Summary

Goal of the project: The goal of the Pregnancy Risk Assessment Monitoring System (PRAMS) is to collect jurisdiction-specific (states, cities, and U.S territories), population-based data on maternal behaviors and experiences before, during, and shortly after pregnancy.

Intended use of the resulting data: PRAMS is a jurisdiction customized survey conducted in 50 jurisdictions in the United States (U.S.). The data are used to identify groups of women and infants at high risk for health problems, monitor changes in health status, and measure progress towards state and national objectives in improving the health of mothers and infants. PRAMS data are also used by researchers to investigate emerging issues in the field of reproductive health and by federal, state, and local governments to plan and review programs and policies aimed at reducing health problems among mothers and babies.

Methods to be used to collect the data: Information is collected 2-6 months after live birth or stillbirth by mail and web survey, with telephone follow-up for non-responders. Because PRAMS uses standardized data collection procedures and instruments, it allows data to be compared among jurisdictions. Respondents are selected through a stratified systematic sample pulled monthly from the vital records birth certificate or fetal death files in each participating jurisdiction. Ad-hoc sampling strategies such as hospital-based may be used when needed, such as during an emergency response.

Subpopulation: The subpopulation to be studied for PRAMS is women who recently delivered a live born or stillborn infant.

How data will be analyzed: CDC analyzes aggregated or multi-site data to produce estimates on selected maternal and infant health indicators. Descriptive analysis methods are used to estimate prevalence and 95% confidence intervals while bivariate and multivariable regression methods are used to identify relationships between health behaviors and experiences and health outcomes via odds ratios or prevalence risk ratios. Grantees also employ similar analytic methods to analyze jurisdiction specific data.

Justification

1. Circumstances Making the Collection of Information Necessary

This Information Collection Request (ICR) is for an Revision of a previous ICR (OMB #0920-1273, Expiration 03/31/2026) to continue the implementation of the Pregnancy Risk Assessment Monitoring System (PRAMS) for three more years. PRAMS is a joint surveillance effort between CDC and participating jurisdictions, funded by cooperative agreement DP21-001. CDC is currently collecting data using the Phase 9 PRAMS survey and is seeking an Revision.

PRAMS data supports CDC's Safe Motherhood and Infant Health activities to enhance the understanding of maternal behaviors and experiences and their relationship with adverse pregnancy and infant outcomes. PRAMS is a population-based surveillance system that provides data not available from other sources and complements information provided by birth certificates with more details on behaviors and experiences from the pre-pregnancy, prenatal and postpartum period. PRAMS uses a stratified systematic sample of women who recently delivered a live birth or stillbirth; with statistical weighting, PRAMS becomes representative of the jurisdictions' live birth or fetal death population. PRAMS data is used by participating states and jurisdictions for needs assessment and to inform program development and evaluation, health care services and policy.

PRAMS has a core set of questions common across all funded jurisdictions. There are optional standard modules that jurisdictions can choose to include from a CDC developed bank of questions to address jurisdiction-specific priorities or special topics (e.g., adverse childhood experiences, emerging tobacco products). In addition, jurisdictions can choose to field jurisdiction-added questions that are independently jurisdiction-designed. In most jurisdictions, PRAMS is an ongoing survey that produces annual, jurisdiction-level estimates. Jurisdictions not intending to implement the survey on an ongoing basis can alternatively employ a point-in-time survey for one year of data collection.

Increasingly, PRAMS infrastructure is used to support special-purpose information collection (supplemental modules). PRAMS has the capability of rapidly adding

supplemental modules to address emerging issues (e.g., COVID-19 experiences, substance use). Consistent with terms of clearance for PRA approval for PRAMS and the Behavioral Risk Factor Surveillance System (BRFSS), CDC will use the change request mechanism for approval of new supplemental modules that may be developed in the future to address other emergent issues as they arise. Per the discussion in section 12, anticipated burden hours are included in the burden table.

Ongoing surveillance efforts that quantify disease and risk factors and identify opportunities for prevention are central to CDC's planning and evaluation efforts. CDC's authority to collect information for this purpose is provided by the Public Health Service Act (PHSA; **Attachment 1a**), and PRAMS is authorized under section 317(k) (**Attachment 1b**). Furthermore, PRAMS data is essential to informing CDC's Safe Motherhood and Infant Health activities. An additional example of legislative support for PRAMS can be seen in the Prematurity Research Expansion and Education for Mothers who deliver Infants Early (PREEMIE) Act, which supports the use of PRAMS to track pregnancy outcomes and help prevent preterm birth (**Attachment 1c**).

2. Purpose and Use of Information Collection

PRAMS is an ongoing, population-based surveillance system based on a stratified systematic sample designed to produce annual estimates of selected maternal experiences and behaviors that occur during the months prior to and during pregnancy, as well as the first months after pregnancy for each site. Data for PRAMS are collected by funded jurisdictions from women who recently gave birth to a live born or stillborn infant. As of May 2021, PRAMS is funded in 50 jurisdictions. The births in the 50 jurisdictions that participate in PRAMS surveillance are 81% of all live births in the United States. Jurisdictions that collect data on women with recent livebirths include 46 states, New York City, Washington DC, Puerto Rico, and the Commonwealth of the Northern Mariana Islands. Three sites collect data on women with a recent stillbirth.

Findings from PRAMS are used to enhance the understanding of maternal behaviors and their relationship with adverse pregnancy outcomes. PRAMS data can also be used by participating jurisdictions for needs assessment and to inform program development and evaluation, as well as health care services and policy. PRAMS data are used to monitor various targets in Healthy People 2030, preconception health and health care indicators, and selected performance measures for various programs and initiatives (e.g., Title V Maternal and Child Health Program and The Collaborative Improvement and Innovation Network to Reduce Infant Mortality).

PRAMS data from 2017-2018 was used as an evaluation component by the Maternal and Child Health Bureau (MCHB) in the Health Resources and Services Administration (HRSA) for the Healthy Start program evaluation. At the time of the evaluation, 63 of the 75 continuing Healthy Start grantees eligible for selection were located in jurisdictions that conduct the PRAMS survey. From among these grantees, MCHB/HRSA randomly selected 15 jurisdictions with Healthy Start grantee to participate for the one-time oversampling (oversampling of Healthy Start participants for 2017- 2018 only). The goal of the evaluation was to determine the effect of the Healthy Start program on changes in participant-level characteristics (e.g., health services utilization, preventive health behaviors, health outcomes). For one component of the overall program evaluation, HRSA compared Healthy Start participants and non-participants using PRAMS and linked vital records for key benchmarks and outcomes such as low birth weight; preterm birth; perinatal depression screening; breastfeeding initiation; safe sleep practices; and health care access into the postpartum period. Future collaborations with federal partners to augment PRAMS to oversample special populations will be submitted as a change request for approval.

PRAMS data is used to inform maternal and infant health programs and health policy to reduce maternal and infant morbidity and mortality related to several purposes by a diverse set of users. The primary uses of the data are listed below:

- PRAMS data, combined with California’s Maternal and Infant Health Assessment (MIHA) survey, will be used to track several Healthy People 2030 objectives related to Maternal, Infant, and Child Health. The live births in the 50 jurisdictions that participate in PRAMS and California MIHA are 96% of all U.S. live births. Current Healthy People 2030 objectives using PRAMS data include:
 - o MICH-14 – Increase the proportion of infants who are put to sleep on their backs
 - o Three developmental objectives
 - MICH-D01 - Increase the proportion of women who are screened for postpartum depression at their postpartum checkup
 - MICH-D02 – Reduce the proportion of pregnant women who use illicit opioid pain relievers during pregnancy
 - MICH-D03 – Increase the proportion of infants who are put to sleep in a safe sleep environment
- Jurisdiction health departments will use PRAMS data for needs assessments (e.g., HRSA Title V needs assessments), planning and reviewing programs, and policies aimed at reducing health problems among mothers and babies.
- PRAMS data will be used by jurisdiction maternal and child health program staff, policy makers, and health providers to identify gaps in health care provision or utilization.
- PRAMS data will be used by researchers to investigate emerging issues in the field of reproductive health.
- PRAMS is a key data source for preconception indicators and will be used by a variety of agencies in planning maternal and infant health programs.
- Researchers can request a multi-site dataset with de-identified individual-level data according to the guidelines on the PRAMS website at [PRAMS Data | PRAMS | CDC](#). This multi-site PRAMS dataset is updated annually and consists of weighted data from jurisdictions that participate in the PRAMS Automated Research File for the

surveillance year. The multi-site dataset is used to provide jurisdiction-level estimates for maternal and child health indicators, health risk, and protective behaviors. Data will be appropriate for trend analyses; tests of differences among (demographic) subpopulations; multivariate analyses of health outcomes; and other statistical analyses. The dataset can be used to calculate aggregate estimates for the included jurisdictions, but is not weighted to provide national estimates of health indicators. The aggregate estimates are not nationally representative but instead reflect the combined estimates from jurisdictions included in the dataset and the estimates are proportional to the number of live births in each jurisdiction.

- An annual summary of maternal and child health indicators derived from PRAMS data are available in aggregate and by jurisdiction for public health reporting at [Selected 2016-2022 Maternal and Child Health \(MCH\) Indicators | PRAMS | CDC](#). Findings from PRAMS are also used by jurisdictions to inform program and policy that improve maternal and child behaviors and outcomes as described [PRAMS Data to Action Success Stories | PRAMS | CDC](#).

3. Use of Improved Information Technology and Burden Reduction

The PRAMS data are collected using the PRAMS Integrated Data Collection System (PIDS). PIDS is used to schedule and track data collection activities; record data on mail, web, and telephone operations (e.g., when survey was completed by mail or phone); manage call attempts for telephone interviews; and record survey responses and capture additional comments provided by mothers. The PIDS system consolidated several standalone data collections systems for mail data entry, telephone interviewing, and tracking activities into a secure web-based single point-of-entry centralized database. PIDS allows centralized data storage and real-time updates on participants' survey completion status. PIDS is implemented using Commercial off-the-shelf [COTS] software tools that encompasses the latest technology.

PRAMS is currently a mail or web survey with telephone follow-up. Due to the flexibility of the PIDS data collection system, women have the option of completing the survey by mail, web, or telephone, depending on their own needs and preferences. The web mode may better reach some populations that have lower response rates in PRAMS data and may result in an increase in the response rate overall and improved representativeness of survey respondents. Web mode will not be offered in stillbirth data collection. The combination of multiple contacts and mixed data collection modes has proven effective in increasing response rates in many populations. The specific modes selected for PRAMS complement one another to maximize response rates while minimizing cost.

Telephone surveys offer a cost-effective method of data collection to engage individuals who do not have a permanent address or who prefer telephone interviews to self-administered paper surveys. Telephone data collection can accommodate the respondent's schedule by arranging to conduct interviews at a convenient time. Interviewers use Computer Assisted Telephone Interview (CATI) software to enter data directly into the centralized database. Use of CATI software promotes efficiency in two ways: skip patterns are programmed in the survey instrument to route interviewers to ask respondents only questions that they are eligible to answer, and real-time quality control checks can be used to eliminate errors which may have been caused by manual data entry procedures.

The web survey mode of data collection was piloted in five sites (Maryland, Puerto Rico, South Carolina, Virginia, and Wyoming) in 2022. Analyses were conducted comparing metrics before and after the availability of the web mode option (e.g., changes in response rates, response rates by subpopulation, data quality (measured by item non-response), and grantee resources and costs). Across each metric examined, the post-web metrics

indicated modest overall improvement relative to their pre-web counterparts. After the web mode was implemented, there was, on average, a 2 percentage point increase in response rates, improved response rates for all categories of race, ethnicity, and education level examined, reduced item nonresponse as compared to mail and telephone modes, reduced postage costs from 13% to 4%, reduced staff hours expended from 41% to 6% in all but one site, and no change in the number of technical support queries from sampled mothers.

4. Efforts to Identify Duplication and Use of Similar Information

PRAMS regularly collaborates with other federal agencies to identify other sources of maternal and infant data that may be duplicative and identifies opportunities to leverage and learn from other data collection systems. Because only 1-5% of the general population is pregnant or postpartum at any time, there is a need for data that purposively samples from this population to provide stable estimates that can be stratified by population subgroup as well as to provide jurisdictional-specific estimates of maternal experiences and behaviors that occur before, during, and shortly after pregnancy.

Data on maternal health may be available at the national level but are not designed specifically to create jurisdiction-based estimates. National-level surveys such as the National Survey of Children's Health, the National Survey of Family Growth (NSFG; OMB No. 0920-0314) the National Health Interview Survey (NHIS, OMB No. 0920-0214), the National Health and Nutrition Examination Survey (NHANES; OMB No. 0920-0950), among others, collect data on maternal health (e.g., pregnancy history) to produce prevalence estimates at the national level. PRAMS differs in that its sample is at the jurisdiction level and produces direct (i.e., not modeled) estimates for jurisdictions.

Other jurisdiction-based surveillance systems such as the Behavioral Risk Factor Surveillance System (BRFSS; OMB No. 0920-1061) and the Youth Risk Factor Surveillance

System (YRBS; OMB No. 0920-0493) collect jurisdiction-level population-based estimates that may be relevant to maternal health such as use of family planning methods. While BRFSS is a sample of the adult general population in each jurisdiction and YRBS is a sample of middle and high school students in each jurisdiction, PRAMS is the only data system specific to women with a recent live birth or stillbirth. New mothers and women currently pregnant may be found among BRFSS- or YRBS-sampled population, but they constitute a population subgroup that is usually too small for detailed analysis. This limitation expresses itself in two ways: small numbers generally preclude making statistically reliable estimates for various topics on the general survey that are specific to this subgroup; and their rarity in the sample makes it inefficient to ask questions specific to pregnancy and childbirth, as the questions would rarely be applicable to respondents.

The National Institutes of Health (NIH) hosts a passive data collection system called PregSource. PregSource uses a crowd-sourcing approach, asking pregnant women to enter information regularly and directly about their pregnancies throughout gestation and the early infancy of their babies into online surveys and trackers via a website and/or mobile application. PregSource does not collect state-level population-representative data nor collect the breath of information to inform indicators of national or state interest.

CDC actively engages with partners for feedback on survey priority topics and new questions. During 2021 and 2022, CDC engaged in a highly collaborative process to develop Phase 9 of the PRAMS survey. Over 300 federal, state, local, academic, and professional organizations were invited to submit proposals to add new PRAMS questions or modify the existing questions. In response, PRAMS received 155 unique requests to add new questions and 146 requests to modify existing PRAMS questions for Phase 9. These requests were evaluated by subject matter experts and selected through multiple rounds of review for inclusion in the Phase 9 questionnaire. All PRAMS grantees and the Division of Reproductive Health questionnaire revision workgroup were invited to participate in the review process. Furthermore, PRAMS regularly consulted with other

federal agencies and a range of centers and divisions within CDC to ensure new and existing PRAMS survey questions align with current standards and practices for specific topics. Examples of collaborations include the Health Resources and Services Administration for infant sleep environment and food insecurity questions; Food and Drug Administration for cigarette and e-cigarette use during pregnancy; National Institute of Child Health and Human Development (National Institute of Health) for disability; CDC's National Center for Birth Defects and Developmental Disabilities for alcohol use during pregnancy; CDC's National Center for Immunization and Respiratory Diseases for maternal vaccination; CDC's Division of Heart Disease and Stroke Prevention for blood pressure monitoring; CDC's Division of Violence Prevention for intimate partner violence and adverse childhood experiences; and CDC's Division of Oral Health for dental care utilization during pregnancy.

Additionally, to ensure that duplicative information is not collected, data elements (e.g., demographic information) that are already available from existing source datasets (e.g., birth certificates or fetal death records) for the sample are not collected by PRAMS. To determine the accuracy of select PRAMS self-reported survey data and birth certificate data, CDC compared these data to hospital delivery and prenatal care records in 2009. Based on the findings of this internal validity study, modifications were made to the core PRAMS survey to improve efficiency. The PRAMS team used the results to improve and/or remove select items from the current PRAMS survey. For example, past PRAMS surveys asked women about the number of prior live births and whether their last birth resulted in a low birthweight and/or preterm infant--information also captured on the birth certificate. For the Phase 8 PRAMS survey, these items were removed from the core survey due to the high validity on the birth certificate: therefore, reducing the length of the PRAMS survey, limiting participant burden, and saving the government time and money. Other items, such as length of hospital stay, were kept on the survey when it was found that PRAMS data provided accurate supplemental information not collected on the birth certificate.

This approach continued with the development of the Phase 9 PRAMS survey. To further reduce participants' burden, we looked to eliminate questionnaire redundancy with birth certificate data by examining additional indicators that are common to both the PRAMS survey and the birth certificate. PRAMS reviewed nine published validation studies of PRAMS data against the birth certificate data, compared select indicators on the PRAMS survey against those obtained from the birth certificate, and consulted with colleagues from the National Center for Health Statistics to discuss the viability of removing certain PRAMS survey questions and using birth certificate data instead. Based on these findings, questions on height, weight, vitamin use, preconception care, infant date of birth, and timing of first prenatal care visit were dropped from the Phase 9 survey as this information can be accurately captured from birth certificate data. Certain questions were also made shorter by collapsing the responses options for questions on e-cigarette use, smoking, alcohol use, health insurance coverage (preconception, prenatal, and postpartum), life stressors, and income into fewer response categories.

5. Impact on Small Businesses or Other Small Entities

There will be no impact on small business.

6. Consequences of Collecting the Information Less Frequently

PRAMS is an ongoing surveillance system providing annual estimates of maternal behaviors and experiences before, during, and shortly after pregnancy. These data are used for the purposes of monitoring trends; allowing state-by-state comparisons; and used by states and federal agencies for reporting performance measures and other benchmarks. Collection of data less frequently would prohibit calculation of these annual estimates and inhibit the utility of the data. Trend analyses created from annual estimates and the ability to monitor health impact changes would be interrupted by less frequent data collection. Furthermore, ongoing data collection maintains the infrastructure to

monitor the health impacts of any state policy changes and to collect data on emerging issues.

7. Special Circumstances Relating to the Guidelines of 5 CFR 1320.5

There are no special circumstances. This request complies with the regulation of 5 CFR 1320.5.

8. Comments in Response to the Federal Register Notice and Efforts to Consult Outside the Agency

A 60-day notice was published in the Federal Register on November 21, 2025 (Vol. 90, No. 223, 52666-52667) to make the public aware of this information collection (**Attachment 3a**). 419 comments were received all in support of the data collection: 75 were anonymous or with no email provided. For the 344 comments with emails provided a response was developed and sent (**Attachment 3b**). No modifications were needed to the information collection plan in response to these comments. A 30-day notice will be published in the Federal Register to allow for additional public and affected agency comments.

The PRAMS questionnaire development process is described in **Attachment 4**. Efforts to consult within and outside of the agency are meant to ensure relevant core and emerging topics are captured; obtain external partner feedback on the survey questions; and ensure continued relevance and utility. Consulted organizations are listed in **Table A.8-1**.

Table A.8-1. Consulted organizations for questionnaire development process

<i>Organizations Consulted (2014-present)</i>	
<i>Name/Organization</i>	<i>Subject Matter Expertise Provided</i>
CDC, Division of Reproductive Health	Contraception, safe infant sleep, weight gain during pregnancy, chronic conditions, disaster preparedness, sexually transmitted infections
CDC, Division of Nutrition, Physical Activity, and Obesity	Breastfeeding, food insecurity
CDC, Division of Oral Health	Dental care utilization

CDC, Emergency Operations Center	Zika
CDC, Immunization Services Division	Influenza vaccine, Tdap, COVID-19
CDC, National Institute for Occupational Safety and Health	Occupation
CDC, National Center for Injury Prevention and Control	Opioid use/misuse; intimate partner violence, adverse and positive childhood experiences
CDC, National Center for Birth Defects and Developmental Disabilities	Infant development, folic acid, alcohol use
CDC, Office on Smoking and Health	E-cigarette and hookah use
CDC, National Center for Heart Disease and Stroke Prevention	Blood pressure monitoring
FDA	E-cigarette and hookah use
HRSA	Infant health care visits, safe infant sleep, food insecurity
NIH	Disability

9. Explanation of any Payment/Gift to Respondents

PRAMS has historically worked with grantees to identify best strategies to improve response rates and has offered grantees the option of providing gifts and response incentives since 1989. Jurisdictions--not CDC--individually decide whether to provide a gift, which is offered to all sampled mothers, and/or response incentives, which is offered to mothers who respond to the survey. Jurisdictions also choose the type of gift and/or incentive that they provide. Each jurisdiction documents their choice of gift and/or incentive in their PRAMS Protocol that is submitted for IRB review at the jurisdiction level. Most PRAMS jurisdictions offer gifts to all sampled mothers and incentive to sampled mothers who responded to the survey. A few jurisdictions offer either a gift or an incentive, but not both. In general, gifts and incentives have been found to be important for encouraging participation in federal surveys, especially for more reluctant responders.^{1,2,3} For PRAMS, increasing motivation to respond readily is particularly salient: this survey focuses on a special population during a limited time period following the birth of an infant when women indicate that participating in even simple activities is

constrained by lifestyle changes, financial constraints, childcare duties, and fatigue.^{4,5} Given these constraints, jurisdiction-level gifts and incentives have been found to be important and useful for PRAMS, so that they can be tailored to those less likely to respond in a given jurisdiction (e.g., from racial and ethnic minority groups, and women with lower education or literacy levels, lower income.)⁶ as well as respondents that require additional follow up (phone responders).

PRAMS jurisdictions have historically conducted experiments to determine what kind of gift or incentive is most effective in motivating survey response as part of the PRAMS protocol.^{7,8} Gifts are often of nominal value and are sent to all sampled mothers, usually in the first survey mailing. A gift is provided prior to filling out the survey and is independent of participation. Examples of these gifts include pens, refrigerator magnets, thermometers, pocket calendars, and baby bibs. Response incentives are provided to individuals who complete the survey. Jurisdictions may employ different strategies in offering an incentive to maximize participation. Some jurisdictions offer the same incentives to all individuals who complete the survey, and some offer a choice of incentives. Those individuals who do not respond to the three mailings may be more difficult to recruit for participation and, as such, a few jurisdictions offer slightly larger incentives to those who complete a phone interview (i.e., phone contacts and interviews only begin after a mother has been sent three mailings and has not responded). Some jurisdictions only provide incentives to those that complete the survey through a phone interview. Incentives tend to be higher in value than gifts. Examples of incentives include \$10-\$30 gift cards to grocery stores or other local retail stores, birth certificates, diaper

packs, music CDs, and tote bags. At the time of the initial Paperwork Reduction Act approval for PRAMS, jurisdictions were providing a range of incentives which, in some cases, are valued over \$25. Changing incentives already in place in jurisdictions could detrimentally affect response rates. In the event a jurisdiction would like to offer a new response incentive greater than \$25, CDC will consult with OMB. CDC will track the relationship between incentive size and response rates, particularly for populations that are less likely to respond. CDC will also work with jurisdictions to conduct experiments to assess the impact of changes to incentive size.

Jurisdictions have conducted experiments to establish appropriate incentive levels. In 2009, in order to increase telephone response rates, Missouri PRAMS experimented with adding a \$20 gift card for women who responded to the telephone survey. They compared six months of data collection without this incentive and six months of data collection with the incentive. The telephone response rate increased by 6.5 percentage points after the implementation of the incentive. During this same time period, mail responders were continued to be offered a \$10 gift card with no change. There was no observed increase in the mail response. Louisiana conducted an experiment in 2014 to compare the effect of raising the value of their gift card incentive from \$10 to \$20 on response rates. They observed an increase of 5 percentage points in overall response and a significant increase of 12 percentage points in mail response using the higher value incentive. Among subgroups, response rates increased for: 1) Black mothers living in Orleans parish (14 percentage point increase); 2) Black mothers living outside of Orleans parish with low birth weight infants (13 percentage point increase); and 3) Black mothers living outside of Orleans parish with normal birth weight infants (11 percentage point increase). The results also indicated the higher value incentive was more cost effective than devoting resources to increase follow-up efforts.

Women with a recent stillbirth experienced a recent pregnancy loss and they will still be grieving the loss of their stillborn child; thus, gifts and/or incentives will be differentiated

from mothers with a recent livebirth for whom their infant has died. Sensitivity considerations are built into all components of the data collection methodology.

A full list of gifts and incentives by jurisdiction is included in **Attachment 5**.

10. Protection of the Privacy and Confidentiality of Information Provided by Respondents

Privacy Act Determination

PRAMS data collection activities rely on the PRAMS Integrated Data Collection System, also known as PIDS. All PRAMS grantees are required to use PIDS. PIDS contains information from jurisdiction birth/fetal death certificates which is used by the jurisdictions to contact sampled mothers for data collection and to link to the birth certificate file for data weighting. The National Center for Chronic Disease Prevention and Health Promotion (NCCDPHP) Information Systems Security Officer determined that the Privacy Act does apply to PRAMS because of the use of personally identifiable information (PII) from the birth certificate that is collected in PIDS (**Attachment 6**). As a result, the PRAMS questionnaires will include a Privacy Act notice.

A text file is created at the jurisdiction level that contains personally identifiable information (PII) from the birth/fetal death certificate; the text file is imported into PIDS data system. Monthly batch files are imported by PRAMS jurisdictions into PIDS. Batch files contain PII such as mother's name, date of birth, address, telephone number, and the infant's name and date of birth. To identify the sample for PRAMS, CDC receives from the jurisdictions through PIDS the birth certificate number and dates of birth. Once the sample is selected, a PRAMS ID is assigned to individual records and the web UserID and passcode are also assigned for each sampled mother for the web data collection mode. The jurisdictions, but not CDC, have name and addresses for moms selected for the sample. PII maintained in the system is used by jurisdictions to generate letters and labels

to be mailed to respondents for PRAMS surveillance. Similarly, PII is used to verify a respondent's identity when a phone interview is conducted. If a respondent elects to complete the survey on the web, mother's year of birth is used to verify a respondent's identity once logged into the web mode of data collection. Because of PII uploaded and retrieved by PIDS, the system is categorized as a moderate level system for security purposes. Mothers are assigned a unique ID in PIDS for all data collection functionality including linkages for follow-up surveys. The unique ID is randomly generated and cannot be used to identify respondents. PII maintained at the jurisdiction level is destroyed when the annual weighted data set is received.

PII data are transmitted and loaded into PIDS from jurisdictions to CDC through a secure, encrypted https protocol. All PIDS data are stored and accessed in accordance with industry standard procedures. No information in identifiable form (IIF) will be filed or retrieved by the name of the individual or other unique respondent identifier such as social security number. PII Data stored in PIDS are only accessible to select jurisdiction users and contract PIDS developers. CDC staff members, outside of those who conduct statistical weighting and PIDS system maintenance, do not have access to PII data. The System of Records Notice (SORN) being used for PIDS is 09-20-0160:

<http://www.cdc.gov/SORNnotice/09-20-0160.htm>.

Overview of the Data Collection System

The PRAMS sample is drawn from the birth certificate or fetal death record file monthly by collaborators in the jurisdiction's Vital Records Department. It is delivered to the jurisdiction PRAMS staff usually within the first week of each month. Jurisdiction PRAMS staff clean up the file, making sure addresses, phone numbers, or any other missing information are completed, before uploading the sample file into PIDS. Jurisdiction PRAMS staff initiate the data collection process, starting with contacting sampled mothers by mail. In the pre-survey letter and the three mailings that include paper questionnaires, sampled

mothers can complete the survey by paper (mail) or web. Information on how to complete the survey by web is included in the pre-survey letter and in the three mailings that include the questionnaire. After the three mailings, sampled mothers who did not respond by mail or web are contacted by telephone.

The PIDS web-based data collection software system is provided by the CDC to all funded grantees (PRAMS jurisdictions) for collection of livebirths data. Data collection on stillbirths is completed in REDCap and not in PIDS. CDC, through the support of a contractor, programs each jurisdiction's mail survey into PIDS for data entry, creates web survey screens for PIDS web data collection, and programs the telephone survey into the CATI interface within the PIDS system. Responses from the returned paper surveys (mail) are entered into PIDS' mail data entry portal and telephone interview responses are entered into CATI by interviewers as they are conducting the interviews. For the web mode, respondents access the survey through a secure CDC website which interfaces with the PIDS system to record web responses. Data entry verification for information entered from the mail surveys is performed by the jurisdiction, where at least 10% of returned surveys are entered twice, during verification process, into PIDS to ensure that the initial mail data entry is correct. Data entry during the verification process is not saved in PIDS. Jurisdictions and CDC can view operational summary reports at any time in the PIDS system. Jurisdictions signal the end of data collection for a monthly batch by releasing the data to CDC using a batch expiration feature in the PIDS system, after the 90-day data collection period for each batch. At the end of data collection for a calendar year, all jurisdiction data are cumulated, and final cleaning and quality control checks are done at CDC. Once the data are cleaned and checked, data weighting is done. PRAMS does not report discordant self-reported data back to jurisdiction vital records for corrections to the birth certificate. As part of the final cleaning and quality control checks, for each sampled respondent, CDC verifies the variables captured on the finalized jurisdiction birth certificate file for the calendar year to ensure alignment with variables captured in the PRAMS data set.

Items of Information to be Collected

A complete PRAMS questionnaire topic reference is provided for Phase 9 in **Attachment 7**. The questionnaires are laid out by CDC programmers in PIDS for each jurisdiction at the beginning of each data collection cycle (phase). PRAMS core questionnaire for Phase 9 livebirths (**Attachments 8e-8j**), and stillbirths (**Attachments 9a-9d**) includes questions on maternal behaviors and experiences before, during, and shortly after pregnancy and includes information on health conditions, utilization and content of health services, and risk behaviors. Demographic information such as race/ethnicity and age is not collected on the PRAMS questionnaire because that information is already available in the birth certificate or fetal death file from which the sample is drawn.

Standard module questions (for livebirths only) are selected by individual jurisdictions based on their information needs and are generally implemented as written. However, jurisdictions may elect to drop options from the list of responses for some questions if jurisdictions feel those responses are not applicable in their context. Phase 9 Standard modules (**Attachment 10e-10j**) cover a range of health topics. CDC programs each jurisdiction-specific survey into PIDS and jurisdictions administer their tailored version of the survey (core plus standard modules) without change throughout the questionnaire phase, which typically lasts between 3 and 5 years.

CDC periodically funds PRAMS jurisdictions to rapidly implement supplemental modules developed mid-phase by CDC to address emerging issues. Jurisdictions have the option to continue to collect CDC developed supplemental modules in the absence of funding. Supplemental modules available for use during Phase 9 include social experiences, COVID-19 vaccine, COVID-19 experiences, prescription and illicit opioid use, and marijuana (**Attachments 11a-11j**). The disability supplement, available in Phase 8, has been integrated into the core. These supplements can be added for one or more birth years but

can be discontinued at the end of a year of data collection. If jurisdictions elect to add additional supplemental modules to the survey mid-phase to address emerging needs and priorities, questions are added as attached leaflets to the mail survey and added to the end of questionnaire in PIDS CATI for the phone data collection mode.

Web versions of the questionnaire for each jurisdiction used to collect data from mothers with livebirths are also programmed in PIDS. The web mode of data collection is not available for stillbirth data collection. For Phase 9, the programmed web survey includes the core PRAMS questions (**Attachments 8i-8j**) in addition to the standard questions (**Attachments 10i-10j**) and supplemental modules (**Attachments 11b,11d,11f,11h, and 11j**) selected by the individual jurisdictions. The version of each jurisdiction questionnaire is the same for all data collection modes (mail, phone, web). Core and standard questions remain the same for the questionnaire phase (Phase 9 began with 2023 calendar year births (data collection began April 2023)).

Planned Controls

The PIDS system was designed with the highest level of security to ensure data encryption and protection of information. The PRAMS model protocol specifies jurisdiction-level physical and IT-related security measures that must be implemented at each site. Jurisdictions may customize or enhance these recommended procedures, and they must be documented in the jurisdiction PRAMS protocol that is submitted to the local IRB for review. Compliance with these measures is evaluated during site visits that occur annually or every other year. All jurisdiction PRAMS staff are required to complete CDC PRAMS-developed Human Subjects Training prior to accessing the PIDS system or any participant information upon hiring, and annually thereafter. A central part of this training is related to ensuring respondents' privacy. Jurisdictions must document attendance at the Human Subjects Training, and quarterly monitoring of trained telephone interviewers. This documentation must be submitted to CDC.

PRAMS staff at the jurisdiction level have access to personal identifying information (PII) from the birth certificate or fetal death file, such as birth certificate numbers, names, addresses and phone numbers. The birth certificate or fetal death file number is only made available to the CDC statistician who conducts data weighting for the purpose of conducting the weighting procedures. PII maintained at the jurisdiction level is destroyed when the annual weighted data set is received. PII data is encrypted and stored on the CDC network, and complies with all agency physical (e.g., gated campus and building access) and administrative (e.g., password-protected network) security measures. Access is managed through CDC's Secure Access Management Services [SAMS] portal and employs common and consistent enterprise controls for user identity management, identity proofing, authentication, and authorization. Access to the data center is limited only to select authorized personnel. Records at CDC are retained and disposed in accordance with the Scientific and Research Project Records Control Schedule.

How Information Will Be Shared and For What Purpose

Jurisdiction health departments and/or their designees are the data collectors for PRAMS (i.e., information will originate with the jurisdiction), and then data are released by the jurisdiction to CDC on a monthly basis. CDC does not transmit data from one jurisdiction to any other and only provides annual weighted data sets to each jurisdiction through a secure file transfer system accessible through PIDS. CDC receives only de-identified records. Jurisdictions maintain responses to the PRAMS questionnaire separately from sample files. After data collection and receipt of the final weighted dataset, sample files are destroyed. Jurisdiction-level datasets are owned by individual jurisdictions, include all variables, and are used for jurisdiction purposes at the discretion of the jurisdiction. Historically (data through 2011), a subset of jurisdiction data was uploaded into PRAMStat, a public access data platform available to the public that displays only pre-determined tables of a subset of indicators from the full dataset. More recent years of data (2016-

2022) for maternal and child health indicators are available in aggregate and by jurisdiction are available at [Selected 2016-2022 Maternal and Child Health \(MCH\) Indicators | PRAMS | CDC](#) .

On January 22, 2024, CDC PRAMS transitioned to an automated process for requesting access to a pre-approved list of variables (or data set), in order to disseminate data in a more timely and efficient manner. This pre-approved data set, called “PRAMS Automated Research File,” is a restricted use data set and has been stripped of several variables that could potentially identify a respondent (e.g., full date of birth, hospital of birth, county of residence), while other demographic variables also are only provided in grouped categories (e.g., age group). The data is available for download via a secure portal, CDC’s Secure Access Management System (SAMS). To access and download the data set, researchers must register with SAMS for identification verification, provide their contact information (name and email address), and acknowledge the PRAMS data sharing agreement on the terms of use of the data. This automated process for releasing data makes PRAMS data more readily available to researchers and public health practitioners while also helping reduce burden created by individual requests for data on jurisdictions and CDC PRAMS. A data use agreement (DUA) outlining the new process has been executed with jurisdictions that elect to participate in the Automated Research File. The DUA signed between CDC and each PRAMS grantee that participates in the Automated Research File specify how variables will be categorized for release and which variables are not to be released. For jurisdictions that could not sign this DUA, researchers can contact those jurisdictions for approval for access to their data.

Previously, jurisdiction data that met the response threshold (50% with Phase 8) was released to individuals who access the PRAMS Automated Research File. Beginning with the first year of Phase 9 data (2023 birth cohort data), the response rate threshold requirement was removed, and jurisdiction data was released through the PRAMS

Automated Research File portal regardless of the response rate. For previous calendar years of births (Phase 8 years 2016 to 2022), data for jurisdictions that had not been previously released based on a response rate threshold was uploaded to the Automated Research File. Nonresponse bias analyses (Attachment 19a) provide justification for the removal of the response rate threshold requirement.

Impact of the Proposed Collection on Respondents' Privacy

PRAMS sample files include names, addresses, and some phone numbers. Email addresses may be provided by sampled women in the web mode. The names, addresses, email addresses, and phone numbers are maintained at the jurisdiction level and used solely for the purpose of contacting respondents. They are not provided to CDC and never included in any datasets released for analysis. Other information, including maternal age, race/ethnicity, and infant characteristics available from the birth certificate file, are released in grouped categories in the datasets that are released to requestors to protect the confidentiality of respondents. Other potentially identifying information such as birth certificate number or birth dates are not released to researchers. A Certificate of Confidentiality provides additional protections to respondents for sensitive questions such as substance use. Section 301(d) of the Public Health Service Act (PHS) Act, which authorizes the use of Certificates, was amended by the 21st Century Cures Act amends Section 301(d) of the Public Health Service Act (PHS) and automatically issues Certificates to biomedical, behavioral, clinical, or other research activities in which identifiable, sensitive information is collected.

How Individuals Are Informed That Providing Information Is Voluntary Or Mandatory

Individuals participating in PRAMS are informed that they do not have to participate and that they may refuse to answer any question. A description of the protections and limitations of the Certificate of Confidentiality is provided.

Opportunities to Consent

For the mailed survey, informed consent information is provided with each survey (**Attachments 12a-12b** [livebirth]; **12c-12d** [stillbirth]). Completing and returning the self-administered booklet by mail is understood as consent to participate. Verbal consent is obtained during the introduction for telephone interviews (**Attachments 12e-12f** [livebirth]; **12g-12h** [stillbirth]). The introductory script, including the voluntary nature of the survey and ability to refuse to answer sensitive questions, precedes the phone survey questions with a prompt asking if it is okay to proceed with survey administration. For the livebirth web mode of data collection, a web screen containing informed consent information (**Attachments 12i-12j**) is displayed prior to accessing the survey. Women must actively consent before proceeding with the survey. Jurisdictions may modify the informed consent to reflect jurisdiction and local context (e.g., abuse reporting laws). These modifications are approved by the CDC (**Attachment 13**) and local IRBs.

How Information Will Be Secured

Access to jurisdiction datasets will be limited to the jurisdictions themselves and CDC contractors and staff who conduct weighting and data cleaning procedures. Security measures include: 1) Physical controls: CDC facilities are secure, ID-accessed buildings. Data will not be stored in hard copy formats; and 2) Technical controls: all electronic data are stored on secured servers protected with firewalls and passwords. All employees are trained on data security measures by taking appropriate HHS courses online. All data collection and records management practices and systems adhere to HHS and CDC IT policies and procedures.

11. Institutional Review Board (IRB) and Justification for Sensitive Questions

The PRAMS Protocol is submitted annually for continuing review to the CDC Institutional

Review Board (**Attachment 13**) as well as local IRB in implementing jurisdictions (some jurisdictions have opted to implement provisions of the Revised Common Rule and not seek annual continuing review). All modifications to the data collection protocol, as well as changes to core and standard modules, and new supplemental modules (if any) are submitted as amendments for review by the CDC IRB, as well as the jurisdiction IRBs. Additional jurisdiction specific modifications also receive local and CDC IRB review. The PRAMS core questionnaire has included some questions that may be considered sensitive such as those regarding substance use during pregnancy; experience of intimate partner violence, experience of stressful life events; experiences with depression or anxiety; and HIV testing. Standard questions are available for additional sensitive topics such as maternal substance use. Jurisdictions may be funded to collect data as supplemental modules that also contain sensitive data. This sensitive information reveals jurisdiction needs for health programs and services for emerging health issues. The informed consent preceding data collection expresses the voluntary nature of the survey and ability to refuse to answer sensitive questions. Per the 21st Centuries Cure Act, all federally funded research that collects sensitive data are automatically granted a Certificate of Confidentiality to provide additional protections to the privacy of research participants responding to sensitive questions. Sensitivity considerations are built into all components of the data collection methodology, especially as some respondents are grieving a stillbirth or recent loss of a live born child. Any questions of a sensitive nature are not asked during field testing when administering the verbal interview format to protect the confidentiality of respondents.

12. Estimates of Annualized Burden Hours and Costs

Burden estimates are based on data collection for Phase 8 which concluded June 2023. Phase 9 began in April 2023 and was designed to be approximately the same length as Phase 8. The core survey does not change during a given phase of implementation. Optional standard questions are selected at the beginning of each Phase by jurisdictions and do not change during a given phase of implementation. However, new supplemental

modules may be introduced during the survey phase. No new supplemental modules will be implemented for the remainder of Phase 9.

For this estimation, resident birth totals for each participating jurisdiction are based on 2019 data. The base total number of interviews is similar across years and is assumed to be the same in subsequent years. Although the sample size varies from jurisdiction to jurisdiction—based on the stratification scheme and the number of births—annual sample sizes with anticipated completed number of surveys per jurisdiction range from approximately 500 to 1600 for continuous livebirths surveillance, for an estimated total of 51,556 survey respondents annually.

Each jurisdiction participating in PRAMS Phase 9 currently conducts data collection by mail and web mode with telephone follow-up for non-responders. All modes of data collection contain the same set of questions. Each jurisdiction has its own version of the survey that consists of a combination of core questions (used by all participating states) and jurisdiction-selected standard modules. Both English and Spanish language versions are available for each survey mode. Sites decide if they are going to use a Spanish version at the initiation of each Questionnaire Phase based on their jurisdiction's Hispanic population. The total number of questions on the survey will vary by site, but all sites must adhere to a 14-page space limit on the English mail survey and use only corresponding questions on the Spanish mail survey. All sampled women are eligible to participate, so there are no screening procedures administered.

The PRAMS survey experiences a very low drop-off rate for phone respondents and very few partially completed mail surveys, and even fewer drop-offs with web mode. Based on duration data from previous years of PRAMS administration, we estimate the average burden for the introduction and consent process for the livebirth mail (**Attachments 12a-12b**), telephone (**Attachment 12e-12f**) and web modes (**Attachments 12i-12j**) of data collection is 1 minute. The burden for the core livebirth questions (**Attachments 8e-8f**) is

estimated to be 15 minutes. Questions from standard modules (**Attachments 10e-10f**) chosen by the jurisdiction is estimated to be 10 minutes. Total time estimated for women with a recent live birth completing the survey, inclusive of informed consent, is 26 minutes.

Periodically, the PRAMS surveillance infrastructure is used for fielding emerging public health priorities of interest or to address emergency response activities. Emerging priorities or emergency response activities may happen under rapidly evolving circumstances and cannot always be planned for. Recently, 22 jurisdictions collected supplemental data on social experiences of health (AZ, CO, GA, KS, LA, ME, MA, MN, MS, MO, NH, NYS, OK, PA, RI, SC, SD, TN, UT, VT, WV, and WI); 11 jurisdictions collected supplemental data on COVID-19 Vaccine (AZ, DC, IL, NE, NJ, NYS, CNMI, OR, PR, SC, and WY); 10 jurisdictions collected supplemental data on COVID-19 experiences (AZ, DC, MD, NE, NJ, CNMI, PR, SC, VA, and WY); 6 states collected supplemental data on prescription pain reliever (opioid) use (AL, KS, MA, NV, SD, and VT); 2 states collected supplemental data on marijuana use (RI and VA); and one state collected supplemental data on disability (MA). Burden hours for supplemental modules are based on the estimated number of times a PRAMS survey respondent would complete an additional supplemental module (i.e., responses). Using the number of completed PRAMS interviews in 2019 and number of supplemental modules implemented recently, we estimate 52,984 responses completed annually for supplemental modules (**Attachment 14**); it is anticipated that similar supplemental collections with a similar number of responses and average burden per response will be fielded during subsequent years of approval. In order to calculate burden hours, the number of estimated responses is used in place of the number of respondents because respondents in one jurisdiction may complete multiple supplemental modules whereas in another jurisdiction respondents may not complete any supplemental modules. The estimated average time for completion of each supplemental module is 8 minutes based on previous experience with supplements.

Consistent with terms of clearance for PRA approval for PRAMS and BRFSS, CDC will use the change request mechanism for approval of new supplemental modules that may be developed to address other emergent issues as they arise.

The stillbirth survey, administered in three jurisdictions, only includes a core survey instrument. We estimate approximately 160 responses to the stillbirth survey per year. The total time estimated for completing the introduction and consent is 1 minute (**Attachments 12c-12d**). The burden for the stillbirth survey (**Attachments 9a-9d**) is estimated to be 24 minutes. Total time estimated for women with a recent stillbirth completing the survey, inclusive of informed consent, is 25 minutes.

Each month, jurisdictions sample mothers from the monthly birth certificate file using a pre-programmed SAS file to create the data file and import it into PIDS to begin data collection. This process takes, on average, 30 minutes for each jurisdiction to complete each month. The annual estimate for 50 jurisdictions is 300 hours.

The total number of women respondents are estimated at 51,716 (total number of women anticipated to participate in the PRAMS survey or the PRAMS Stillbirth Questionnaire).

The burden estimate for PRAMS includes four types of information collection: (1) PRAMS data collection for women with recent live births (PRAMS Phase9 core questions and jurisdiction-selected standard modules) (**Attachment 8e-8j and 10e-10j**); (2) supplemental modules (**Attachment 11a-11j**); (3) PRAMS data collection for women with recent stillbirths (**Attachment 9a-9d**); and (4) jurisdictions' submission of data files to CDC.

Participation is voluntary and there are no costs to respondents other than their time. In addition, there is a burden estimate for the amount of time for each of the 50 jurisdictions to randomly sample mothers, pull their data, and upload the pulled data into PIDS on a monthly basis. The total estimated annualized burden hours are 29,773.

Table A.12-1. Estimated Annualized Burden to Respondents

Type of Respondents	Form Name	No. of Respondents	No. of Responses per Respondent	Average Burden per Response (in hours)	Total Burden Hours
Women who recently delivered a live birth	PRAMS Phase 9 Questionnaire (core questions plus jurisdiction selected standard modules)	51,556	1	26/60	22,341
	Supplemental Modules	52,984*	1	8/60	7,065
Women who recently delivered a stillbirth	PRAMS Stillbirth Questionnaire	160	1	25/60	67
Jurisdictions	Submission of data file to CDC	50	12	30/60	300
Total hours					29,773 hours

*This value does not represent additional *respondents*, but the estimated number of *responses* based on supplemental modules implemented in jurisdictions for calendar year 2022 births. Estimated number of *responses* are based on the sum of the number of respondents from 2019 weighted data among jurisdictions that are participating in the following supplemental modules: The social experiences of health supplement (PRAMS respondents to complete = 22,573), the COVID-19 vaccine supplement (PRAMS respondents to complete = 12,938), the COVID-19 Experience supplement (PRAMS respondents to complete = 9,343), the prescription pain reliever (opioid) use supplement (PRAMS respondents to complete = 5,854), and the marijuana use supplement (PRAMS respondents to complete = 2,276).

Annualized burden costs are summarized in the table below. These calculations assume the average hourly wage of \$29.81 for all jurisdictions included in the PRAMS. Hourly rates were taken from the most recent publicly available Current Employment Statistics of the Bureau of Labor Statistics and are based upon the average hourly earnings for December 2020 from the Current Employment Statistics survey conducted by the Bureau of labor

Statistics (available at <http://data.bls.gov/cgi-bin/surveymost>). We estimate the total annual burden cost to be \$887,533.13.

Table A.12-2. Estimated Annualized Cost to Respondents

Type of Respondents	Form Name	No. of Respondents	Total Burden (in hours)	Average Hourly Wage Rate	Total Cost Burden
Women who recently delivered a live birth	PRAMS Phase 9 Questionnaire (core Questions plus jurisdiction selected standard modules)	51,556	22,341	\$29.81	\$665,985.21
	Supplemental Modules	52,984	7,065	\$29.81	\$210,607.65
Women who recently delivered a stillbirth	PRAMS Stillbirth Questionnaire	160	67	\$29.81	\$1,997.27
Jurisdictions	Submission of data file to CDC	50	300	\$29.81	\$8,943.00
Total					\$887,533.13

13. Estimates of Other Total Annual Cost Burden to Respondents or Record Keepers

There are no maintenance or capital costs to respondents.

14. Annualized Cost to Federal Government

Costs that are presented below include data collection, weighting and sampling, as well as data distribution (i.e., websites and production of data sets). These are based on the funds provided to jurisdictions for data collection as well as internal PRAMS costs.

Table A.14-1. Annualized Estimated Cost to the Federal Government

Estimated funds provided to jurisdictions	\$8,005,416
---	-------------

Estimated CDC PRAMS budget (costs for operations and contracts including PIDS)	\$5,709,369
Total	\$13,714,785

15. Explanation for Program Changes or Adjustments

This request is for an Revision of PRAMS data collection which currently expires 03/31/2026. Since some components have been completed (i.e., call back surveys, cognitive and field testing), the total estimated annual burden is lower. Specifically, removal of call back surveys decreased annual burden by 1,395 hours and removal of cognitive and field testing decreased annual burden by 100 hours.

16. Plans for Tabulation and Publication and Project Time Schedule

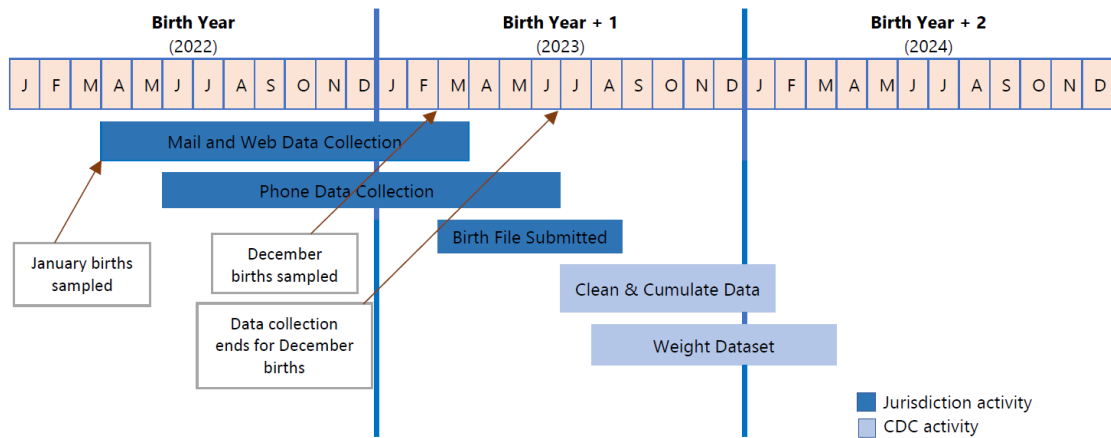

PRAMS data collection is ongoing. Data collection for each year of PRAMS begins in April of that year and continues to the end of June of the subsequent year. Births occurring in January are sampled in April to ensure all infants are at least two months old at the time the survey is completed. Data collection for December births starts in March of the subsequent year and continue through the end of June. Data is submitted monthly to CDC for editing and cleaning. Real-time data quality reports can be generated by jurisdictions using the PRAMS Integrated Data Collection System (PIDS). Editing, cleaning, and weighting of the data will be conducted by CDC, is ongoing, and usually begins in July of the subsequent year.

Jurisdictions must ensure submission of birth files to CDC for use in the weighting process. Currently, 24 jurisdictions have enrolled in the State and Territorial Exchange of Vital Events (STEVE) to transmit their birth files in real-time on a weekly basis to CDC and the remaining 26 jurisdictions submit their final birth file via CDC’s SAMS portal. Participation in STEVE is voluntary. CDC will continue to enroll jurisdictions who wish to participate in STEVE in the next two years. Final weighted data sets will be returned to the jurisdictions as they are weighted. Jurisdiction data will be released for use by internal and external

researchers. Data availability by jurisdictions can be found on the PRAMS website [PRAMS Data | PRAMS | CDC](#). Previously, researchers were required to submit a proposal to access the PRAMS analytic research file. In January 2024, PRAMS began releasing multi-jurisdiction data using the PRAMS Automated Research File, a pre-approved list of variables (or data set) in order to disseminate data in a more timely and efficient manner. Supporting technical documentation including a detailed description of PRAMS standardized data collection methodology, questionnaire and weighting process is available on the PRAMS website at [Data Methodology | PRAMS | CDC](#). To access and download the pre-approved data set, researchers register with SAMS for identification verification, provide their contact information, and acknowledge the PRAMS data sharing agreement on the terms of use of the data. Additional documentation including formats, codebooks, and technical notes are available on the Automated Research File web portal. Instructions for accessing analytic files are found on the PRAMS website at <https://www.cdc.gov/prams/php/data-research/index.html>. The new automated process reduces the data access wait time from 2-3 months to 2-3 days. reduces the data access wait time from 2-3 months to 2-3 days.

For Healthy People 2030 measures, all PRAMS jurisdiction data are used without a response rate threshold.

Figure 1. PRAMS Data Collection Timeline for the Last Year of Phase 8 Data Collection

17. Reason(s) Display of OMB Expiration Date is Inappropriate

Not applicable. The expiration date of OMB approval is displayed on all PRAMS surveys.

18. Exceptions to Certification for Paperwork Reduction Act Submissions

There are no exceptions to the certification.
