General Comment

CMS has historically been aggressive on the screening of dementia, but not aggressive on the management of the complications of dementia.

KPIs to analyze

of agitation episodes per month

of delirium episodes per month

of combativeness episodes per month

% of patients with combativeness

Average severity of delusions

Post acute facilities need to track frequency of intergenerational visits to see the effectiveness of post acute care patients' interactions with young children and infants. The interactions of post acute patients with young children and infants makes an effect on mood, behavior for increased engagement and stronger emotional, social responses.

Potential KPIs for intergenerational interactions:

- # of intergenerational sessions per month
- Average duration of engagement per patient
- Change in agitation episodes per month
- Mood improvement per session

This would be helpful intel to have the post acute facilities to report
