES: Good afternoon, everyone. My name is
6 Rhonda Jones, and I lead the NERC compliance efforts
7 for Invenergy, and we're a developer and operator of
8 many projects throughout the United States, and we're
9 headquartered in Chicago.

10 MR. GUGEL: And I'm Howard Google, vice president
11 of regulatory oversight at NERC.

12 MR. PATEL: Manish Patel, Electric Power Research
13 Institute.

14 MR. YEUNG: Again, I'm Charles Yeung. I work for
15 Southwest Power Pool, a member of the Standards
16 Committee, and we know Jamie is.

17 MS. CALDERON: Yeah. My name's Jamie Calderon
18 with NERC Standards Development. My computer seems to
19 have just bricked.

20 MR. YEUNG: Crowdstrike?

21 MS. CALDERON: Yes, probably.

22 MR. YEUNG: Well, I think implementation's a real

1 important issue. I believe two of these standards have
2 already passed. One is under a final ballot, I think
3 the PRC-030, and hopefully as far as this conference is
4 concerned, we'll get to passing a standard for PRC-029.

5 I think one of the things probably not recognized
6 because it's still in development is the issue of
7 exemptions. That's going to be -- yet have to be
8 finalized exactly what that would look like, but I
9 think that might have some bearing on this
10 implementation. So maybe the panelists can consider
11 some of the comments we've heard so far about
12 exemptions and implementation because with exemptions,
13 certainly there's different types, different impacts,
14 and perhaps impacts on the implementation, too.

15 So the first question is, given the complexities
16 of these three standards -- PRC-028-1, PRC-029-1, and
17 PRC-031 -- what strategies would you recommend in
18 synchronizing implementation to avoid conflicts or gaps
19 in compliance? Again, with the explanation Jamie gave,
20 they're all one big happy family, so we need to
21 synchronize those together. And then what
22 considerations are needed to prevent potential overlaps

1 or inconsistencies in that implementation? So you want
2 to just start on the end?

3 MR. HAKE: Yeah. Yeah, absolutely. So a couple
4 of points to make here. I think, first of all, we
5 should expect overlap. I think that currently in the
6 existing implementation plans, that is acknowledged, as
7 Jamie just presented. I do think that we have some
8 concern over the differentiation between the design
9 portion versus their performance. Particularly for
10 PRC-029, a lot of the challenges that we've heard
11 discussed -- you know, OEMs being out of business,
12 modeling information not being available -- those are
13 really going to impact us on the design side first,
14 right? That's the first thing that we have to do. And
15 so I think that for our -- my personal view, I think
16 that the link that we currently see through the
17 performance requirements needs to be replicated also
18 for the design. I'm not sure that we can really
19 cleanly differentiate between those.

20 And then the second main point I wanted to make
21 was also referring to some discussion that we heard
22 yesterday about the design cycles for the equipment

1 capabilities here. So it was on the order of five
2 years for the design cycle. That's five years to have
3 the equipment available, not installed in the field,
4 looking at another three years for deployment. So with
5 eight years there, we're already at the very end of the
6 -- you know, the 2030 hard date. So we're certainly
7 confused and concerned about that, and I think that
8 that's something that really needs to be seriously
9 considered as the Drafting Team and NERC moves forward.

10 MS. JONES: Some of the things that we've done at
11 Invenergy to kind of prepare, yes, definitely we share
12 some of the same concerns about design with some of our
13 equipment. But one of the things that we've done to
14 kind of help get ahead of this is that we've already
15 started to kind of develop, like, timelines, in
16 specific, to the type of equipments that we have. And
17 so we kind of map out current day, if this goes into
18 effect, what would it look like. What would I need to
19 do today to be ready from a design perspective, being
20 probably proactive, and looking at equipment and who
21 we're going to procure that from, and what does that
22 look like? So we are really, like, starting earlier to

1 kind of just planning side of it to really help us to
2 make sure that things are coordinated, and kind of
3 almost doing a gap analysis early to just kind of see
4 where some of those needs will be and trying to fill
5 those in and be proactive in that regard.

6 Also, too, as Jamie kind of talked about early,
7 kind of prioritizing those high-risk assets and those
8 that we would probably need to give -- that will
9 require the greatest need of support. Say if an OEM is
10 no longer in business, what is our strategy or
11 contingency to kind of come up with how do we
12 articulate design in those cases and respond
13 accordingly? And one of the things that we feel is
14 just really big here is just we can't underestimate the
15 power of kind of mapping it out almost project style.
16 I have over 75 plants that I have to get ready for
17 this, and by the time, you know, we have to start
18 implementing and kind of installing equipment, I'll
19 probably be at 85, 90 plants that I have to do this
20 for. So just really strategizing early on a timeline
21 and a schedule to get the different phases done.

22 MR. GUGEL: Yeah. I'll kind of tie this back into

1 the previous panel's discussion. I think it's going to
2 depend on how the next version of PRC-029 deals with
3 exemptions. I think the closer the exemptions and the
4 performance expectations map to what everyone is saying
5 that their current units can perform to, it'll be
6 easier to demonstrate that than if it varies from it.
7 So, you know, if there's a, an expectation by most
8 folks that, yeah, we can meet PRC-024, maybe if that
9 exemption is closer to that curve for existing units,
10 it might be a little bit easier to kind of work through
11 and demonstrate that than if all your existing units
12 you needed to demonstrate something that's a little bit
13 different from that, and would be different
14 documentation that you have in place.

15 MR. PATEL: I don't have too much to add, but
16 before I forget, I think we need a Ride-through
17 standard for Jamie's laptop.

18 (Laughter.)

19 MR. PATEL: Anyhow, so I think what Howard said is
20 absolutely right. I think it depends on how PRC-029
21 looks like in the next couple of weeks. But beyond
22 that, I think credit to all three standard Drafting

1 Teams. I think, my personal opinion, the
2 implementation plans were pretty synchronized. I think
3 we can always debate is the time allowed enough or not,
4 but I think there was great deal of effort in
5 coordinating implementation plans of the three
6 standards, and there is an opportunity to tweak those
7 based on what the changes might look like.

8 MR. YEUNG: Yeah.

9 MS. CALDERON: I have a follow-up question if I
10 may. Yeah. When it comes to the challenges with
11 specific equipment, is there a particular type of
12 equipment that would be perhaps more difficult to
13 secure? And I don't know if you have this off the top
14 of your head, but just when it comes to the
15 installation of new monitoring equipment, is there any
16 that are more challenging to do on the front end
17 because, like, transformers have a long lead time. I'm
18 just unfamiliar with the disturbance modern equipment
19 that's being required at the plant level and the -- and
20 the sub-plant level as well.

21 MR. PATEL: Right, right. So I think the PRC-028
22 Standard Drafting Team debated that a lot, right? It's

1 one thing to draw up a CT or PT distance monitoring
2 equipment on a piece of paper, a single-line diagram.
3 It's another thing to actually go out, get an outage,
4 procure equipment, get the panel on which you will hook
5 on the equipment.

6 So I think the 028 team did take into
7 consideration all that, with the expectations or the
8 directives from Order 901, right? Order 901 is very
9 clear in terms of when those standards need to be fully
10 enforced. But then if you remember, and some of you
11 may have noticed that we realized that, you know, it
12 may be challenging. I don't know how many plants we
13 are talking about. I think when we were only writing a
14 standard for BES IBRs, we had some idea about how many
15 plants we were talking about. I think someone at NERC
16 staff had pulled up some data and said about 800 to
17 thousand BES IBR plants. But then we rolled in non
18 BES-IBRs, and we have no clue how many of them are out
19 there. So long story short, we have to honor the
20 directive of the Order 901, and we have to realize that
21 there are some practical limitations based on which,
22 you know, equipment gets installed in the -- in the

1 station or at the plant.

2 So the framework, there is a framework in the
3 implementation plan. If the NTT provides reasoning
4 that beyond -- that is beyond their control, right,
5 then there is a framework in the implementation plan of
6 the PRC-028 standard that allows to seek exemption or
7 seek extension -- sorry -- extension of implementation
8 plan from the compliance enforcement authority. So
9 anyhow, I think the PRC-028 team did as much as they
10 could to honor the directive and realizing actual, you
11 know, problems that might come up as industry goes
12 installing equipment.

13 MR. YEUNG: Thank you, Manish. Second question,
14 and, Panelists, if you have things to add, maybe you
15 can elaborate with the second question because it's
16 very related to the first one. So question is, what do
17 you anticipate would the -- with the -- will be the
18 most significant challenges when retrofitting or
19 modifying the legacy IBR -- and that's kind of what
20 Howard mentioned on the exemptions -- to comply with
21 these new standards? And the question's kind of silent
22 on which one of the three, it just refers to all three,

1 but if there is a particular one that you want to call
2 out, I suspect there is, that's more challenging than
3 others, that'd be helpful. So can you share any
4 practical solutions or best practices that have proven
5 effective? And I think we heard some things about
6 getting started early, so thoughts on that, Panel? Go
7 this way or start down there again?

8 MR. GUGEL: Yeah. No, I can start again. So I
9 think that one of the huge challenges that we are
10 concerned with, again, as been discussed previously, is
11 resource availability both on the GO side, the OEM
12 side, really across the board. Having a confusion and
13 uncertainty on the path forward makes that extremely
14 difficult, and I think it's going to hit every part of
15 the industry. And then I think the second point I
16 wanted to make here as far as challenging for
17 retrofits, you know, I'm focusing on PRC-029 here,
18 although I'm not sure I would want to opine on which is
19 more difficult. But so specifically regarding the
20 exemptions, I made a similar point yesterday about
21 hardware- versus software-based exemptions, and again,
22 this goes into planning. We're not sure how to

1 interpret this and what to do about it.

2 I do -- I just want to caution that I'm concerned
3 that the focus on hardware- versus software-based
4 limitations is missing part of the point. A lot of our
5 concern, again, is on the modeling side, and as I
6 understand it, models are very literally a software-
7 based representation of the entire system, which
8 includes hardware and it includes software. So again,
9 just driving the point home that having exemptions only
10 for hardware seems to be unnecessarily restrictive and
11 makes the assumption that the software issues can be
12 resolved much more simply, which I'm not entirely sure
13 is true.

14 MS. JONES: Just to kind of add to that, I think
15 for us kind of doing just that commercial/economic
16 assessment now and being a part of, like, kind of our
17 long-term forecasting is, these solutions, even if we,
18 you know, do exercise exceptions, is going to require a
19 financial -- increased financial investment, and that's
20 just the reality of it. And I think what's hard is
21 they're saying, hey, Rhonda, how much is it going to
22 cost, and I'm saying, I don't know yet, but you want me

1 to buy it tomorrow. And just trying to figure out what
2 does that number look like, but also, too, you know,
3 the challenge is kind of having that conversation with
4 the OEMs to kind of help us to get to a number that's a
5 strong, strong estimate of that.

6 So understanding the commercial and financial
7 impact, but also, too, being able to articulate the
8 return on this possible investment that we're making.
9 Hey, Rhonda, we're going to do this, and what does that
10 mean for us as far as production? Hey, Rhonda, what
11 does this mean for us as far as return, and kind of
12 substantiating that is something, too, that's -- can be
13 a little bit of a challenge in that regard because it
14 needs data. Just like my neighbor here, I think
15 modeling -- I'm happy that we do have an in-house
16 modeling team to kind of help us with that. But that
17 also, too, is going to really kind of increase the
18 resource need there as we try to articulate our
19 position in that regard.

20 Also, too, we worry about -- another big challenge
21 is termination of services for the few OEMs that we
22 have equipment for that are no longer in operation and

1 just trying to figure out what is that -- you know,
2 what is that story that we tell from an engineering
3 perspective to give our best understanding of what to
4 expect of these devices. And then also, too, just the
5 collateral impact to other standards. This is just not
6 PRC, but there's a lot of other NERC standards that are
7 going to have to be addressed once the standards are
8 approved and kind of putting things in place to kind of
9 address the -- I call it the collateral impact of these
10 standards going forward. I think about my facility
11 ratings, et cetera, and safety and also, too, and the
12 analysis and impact there, which is of great concern.

13 But hey, yeah, those are the concerns, but how do
14 you kind of address those? I kind of encourage folks
15 that have never really talked to their OEMs, get to
16 know them today. Establish a relationship with them.
17 Really get to know about your fleet and about your
18 equipment, about the type it is. Find those, those
19 tech sheets, those specs. Sometimes if you all are in
20 the business as we are of acquiring already existing
21 projects, make that a part of your turnover package.
22 To really, really learn these assets, you're probably

1 going to be more of an expert on the asset, and that
2 expectation is to know it there. You can start having
3 these conversations now even before the standards get
4 approved to just knowing what you're working with. So
5 those are some things to do to kind of offset it.

6 And then we are a big fan of the, you know,
7 hardware exemptions, and I think that that's a good
8 thing, but also, too, you can start now building that
9 story and what does that look like in order to
10 substantiate it. I don't think it's solely on the OEMs
11 to do it alone, but, you know, when you're an operator,
12 you're close to the action. You can tell the story
13 about effectiveness and what your limits are.

14 Part of the strategy that I have in my shop is
15 always about optimization. What is the optimization
16 story? And that's something that's -- with or without
17 PRC-029, we're always in a position to demonstrate is
18 my equipment performing to the best of its ability and
19 this is why. And I think an optimization story, even
20 if it is used to substantiate an exemption, is
21 something that is knowledge that can go a long way in
22 helping you.

1 MR. YEUNG: So let me kind of follow up with you
2 and Andy, Rhonda. As far as the implementation time
3 frames, yes, there -- we have a lot of these. Is there
4 any particular one of these standards where the
5 implementation time frame really is just, you know, as
6 proposed is more problematic, or are your concerns
7 through both 028, 029 and 030 implementation?

8 MS. JONES: I would -- I would say that -- you
9 know, also, too, if I could have a longer runway, I'll
10 take it because like I said, I have about, you know, 70
11 to 80-plus projects to get ready for, and I just think
12 I'm concerned because one of the biggest thing is just
13 the bottleneck. And right now it's hard to predict if
14 I went forth to my OEMs with what my needs and supports
15 are, do they have the capacity to fit the timelines
16 that are being proposed and those that we have
17 internally at in Invenergy. And so that's one of the
18 things, just trying to merge their availability and
19 capacity with ours. And sometimes I do kind of predict
20 that it may really be challenging to meet that, and so
21 that's one of our biggest concerns.

22 On the disturbance monitoring equipment side, we

1 haven't gotten a lot of concerning feedback about the
2 availability of that, but maybe a lot of people haven't
3 started asking about it yet, so we don't really see a
4 lot of big concerns there. But once everything starts
5 to kind of get going and going out of the gates, we are
6 concerned that just from just bottleneck of services is
7 going to be a challenge.

8 MR. YEUNG: Supply chain issues. Andy, anything
9 to add to that?

10 MR. HAKE: Yeah. So I think I agree with pretty
11 much everything that was just said. We're a big fan of
12 the phased-in implementation for PRC-028. I think
13 that's very, very important. I made the point earlier
14 during the first question that I personally believe
15 that the design portion shouldn't be separated from the
16 performance portion. I don't see that needing to be --
17 to be separate and should also be contingent on the
18 PRC-028 information.

19 And then the last part I'll mention here is on the
20 newly-revised PRC-038 implementation plan. Again,
21 personally, I think that the link there to PRC-029 is
22 important. I'm not sure how much we can discuss that

1 today, but just putting that out there that, again, I
2 view all three standards as being somewhat sequential,
3 and I'm not entirely understanding why that revision
4 needs to be made after it was already approved.

5 MR. GUGEL: Yeah, Rhonda, if I could pull on a
6 thread of something you mentioned earlier because it's
7 not anything that I had considered. What are the
8 things in PRC-028, 029, and 030 that would cause
9 changes to your FAC-008 policy?

10 MS. JONES: Well, like, when we talk about some of
11 the auxiliary equipment that, these changes that we're
12 making, if PRC-029, the curves are approved as
13 proposed, we think about some of the safety concerns
14 with the equipment down the line. So that's where kind
15 of that comes in when we're looking at the transformers
16 and stuff like that. In certain events, in the
17 scenarios that they showed, it's like, well, wow, I'm
18 not only worried about the actual inverter itself, but
19 worried about some of the other auxiliary equipment in
20 that regard when you look at it from a scenario
21 perspective.

22 MR. GUGEL: Okay. Yeah, I just -- I mean, the

1 time frames that you're talking about, let's assume
2 that, you know, that the curves in PRC-029 stay the way
3 that they are. You know, the thermal constraints for
4 most of the auxiliary equipment you'd be talking about,
5 especially when you're talking about transformers, CTs,
6 PTs, breakers and switches, seconds is not going to be
7 enough for that to heat up and cause any kind of -- I
8 don't think, at least in my experience, wouldn't be
9 enough to change a rating for any of those. Now, if it
10 was extended, protracted, maybe, out for 15 to 20
11 minutes, which is not something we'd really be talking
12 about here, then I could see how that could be
13 affected. But I'm struggling a little bit trying to
14 figure out where it would change a -- that short-term
15 thing would change some sort of a rating for your
16 facility that isn't already taken into account in your
17 existing FAC-008 process. Yeah, that's something I'm

18 MS. JONES: (Off mic) probably spent years on, but
19 definitely, that's something that came up about the
20 safety of the equipment and its ability to react, and
21 how it just can have that domino effect down the line.

22 MR. YEUNG: Okay. Manish, your comments, and if

1 you can throw in a joke, it'd be appreciated.

2 MR. PATEL: I'm running out of them. So I'm going
3 to take a slightly different way to answer this. And
4 so, you know, PRC-023 transmission, really loadability
5 standard. PRC-025, generator relay loadability,
6 standard. PRC 26, stable power swing standard. All
7 those standards, when they were written, either
8 concurrently or immediately after, there was a document
9 produced either by the Standard Drafting Team or some
10 other technical committee or working group at NERC that
11 shows how to do calculations so that, you know, people
12 know how to meet the requirements of the standard,
13 right?

14 PRC-024, there is actually a document that -- out
15 there that shows three methods to do calculation for
16 converting voltage from high side of the main power
17 transformer, the generator step of transformer, to
18 synchronous machine terminals. And three years ago or
19 so, some solar developers came to say, well, you have a
20 document that shows calculations for synchronous
21 machines, not for, you know, solar plants. So System
22 Protection Working Group -- I work with them -- we put

1 together a white paper that shows one method that, as I
2 mentioned earlier this morning, that hopefully will get
3 approved by RSTC.

4 What I'm trying to say with all that back story is
5 PRC-029, it's a Ride-through standard. There is no
6 framework out there to show a sample method to evaluate
7 your plan with and show that either it meets or does
8 not meet the Ride-through requirements, right? So I
9 think as we think about implementation plan, we need to
10 think about the Joe Smith out there working on putting
11 together documentation to show compliance. Does he
12 have or she has tools and calculation methodologies to
13 go along, right? As written the implementation plan,
14 assuming that the standard gets filed, approved by FERC
15 early next year, then within one year, so first quarter
16 or second quarter of 2026, we are looking at fully
17 enforced standard, right? Do we -- do we have -- have
18 we provided tools, methodologies to the industry that
19 can be followed and then that can be applied to this
20 thousand BES and then, in another nine months or so,
21 non-BES IBRs needs to be fully enforced. Can all these
22 calculations be done in some of this?

1 You still need to go back to your OEMs, right, get
2 some information that might be necessary to show
3 compliance or seek exemptions and all that stuff. So I
4 think -- I think we need to about some of those things
5 when we talk about implementation plan. I don't have
6 any comment on PRC-028 implementation plan. I'm a
7 chair of the Standard Drafting Team, and as I said, we
8 have done best possible. And I think PRC-030 is
9 slightly different in nature, but I think when we think
10 about PRC-029 implementation plan, we need to be very
11 careful that we provide industry time and tools, right?
12 There is not a single literature document out there
13 that shows this is how you will evaluate Ride-through
14 capability. Ride-through, this is first-of-a-kind
15 regulatory standard, right? There is no tools in
16 methodology out there, I think.

17 MR. YEUNG: So we should've made you chair of PRC-
18 029, Manish. There wouldn't be a question. Jamie,
19 anything to add?

20 MS. CALDERON: No, not on that question.

21 MR. YEUNG: Okay. So the next question is about
22 new generators. As mentioned, we also now have a Sub-

1 Category 2 type of registration that's going to be
2 under compliance for these standards as well. So since
3 NERC is expanding their registration criteria for the
4 GOs, how should companies approach the integration of
5 new assets or changes in ownership to ensure seamless
6 compliance, and what are there -- what are the key
7 considerations to keep in mind? I think we already
8 heard some of the things about, you know, tools, right,
9 especially these new players, as you said, the plain
10 Joes who have never been subjected to noncompliance.

11 MS. CALDERON: Well, if I may expand on that, the
12 impetus for this question as well is we see a transfer
13 in ownership much more with a lot of the smaller IBR
14 than we're seeing with, like, conventional generation
15 where whole companies come and go. It seems very
16 quickly we have foreign-owned investors, and there's a
17 lot of interchange between some of this ownership with
18 IBR that we don't see traditionally. So there's an
19 additional layer of complication to this question then,
20 I think, is why we wanted to bring it up to the panel.

21 MR. HAKE: Yeah, so I'll start again. This is --
22 this is a fun challenge for sure. So I guess what I'll

1 do is just explain a little bit about how AES has kind
2 of attacked this, at least very, very early stages, to
3 be clear.

4 So we've come up with our list of potential new
5 Category 2 sites, right, based on all the data that we
6 have on our operating fleet, begun the effort of
7 gathering data in the field. We believe that it's
8 going to be a tremendous resource drain and constraint
9 on us in order to get this information. It's not
10 trivial. So even though, currently, we don't have a
11 super firm understanding of what exactly are we going
12 to have to do for these Category 2 sites, we figure we
13 can at least get some stuff started. You know, we're
14 going to need that data no matter which standards
15 apply.

16 And then to more directly address the question
17 about change of ownership for projects or how are we
18 now treating these Category 2 projects, especially new
19 ones that are coming up, and it might sound like a bit
20 of a simple answer, but, essentially, what we're doing
21 is treating them the same way that we do our Category 1
22 projects. So again, because we don't necessarily know

1 specifically which standards will apply, we are taking
2 a conservative approach and assuming it's going to be
3 most of them, if not all of them.

4 It does raise a lot of concerns and challenges in
5 working with our contractors trying to figure out what
6 is going to happen. You know, they don't like
7 uncertainty just the same way that we don't, but that's
8 essentially what AES Clean Energy, our approach has
9 been thus far. And we're certainly eager and awaiting
10 additional information so that we can, you know,
11 continue to plan and make sure, again, touching on the
12 resource availability point, that we have all the
13 people in the right places in order to actually make
14 this happen.

15 MS. JONES: I echo -- I echo that process very
16 similar to how we do it in our shop. With any asset,
17 we have about definitely 10 or 12 that'll come into --
18 under Category 2, and we just kind of stress test them
19 under the most extreme scenario. Now, our hope is that
20 the curves will come in a little bit, but nonetheless,
21 we just try to, in our shop with our NERC readiness
22 process, is try to understand now, well, what do we

1 need to do to get these facilities ready to be able to
2 demonstrate compliance, and it's just starting early
3 and trying to figure it out.

4 And we do have one or two cases where the vendor
5 is no longer there and just trying to, on our own, be
6 able to substantiate their effectiveness to the grid,
7 which we think is most important, and being able to
8 show how they continue to support grid reliability in
9 the absence maybe of some of that information because
10 the OEM is no longer around.

11 MR. GUGEL: I like what I'm hearing, I mean, and I
12 think that's an excellent approach for folks to be
13 taking. The other thing is that as assets change
14 hands, hopefully there's a communication that occurs to
15 let folks know, hey, by the way, are you registered
16 with NERC if you're -- if you're selling an existing
17 asset or changing it, and if not, you might want to
18 reach out because the world's about to change. But
19 yeah, raising that awareness, too, it would help -- it
20 would help us and help them, I think, entirely to make
21 sure that we've got awareness raised on those areas.
22 You know, the fortunate thing is we don't register

1 assets, we register entities, so once you're in, you're
2 in and, and you're in the know, if you will, so yeah,
3 but the approach that y'all are taking I think is
4 really good.

5 And then just a reminder that since these are, you
6 know, non-BES assets, standards would only be
7 applicable as they're changed or as, you know,
8 definitions kind of change in that area. So it's going
9 to be a process of standards development as each one of
10 -- each standard is modified to see whether or not
11 these non-BES assets are included or not.

12 MR. PATEL: So I don't have much to add to what
13 Howard said. When I read this question, the raw
14 thought that came to mind is, you know, when you sell
15 your home, you have to -- you have to sign this
16 disclaimer about the status of the home, what's in it.
17 If something's broken, you have to declare it and all
18 that stuff. I think -- I think there might be a
19 checklist out there that someone can put together that
20 one owner gives to another owner, then the ownership
21 changes, and, you know, let the new owner become aware
22 of what they're getting into. I don't have much to add

1 here. I think it's an administrative process, but all
2 those entities who play in this non-BES assets world
3 need to catch up to the reality that NERC standards
4 would apply to those assets now.

5 MR. YEUNG: -- communication for the new owners,
6 and, of course, NERC has already a plan for registering
7 these new owners, too.

8 The next question is a little bit maybe kind of --
9 kind of going back to some of the things that already
10 been said, so I'm going to revise it a little bit. The
11 question is, how does supply chain issues impact the
12 timely implementation of these new standards,
13 particularly in terms of retrofitting existing or new
14 installs, and what proactive measures can be taken to
15 mitigate these potential risks?

16 And I think we are over these past couple of days,
17 we've heard a lot about the PRC-029 impacts of these --
18 implementation and how the supply chain might impact
19 that. So maybe kind of talk more about maybe the other
20 two standards, 028 and 030, and, Manish, I think you
21 already opined on that a little bit, particularly,
22 again, this is about a lot of new Category 2 assets

1 that probably don't have any type of this equipment
2 presently.

3 MR. PATEL: That is true for PRC-028. It is very
4 likely that non-BES IBRs do not have all necessary
5 equipment. They may have some that can do some
6 recording as required by the standard, but not all
7 recordings that the standard requires. This will
8 require them to -- actually, if they don't have their
9 own engineering staff, first of all, go and find an
10 engineering consultant who can help them, right, design
11 the DME equipment, and then go and find folks who can
12 actually go into the substation and install it, right?
13 So it's going to be quite a bit of work.

14 In some cases they will have to talk to IBR unit
15 OEMs because the standard requires SCR data from the
16 inverters or the wind turbine generators. So they will
17 have to go and talk to the OEMs about the capabilities
18 of that particular, you know, vintage of equipment that
19 they have in their asset. So there is quite a bit of
20 work required, and I think that's why, as I said
21 earlier, the Standard Drafting Team, you know,
22 respecting the directive of the Order 901 in terms of

1 when the standard needs to be fully enforced, still
2 went ahead and offered a framework to seek extension,
3 right, because again, I can draw up DME equipment right
4 here on my notepad in matter of five minutes. It's
5 another thing to actually go and get it installed in
6 the substation.

7 MR. YEUNG: Howard, any thoughts?

8 MR. GUGEL: Yeah. I don't really have anything to
9 add. I'm not sure that, from our perspective, we
10 really understand the supply chain issue there. I do
11 think that, as it's mentioned before, you know, volume
12 is going to play in -- come into play here, and the
13 fact that you've got, you know, a significant number of
14 folks that are having to procure new equipment may
15 bring that into play and may cause a supply chain
16 issue.

17 I could be totally wet on this and some folks may
18 be able to straighten me out on this later, but I think
19 one advantage that these units have over maybe the
20 traditional synchronous units are that they're already
21 sampling a lot of information. They're already
22 bringing a lot of data in to do all the monitoring

1 that's necessary internally. So it may be, you know,
2 the fact that they don't have to install some
3 additional inputs might be an advantage, but you're
4 still going to have to have that external logging
5 equipment there that would be able to pull that
6 information in. So while one part of it may be a
7 little bit easier, there's still a lot of stuff that
8 has to occur and would be impacted by supply chain.

9 MS. JONES: Nothing new to add with supply chain.
10 I think we've kind of talked about it with just the
11 volume and not knowing that, and just hope that we're
12 at the front of the line is what I strive for when we
13 start to request this equipment. But nonetheless, you
14 know, I think the other thing that we kind of think
15 about with supply chain is not just equipment. But one
16 of the things that kind of came up in our analysis is
17 the ability for this equipment to record all this data
18 and what does that mean for additional kind of
19 capacity, and should we be looking at that as far as
20 something else to kind of consider as far as managing
21 and storing that data is something also, too, came up
22 in some of our conversations.

1 MR. HAKE: Yeah, I don't have too much more to add
2 on this one. I think that -- you know, I'll mention
3 again that in some cases, OEMs are out of business, so,
4 effectively, the supply chain does not exist. We're
5 early enough in the process that we haven't encountered
6 any specific supply chain issues with particular
7 equipment. But, you know, we, of course, share similar
8 concerns that there's a whole lot of companies out
9 there that are going to be requesting the same thing,
10 at the same time, on the same timeline. And that's
11 very concerning, right, again, from equipment and,
12 again, from a resource availability standpoint

13 I think one thing that I learned yesterday that I
14 perhaps didn't appreciate previously is that this
15 equipment is wildly complicated, hearing from the OEMs
16 about how, you know, even just a single turbine is a
17 system of systems with auxiliary equipment. It's a lot
18 of stuff that, again, everybody is going to be
19 requesting to upgrade and have updated at the same time
20 on a short timeline.

21 MR. GUGEL: I could add just one thing because it
22 just came to mind, too. I'm going to take an

1 opportunity here to put in a little bit of a plug. I
2 think if you're not already a member of some sort of a
3 trade organization, it would really be helpful in that
4 -- in that aspect. So there's power in community, and
5 so it would be good to join up with some other trade
6 organization, get some of the collective thoughts that
7 are there, and work together towards some of those
8 solutions because sometimes working by yourself, you
9 might come up with something, but as a community, if
10 you come up with a solution, there's kind of the power
11 that could occur there. And yeah, Mark's reminded me,
12 you know, we've also got the Generator Forum that would
13 be an excellent source for you also there. But, you
14 know, between the forums and the trade organizations, I
15 think there's a wealth of information that can be
16 tapped there as you get involved in those things. So
17 just -- it was kind of my opportunity to kind of say
18 look for those also.

19 MS. CALDERON: So we've talked a bit about
20 installation of equipment, supply chain issues,
21 testing, and all of that. PRC-030 also has that piece
22 about root cause analysis and being able to diagnose

1 the fault recorder data to be able to diagnose root
2 cause. And that's an entirely different form of
3 analysis that needs to be proactively addressed as
4 well. I would suggest making sure that you've got
5 either onsite engineer or contractors, like, set up or
6 consultants set up to be able to do that type of
7 analysis because there will be a time limit once it's
8 being triggered and that request for the analysis is
9 being triggered, and it's a very specialized skillset.
10 So that's something else to keep in mind.

11 MS. JONES: And that's a good point that you bring
12 up, Jamie, because part of our -- in our planning
13 efforts is kind of being able to design and how do we
14 maximize the filtering of that data to help us quickly
15 support a root cause analysis. And to be just
16 transparent, you know, we've kind of recommended we
17 need to build a program just around root cause
18 evaluation. It's its own program in and of itself.
19 It's not just this casual task of someone just flips
20 through the paper and says what's happened, but you
21 actually have to tell the story and substantiate it,
22 and then talk through remediation and mitigation if

1 that's the case.

2 And so in our shop, we've talked about the need to
3 maybe carve out, for PRC-030, its own program. We work
4 a lot with our data analytics team, we work a lot with
5 our engineering team and our compliance professionals
6 to kind of bring that together, but we look at the
7 volume and the number of faults that's happened. Also,
8 too, you have to think about your workforce and the
9 FTEs that are going to be needed to kind of support
10 that, also.

11 MR. HAKE: Yeah, that's a really good point there,
12 and I would like to add, also, that the way that we're
13 currently interpreting PRC-029, in some of the
14 measures, it talks about retention of actual
15 performance data to demonstrate compliance with these
16 performance requirements. So, in effect, we are going
17 to have to do a similar type of effort every single
18 time an inverter trips offline. I know there was
19 discussion earlier about the Ride-through definition,
20 and we're optimistic that that can be clarified to try
21 and mitigate some of those concerns. But I think
22 similar to your point on PRC-030, there's also going to

1 be a substantial amount of expertise and resources and
2 effort involved with that, right? Every time something
3 trips, we have to evaluate it versus the Ride-through
4 requirements.

5 MR. GUGEL: Yeah. The only thing I would add is I
6 think if you've already got a team looking at PRC-024
7 and any mis-operations, they're already kind of
8 involved in that RCA thought. And if you can draw on
9 them to maybe provide some information or some help to
10 look into your inverter trips, that would be really
11 good, too.

12 MR. HAKE: Yeah, I think that's a really good
13 point, Howard. The one distinction I would draw is,
14 currently, we're looking at a significantly larger
15 volume than we would for PRC-024, so PRC-024 mis-
16 operations. Again, not speaking just for AES, just
17 personally, they don't happen very often, so it's much
18 easier to deal with.

19 MR. GUGEL: Yeah. You just need to clone them,
20 right?

21 (Laughter.)

22 MR. HAKE: Exactly. Problem solved.

1 MR. YEUNG: We have one more question for this
2 panel. I'm just going to dig a little bit deeper into
3 some of the things we've mentioned earlier about
4 testing and verification to whether or not you meet
5 these requirements, particularly 029 requirements. So
6 what are some of the most challenging aspects of
7 testing and verification in the context of these new
8 standards -- 028, 029, or 030 -- probably you're going
9 to be talking about 029 -- and especially in the case
10 that you're going to have this mix, right, of existing,
11 new retrofitted, it's going to be a changing landscape
12 in your fleet. So what's going to be some of those
13 challenges to testing and verification, and how do you
14 ensure that testing protocols are robust now to meet
15 these requirements and avoid, as little as possible,
16 delays?

17 MR. HAKE: So I'm not sure I have the answer for
18 that one. The first thing that comes to mind, though,
19 are the -- some of the challenges we've talked about in
20 modeling, right? So when we -- when we talk about
21 verifying performance on the design side, the model has
22 to come first. And, you know, as discussed at length

1 here the last couple of days, getting all of that
2 information is a major challenge, particularly for
3 legacy products. But even moving forward, again, going
4 back to the design cycle comment, in the short to
5 medium, even long term, we're going to have a similar
6 challenge. And if we don't have the model in order to
7 run the tests, we can't demonstrate performance
8 requirements or compliance with them.

9 MS. JONES: Just add to that, you know, definitely
10 trying to nail down the modeling is going to be a --
11 you know, a work in process. But one of the things
12 that came up in our shop was, is there just like this
13 consensus testing standard that exists on how testing
14 should be performed? And if that kind of a standard
15 was to be developed, who is best to develop it that we
16 can have a shared approach at how we do testing, if not
17 just defining testing.

18 If I was a regulator and everybody had to define
19 their own testing, it could really get kind of
20 squirrely there. But we don't have the answer to it,
21 but that's one of the questions that we're -- that
22 we've been talking about internally, what is that

1 consistent standard of testing that we can adopt and
2 apply across the board and across equipment type? And
3 that's something that we are still looking to kind of
4 learn more of, and we think that would help to simplify
5 things versus developing our own, this other entity
6 develops their own, and it's just everybody has their
7 own way of testing it, and do we -- are we achieving
8 the same objectives? But that's one of our
9 recommendations is to get that kind of consistent
10 standard of testing.

11 MR. GUGEL: Yeah, I would agree. I think that's a
12 -- that's an area to concentrate on. The synchronous
13 machines all struggled through that when we first went
14 through the MOD standards to try to figure out how to
15 do their real and reactive power output verifications
16 and their model verifications. And I think that these
17 -- that the inverter-based resources have such an
18 additional complexity to their operation, that it is
19 going to take some specialized folks to set up those
20 testing procedures. I agree.

21 MR. PATEL: So this is also kind of only a
22 question for really PRC-029 disturbance monitoring

1 equipment. We have been installing for a long time.
2 We know how to commission tests. PRC-030 is kind of
3 unique, very specific criteria in R1. I think we can
4 come up with process, you know, to honor that.

5 So then PRC-029, we are not going to apply a 230
6 kV fault for 160 millisecond to test plant is able to
7 Ride-through or not, right? So this begins from lab
8 testing, solar inverter, or container testing wind
9 turbine generator. I don't even know what to think
10 about HVDC terminals. They're a thousand megawatt in
11 capacity. But there has to be some sort of guidance
12 out there that says these are some of the tests that
13 you need to run on your IBR units, right -- the solar
14 inverters, the wind turbine generators, the HVDC
15 converters. Somehow convert those tests into models
16 and then use the models at the plant level, and then a
17 simulation engineer like me can apply 230 kV fault all
18 day every day of whatever time duration, right?

19 But this is what I meant earlier that -- we wrote
20 the standard. It will get done in one form or another
21 here in next couple of months, and then how to show
22 compliance with the standard, it's a big task. It

1 begins with lab testing of equipment and then, you
2 know, some sort of model-based verifications. And
3 there is a -- there is a need to develop framework for
4 all this work. Some of that, I know we're all tired of
5 listening "IEEE," but some of that work is being
6 carried out in IEEE 2800.2 Working Group. It takes
7 time to develop some of those things.

8 We have been talking with some OEMs, you know.
9 Testing for MVA battery energy storage inverter is very
10 different than testing a 12-megawatt wind turbine
11 generator in a container which is actually connected to
12 the system, right? There are many different ways of
13 testing. Now, I'm talking about things that I don't
14 understand well, but, you know, a lot of things go on
15 what can be tested, what cannot be tested, and then
16 somehow bring it all into a simulation world and show
17 that the plant was designed. If I was a GO, I want to
18 have a confidence before we go commercial operation
19 that the plant will Ride-through, right? All system
20 disturbances, right? So I think there is a lot of work
21 remains in putting together a framework for test and
22 verification of Ride-through standard.

1 MR. YEUNG: Okay. Well, thank you. Go ahead.

2 MR. GUGEL: If only there was a research institute
3 for the electric power area, there might be a way for
4 this to happen.

5 (Laughter.)

6 MR. GUGEL: That was my attempt at humor, by the
7 way.

8 MR. YEUNG: -- some questions. We're going to
9 start in the room for this panel. Any questions?
10 Scott?

11 MR. KARPIEL: Scott Karpiel of SMA America. Just
12 curious to understand, considering some of the hurdles
13 and issues, concerns with supply chain costs, transfer
14 of ownership -- let's see -- the costing of upgrades,
15 testing, modeling, you know, it all kind of stacks up.
16 At some point, there's diminishing returns on that
17 investment. Curious to understand if there's a
18 possibility that a plant or an asset would be
19 decommissioned, and, if so, how would that affect
20 transmission in planning?

21 MR. GUGEL: I'm not sure I understand the
22 question. Can you elaborate just a little bit more on

1 that?

2 MR. KARPIEL: Sure. So if I'm an owner, which I'm
3 not, right, there's a financial commitment. There's a
4 return on the investment that I'm going to have to make
5 to bring this asset up to current code and standard.
6 If I were to deem that it wasn't worth my investment to
7 do that and I decided to shut the plant down,
8 decommission the plant, curious to understand how that
9 would affect the network from a planning standpoint,
10 from an operational standpoint. You know, I think
11 there's a real possibility, especially for some of the
12 smaller asset owners, that they may decide to just
13 throw their hands up and close down the plant or
14 decommission the plant.

15 MR. GUGEL: Yeah, that goes back to something we
16 had mentioned earlier that definitely do not want that
17 perverse incentive there. You know, the last thing we
18 need is a retirement of additional capacity that's out
19 there, but we do need the capacity that's there to act
20 reliably. So, you know, the reliability coordinators
21 will be the ones that will be looking at this, in my
22 opinion, and if there's a decision made to retire, they

1 would be able to look at that and see what the overall
2 reaction to the system would be on that. But again,
3 you know, that's going to be a decision that's based on
4 the owner of that asset and then, you know, the
5 reliability coordinator, looking at all the reliability
6 for the area. Just my thoughts on that.

7 MS. CALDERON: I would -- I would add that there's
8 substantial precedent for this type of business
9 decision just when retrofitting units, like carbon
10 capture, that was putting baghouses on coal units.
11 There's a whole lot of history with having to do some
12 form of retrofitting or upgrades. That's just part of
13 the business of having generation.

14 MR. HAKE: Yeah. So I guess what I would add here
15 is, putting my personal opinion hat on, I don't know
16 that AES Clean Energy, we have not gone through a
17 detailed analysis to say X number of our plants will be
18 decommissioned. What I would say, though, is I think
19 it's a very valid and real concern, especially for
20 plants that are older, right? The older the plant,
21 potentially the less ROI we're getting, the more we
22 have to spend on, it begins to not make sense very

1 quickly. So I -- so I appreciate the question. I
2 think it's a -- it's a really good point to make.

3 MS. JONES: This is Rhonda's, not Invenergy's. I
4 feel that the -- there's still a very strong argument
5 that the IBRs, even the ones that are, you know, quite
6 seasoned, still have an effective role in grid
7 stability, even not being upgraded to the latest and
8 greatest, that they still play a role. And it would be
9 an interesting argument to hear that them being
10 prematurely decommissioned is better for the grid than
11 them staying on and still helping grid reliability, and
12 I just -- I don't really -- I don't -- I don't really
13 see that case.

14 Definitely the goal is to optimize performance.
15 Definitely that's an ever-changing responsibility based
16 on grid conditions and dynamics, and you should be in a
17 position to optimize performance and how we're kind of
18 defining that now. But I do still feel there is a
19 stronger case, personally, for proving with data that
20 the role that they serve now on the grid is still very
21 helpful overall to reliability versus not being on it.
22 And with some of the queue positions getting backed up

1 and things taking longer to come online, you can't even
2 say, oh yeah, you're out of here, we have somebody
3 ready to replace you right away. The timing doesn't
4 happen exactly like that. So I appreciate the
5 question.

6 MR. HAKE: And I would agree with, I think, your
7 premise at a high level. The one thing that I'd leaned
8 back onto a comment that I made earlier is, if the grid
9 operators don't understand how that unit is going to
10 react and actually, you know, how during disturbances
11 or during extreme situations on the system what they
12 can expect to be on or off, there may be negative
13 reliability impacts in those areas as opposed to the
14 steady state issue. So that -- all of that needs to be
15 taken into account. And if an entity chooses to not
16 want to look into that issue, I'm not sure that that's
17 a benefit to reliability for them to hang on just for
18 the sake of hanging on, but I do think that somebody
19 does need to analyze that information.

20 MR. HAKE: Yeah, I agree, and if I could just
21 offer one mitigating factor. I think that, at least
22 for existing BES units, they would already comply with

1 PRC-020. So we're not talking about units that are
2 totally off the wall doing crazy things, right?

3 MS. JONES: Right.

4 MR. MAJUMDER: Rajat from GE Vernova. So, Howard,
5 question to you. What's the basis of that you were
6 saying that it's not being done, that somebody's not
7 looking into it, when you say the grid operator needs
8 to know what the unit are going to be doing? I mean,
9 isn't it something we are doing already? So why is it
10 being raised as a matter of concern? There are always
11 going to be outlier where the models did not keep up to
12 the actual equipment behavior. And I did not made the
13 statement when we were working in Appendix G of 2800,
14 so I'm bringing it up again. And there has been some
15 statement made that, oh, well, the models are not good.
16 It's not true. Yes, there has been some exception, but
17 rest of the thing, we are all going through Mod 26 and
18 27, not every other 26 and 27 shows models are matched.

19 MR. GUGEL: Yeah.

20 MR. MAJUMDER: So I'm just trying to sense your
21 concern that when you say that it's a reliability risk,
22 flagging that grid operator does not know how these

1 equipments are going to behave.

2 MR. GUGEL: So I would point to all of the reports
3 that we have on our system. If you look at each of the
4 events that we've analyzed, we pointed back to grid
5 components that reacted in ways that both the
6 reliability coordinator, the transmission operator,
7 and, in many instances, the generator owner/operator
8 did not expect that to happen. After a root cause
9 analysis was done into that, it was found out that
10 there were maybe some additional controls that were
11 installed on the plant that nobody was aware of, or
12 that the generator owner might've been aware of it, but
13 that information had not been translated to the
14 transmission operator or to the reliability
15 coordinator.

16 So if you -- if you look through all of -- that's
17 why I'm saying that our experience has been, over the
18 last seven to eight years, that disturbances that are
19 occurring on the grid are happening, and the
20 reliability coordinator and the transmission operator
21 is seeing things happen that they're not expecting.
22 And it's because these units, each time they come up,

1 they're behaving in a little bit of a different way
2 than they have in the past. So we'll fix -- what's
3 happening is we'll fix one problem, you know, let's,
4 let's take Blue Cut Fire. We had an issue with three
5 phase fault, bunch of units tripped out, found out that
6 that was an issue with sampling on frequency, got that
7 fixed. A year later, had a bunch of other units trip
8 out on a single line-to-ground fault for a different
9 control system that was in the same plant.

10 Until we do a deep dive and try to figure out what
11 those scenarios are, we're going to continue to see
12 grid perturbations that occur that are reliability
13 concerns that are small at this point, but when we get
14 to a 50-percent penetration, they're not going to be
15 small anymore, is my concern.

16 MR. MAJUMDER: Yeah.

17 MR. GUGEL: So that's why I'm raising --

18 MR. MAJUMDER: I fully agree with that, and that's
19 what I'm saying, that things has happened and even
20 there were repeat offender. I know that. I mean,
21 Odessa even not specifying anything when ERCOT went
22 ahead, and, you know, published the report, there were

1 plans/manufacture who made a commitment to fix it, and
2 the second one came up and it was saying that it's
3 there. So I fully understand.

4 But at the same time, let's not -- I'm just trying
5 to say that let's not think -- that thing has also
6 happened with synchronous machine. There are so many
7 synchronous machine out in the -- in the field, but the
8 excitation system model, if you look at it, there's
9 still rotation, you know, the slow rotary excitation
10 system. In real field, it's completely different. So
11 the issue is not only in IBR, so let's not think that
12 how it's going to be -- I'm not at all undermining the
13 necessity that you are establishing. I fully agree
14 with that, but I'm just trying to say that please let
15 us not flag IBR fleets specifically for this issue.
16 This issue exists.

17 MR. GUGEL: So my qualification was just the
18 specific question that you asked me: Why, Howard, are
19 you calling out and saying that grid operators don't
20 know what's going on, and so that's why I was pointing
21 to the reports there. Do we see issues happening with
22 synchronous generators? Yes. Have we modified

1 generation standards over the years to basically react
2 to that? Yes. But from a synchronous generator
3 standpoint, a lot of the technology that's behind that
4 and the basis behind it is something that's been around
5 for 50, 60 years. We've had the ability to kind of go
6 through that, understand the issues, and basically know
7 how that reacts on the grid.

8 We're now introducing some new components at a
9 fascinating, incredibly fast rate of equipment that has
10 some great reliability benefits. It has a potential
11 for that, but also has a potential to give us some
12 unknowns and put us in unknown operating states.

13 MR. YEUNG: So, Howard --

14 MR. GUGEL: We need to be in front of that as
15 opposed to --

16 MR. YEUNG: Howard, I'm going to interrupt a
17 little bit. I think those are probably basis of the
18 order, you know, so we need to move forward, and, you
19 know, implement the order, so absolutely important
20 arguments, but any more questions about implementation?

21 MS. CASUSCELLI: We have one online. Is there an
22 effort underway for the design compliance and further

1 performance compliance for PRC-029?

2 MS. CALDERON: Could you say that again?

3 MS. CASUSCELLI: I can repeat it. Mentioned in
4 the panel was a technical document. Is there a way --
5 is there any effort underway for the design compliance
6 and for the performance compliance for PRC-029?

7 MR. PATEL: Yeah. So I think -- I think that's
8 where I mentioned IEEE 2800.2, where we are trying to
9 put the framework where, you know, the equipment
10 actually gets tested, right? IBR units, individual
11 inverters, the wind turbine generators, we understand
12 their capability. We build the plant model, and then
13 we run the simulations on plant model to verify that
14 the plan will be able to Ride-through what the standard
15 requires. There is no effort at the NERC level.

16 I think that was my point when I gave all the
17 examples of different PRC standards, right? There is a
18 companion NERC document that shows how to do
19 calculations for 023, 025, 026, et cetera, standards,
20 and I think there is equal need. I'm not advocating
21 here for a companion NERC document to PRC-029, but
22 maybe IEEE 2800.2 can serve that role where, you know,

1 you pick up the framework, put together in that
2 document in compliance with, I'm going to start calling
3 2900. Maybe it will become true.

4 (Laughter.)

5 MS. CALDERON: Well, and to add in on that as
6 well, there's ongoing work within the IRPS and within
7 the RSTC work tackling those types of engineering
8 questions. They've had power plant model validation
9 guidelines put out. There's ongoing discussions within
10 those groups, and it seems like an opportune place to
11 bring those up. When it comes to performance, it's
12 really just did it or did it not meet the criteria
13 based off of the measured data. So there'll be a
14 pretty big distinction between those two and how you
15 approach compliance with those.

16 MR. YEUNG: Any more questions? Any more
17 questions on the internet or Slido? Todd, do you have
18 a question or do you have a comment?

19 MR. BENNETT: I don't think I have a question or
20 necessarily a comment. I wasn't seeing it either in
21 the room, and, Amy, are we wrapped up online?

22 (Nonaudible response.)

1 MR. BENNETT: Okay. So with that, thank you to
2 our panel. Very in-depth discussion here. Many thanks
3 to you. So anyway, how about a round of applause?
4 That's our last panel of this Technical Committee.

5 (Applause.)

6 MR. BENNETT: And why don't we get back together
7 here in 15 minutes, and we will review some Slido polls
8 and have some additional polls on PRC-2900.

9 (Break.)

10 MR. BENNETT: Okay. So it looks like we're
11 getting ready to start back up here for our last
12 session of the Technical Conference today. I think
13 this should go fairly quickly, but we have three
14 questions to poll to all the participants through
15 Slido, so if you need to, go ahead and join back in on
16 there. I don't know if we can put the QR code back up
17 here real quick just in case anybody needs to join.
18 I'm not sure, but I believe -- yes, Amy's going to have
19 three questions here, and here's the results of our --
20 of our previous one. Oh, this is actually new, so,
21 okay. So yeah.

22 MS. CASUSCELLI: Yeah, Todd, that's the new one.

1 Sorry.

2 MR. BENNETT: So there's three questions here, and
3 I'm going to hand it over to Amy to kind of lead us
4 through this for the next few minutes.

5 MS. CASUSCELLI: All right. Yeah, thanks Todd.
6 So as Todd mentioned earlier, you know, we have a
7 series of questions. I believe there's three of them,
8 and, you know, this is not a formal voting mechanism.
9 This is just meant to inform the Standards Committee
10 members' decisions in the next couple of days here on
11 the path forward for all of the things that we've been
12 talking about for the last day and a half.

13 So for this initial question here, based on the
14 conversation you heard today, and I want to make sure
15 that we differentiate here. This question is related
16 to legacy assets. So what should the PRC-029 voltage
17 and frequency criteria follow that assures reliability
18 assets? So just note that that is for legacy assets.
19 So I'm going to not narrate the entire -- the entire
20 moment here and just let us sit in silence as you all
21 consider and cast your votes.

22 (Slido voting.)

1 MS. CASUSCELLI: All right. So I think that we've
2 pretty well slowed down with our votes cast, so looks
3 like we've got an overwhelming response for that
4 question. Thanks for -- everybody, for your input. I
5 think we can move on to the next question.

6 All right. So this question is the -- identical,
7 with the exception of this is for assets being brought
8 online in the future. So only two options for this
9 one, and this is future assets.

10 (Slido voting.)

11 MS. CASUSCELLI: Oh, okay. So I think the -- for
12 those of you who are looking on the screen here in the
13 room, the bottom option is cut off, but it says, "adopt
14 voltage and frequency bands proposed in IEEE 2800."

15 (Continued Slido voting.)

16 MS. CASUSCELLI: All right. So it looks like we
17 have a -- an overwhelming opinion on that one as well.
18 So with that, I think we can -- we're ready to move on
19 to our next question, and this one is related to the
20 implementation plans.

21 UNIDENTIFIED SPEAKER: Amy, I don't think we have
22 a presentation for this. Are we putting the question

1 in front of it?

2 MS. CASUSCELLI: Okay. Hold on.

3 (Brief pause.)

4 MS. CASUSCELLI: All right. It's coming. I see
5 it in Slido. There we go. All right. So regarding
6 the implementation for these new standards, in 25 words
7 or less, what should NERC provide more information on
8 to assist industry in preparation? I don't think
9 there's any penalty for going over 25 words, but --

10 (Off mic comment.)

11 MS. CASUSCELLI: Oh, really? Oh, it does cap.
12 Okay. Okay.

13 (Slido voting.)

14 MS. CALDERON: All right. Just a quick point of
15 clarity that, of course, that is 25 characters or less.
16 What we're going to do here is when this closes, we're
17 going to close it and reopen it with that image
18 removed, just so it's easier to see for -- at least for
19 the folks in the room.

20 (Continued Slido voting.)

21 MS. CASUSCELLI: All right. I think we've seen a
22 slowdown in responses, so I think we're ready to close

1 it. And if you could, yeah, Jamie, like you said,
2 display the image, I think that would be helpful for
3 folks.

4 (Brief pause.)

5 MR. BENNETT: Okay. So while we wait on the
6 results to be posted up here on the screen for everyone
7 to see, at least something that jumped out at me on
8 this was the term "compliance guidance." So it was
9 larger in the middle. That that means it got mentioned
10 a bit more than some of the other items. So, you know,
11 one thing that I am glad about on compliance guidance
12 is there's not only one path. So there's multiple
13 organizations that have been approved to put documents
14 like that together and can be endorsed by NERC. So o
15 it's -- I don't think that's a deviation from the past,
16 so I think there's some real promise there. Another
17 word that I saw that wasn't quite as big as "compliance
18 guidance," but it makes me think of certainty, but it
19 was "implementation timing," you know, what to expect.

20 So with that, maybe I can kind of segue into the
21 next part of what to expect after this technical
22 conference concludes. So after we wrap up today, we'll

1 take the feedback from these polls from the -- from the
2 conversations over the last couple days, and the NERC
3 Standards Committee, in conjunction with members from
4 NERC as well as some of the Drafting Team members that
5 are available, we'll get together and start redlining
6 the standard based on what we've learned. So there's
7 not an infinite time to do that. It's pretty
8 compressed. So I would expect, you know, that to
9 probably conclude by the end of next week, you know.
10 So it's going to be a busy next six or seven days for a
11 group of people, but at that time, I believe that we'll
12 be able to have a revised standard that captures maybe
13 a slightly different path forward. But then also part
14 of that is an implementation plan that is with that,
15 and I believe that will help with the certainty.

16 You know, both of these documents, I can't for
17 foretell what will be on them at this current point in
18 time. But they will be out there and I believe that
19 the implementation plan will help with that, what to
20 expect, and, based on certain scenarios, what companies
21 should try to plan on, given that the standard's
22 approved. If it's not approved, that's a whole

1 different -- that's a different story. That's not our
2 conversation for today. So anyway, I think that that
3 might help with what to approve and implementation
4 guidance. Based on the conversations that I've heard
5 today, and some of the -- you know, the history with
6 the multiple ballots going out to industry and
7 struggling to find consensus, this does seem like an
8 ideal candidate for some type of implementation
9 guidance.

10 So with this in front of us here, these are the
11 most popular feedback words from today. So there's
12 "compliance guidance" in this poll, "timelines," "we've
13 anticipated timeline," "priorities." So there's a lot
14 of things that we've already touched on, but then I see
15 several words up there that we need to consider over
16 the next week. So with that, I don't have anything
17 else to add, but are there any other questions in here
18 about the path forward and what to expect over the next
19 few weeks?

20 Maybe something I can -- that I didn't touch on
21 is, I believe the draft standard as well as the
22 implementation plan posting to industry, we don't have

1 a specific date yet, but be on the lookout for mid-
2 September, so somewhere in there. We still have some
3 processes to make it through for quality review and
4 drafting. After that, it also has not been agreed upon
5 the amount of time for comment and ballot. However, we
6 do have to have it concluded by the 30th, so the end of
7 the month. So one thing that I'm trying to commit to
8 is to give industry as much time as we possibly can but
9 still get the best product that we can with the limited
10 time that we have. So with that, any parting questions
11 on this?

12 MS. JONES: (Off mic question.)

13 MR. BENNETT: So the question is balloting will
14 happen this month. So that's what I'm -- that's what
15 I'm hearing. This will be posted for ballot in mid-
16 September, and then the timeline has not been released,
17 whether that will be five days, seven days, 10 days,
18 but, you know, somewhere kind of in there, but we have
19 to have it concluded by the 30th.

20 MS. JONES: (Off mic question.)

21 MR. BENNETT: So the question is about comments
22 previously provided. So the previous ballot is what

1 you're referring?

2 MS. JONES: (Off mic comment.)

3 MR. BENNETT: Oh, for this conference.

4 (Off mic comments.)

5 MS. JONES: So for the comments that were provided
6 or testimonies to support this Technical Conference, if
7 the team that's working on drafting the new ballot
8 decide to use some of that or borrow from it, if they
9 borrow it, will there be citations related to who they
10 borrowed it from?

11 MR. BENNETT: So on that, and my NERC friends
12 here, correct me if I'm wrong, I have not heard any
13 response to responding to the comments that were
14 provided to support this Technical Conference. The
15 comments and testimony that was provided to help with
16 this Technical Conference was for learning, for the
17 building of a -- an official record of what happened
18 with this for, you know, a potential future filing with
19 FERC, but then also to provide some metrics and inform
20 and to help us develop the agenda for today as well as
21 some of the follow-up questions for the agenda today.
22 So that's what that comment -- that's what those formal

1 comments were used for at this point.

2 MS. JONES: Okay. So they won't be probably used
3 with the Drafting Team. I thought they would possibly
4 be.

5 MS. CALDERON: Yeah. So the next steps is with
6 the Standards Committee. We actually do have the
7 Drafting Team and NERC staff to make revisions to the
8 standard, working together, putting together the
9 official memo. All of it's going to be used for the
10 record of development as well for the filings, so
11 decisions made that were based off of information that
12 was provided. We got a lot of substantial information
13 from the OEM, will be used to substantiate decisions
14 made in the filing with FERC.

15 MS. JONES: Thank you.

16 MR. BENNETT: Okay. Thank you, Jamie. I'm
17 looking around the room. I don't see any final
18 questions here. Okay. With that -- oops, sorry. We
19 have one more.

20 MR. CONWAY: Yeah, Kevin Conway, Western Power
21 Pool. More of a comment about this forum. We've
22 talked, I think, in the hallway quite a bit about it.

1 It would be nice if through our standards process we
2 engage in this type of process earlier, right? Too
3 many times, just like in this case here, we're already
4 down the road so far. There's no course corrections of
5 any major impact that we can make, but our -- with the
6 intent of trying to accelerate the development of these
7 standards based on Board direction or FERC direction,
8 these are helpful and these move the Drafting Team
9 faster, farther, and more effectively down the road.

10 MS. CALDERON: -- going to speak on your behalf,
11 Soo Jin, on just everything you've been doing for
12 getting more of these, so I'll let you go ahead.

13 MS. KIM: Probably to Levetra and Tiffany and
14 Kelsey's chagrin, I do think we're going to have a lot
15 more technical conferences, not just for the next
16 couple of milestones, but as you all know, there are
17 several other projects on the horizon. We have an
18 extreme hot and cold weather temperature project that
19 is another directive that is due in December. There's
20 a webinar next Tuesday, so I'm going to put a little
21 plug in for that for all of the utility stakeholders
22 who are participating in that. I think the team has

1 made some tremendous progress. I think they would like
2 to present that. They're going to borrow some of the
3 tools from today that was very effective, and so
4 they're going to try to solicit a lot of technical
5 input next Tuesday for extreme hot, cold -- hot and
6 cold temperatures. I do believe for the next
7 directives after that, as many of you know, we have
8 some directives with regards to extreme cold weather.
9 That one is also probably going to require some type of
10 technical input.

11 We will have more of these events. We did commit
12 to doing that. I cannot promise that every project
13 will have that. But for some of the major projects
14 that we see on the horizon, high-priority projects,
15 things that require a lot of coordination where there's
16 major gaps in information that the team just did not
17 have at its fingertips, I do think that these events
18 are much more fruitful than I think many people imagine
19 when we first started down this path.

20 So thank you again for your participation. I will
21 commit that the Department is going to not just look at
22 this just from the standards perspective, but also on

1 the engineering side. We have talked about doing more
2 technical conferences generally, even before we get to
3 some of the standards development steps.

4 MR. BENNETT: Okay. Thank you Soo Jin. And I
5 just wanted to say, I'm going to have -- I'm going to
6 ask Sue to say a few words here at the end, but I just
7 wanted to mention to everybody that, you know, this was
8 kind of a first of its kind, so thanks for bearing with
9 this as we made it through this. We did learn that
10 some things worked really well, some probably could've
11 worked a little better, but it sounds like there'll be
12 more of this, and this was a learning event for
13 everybody, so thank you. And Sue, do you have any
14 parting words?

15 MS. KELLY: I do. I have been designated to give
16 the benediction.

17 (Laughter.)

18 MS. KELLY: So on behalf of the Board, I want to
19 thank everyone who participated in this technical
20 conference, both in person and online. It has been a
21 content rich experience, especially for, you know, a
22 laywoman like me, and I think I've learned a lot. I

1 also know a lot more about what I don't know which is,
2 I guess, also good. I think we all have a better idea
3 of some of the pressure points and the fault lines
4 regarding the current draft of this standard, and I
5 think we have some ideas about how we might be able to
6 address those, which is great.

7 I want to thank NERC staff and the Standards
8 Committee, not only for what you've already done, but
9 the mission which you are about to undertake, effort
10 you're going to have to undertake to prepare the next
11 draft of this standard for ballot in an extremely
12 accelerated time frame as Todd just reviewed with you.
13 As Soo Jin noted this morning, we're operating under
14 tight time frames that were set both by FERC and by
15 Rule 321 if you care to go review that. We have to
16 finish the balloting by September 30th, so everyone
17 involved is going to need to put their shoulder to the
18 wheel to make sure this happens.

19 And we do need to get it done. I would note that
20 FERC has instructed us to get it done by a date
21 certain, and the Board intends -- we're going to do
22 that, but the need to finish this effort goes well

1 beyond the administrative imperatives that we face.
2 NERC produced its first reliability guideline on these
3 issues back in 2018. I was reviewing that this
4 morning. This drafting project commenced in 2020. As
5 Howard pointed out this morning, we already have hours
6 in some regions where energy from embroider-based
7 resources are producing virtually all the energy on the
8 grid. And the projections are that by the end of the
9 decade, it could be 50 percent of our capacity might be
10 IBR based. If the lead time estimates for the needed
11 software and hardware changes that we heard about from
12 the OEMs yesterday are indeed accurate, then we need to
13 move swiftly now to establish new standards that will
14 ensure reliability going forward as we have many more
15 of these devices on our grid.

16 So again, thank you for your time and attention so
17 far, and thank you for the additional work that you are
18 going to undertake to bring us to the finish line by
19 September 30th, and may you all have safe travel home.
20 Thank you.

21 (Applause.)

22 MR. BENNETT: Okay. So with that, I believe that

1 we are adjourned for the day, so thanks again for
2 everyone's participation. Safe travels, and more to
3 come.

4 (Whereupon, at 3:23 p.m., the Technical Conference
5 was concluded.)

Summary of Issues and Alternatives Considered Memo

To: NERC Board of Trustees and Stakeholders

From: NERC Staff and Representatives from the Standards Committee

Re: Summary of Issues and Alternatives Considered, Proposed Reliability Standard PRC-029-1
(Frequency and Voltage Ride-through Requirements for Inverter-based Resources)

Date: September 24, 2024

In Order No. 901, the Federal Energy Regulatory Commission (“FERC”) directed the development of new or revised Reliability Standards to address certain reliability issues related to inverter-based resources (“IBRs”), including IBR ride-through performance.¹ To address the IBR ride-through directives, Project 2020-02 Modifications to PRC-024-4 initiated development of proposed Reliability Standard PRC-029-1 (Frequency and Voltage Ride-through Requirements for Inverter-based Resources). However, proposed Reliability Standard PRC-029-1 has failed to pass ballot through the usual standard development process.

Section 321 of the NERC Rules of Procedure allows the NERC Board of Trustees to take special actions when a ballot pool has failed to approve a proposed Reliability Standard that contains a provision to adequately address a specific matter identified in a directive issued by an Applicable Governmental Authority. The NERC Board of Trustees took such action for the proposed PRC-029-1 standard at its August 2024 meeting.²

Consistent with Section 321.2 of the NERC Rules of Procedure, the Standards Committee and NERC staff convened a technical conference from September 4-5, 2024 to discuss the issues surrounding the FERC Order No. 901 directives, including whether or not the proposed Reliability Standard PRC-029-1 is just, reasonable, not unduly discriminatory or preferential, in the public interest, helpful to reliability, practical, technically sound, technically feasible, and cost-justified. This memorandum discusses the issues, an analysis of alternatives considered, and other appropriate matters.

Background

On October 19, 2023, the Commission issued Order No. 901 directing the development of new or revised Reliability Standards to address reliability issues associated with the growth of IBRs on the Bulk-Power

¹ *Reliability Standards to Address Inverter-Based Resources*, Order No. 901, 185 FERC ¶ 61,042, Docket No. RM22-12-000 (Oct. 19, 2023) [hereinafter Order No. 901]. Available [here](#).

² NERC Board of Trustees, Minutes of the August 15, 2024, available [here](#).

System.³ The Commission directed NERC to develop new or revised Reliability Standards addressing IBR reliability issues as follows:

- 1) IBR disturbance monitoring data sharing and post-event performance validation⁴ and ride-through performance requirements⁵ by November 4, 2024;
- 2) IBR data and model validation⁶ by November 4, 2025; and
- 3) planning and operational studies⁷ for IBRs by November 4, 2026.

The Commission also directed NERC to develop and submit a work plan to develop new and revised Reliability Standards to address these issues in accordance with the specified timeframe.⁸

On January 17, 2024, NERC submitted its Order No. 901 Work Plan,⁹ which consists of key milestones to meet the Commission's directives by the filing deadlines mentioned above. **Milestone 2**, in progress, focuses on the development of Reliability Standards to address disturbance monitoring, performance-based ride-through requirements and post-event performance validation for registered IBRs by November 4, 2024.

The Reliability Standards being proposed to address **Milestone 2** of FERC Order 901 are being developed through the following projects:

- [Project 2020-02 Modifications to PRC-024 \(Generator Ride-through\)](#),
- [Project 2021-04 Modifications to PRC-002](#),
- [Project 2023-02 Analysis and Mitigation of BES Inverter-Based Resource Performance Issues](#)

As of this writing, Projects 2021-04 and 2023-02 are on track for timely completion through the usual NERC standard development process. Project 2020-02, addressing generator ride-through directives from Order No. 901, is the subject of special Board action under Section 321.

Specifically, proposed Reliability Standard PRC-029-1 (Frequency and Voltage Ride-through Requirements for Inverter-based Resources) is a draft standard designed to establish capability-based and performance-based ride-through requirements for IBRs during grid disturbances, to address the Commission directives from Order No. 901. The draft standard failed to achieve consensus from the Registered Ballot Body over

⁹ Informational Filing of the North American Electric Reliability Corporation Regarding the Development of Reliability Standards Responsive to Order No. 901, (Docket No. RM22-12-000) (2024) [hereinafter Order No. 901 Work Plan].

multiple ballots, the latest of which occurred between August 2, 2024 to August 12, 2024. This called into question whether development would be completed by FERC's filing deadline of November 4, 2024.

As a result, the NERC Board of Trustees initiated the use of Section 321 at its August 15, 2024 meeting. Under this special authority, the Board directed the Standards Committee to work with NERC Staff to convene a technical conference to gather input from industry to address the outstanding issues and revise PRC-029-1. This memorandum describes the issues that led to the technical conference convening and the alternative solutions that were considered. The proposed PRC-029-1 standard has been revised using input from the technical conference and is submitted for stakeholder ballot. This process must be completed within 45 days of being initiated, which is September 30, 2024. If the re-balloted proposed Reliability Standard achieves at least an affirmative 60% majority vote of the weighted Segment votes cast, then the Board may consider it for adoption under Section 321.

Order No. 901 Directives for Ride-through

In Order No. 901, the Commission cites to multiple event reports as the reason that IBRs should have Reliability Standards for ride-through frequency and voltage system disturbances and that permit IBR tripping only to protect the IBR equipment in scenarios similar to when synchronous generation resources use tripping as protection from internal faults.¹⁰ Below you will find the Commission's specific directives on how IBRs should ride-through disturbances and how exceptions should be applied to certain IBRs. Finding consensus around these directives were a part of the main issues addressed during the technical conference.

“Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require registered IBR generator owners and operators to use appropriate settings (i.e., inverter, plant controller, and protection) to ride through frequency and voltage system disturbances and that permit IBR tripping only to protect the IBR equipment in scenarios similar to when synchronous generation resources use tripping as protection from internal faults. The new or modified Reliability Standards must require registered IBRs to continue to inject current and perform frequency support during a Bulk-Power System disturbance. Any new or modified Reliability Standard must also require registered IBR generator owners and operators to prohibit momentary cessation in the no-trip zone during disturbances. NERC must submit new or modified Reliability Standards that establish IBR performance requirements, including requirements addressing frequency and voltage ride through, post-disturbance ramp rates, phase lock loop synchronization, and other known causes of IBR tripping or momentary cessation.”¹¹

“Therefore, we direct NERC through its standard development process to determine whether the new or modified Reliability Standards should provide for a limited and documented exemption for certain registered IBRs from voltage ride-through performance requirements. Any such exemption should be only for voltage ride-through performance for those existing IBRs that are unable to

¹⁰ See Order No. 901 at PP 190.

¹¹ See *id.*

modify their coordinated protection and control settings to meet the requirements without physical modification of the IBRs' equipment."¹²

Summary of Issues and Alternatives Considered

The technical conference took place on September 4-5, 2024, and focused on unresolved issues raised by stakeholders raised during the PRC-029-1 comment periods. Specifically, the technical conference focused on: (1) the proposed definition of "Ride-through"; (2) the proposed criteria for frequency ride-through performance; and (3) the feasibility of allowing hardware-based exemptions from the frequency ride-through requirements, similar to the voltage ride-through exemption FERC directed NERC to consider in Order No. 901.¹³ These issues, and the alternatives considered, are discussed below.

Ride-Through Definition

The most recent Standard Authorization Request for Project 2020-02 included direction to the drafting team to define the term "ride-through" as necessary. During the development of **Milestone 2** projects, a definition for "ride-through" was considered by the drafting teams of both PRC-029 and PRC-030 as both Reliability Standards leverage the term to refer to acceptable performance criteria outlined in PRC-029. Per the Standards Process Manual (NERC Rules of Procedure Appendix 3A), definitions themselves may not include statements of performance requirements. As such, the specific performance requirements and measures to demonstrate ride-through are to be found within the Requirements and Attachments of PRC-029-1. References to "Ride-through criteria" in PRC-030-1, allow for those additional analytics to include further evaluations with PRC-029-1 Ride-through performance requirements as appropriate while preventing duplication of those performance requirements in different Reliability Standards.

Comments from Draft 3 of PRC-029-1 concerning the proposed definition of "Ride-through" were reviewed. In the previously proposed definition, many stakeholders argued that the proposed definition was too broad and ambiguous, particularly with the inclusion of phrases like "entire" and "in its entirety." Those stakeholders recommended revisions to clarify the definition and ensure it aligns better with IEEE Std 2800™, IEEE Standard for Interconnection and Interoperability of Inverter-Based Resources (IBRs) Interconnecting with Associated Transmission Electric Power Systems.¹⁴ The Draft 3 proposed definition of "Ride-through" was discussed at the technical conference and presented on by a member of the original drafting team.¹⁵ The Draft 3 definition was presented as follows: "The entire plant/facility remaining connected to the Bulk Power System and continuing in its entirety to operate through System Disturbances."

As part of the presentation, ten (10) alternative definitions were presented as proposed by commenters during the previous rounds of ballot and formal comment. After the presentation, four (4) of the most

¹⁴ Hereinafter referred to as "IEEE 2800-2022".

¹⁵ See "Outlining Objectives of a Ride-through Definition" of posted [Standards Committee and NERC Ride-through Technical Conference material](#); page 94/129.

distinct definitions were opened to technical conference attendees as a straw poll to gauge overall industry preference. When asked “Which of the following proposed definitions for Ride-through do you think is most correct?”:

- 68% voted in favor of the “Ability to withstand voltage or frequency disturbances inside defined limits and to continue operating as specified.”;
- 16% voted in favor of “The plant/facility remaining connected to the Bulk Power System and continuing to operate through System Disturbances as defined in applicable reliability standards.”;
- 12% voted in favor of “The entire plant/facility remaining connected to the Bulk Power System and continuing in its entirety to operate through System Disturbances.”; and
- 4% voted in favor of “The plant/facility shall remain connected and in service, maintaining the pre-disturbance equipment configuration in operation, throughout the entirety of the system disturbance and recovery.”

Following the technical conference, NERC staff, Standards Committee representatives, some members of the drafting team, and FERC staff met to discuss the results of the straw poll as well as previously reviewed material. Based on that discussion, language in the preferred definition such as “ability to withstand”, “defined limits” and “as specified” were unclear and were inherently challenging for use in a definition that must be leveraged by multiple Reliability Standards. It was determined that the final draft would proceed with the 2nd most preferred definition, with slight modifications to remove usage of other defined terms that had an embedded usage of the Bulk Electric System defined term. The final definition as proposed in Draft 4 of PRC-029-1 is as follows: “The plant/facility remains connected and continues to operate through voltage or frequency system disturbances.”

Proposed Criteria for Frequency Ride-Through Performance

As described in the Project 2020-02 Standard Authorization Request and assigned directives from Order No. 901, the drafting team was tasked with developing new or modified Reliability Standards to assure a performance-based approach to generator ride-through. This scope included requirements that generating resources shall ride-through grid disturbances and include quantitative measures on expectations for ride-through that address all possible causes of tripping and power reductions from generating resources (particularly generator, turbine, inverter, and all plant-level protection and controls).

The proposed new Reliability Standard PRC-029-1 requires generator owners of IBR to both design and operate their IBR plants to ride-through voltage and frequency system disturbances. Requirement R3 and Attachment 2 of PRC-029-1 define the quantitative frequency ride-through criteria by use of measured frequency magnitude and time duration of sustaining that magnitude for all conditions. As discussed during the development of PRC-029-1, many stakeholders commented in previous ballots a preference to leverage those quantitative values as currently established in IEEE 2800-2022.

Frequency ride-through criteria was a prominent discussion of the technical conference. Members of the drafting team presented on the decisions made during the development of these criteria during the technical conference.¹⁶ The presentation explained that the voltage and frequency ride-through zones

¹⁶ See “Review of Voltage and Frequency Ride-through Criteria in PRC-029-1” of posted [Standards Committee and NERC Ride-through Technical Conference material](#); page 47/129.

proposed in Draft 3 of the standard were based on the IEEE 2800-2022 no-trip zones and were established in view of drafting team member experience with frequency excursions in planning and operations. The drafting team also stated the proposed frequency criteria were reasonable and were practical limits of IBR frequency tolerances, inclusive of adequate margins for worst-case conditions.

Following the presentation by the drafting team, NERC staff presented on voltage and frequency Ride-through evaluations taken from recent NERC disturbance reports and the report results from the March 2023 Level 2 Alert.¹⁷ The NERC presentation stressed balancing Bulk Power System needs with reasonable criteria that account for technical capabilities of currently designed equipment. NERC also highlighted a continued need to coordinate messaging during the design and interconnection phases of new IBR to have protection and controller equipment set in accordance with the hardware capability of the IBR rather than only in relation to minimum values established in NERC Reliability Standards.

Two panels regarding frequency criteria were held during the technical conference. The first panel included representatives of various IBR original equipment manufacturers, and the second panel included other members of industry.¹⁸ Discussions from both panels highlighted the following key issues:¹⁹

- Many IBR designed before 2014 would be unable to meet frequency Ride-through magnitude and duration criteria proposed in Attachment 2 of Draft 3. It was estimated by one panelist that approximately 20 GW of installed capacity would not be able to meet the criteria, indicating significant challenges for legacy IBR without substantial hardware replacement and redesign.
- Many IBR had not been designed to meet a rate of change of frequency (RoCoF) of 5 Hz per second. Of concern from the panelist was the technical basis for determining the need for a 5 Hz RoCoF did not include a study or more thorough evaluation of potential system strength benefits and that different parts of the Bulk Power System have not been demonstrated to require it.
- Recent event reports presented by NERC were all related to voltage excursions, potentially indicating that frequency-based disturbances were less likely to occur. Some panelists contended that this potential lower likelihood of experiencing a frequency event did not align with the expansion of frequency criteria beyond those currently established in IEEE 2800-2022.

After the panels of this topic, two straw polls were opened for attendees of the Ride-through technical conference to provide their feedback for consideration regarding “legacy” IBR and future IBR.

When attendees were asked “Based on the conversation you heard today from our panels, for legacy assets, what should PRC-029 voltage and frequency criteria follow that assures reliability and is reasonable for industry?”:

- 64% voted in favor of “Maintain PRC-024 criteria for IBR”;

¹⁷ See “Review of Voltage and Frequency Ride-through” of posted [Standards Committee and NERC Ride-through Technical Conference material](#); page 67/129.

¹⁹ See Day 1 Recording and Transcript of the Standards Committee & NERC Ride-through Technical Conference; [Project 2020-02 Modifications to PRC-024 \(Generator Ride-through\) Related Files](#); posted September 18, 2024.

- 29% voted in favor of “Adopt voltage and frequency bands proposed in IEEE 2800-2022”; and
- 6% voted in favor of “Retain currently proposed PRC-029 criteria”.

When attendees were asked “Based on the conversation you heard today from our panels, for assets being brought online in the future, what should PRC-029 voltage & frequency criteria follow that assures reliability and is reasonable for industry?”:

- 90% voted in favor of “Adopt voltage and frequency bands proposed in IEEE 2800-2022”; and
- 10% voted in favor of “Retain currently proposed PRC-029 criteria”.

Following the technical conference, NERC staff, Standards Committee representatives, some members of the drafting team, and FERC staff met to discuss the results of the straw polls as well as previously reviewed material. The team discussed that the term “legacy assets”, as used during the technical conference, aligned with the date for seeking potential exemption within PRC-029-1; meaning those IBR that were “in-service” by the effective date of PRC-029-1. While respondents at the technical conference did vote more favorably to retaining existing PRC-024 criteria for legacy assets, other information submitted by commenters and highlighted during the panel of original equipment manufacturers, indicated that a significant majority of IBR have been designed to meet IEEE 2800-2022 values.^{20, 21}

Additional information provided during the NERC staff presentation²² identified that many IBR were still being designed and installed without setting their protection and controls in accordance with their physical capabilities. Due to a concern of lowering the bar of performance by requiring that IBR perform less than what the significant majority of IBR are being designed and manufactured to, it was determined that the proposed standard should not align with previous PRC-024-3 criteria.

Based on the more clearly understood hardware-based capability limitation established due to manufacture design for a significant amount of installed IBR, there was a reliability concern to proceed with Draft 3 PRC-029-1 frequency criteria as that same amount of IBR could necessitate disconnection and retrofitting in order to comply. It was also identified that the potential disconnection of a large amount of installed IBR capacity did not substantially outweigh unstudied reliability benefits potentially resulting from setting frequency ride-through bands wider than those established in IEEE 2800-2022 and overwhelmingly identified by manufacturers during our comment review when designing IBR throughout the past decade. Due to these reliability concerns, the frequency criteria in Attachment 2 of the draft has been adjusted to align with those values in IEEE 2800-2022.

Feasibility of Hardware-Based Exemptions from Frequency Ride-Through Requirements

Potential hardware-based exemptions were discussed during each formal comment period of PRC-029-1, with a significant majority of commenters supporting some exemptions from frequency ride-through

criteria for legacy IBR. The drafting team and industry were advised that Order No. 901 only included and only allowed for exemptions of voltage ride-through performance requirements, based on the following discussion of allowable exemptions within the order:

“Therefore, we direct NERC through its standard development process to determine whether the new or modified Reliability Standards should provide for a limited and documented exemption for certain registered IBRs from voltage ride through performance requirements.”²³

“Further, we direct NERC to ensure that any such exemption would be applicable for only existing equipment that is unable to meet voltage ride-through performance. When such existing equipment is replaced, the exemption would no longer apply, and the new equipment must comply with the appropriate IBR performance requirements specified in the Reliability Standards (e.g., voltage and frequency ride through, phase lock loop, ramp rates, etc.)”²⁴

While the order spoke only to exemptions from voltage ride-through requirements and was silent regarding any exemptions for frequency ride-through criteria, industry continued to identify that there was a need to include such exemptions in PRC-029-1. It was determined that the details shared leading up to and during the technical conference provided clarity as well as a more substantiated basis for why hardware-based exemptions of frequency ride-through criteria was needed.

Prior to the technical conference, NERC solicited comments from industry as well as original equipment manufacturers.²⁵ In particular, any information on hardware-based limitations that would prevent IBR from meeting the proposed frequency criteria within PRC-029-1 was requested. 21 individual comments were received including six (6) from different original equipment manufacturers of IBR. NERC and representatives from the Standards Committee reviewed the submitted material and confirmed that IBR are being designed by original equipment manufacturers to be able to meet those voltage and frequency ride-through curves established in IEEE 2800-2022. As Draft 3 of PRC-029-1 proposed frequency criteria were beyond those established in IEEE 2800-2022, there was a concern that IBR would not be able to meet those proposed frequency criteria as IBR capability limits were hardware-based and inherent to a manufacturer’s design.

While many comments received during the formal comment periods stressed a desire to align PRC-029-1 with IEEE 2800-2022, there was little differentiation between comments that sought to leverage other industry volunteer guidelines that have been significantly adopted with those comments that sought exemptions due to the fact that manufacturers are designing IBR capabilities to the IEEE 2800-2022 values. Moreover, comments submitted by manufacturers provided a better understanding and approximation of what percentage of the installed fleets of IBR would be unable to meet PRC-029-1 frequency criteria. While additional information regarding specific amounts of affected IBR is still sought by NERC, from the

²⁵ See Standards Committee and NERC Ride-through Technical Conference; Conference Details; publicly announced August 21, 2024; https://www.nerc.com/pa/Stand/Documents/SC_and_NERC%20Ride-through_Technical_Conference_Details_08212024.pdf

information provided, it appears that a significant percentage of IBR²⁶ – specifically Type 3 wind turbine facilities – would need to retrofit to avoid noncompliance with PRC-029-1 as proposed in Draft 3.

The technical conference included a panel discussion on frequency exemptions. Panelists discussed various challenges related to legacy IBR, such as difficulties obtaining more detailed information on equipment capabilities; specifically for manufacturers who are no longer in business and for IBR that are no longer supported by the manufacturer. In such instances, additional time and cost would be expected to conduct more detailed capability testing. Other concerns raised included the possibility that manufacturers would not be willing to provide design or hardware limitation documentation should they identify the information to be proprietary information. Other discussions substantiated information received during the solicitation of comments for the conference and provided more clarity as to the alignment of the IEEE 2800-2022 curves with inherent capability limitations.²⁷

Following the technical conference, NERC staff, Standards Committee representatives, some members of the drafting team, and FERC staff met to discuss the discussions during the conference as well as previously reviewed material. Based on the more clearly understood hardware-based capability limitation established due to manufacture design for a significant amount of installed IBR, there was a reliability concern to proceed with no potential for hardware-based limitations for frequency criteria, as that same amount of IBR could necessitate disconnection and retrofitting to comply.

It was determined that this potential disconnection of a large amount of installed IBR capacity overwhelmingly indicated a reliability need to allow for a documented and limited set of exemptions for IBR from voltage and frequency ride-through criteria. In light of this reliability concern, Requirement R4 of PRC-029-1 has been modified to allow for a documented, and limited set of exemptions for IBR from frequency criteria. Further modifications were made to allow Generator Owners to exclude information considered to be proprietary from submittals to anyone other than the Compliance Enforcement Authority, to facilitate the sharing of requisite information from manufacturers.

Conclusion

After following the process described in Section 321 of the NERC Rules of Procedure, as directed by the NERC Board of Trustees at the August 15, 2024 meeting, proposed Reliability Standard PRC-029-1 has been revised to: include revised definition for the new proposed term “Ride-through”, align frequency ride-through criteria with IEEE 2800-2022 values, allow for a limited documented set of exemptions for hardware-based limitations for frequency ride-through criteria, and to allow Generator Owners to only share information deemed by the original equipment manufacturer as proprietary with the Compliance Enforcement Authority..

These revisions in proposed Reliability Standard PRC-029-1 reflect a fulsome consideration of the technical, reliability, and implementation considerations raised in the underlying development proceeding and during

²⁶ Analysis of the data collected through NERC’s Level 2 Alert: Industry Recommendation for IBR Performance Issues showed that the number of resources that are not able to meet PRC-029 Draft 3 is approximately double when compared to those same resources ability to comply with the updated criteria in PRC-029 Draft 4 which align with IEEE 2800-2022. Information submitted through the comment period and the technical conference discussions indicated that this ratio would be higher for wind resources, specifically Type 3 wind.
