	)	

PETITION OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION FOR APPROVAL OF PROPOSED RELIABILITY STANDARDS MOD-032-2, IRO-010-6, AND TOP-003-8

Pursuant to Section 215(d)(1) of the Federal Power Act ("FPA")[1] and Section 39.5 of the regulations of the Federal Energy Regulatory Commission ("FERC" or "Commission"),[2] the North American Electric Reliability Corporation ("NERC")[3] hereby submits for Commission approval three proposed Reliability Standards:

- Reliability Standard MOD-032-2 – Data for Power System Modeling and Analysis;
- Reliability Standard IRO-010-6 – Reliability Coordinator Data and Information Specification and Collection; and
- Reliability Standard TOP-003-8 – Transmission Operator and Balancing Authority Data and Information Specification and Collection.

The proposed Reliability Standards[4] would advance the reliability of the Bulk-Power System by establishing requirements addressing the provision of Inverter-Based Resource (or "IBR") model data and parameters. Such information is needed to assure accurate representation of IBR performance within system models. Assuring accurate representation of IBRs is necessary as the Bulk-Power System transitions from a resource mix consisting primarily of large synchronous resources to one that is increasingly reliant on IBRs.

---

1 16 U.S.C. § 824o.

2 18 C.F.R. § 39.5 (2025).

3 The Commission certified NERC as the electric reliability organization ("ERO") in accordance with Section 215 of the FPA. *N. Am. Elec. Reliability Corp.*, 116 FERC ¶ 61,062 (2006) [hereinafter ERO Certification Order].

4 Unless otherwise indicated, terms capitalized in this filing shall have the meaning provided in the *Glossary of Terms used in NERC Reliability Standards*, https://www.nerc.com/pa/Stand/Glossary%20of%20Terms/Glossary_of_Terms.pdf.

The proposed Reliability Standards are an integral part of NERC's proposed framework to address IBR reliability issues in a comprehensive and holistic manner. The proposed Reliability Standards addressed in this filing are responsive to the Commission's directives in Order No. 901 directing NERC to submit new or revised standards addressing IBR data sharing and modeling by November 4, 2025.[5] As discussed in detail below, the proposed Reliability Standards are part of a suite of standards that collectively respond to the Commission's directives for requirements addressing data sharing and data and model validation for IBRs, including IBRs that are connected to the Bulk-Power System as well as IBRs that are connected to a distribution system but in the aggregate have a material impact on the Bulk-Power System. This proposed framework consists of the following standards and definitions:

- Proposed definition of the term Distributed Energy Resource (DER), for inclusion in the *Glossary of Terms used in NERC Reliability Standards*;
- Proposed Reliability Standard MOD-032-2 – Data for Power System Modeling and Analysis;
- Proposed Reliability Standard IRO-010-6 – Reliability Coordinator Data and Information Specification and Collection;
- Proposed Reliability Standard TOP-003-8 – Transmission Operator and Balancing Authority Data and Information Specification and Collection;
- Proposed Reliability Standard MOD-026-2 – Verification and Validation of Dynamic Models and Data, and the proposed definitions of Model Validation and Model Verification (*separately filed, concurrently with this petition*); and
- Proposed Reliability Standard MOD-033-3 – Steady-State and Dynamic System Model Validation (*separately filed, concurrently with this petition*).

Proposed Reliability Standard MOD-032-2 would require Planning Coordinators/Transmission Planners to include in their data specifications and reporting

[5] Order No. 901, *Reliability Standards to Address Inverter-Based Resources*, 185 FERC ¶ 61,042 at P 229 (2023) [hereinafter Order No. 901].

procedures information necessary to model IBRs in the planning area and to identify the entities responsible for providing such information. In so doing, those entities will be required to provide the information, in estimated form if necessary, so that Bulk-Power System planners can build system models for use in planning studies that accurately reflect the performance and characteristics of those IBRs. Similarly, the proposed standard would require Planning Coordinators/Transmission Planners to include in their data specifications and reporting procedures information necessary to model distribution-connected generation resources (Distributed Energy Resources or "DERs"), that in the aggregate can affect the reliable operation of the Bulk-Power System.

Proposed Reliability Standards IRO-010-6 and TOP-003-8 would reinforce that Reliability Coordinators, Transmission Operators, and Balancing Authorities are to request IBR-specific data and parameters in their data specifications as needed for operations purposes. Where model submissions are required, responding entities should provide models that are generally consistent with those provided for planning purposes under proposed Reliability Standard MOD-032-2.

The proposed standards would establish the uniform framework for modeling IBRs contemplated by the Commission in Order No. 901 that would be leveraged by Bulk-Power System operators and planners for conducting system studies. Additional work is underway to complete the development of proposed Reliability Standards responsive to the Commission's Order No. 901 directives relating to such studies by the 2026 deadline, with an orderly implementation of all new and revised requirements by 2030.

NERC requests that the Commission approve the proposed Reliability Standards, provided in Exhibit A hereto, as just, reasonable, not unduly discriminatory or preferential, and in the public interest. NERC also requests approval of: (1) the associated Implementation Plan (Exhibit B); the

associated Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") for the proposed Reliability Standards (Exhibit G); and the retirement of currently effective Reliability Standards MOD-032-1, IRO-010-5, and TOP-003-7.

As required by Section 39.5(a) of the Commission's regulations,[6] this petition presents the technical basis and purpose of the proposed Reliability Standards, a summary of the development history, including the adoption of the proposed Reliability Standards by the NERC Board of Trustees on October 31, 2025 (Exhibit H), and a demonstration that the proposed Reliability Standards meet the criteria identified by the Commission in Order No. 672[7] (Exhibit C).

I. SUMMARY

Models provide the foundation of virtually all power system studies used to assess the reliability of the Bulk-Power System. Power system studies rely on models to predict system performance under various conditions. If models are too optimistic, it could result in grid under-investment, unsafe operating conditions, and power outages. If models are too pessimistic, it could result in overly conservative grid operation and under-utilization of network capacity. It is therefore important that models, including all their data, are complete, accurate, and up to date.

Over the last decade, the Bulk-Power System has undergone a remarkable transformation. The resource mix, once consisting generally of large, synchronous generators, is increasingly comprised of relatively smaller IBRs and DERs. Such resources have unique technical and operational characteristics which must be modeled accurately in system studies. NERC and the Commission, however, have identified deficiencies in how these resources are modeled,

---

6 18 C.F.R. § 39.5(a).

7 *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, 114 FERC 61,104 at PP 262, 321-37 (2006) [hereinafter Order No. 672], *order on reh'g*, Order No. 672-A, 114 FERC 61,328 (2006).

deficiencies which have implications for the system studies that rely on these models and the actions that are taken in response to these studies. Several Bulk-Power System events in recent years have demonstrated the risks to reliability that may result from unexpected IBR performance. Further, failing to understand the nature and extent of the IBRs and DERs connected to or affecting the Bulk-Power System can affect how entities plan for reliable operation of the Bulk-Power System.

In recognition of the risks posed by the rapid growth of IBRs, the Commission issued Order No. 901 in 2023. Order No. 901 highlighted the need for a comprehensive set of Reliability Standard requirements addressing all manner of issues related to IBR performance, operations, and planning. Previous work has addressed Commission directives from this order relating to IBR performance and disturbance monitoring capabilities. Proposed Reliability Standards MOD-032-2, IRO-010-6, and TOP-003-8 would advance the reliability of the Bulk-Power System by establishing a uniform modeling framework to improve how IBRs are accounted for in system models and ultimately, the system studies in the operations and planning horizons that rely on those models. The proposed Reliability Standards would also improve how DERs including both IBR-DER and other forms of distribution-connected generating resources, are accounted for in system models when such resources can impact Bulk-Power System reliability. The proposed Reliability Standards address several Commission directives in Order No. 901 related to IBR data sharing and modeling, as well as several findings and recommendations from NERC reports and lessons learned on past Bulk-Power System events.

For these reasons, which are summarized here and stated more fully below, NERC requests that the Commission approve the proposed Reliability Standards, provided in Exhibit A hereto, as just, reasonable, not unduly discriminatory or preferential, and in the public interest.

III. REGULATORY BACKGROUND

A. Regulatory Framework

By enacting the Energy Policy Act of 2005,[9] Congress entrusted the Commission with the duties of approving and enforcing rules to ensure the reliability of the Bulk-Power System, and with the duty of certifying an Electric Reliability Organization ("ERO") that would be charged with developing and enforcing mandatory Reliability Standards, subject to Commission approval. Section 215(b)(1) of the FPA states that all users, owners, and operators of the Bulk-Power System in the United States will be subject to Commission-approved Reliability Standards.[10] Section 215(d)(5) of the FPA authorizes the Commission to order the ERO to submit a new or modified Reliability Standard.[11] Section 39.5(a) of the Commission's regulations requires the ERO to file for Commission approval each Reliability Standard that the ERO proposes should become

[8] NERC respectfully requests a waiver of Rule 203 of the Commission's regulations, 18 C.F.R. § 385.203, to allow the inclusion of more than two persons on the service list in this proceeding.

[9] 16 U.S.C. § 824o.

[10] *Id.* § 824(b)(1).

[11] *Id.* § 824o(d)(5).

mandatory and enforceable in the United States, and each modification to a Reliability Standard that the ERO proposes to make effective.[12]

The Commission has the regulatory responsibility to approve Reliability Standards that protect the reliability of the Bulk-Power System and to ensure that such Reliability Standards are just, reasonable, not unduly discriminatory or preferential, and in the public interest. Pursuant to Section 215(d)(2) of the FPA and Section 39.5(c) of the Commission's regulations, the Commission will give due weight to the technical expertise of the ERO with respect to the content of a Reliability Standard.[13]

B. NERC Reliability Standards Development Procedure

The proposed Reliability Standards were developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[14] NERC develops Reliability Standards in accordance with Section 300 (Reliability Standards Development) of its Rules of Procedure and the NERC Standard Processes Manual.[15] In its ERO Certification Order, the Commission found that NERC's proposed rules provide for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in developing Reliability Standards and thus satisfies certain criteria for approving Reliability Standards.[16] The development process is open to any person or entity with a legitimate interest in the reliability of the Bulk-Power System. NERC considers the comments of all stakeholders.

Further, a vote of stakeholders and adoption by the NERC Board of Trustees is required before NERC submits the Reliability Standard to the Commission for approval.

IV. THE NEED FOR REVISED DATA SHARING AND MODELING STANDARDS ADDRESSING INVERTER-BASED RESOURCES AND DISTRIBUTED ENERGY RESOURCES

A. History of the MOD-032 Reliability Standard

Models provide the foundation of virtually all power system studies used to assess the reliability of the Bulk-Power System. Power system studies rely on models to predict system performance under various conditions. Calculation of operating limits, planning studies for assessments of new generation and load growth, and performance assessments of system integrity protection schemes are examples of studies that depend on accurate mathematical representations of transmission, generation, and load. If models are too optimistic, it could result in grid under-investment, unsafe operating conditions, and power outages. If models are too pessimistic, it could result in overly conservative grid operation and under-utilization of network capacity. It is therefore important that models, including all the data to populate the model parameters, are complete, accurate, and up to date.

NERC developed currently effective Reliability Standard MOD-032-1 in 2013-2014 to establish consistent modeling data requirements and reporting procedures for the development of planning horizon cases necessary to support analysis of the reliability the interconnected transmission system. In developing Reliability Standard MOD-032-1 and the model validation standard Reliability Standard MOD-033-1, NERC considered Commission directives from Order No. 693 addressing modeling responsibilities, [17] directives from Order No. 890 addressing the

[17] *Mandatory Reliability Standards for the Bulk-Power System*, Order No. 693, 118 FERC ¶ 61,218 (2007), at PP 1178, 1183, 1197, 1210, 1211, 1220, *order on reh'g*, Order No. 693-A, 120 FERC ¶ 61,053 (2007).

periodic review and modification of models to ensure that they are up to date,[18] and NERC committee recommendations to improve upon and streamline the modeling standards.[19] Reliability Standard MOD-032-1 improved upon and consolidated several then-existing MOD Reliability Standards addressing data requirements and reporting procedures for power system models for use in reliability studies.

Reliability Standard MOD-032-1 is intended to provide clear expectations as to who provides what data to whom while also providing entities with flexibility to develop data requirements and reporting procedures that are appropriate to their specific circumstances and Interconnection. The standard consists of the following framework:

- Requirement R1 requires Planning Coordinators and Transmission Planners to jointly develop data requirements and reporting procedures for steady-state, dynamics, and short circuit modeling data for entities in their planning area.

- Requirement R2 requires the registered entities that have the modeling data (i.e., data owners) to provide their data to their Planning Coordinator(s) and Transmission Planner(s) in accordance with the data requirements and reporting procedures developed pursuant to Requirement R1.

- Requirement R3 provides Planning Coordinators and Transmission Planners an opportunity to coordinate with the data owners to address any technical concerns with the data provided under Requirement R2.

- Requirement R4 obligates Planning Coordinators to make available models for its planning area reflecting the data provided to it under Requirements R2 to the ERO, or its designee, for use in creating the Interconnection-wide cases.

The Commission approved Reliability Standard MOD-032-1 in 2014.[20]

---

[18] *Preventing Undue Discrimination and Preference in Transmission Service*, Order No. 890, 118 FERC ¶ 61,119 at P 290 (2007), *order on reh'g*, Order No. 890-A, 121 FERC ¶ 61,297 (2007), *order on reh'g*, Order No. 890-B, 123 FERC ¶ 61,299 (2008), order on reh'g, Order No. 890-C, 126 FERC ¶ 61,228 (2009).

[19] Additional information on these directives and recommendations and how NERC considered them in the development of Reliability Standards MOD-032-1 and MOD-033-1 is available in NERC's *Petition for Approval of Proposed Reliability Standards MOD-032-1 and MOD-033-1*, Docket No. RD14-5-000 (Feb. 25, 2014).

[20] *N. Am. Elec. Reliability Corp.*, Docket No. RD14-5-000 (May 1, 2014) (delegated letter order). In this order, the Commission also approved Reliability Standard MOD-033-1, the retirement of then-effective Reliability Standards MOD-010-0 and MOD-012-0, and the withdrawal of four MOD Reliability Standards for which the Commission took no action in Order No. 693.

B. History of the IRO-010 and TOP-003 Reliability Standards

The IRO-010 and TOP-003 Reliability Standards help ensure that the functional entities responsible for planning, monitoring, and assessing their areas of the Bulk-Power System have the data and information necessary to perform those responsibilities. The TOP-003 Reliability Standard contains requirements for the development, distribution, and satisfaction of Balancing Authority and Transmission Operator data specifications, while the IRO-010 Reliability Standard contains requirements for the development, distribution, and satisfaction of Reliability Coordinator data specifications.

The Commission first approved the TOP-003 Reliability Standard in 2007[21] and the IRO-010 Reliability Standard in 2011.[22] Since their initial approvals, both Reliability Standards have been revised multiple times. The Commission approved the currently effective versions of the standards, Reliability Standards IRO-010-5 and TOP-003-6.1, in 2023.[23] The currently effective versions reflect a series of enhancements to improve the approaches used for data and information specification and exchange.

Additionally, the Commission approved a future enforceable version of the TOP-003 standard, Reliability Standard TOP-003-7, in February 2025.[24] This version will add Near-Term Energy Reliability Assessments to the list of activities in Requirements R2 for which Balancing Authorities must have documented data specifications and would ensure Balancing Authorities can obtain the necessary data to perform those assessments. Reliability Standard TOP-003-7 will

become enforceable on October 1, 2026 in the United States.

C. NERC Identifies the Need to Revise the Reliability Standards Modeling Framework to Address the Growth of BPS-Connected IBRs and Distributed Energy Resources

In late 2021, NERC received a series of Standard Authorization Requests to revise Transmission System planning requirements to address the growth of IBRs on the Bulk-Power System, as well as the growth of resources connected to the distribution system potentially impacting Bulk-Power System reliability.

In December 2021, the NERC System Performance Impacts of Distributed Energy Resources Working Group (or "SPIDERWG") submitted two Standard Authorization Requests, each seeking to improve how Planning Assessments account for the potential impacts of distribution-connected generating resources on the planning, operation, and design of the Bulk-Power System. One Standard Authorization Request sought revisions to the MOD-032 standard to address gaps in data collection for the purposes of modeling aggregate levels of such resources in planning assessments, as well as a review to assign responsibilities to the Distribution Provider following the removal of the Load-Serving Entity as a functional entity registration category.[25] The second Standard Authorization Request sought revisions to the TPL-001 transmission planning Reliability Standard to consider the impacts of these resources in planning assessments.

Also in December 2021, the NERC Inverter-Based Resource Performance Task Force (or "IRPTF") submitted a Standard Authorization Request seeking to revise the TPL-001 Reliability Standard to provide clarity and consistency for how Bulk-Power System connected IBRs are considered, modeled, and studied in transmission planning assessments.

[25] The Commission approved the removal of the Load Serving Entity as a functional entity registration as part of NERC's Risk-Based Registration Initiative in 2015. *N. Am. Elec. Reliability Corp.*, 150 FERC ¶ 61,213 (2015) (approving initiative and directing compliance filing).

To address these Standard Authorization Requests, NERC initiated Project 2022-02 with the project name Modifications to TPL-001-5.1 and MOD-032-1. While work was underway to revise Reliability Standard MOD-032-1, the Commission issued two orders related to IBRs that were relevant to NERC's work: the first directing NERC to expand its registry criteria to include non-Bulk Electric System IBRs, and the second directing NERC to submit a series of proposed new or revised Reliability Standards to address IBR-related reliability issues, including data and modeling issues. These orders are summarized in the following sections.

D. Order 901 Directs NERC to Develop Reliability Standards to Address Concerns Related to IBRs at "All Stages of Interconnection, Planning, and Operations"

1. Overview of Order No. 901

On October 19, 2023, the Commission issued Order No. 901,[26] a final rule directing the development of Reliability Standards to address reliability issues associated with the growth of IBRs on the Bulk-Power System. In the order, and in the preceding notice of proposed rulemaking ("NOPR"), the Commission cited multiple ERO resources on IBR issues, including reliability guidelines, white papers, reliability assessments, technical reports, event reports, NERC alerts, and other resources, as underscoring the need for mandatory Reliability Standards to address reliability concerns related to IBRs at "all stages of interconnection, planning, and operations."[27] The Commission concluded that, while NERC, the Commission, and industry groups all had efforts underway to address IBR risks, the Commission directed NERC to address specific reliability gaps because the existing Reliability Standards do not adequately address the reliability risks posed by the increasing numbers of IBRs connecting to the Bulk-Power System.[28] The Commission directed

[26] Order No. 901, *supra* note 5.

[27] *Id.* at P 25.

[28] *Id.* at Section III, Need for Reform.

NERC to develop new and revised Reliability Standards to address the following four topic areas of IBR issues: (1) data sharing;[29] (2) data and model validation;[30] (3) planning and operational studies;[31] and (4) performance requirements.[32]

Within these four topic areas, the Commission identified the specific reliability issues that NERC would need to address. In so doing, the Commission distinguished between IBRs owned by entities currently registered with NERC for compliance purposes, or would be in the future based on revised registry criteria ("registered IBRs");[33] IBRs that are owned by entities not registered with NERC ("unregistered IBRs") but which need to be modeled for reliability; and IBRs that are connected to the distribution system, but, in the aggregate, can impact Bulk-Power System reliability ("IBR-DERs").[34] NERC was directed to develop responsive standards and submit them to the Commission on a three-year, staggered timeframe.

Additionally, the Commission directed NERC to submit an informational filing, within 90 days of the date of the order, detailing a comprehensive standards development plan and explanation of how NERC would prioritize the development of new or modified Reliability Standards.[35]

---

29 *See id.* at PP 66-109 (discussing directives related to data sharing requirements).

30 *See id.* at PP 110-161 (discussing directives related to data and model validation requirements).

31 *See id.* at PP 162-177 (discussing directives related to planning and operational studies requirements).

32 *See id.* at PP 178-211 (discussing directives related to performance requirements).

33 On November 17, 2022, the Commission issued an order directing NERC to undertake actions to expand the class of IBRs that are required to register with NERC and comply with NERC Reliability Standards. *Registration of Inverter-Based Resources*, 181 FERC ¶ 61,124 (2022). Specifically, the Commission directed NERC to explain how it will "identify and register owners and operators of IBRs that are connected to the Bulk-Power System, but are not currently required to register with NERC under the bulk electric system (BES) definition… that have an aggregate material impact on the reliable operation of the Bulk-Power System." *Id.* at P 1 (citations omitted).

The Commission approved NERC's proposed expansion of the Generator Owner and Generator Operator registry criteria to encompass additional IBRs in an order issued June 27, 2024. *Order Approving Revisions to North American Electric Reliability Corporation Rules of Procedure and Requiring Compliance Filing*, 187 FERC ¶ 61,196 (2024).

34 Order No. 901, *supra* note 5, at P 4 n.14.

35 *Id.* at P 222.

2. Order No. 901 Directives Relating to the Modeling Framework for IBRs

In Order No. 901, the Commission directed NERC to develop new or revised Reliability Standards to support accurate modeling of IBRs, including requirements addressing IBR data sharing, IBR model submissions, and requirements addressing validation of system models against actual system behavior. This filing addresses Order No. 901 directives related to IBR data sharing and model submissions, which are summarized below.

a) IBR-Specific Modeling Data and Parameters

Finding that the sharing of IBR modeling data is critical to ensuring that Bulk-Power System planners and operators are able to plan for, operate, and reliably integrate IBRs onto the Bulk-Power System, the Commission directed NERC as follows:

> Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require registered IBR generator owners and operators to provide IBR-specific modeling data and parameters (e.g., steady-state, dynamic, and short circuit modeling information, and control settings for momentary cessation and ramp rates) that accurately represent the registered IBRs to their planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities that are responsible for planning and operating the Bulk-Power System.[36]

Acknowledging comments in the rulemaking proceeding, the Commission further directed NERC to consider specifying data sharing requirements from Transmission Owners to Generator Owners and Generator Operators as part of addressing the above data-sharing directive, while acknowledging that existing processes may already address such sharing.[37] The Commission also directed NERC to consider whether additional IBR data points, beyond those directed to facilitate

[36] *Id.* at P 76.

[37] *Id.* at P 77 (citing comments).

IBR disturbance monitoring and analysis, are needed to further enhance real-time visibility of Bulk-Power System Operations.[38]

In addition to the above-listed directives related to registered IBRs, the Commission also directed the development of new or revised Reliability Standards addressing the provision of accurate modeling data and parameters regarding "unregistered IBRs" and IBR-DERs. NERC and other commenters noted that without all of the relevant protections and controls for these resources being modeled and validated, the resulting studies would not identify possible performance issues.[39] However, there was concern in the underlying proceeding about which entity would be the appropriate entity to provide such data, where the IBR was owned by an entity not subject to compliance with NERC Reliability Standards. Considering the comments, the Commission directed as follows:

> [W]e direct NERC to submit to the Commission for approval one or more new or modified Reliability Standards that require: (1) transmission owners to provide to Bulk-Power System planners and operators modeling data and parameters for unregistered IBRs in their transmission owner areas that, individually or in the aggregate, materially affect the reliable operation of the Bulk-Power System and (2) distribution providers to provide to Bulk-Power System planners and operators modeling data and parameters for IBR-DERs in the aggregate in their distribution provider areas where the IBR-DERs in the aggregate materially affect the reliable operation of the Bulk-Power System.[40]

In so directing NERC, the Commission considered that there may be circumstances where Transmission Owners are unable to gather accurate data or parameters, or unable to gather data at all, to create and maintain models for the "unregistered IBRs" in their areas. In such circumstances,

---

[38] *Id.* at P 86 (citing comments). NERC previously addressed the Commission's Order No. 901 directives regarding the collection and sharing of IBR disturbance monitoring data in the Order No. 901 Milestone 2 projects described in Section V.

[39] *See id.* at P 91 (summarizing comments of NERC, among others).

[40] *Id.* at P 102.

the Commission directed NERC to develop new or modified Reliability Standards that would instead require Transmission Owners to provide Bulk-Power System planners and operators "(1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation."[41] In directing NERC, the Commission recognized the limitations of estimated data, but stated, "on balance we believe that requiring such estimates with explanation of any limitations is an improvement from not having any data at all; and that even estimates will increase the overall adequacy of models and improve the reliability of the Bulk-Power System."[42] The Commission further directed NERC to consider commenter suggestions "to implement a process or mechanism by which transmission owners would receive modeling data and parameters."[43]

Similarly, the Commission recognized concerns that Distribution Providers may not be able to gather adequate modeling data and parameters from IBR-DERs in the aggregate. The Commission therefore directed NERC to include estimation provisions in any new or modified Reliability Standard for IBR-DER data in the aggregate similar to those for "unregistered IBR" data, and to consider commenter suggestions regarding a process or mechanism by which distribution providers would receive modeling data and parameters.[44]

To address compliance concerns as well as comments to specify the data to be submitted by all IBRs, the Commission directed NERC "to determine through its standards development process the minimum categories or types of data that must be provided to transmission planners,

41 *Id.* at P 104.

42 *Id.*

43 *Id.*

44 *Id.* at P 105.

transmission operators, transmission owners, and distribution providers necessary to predict the behavior of all IBRs and to ensure that compliance obligations are clear."[45]

b) Use of Approved Industry Generic Library IBR Models

The Commission directed NERC to "require the use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions when developing planning, operations, and interconnection-wide models."[46] The Commission stated that a responsive standard "could reference the NERC approved component model list which defines the models that may be used, and those models that may not be used, for specific types of studies."[47] The Commission stated, "Without requiring the use of approved industry generic library models, Bulk-Power System planners and operators may not be able to create system models that adequately predict IBR behaviors and subsequent impacts on the Bulk-Power System."[48]

In declining suggestions to allow the use of user-defined models, the Commission stated, "the risks associated with the use of user-defined models in the interconnection context are substantially different than in the Bulk-Power System operations and planning context."[49] The Commission stated that:

> In the event of non-convergence or other problems with the model, a user-defined model, if not appropriately parameterized and not submitted with open-source code or dynamic link library and code files, may not allow internal model components to be viewed or modified, which would impede the ability of planning coordinators,

---

47 *Id.* at P 122. The Commission referenced a document titled the *NERC Standardized Powerflow Parameters and Dynamics Models*, a document created in 2015 as a predecessor to the current Unacceptable Models List.

48 *Id.*

49 *Id.* at P 123.

> transmission planners, transmission operators, and balancing authorities to remediate any issues.[50]

While stating that user-defined models may be appropriate for studying individual transmission systems, the Commission further stated,

> [T]he use of a standard set of approved industry generic library models is essential to creating Bulk-Power System planning and operations system models (i.e., combining models between neighboring entities and for interconnection-wide models) so that Bulk-Power System planners and operators can adequately predict behaviors and subsequent impacts to the reliable operation of the Bulk-Power System.[51]

The Commission directed NERC to determine through its standards development process "which nation-wide approved component models are needed to build IBR plant models for steady state, short-circuit, and dynamics studies"[52] and to "require the sole use of nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build interconnection-wide models."[53]

c) Submission of Dynamic Models Representing the Dynamic Performance of IBRs

With respect to the submission of dynamic models, the Commission directed NERC:

> [T]o require the generator owners of registered IBRs and the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g., planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of registered and unregistered IBRs, including momentary cessation and/or tripping, and all ride through behavior.[54]

---

50 *Id.*

51 *Id.*

52 *Id.* at P 124.

53 *Id.* at P 125.

54 *Id.* at P 141.

Where Transmission Owners are unable to gather accurate "unregistered IBR" data or are unable to gather data at all, the Commission directed NERC to require Transmission Owners to provide dynamic models of "unregistered IBRs" using estimated data in accordance with the estimation framework previously directed.[55]

Similarly, the Commission directed NERC to require Distribution Providers to provide aggregated dynamic models that adequately represent the dynamic performance of IBR-DERs on their systems that in the aggregate have a material impact on the Bulk-Power System, using estimated data if necessary.[56] The Commission further directed that, for those areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but have no associated Distribution Provider, that NERC determine the appropriate registered entity responsible for providing data and maintaining the dynamic models.[57] Last, the Commission directed NERC to "ensure that the proposed new or modified Reliability Standards account for the dynamic performance of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System."[58]

d) Use of the DER_A Model

With respect to IBR-DERs, the Commission stated that the DER_A model represents "an appropriate basis on which to develop new or revised modeling standards for IBR-DERs."[59] Citing the 2015 *NERC Standardized Powerflow Parameters and Dynamics Models* document, as well as six Reliability Guidelines on the use of the DER_A model, the Commission directed NERC to develop standards that:

---

55 *Id.*

56 *Id.*

57 *Id. See also id.* at P 157 (reiterating directive in the context of directives addressing validation of verified IBR models against actual system behavior).

58 *Id.*

59 *Id.* at P 144.

> [R]equire the use of the DER_A model or successor models to represent the behaviors of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System at a sufficient level of fidelity for Bulk-Power System planners and operators to create valid planning and operations and interconnection-wide models and to be able to perform respective system studies.[60]

e) Development of a Uniform Modeling Framework

In addition to the above-listed directives addressing IBR data and model sharing, the Commission directed NERC to establish a framework for coordinating and keeping up to date the verified data and models of registered IBRs, "unregistered IBRs", and IBR-DERs in the aggregate in system models. Citing a need for improved coordination when creating and updating planning, operational, and Interconnection-wide data and models, the Commission directed as follows:

> Pursuant to section 215(d)(5) of the FPA,… we direct NERC to develop new or modified Reliability Standards that require planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities to establish for each interconnection a uniform framework with modeling criteria, a registered modeling designee, and necessary data exchange requirements both between themselves and with the generator owners, transmission owners, and distribution providers to coordinate the creation of transmission planning, operations, and interconnection-wide models (i.e., system models) and the validation of each respective system model. Further, we direct NERC to include in the new or modified Reliability Standards a requirement for generator owners, transmission owners, and distribution providers to regularly update and communicate the verified data and models of registered IBRs, unregistered IBRs, and IBR-DERs by comparing their resulting models against actual operational behavior to achieve and maintain necessary modeling accuracy for inclusion of these resources in the system models. For those areas with IBR-DERs in the aggregate that have a material impact on the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we modify the NOPR proposal to direct NERC to determine the appropriate registered entity responsible for the models of those IBR-DERs and to determine the registered entities responsible for updating, verifying, and coordinating models for IBR-DERs in the aggregate to meet the system models directives. NERC may implement this

[60] *Id.* at P 146.

> directive by modifying Reliability Standards MOD-032-1 and MOD-033-2 or by developing new Reliability Standards to establish requirements mandating an annual process to coordinate, validate, and keep up-to-date the transmission planning, operations, and interconnection-wide models.[61]

f) Orderly and Timely Implementation of Directed Standards

With respect to the implementation of the directed standards modifications, the Commission stated, "we believe that there is a need to have all of the directed Reliability Standards effective and enforceable well in advance of 2030 and direct NERC to ensure that the associated implementation plans sequentially stagger the effective and enforceable dates to ensure an orderly industry transition for complying with the IBR directives in this final rule prior to that date."[62]

V. NERC'S ORDER NO. 901 WORK PLAN

In Order No. 901, the Commission directed NERC to submit an informational filing, within 90 days of the date of the order, detailing a comprehensive standards development plan and explanation of how NERC would prioritize the development of new or modified Reliability Standards to address the directives set forth in that order.

On January 17, 2024, NERC submitted an Informational Filing that included its Order No. 901 Work Plan.[63] NERC detailed how it will leverage the multiple standards development projects planned or already underway to address IBR-related risks and add new projects as necessary, to ensure that the reliability issues identified by the Commission in Order No. 901 are addressed appropriately through the standards development process. The Order No. 901 Work Plan consists of four key milestones with associated dates for completion, consistent with the Commission's

61 *Id.* at P 161 (citations omitted).

62 *Id.* at P 226.

63 Informational Filing of the North American Electric Reliability Corporation Regarding the Development of Reliability Standards Responsive to Order No. 901, Docket No. RM22-12-000 (Jan. 17, 2024) [hereinafter Order No. 901 Work Plan].

direction in Order No. 901, to help ensure that the process proceeds in an orderly and timely manner. These milestones are summarized below:

- **Milestone 1:** Submission of Order No. 901 Work Plan (completed: January 17, 2024)
- **Milestone 2:** Development and filing of Reliability Standards to address disturbance monitoring data sharing, IBR performance requirements, and post-event performance validation for registered IBRs (completed: November 4, 2024)
- **Milestone 3:** Development and filing of Reliability Standards to address data sharing and model validation for all IBRs (completion: November 4, 2025)
- **Milestone 4:** Development and filing of Reliability Standards to address planning and operational studies requirements for all IBRs (completion: November 4, 2026)

Work under Milestone 2 of NERC's Order No. 901 Work Plan was completed on November 4, 2024, with the development of the following Reliability Standards and definitions:

- Definition of Inverter-based Resource (IBR), for inclusion in the Glossary of Terms used in NERC Reliability Standards, approved by the Commission in February 2025;[64]
- Reliability Standards PRC 028-1 (Disturbance Monitoring and Reporting Requirements for Inverter-Based Resources) and PRC-002-5 (Disturbance Monitoring and Reporting Requirements), approved by the Commission in February 2025;[65]
- Reliability Standards PRC-024-4 (Frequency and Voltage Protection Settings for Synchronous Generators, Type 1 and Type 2 Wind Resources, and Synchronous Condensers), Reliability Standard PRC-029-1 (Frequency and Voltage Ride-through Requirements for Inverter-Based Resources), and the definition of the term Ride-through, approved by the Commission in July 2025;[66] and
- Reliability Standard PRC-030-1 (Unexpected Inverter-Based Resource Event Mitigation), approved by the Commission in February 2025.[67]

---

64 *N. Am. Elec. Reliability Corp.*, 190 FERC ¶ 61,098 (2025).

65 *Id.*

66 Order No. 909, *Reliability Standards for Frequency and Voltage Protection Settings and Ride-Through for Inverter-Based Resources*, 192 FERC ¶ 61,076 (2025) (approving standards and directing NERC to clarify documentation obligations, to submit an informational filing within 18 months of the conclusion of the ride-through exemption request period in Reliability Standard PRC-029-1 Requirement R4 assessing the reliability impacts of the exemptions clause, and to further consider concerns raised about the need for additional exemptions through the standard development process.)

67 *N. Am. Elec. Reliability Corp.*, 190 FERC ¶ 61,098 (2025).

Relevant to this filing, NERC prioritized the following standards development projects to meet the goals set in Milestone 3 of the Order 901 Work Plan:

- Project 2020-06 Verifications of Models and Data for Generators;
- Project 2021-01 System Model Validation with IBRs; and
- Project 2022-02 Uniform Modeling Framework for IBR.

The standards projects associated with Milestone 3 address the development of a uniform modeling framework for IBR, with requirements addressing the provision of IBR-specific modeling data and parameters, the submission and verification of IBR models to support improved accuracy in system planning, and the validation of system models against actual system performance.

NERC developed the proposed Reliability Standards addressed in this filing, proposed Reliability Standards MOD-032-2, IRO-010-6, TOP-003-8, and the associated definition of Distributed Energy Resource (DER) under Project 2022-02 Uniform Modeling Framework for IBR. As discussed more fully in Section VI, proposed Reliability Standard MOD-032-2 includes requirements addressing data sharing and modeling requirements for IBRs and DERs, consistent with the relevant Commission directives from Order No. 901 and the recommendations of the SPIDERWG. Proposed Reliability Standards IRO-010-6 and TOP-003-8 include revisions to explicitly address the inclusion of IBR data and parameters in Reliability Coordinator, Transmission Operator, and Balancing Authority data specifications and to require that, where models are required, the models submitted for operations planning be consistent with those submitted under the MOD-032 standard. A summary of the Reliability Standards developed to address the Milestone 3 directives is provided below.

A. Project 2020-06 Verifications of Models and Data for Generators

Addressed in a separate filing filed concurrently with this petition, Project 2020-06 Verifications of Models and Data for Generators proposes Reliability Standard MOD-026-2 – Verification and Validation of Dynamic Models and Data and the defined terms Model Verification and Model Validation for Commission approval. Proposed Reliability Standard MOD-026-2 would consolidate and improve upon two currently effective Reliability Standards governing verification of models and data: Reliability Standard MOD-027-1 - Verification of Models and Data for Turbine/Governor and Load Control or Active Power/Frequency Control Functions and Reliability Standard MOD-026-1 Verification of Models and Data for Generator Excitation Control System or Plant Volt/Var Control Functions.

Proposed Reliability Standard MOD-026-2 would advance reliability by ensuring that models used in planning and interconnection analyses, including models representing IBRs, are verified and validated, and that these models accurately represent in-service equipment. In so doing, proposed Reliability Standard MOD-026-2 addresses several Commission directives in Order No. 901 relating to model verification and model accuracy for IBRs.

B. Project 2022-02 Uniform Modeling Framework for IBR

As addressed in this filing, Project 2022-02 Uniform Modeling Framework for IBR proposes three revised Reliability Standards, Reliability Standards MOD-032-2, IRO-010-6, and TOP-003-8, to establish modeling and data sharing requirements that provide sufficient IBR and DER model data and parameters to assure accurate representations of IBR and DER performance within system models. These standards will form the uniform framework for data sharing and model development to support future Order No. 901-related projects.

C. Project 2021-01 System Model Validation with IBRs

Addressed in a separate filing filed concurrently with this petition, Project 2021-01 System Model Validation with IBRs proposes revised Reliability Standard MOD-033-3 – Steady-State and Dynamic System Model Validation. The purpose of this standard is to establish a process for system model validation to facilitate achieving and maintaining model accuracy. Proposed Reliability Standard MOD-033-3 addresses several Commission directives in Order No. 901 related to the validation of IBR models, including the comparison of resulting system models against actual system operational behavior.

Collectively, the proposed Reliability Standards would enhance the reliability of the Bulk-Power System by addressing critical IBR reliability issues in accordance with Milestone 3 of NERC's Order No. 901 Work Plan.

VI. JUSTIFICATION FOR APPROVAL: PROPOSED RELIABILITY STANDARD MOD-032-2

Models provide the foundation of virtually all power system studies used to assess the reliability of the Bulk-Power System, and it is important that models, including all the data to populate the model parameters, are complete, accurate, and up to date. To date, NERC and the Commission have identified deficiencies in how system models have accounted for IBRs, resources which now comprise a significant part of the grid's resource mix and that have technical and operational characteristics that differ significantly from traditional synchronous generation. Proposed Reliability Standard MOD-032-2 – Data for Power System Modeling and Analysis would advance reliability and improve upon the currently effective MOD-032 standard through requirements intended to ensure that the entities responsible for planning the Bulk-Power System have the data and information they need to build system models that accurately reflect the

performance of IBRs on their portions of the Bulk-Power System, as well as the performance of DERs that can impact Bulk-Power System reliability.

Proposed Reliability Standard MOD-032-2 consists of four requirements, an Attachment 1 describing the information required to effectively model the interconnected transmission system in the near-term and long-term transmission planning horizons, and a new supporting document describing the ongoing process by which NERC will maintain a list of equipment models that structurally do not represent equipment to a suitable fidelity for use in building system models (called the "Unacceptable Models List"). Proposed Reliability Standard MOD-032-2 addresses several Commission directives from Order No. 901 related to the provision of IBR and IBR-DER data and information and improving the quality of submitted IBR and IBR-DER models. As such, it provides an important foundation for completing the operation and planning studies in the Order No. 901 Milestone 4 related standards development projects.

As explained in Exhibit H, NERC developed the proposed Reliability Standard using NERC's standard development process. This process included multiple public comment and ballot periods. The NERC Board of Trustees adopted the proposed Reliability Standard on October 31, 2025.

In this section, NERC provides a justification for each component of the proposed Reliability Standard, with a summary of the supporting rationale. This section concludes with a discussion of how the proposed Reliability Standard addresses the relevant Commission directives from Order No. 901 not otherwise addressed in the supporting rationale. Additional information may be found in the Technical Rationale for Proposed Reliability Standard MOD-032-2 included as Exhibit E to this petition, the Complete Record of Development, included as Exhibit H, and the Consideration of FERC Order No. 901 Directives, included as Exhibit D.

A. Title and Purpose

The title and purpose of proposed Reliability Standard MOD-032-2 – Data for Power System Modeling and Analysis remain unchanged from currently effective Reliability Standard MOD-032-1. The stated purpose of the proposed standard is: "To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system."

B. Applicability

Proposed Reliability Standard MOD-032-2 would continue to apply to the Balancing Authority, Generator Owner, Planning Authority/Planning Coordinator, Resource Planner, Transmission Owner, Transmission Planner, and Transmission Service Provider, as in currently effective Reliability Standard MOD-032-1.

Proposed Reliability Standard MOD-032-2 would remove the Load Serving Entity, an applicable functional entity identified in Reliability Standard MOD-032-1. The Load Serving Entity is a functional entity category that is no longer registered for mandatory Reliability Standards compliance purposes.[68] The Distribution Provider[69] was identified as the typical functional entity that would provide the data formerly associated with the Load Serving Entity in Reliability Standard MOD-032-1. Additionally, the Distribution Provider would be an appropriate registered entity to provide information regarding the DERs on its system under proposed Reliability Standard MOD-032-2, consistent with the Order No. 901 directives relating to the

[68] *See* note 25, *supra*.

[69] The Distribution Provider is defined as the entity that "provides and operates the 'wires' between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage." The criteria for registering Distribution Providers is specified in Appendix 5B to the NERC Rules of Procedure, *Statement of Compliance Registry Criteria* (eff. Jun. 27, 2024), available at https://www.nerc.com/AboutNERC/Pages/Rules-of-Procedure.aspx.

provision of such information.[70] Thus, proposed Reliability Standard MOD-032-2 includes the Distribution Provider as an applicable entity.

Following Commission approval of NERC's proposed revised *Glossary* definition of Generator Owner,[71] proposed Reliability Standard MOD-032-2 would apply to a broader category of Generator Owners than those subject to currently effective Reliability Standard MOD-032-1; specifically, the Generator Owners that own the non-BES IBRs that NERC will register in accordance with revisions to its Rules of Procedure approved by the Commission in 2024.[72] As such, the applicability of proposed Reliability Standard MOD-032-2 is consistent with various directives in Order No. 901 in which the Commission directed NERC to develop IBR data and modeling requirements for "registered IBR generator owners," including Generator Owners owning non-BES IBRs that NERC would register consistent with the IBR Registration Order.[73]

Consistent with paragraph 76 of Order No. 901,[74] the drafting team considered whether to add Generator Operators to the Applicability section of proposed MOD-032-2 and determined that such an addition was not necessary as the Generator Owner oversees the Generator Operator. The

---

70 As discussed in Section VI.D, proposed Reliability Standard MOD-032-2 provides flexibility to identify an alternative applicable registered entity to provide such information if there is no registered Distribution Provider for the area.

71 In August 2025, NERC submitted a petition seeking Commission approval of revised definitions of the terms Generator Owner and Generator Operator used in the NERC Glossary. As explained in NERC's petition, the revised definitions are intended to align the definitions of those terms used in NERC Reliability Standards with the revised registration criteria approved by the Commission in 2024. *See Petition of NERC for Approval of Revised Terms "Generator Owner" and "Generator Operator" used in NERC Reliability Standards and Request for Expedited Action*, Docket No. RD25-10-000 (Aug. 27, 2025).

72 *See Order Approving Revisions to N. Am. Elec. Reliability Corp. Rules of Proc. and Requiring Compliance Filing*, 187 FERC ¶ 61,196 (2024).

73 *See* Order No. 901 at 76; *see also* P 4 n.14 (explaining that the Commission intended "IBRs registered with NERC" or similar phrases to include entities both currently registered and those that would be registered under the revised registry criteria).

74 *See* Order No. 901 at P 76 ("Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require registered IBR generator owners and operators to provide IBR-specific modeling data and parameters…").

Generator Owner may contact the Generator Operator to obtain any information that is needed to satisfy a specification developed under proposed MOD-032-2.

C. Definition of "Distributed Energy Resource"

In conjunction with proposed Reliability Standard MOD-032-2, the Project 2022-02 drafting team developed a proposed definition of Distributed Energy Resource (DER) to provide clarity as to the types of resources for which certain data must be requested and provided under the proposed standard. NERC proposes to define a Distributed Energy Resource (DER) as follows:

> A generator or energy storage technology connected to a distribution system that is capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including one connected behind the meter of an end-use customer that is supplied from a distribution system.

In developing the proposed definition, the drafting team considered various definitions for this term used in the industry, including a working definition developed by the SPIDERWG and definitions used by the Commission and other industry organizations in various contexts. The drafting team also considered the Commission's description of the "IBR-DER" resources for which it was directing NERC to develop new requirements in Order No. 901 ("IBRs connected to the distribution system that in the aggregate have a material impact on the Bulk-Power System.").[75] The drafting team drew on several of these definitions to develop a proposed definition of Distributed Energy Resource (DER) that is sufficiently precise and suitable for defining requirements in Reliability Standards.

The drafting team considered alternative definitions that would not exclude load resources (e.g. energy efficiency and demand response). However, the impact of such load resources is typically reflected in base case load level assumptions rather than requiring explicit modeling

[75] Order No. 901 at P 4 n.14.

within reliability simulations. Thus, including such load resources within the definition of Distributed Energy Resource (DER) would not be suitable for the intended use in Reliability Standards. The phrase "generator or energy storage technology" is intended to capture a wide range of energy sources, including both synchronous resources and IBRs, but excludes devices that only inject Real Power transiently or that are not intended to export Real Power or offset Real Power load. The phrase "in non-isolated parallel operation with the Bulk-Power System" is intended to refer to the types of resources that may impact the reliability of the Bulk-Power System. A resource that is operated only in islanded or isolated mode does not have electrical connectivity to the Bulk-Power System, and it therefore would not have an impact on the reliability of the Bulk-Power System. Last, the phrase "connected to a distribution system" is intended to convey that a Distributed Energy Resource (DER) is a resource that is connected to the distribution system and not the Bulk-Power System; the phase "including one connected behind the meter of an end-use customer that is supplied from a distribution system" clarifies this connectivity includes a resource directly connected to a customer system.

In developing the proposed definition, the drafting team considered including a voltage threshold to define "distribution," but declined to do so for the following reasons. The industry often differentiates transmission from distribution based on the functional use of the system rather than standardized technical specifications. Defining electric facilities as either transmission or distribution is often based on state laws or regulations, Independent System Operator/Regional Transmission Organization tariffs, or utility tariffs. Even though definitions may vary from region to region, there are no conflicts in how applicable entities define distribution and transmission facilities for a given region. The drafting team also considered suggestions to include an active power threshold in the proposed definition. The drafting team declined to do so on the basis that

such technologies can vary in size, and a threshold might inappropriately exclude technologies that are properly considered a Distributed Energy Resource (DER). While the proposed definition is neutral as to size, planning entities may include active power or other entity-determined thresholds in determining which Distributed Energy Resources (DER) to incorporate into planning processes.

D. Requirement R1 and Attachment 1

Proposed Reliability Standard MOD-032-2 Requirement R1 would require each Planning Coordinator and each of its Transmission Planners to jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area. Responsible entities would then be required to provide the data under Requirement R2. Proposed Requirement R1 and the referenced Attachment 1 reflect several improvements intended to improve how planning entities collect data and information regarding the IBRs and Distributed Energy Resources in the planning area, so that the impacts and performance of these resources can be better reflected in system models and thus the planning studies that rely on those models. These improvements are discussed below.

1. Requirement R1

Proposed Requirement R1 would provide as follows:

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include:

1.1. The data listed in Attachment 1, including the entity responsible for each required item.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

1.4. Specifications of the following items for dynamic model submissions:

1.4.1. Required submission of:

• standard library models incorporated within the software(s) utilized to create the Interconnection-wide case(s);

• user-defined models; or

• both standard library models and user-defined models.

1.4.2. Where user-defined models are accepted, usability requirements for any submitted user-defined models including, at a minimum, requirements to provide model documentation and instructions for model set up and use.

1.4.2.1. Each Planning Coordinator and Transmission Planner shall provide their user-defined model requirements within 90 calendar days of receiving a written request for such data from other Planning Coordinators and Transmission Planners within the Interconnection.

Proposed Requirement R1 Part 1.1 would require the inclusion of data listed in Attachment 1, along with the entity responsible for providing each required item. Attachment 1 defines the information that is required to effectively model the interconnected transmission system for transmission planning studies, with three columns addressing data and information needed for steady-state, dynamics, and short circuit analyses. The modifications to Requirement R1 Part 1.1 would require the Planning Coordinator and its Transmission Planners to identify the entity or category of entities responsible for the data items listed in Attachment 1. This modification aligns with changes made to the introductory paragraph in Attachment 1, clarifying that data obligations are established by the Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures. While Attachment 1 continues to specify a "typical" functional entity for providing certain data, the added language in Requirement R1 Part 1.1 would reinforce the authority of the Planning Coordinator/Transmission Planner to request data from the appropriate entities, thereby creating obligations for those entities to provide the requested data, even if those

entities are not the "typical" entities that would provide such data. The drafting team determined that such flexibility would be appropriate after considering multiple stakeholder comments suggesting that the entity best positioned to provide accurate data regarding DERs for which there is no registered Distribution Provider present may vary by planning area.[76]

Proposed Requirement R1 Part 1.2, relating to specifications for data format, level of detail, case types or scenarios to be modeled, and data submission schedules, is carried forward unchanged from the currently effective version. Proposed Requirement R1 Part 1.3, relating to specifications for distributing or posting data requirements and reporting procedures, is also carried forward unchanged.

Proposed Requirement R1 Part 1.4 is a new requirement part that addresses required specifications for dynamic model submissions. Proposed Requirement R1 Part 1.4 includes requirements for the Planning Coordinator/Transmission Planner to specify submission of standard library dynamic models, user-defined models, or both. The phrase user-defined models should be considered interchangeable with user-written models, equipment-specific models, and other such terms. Allowing the specification of standard library models incorporated within modeling software is responsive to Commission concerns about usability, and it would allow Planning Coordinators to maintain current requirements for generic models that may be necessary for the creation of large Interconnection-wide base cases. Allowing the specification of user-defined models is responsive to industry feedback expressed during the NERC Industry Engagement workshops. [77] Proposed Requirement R1 Part 1.4 also provides the Planning

[76] *See* Order No. 901 at P 141 (directing NERC to determine which entity should provide data and models for IBR-DER where no registered Distribution Provider is present through the standard development process). *See also* Technical Rationale, Exhibit E at 6 (discussing how the drafting team considered stakeholder comments).

[77] *See* Technical Rationale, Exhibit E at 7. Additional information regarding the Milestone 3 workshops is available on the NERC Standards in Development page, https://www.nerc.com/pa/Stand/Pages/Standards-Under-Development.aspx.

Coordinator/Transmission Planner with the authority to require submission of both model types. Proposed Requirement R1 Part 1.4.2.1 would require each Planning Coordinator and Transmission Planner accepting user-defined models to provide their user-defined model requirements to other Planning Coordinators and Transmission Planners within the Interconnection upon request.

In Order No. 901, the Commission directed NERC to "determine…which nation-wide approved component models are needed to build IBR plant models for steady state, short-circuit, and dynamics studies" and to develop Reliability Standards that would require the "use of approved industry generic IBR models."[78] The Commission also directed NERC "to develop new or modified Reliability Standards that require the sole use of nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build interconnection-wide models."[79]

In considering how to address the directive regarding the use of approved industry generic IBR models, the drafting team considered that the practical considerations and timelines associated with maintaining a pre-approved model library could conflict with broader objectives to have accurate models, particularly as IBR technology rapidly progresses. The ERO does not presently maintain an "acceptable model library," defining all acceptable models, but rather an "unacceptable model library," identifying models for which issues have been identified. Given the pace of technological development, it may prove difficult to both develop and maintain an approved generic model library in a timely fashion. The approach taken in proposed Reliability Standard MOD-032-2 specifying the use of standard library component models approved and offered by software simulation tools, along with a backstop against the unjustified use of models

[78] Order No. 901 at P 124. *See also id.* at P 108 ("As discussed in more detail in section IV.C of this final rule, we are also directing NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models that accurately reflect the behavior of all IBRs during steady state, short-circuit, and dynamic conditions.")

[79] *Id.* at P 125.

determined to be generally unsuitable (*see* discussion of the Unacceptable Model List in Requirement R2 below), would ensure that models used in Interconnection-wide analysis are robust enough while accuracy is not compromised to any level of detail deemed necessary.

In considering the Commission's directive to require the "sole use" of approved generic models, the drafting team determined to employ an equally effective and efficient approach for addressing the underlying reliability concern. The drafting team understood the overarching goal of this directive would be to obtain IBR models that are accurate and usable by Planning Coordinators/Transmission Planners for building their Interconnection-wide models and planning cases. The drafting team considered that many entities have a different understanding for what is a "generic model," and that NERC as the ERO does not presently maintain a comprehensive list of approved generic models. The drafting team further considered that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 while offering more accurate representations of IBR behavior and characteristics. Therefore, in addressing this directive, the drafting team determined to build upon the modeling framework discussed above to allow Planning Coordinators to specify submission of generic models, user-defined models, or both. Where user-defined models are allowed, the Planning Coordinator/Transmission Planner must specify usability requirements. These usability requirements, which must include, at a minimum, requirements to provide model documentation and instructions for model set up and use, would address issues that are typically associated with user-defined models such as non-convergence. To ensure that there is transparency in building the Interconnection-wide cases, the Planning Coordinator/Transmission Planner must provide its user-defined model usability requirements to other Planning Coordinators/Transmission Planners within the Interconnection upon request. The drafting team concluded that this approach would

balance the practical limitations of "generic models" raised by industry with the need for an improved uniform modeling framework that accurately reflects the behavior and characteristics of IBRs in Order No. 901. This approach would also maintain flexibility to accommodate the rapid pace of technological change.

2. Attachment 1

Attachment 1 to the proposed standard, referenced in Requirement R1, defines the information that is required to effectively model the interconnected transmission system for transmission planning studies. Attachment 1 has three columns addressing data and information needed for steady-state, dynamics, and short circuit analyses.

As an initial matter, proposed Attachment 1 would replace all references to the Load-Serving Entity as a typical entity responsible for providing certain data with the Distribution Provider. This includes data regarding aggregate demand, static VAR systems and flexible alternating current transmission systems (FACTS), and other data as needed. This change is consistent with the revised Applicability of the proposed standard discussed above. Proposed Attachment 1 also reflects revisions corresponding to proposed Requirement R1 Part 1.1, to specify that while typical responsible entities are identified for each data item, the Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures will specify entity responsibility and data flow processes.

Proposed Attachment 1 reflects several revisions to improve data that is collected for IBRs, including Bulk-Power System connected IBRs owned by Generator Owners registered with NERC for mandatory compliance purposes (referred to as "registered IBRs" in Order No. 901) and Bulk-Power System IBRs that fall below the threshold that would require the owner to register with NERC (referred to as "unregistered IBRs" in Order No. 901). Proposed Attachment 1 also reflects

several revisions to improve the data collected for DERs, including IBR-DER and other DER, that in the aggregate can affect the reliability of the Bulk-Power System.

These revisions address the Commission's directive in paragraph 78 to "establish uniform, minimum categories or types of data that must be provided so that Bulk-Power System planners and operators can predict the behavior of all IBRs,"[80] as well as its directive in paragraph 108 to "determine through its standards development process the minimum categories or types of data that must be provided to transmission planners, transmission operators, transmission owners, and distribution providers necessary to predict the behavior of all IBRs and to ensure that compliance obligations are clear."[81] The revisions, which are shown in redline in Exhibit A-1, are discussed below.

a) IBR Data

To improve Attachment 1 as it relates to IBR data, the drafting team revised steady-state column, item 3 to include data on storage units as well as generating units. The term "generating unit" already includes IBR generators such as solar and wind. The drafting team determined to add storage explicitly because storage is typically not classified as a generation resource because it has no primary energy source and consumes more energy than it injects when considering losses. Proposed footnote 4 clarifies that generating and storage units would include IBRs and synchronous condensers.

In the dynamics column, the drafting team replaced the phrase "photovoltaic systems" with "Inverter-Based Resources" in item 7. IBR is a more encompassing term that includes photovoltaic systems. Under 7.a, the drafting team specified the type or data that must be included. The first

80 *Id.* at P 78.

81 *Id.* at P 108.

three, IBR parameters, settings, or capabilities related to momentary cessation, tripping, and ride-through, were added in consideration of the Commission's directive in Order No. 901 paragraph 141.[82] The addition of parameters, settings, or capabilities related to voltage control was added in recognition of the importance of voltage control performance for normal and post-disturbance operations.[83] The addition of parameters, settings, or capabilities related to frequency control was added because frequency response of IBR is important for studying system reliability.[84]

Dynamics item 6 is revised to refer to type 1 and type 2 wind turbines, which are not IBR, to avoid overlap with new IBR item 7.

Proposed footnote 5 indicates that the Planning Coordinator/Transmission Planner data requirements and reporting procedures need to account for what Order No. 901 identified as "unregistered IBRs"; in footnote 5, these IBRs are described as "IBRs that are not DERs and do not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes". Proposed footnote 5 also indicates that the Transmission Owner is the entity that would typically be responsible for providing such data, consistent with Order No. 901 paragraph 102.[85]

---

[82] *Id.* at P 141 ("We also direct NERC to require the generator owners of registered IBRs and the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators…dynamic models that accurately represent the dynamic performance of registered and unregistered IBRs, including momentary cessation and/or tripping, and all ride through behavior.")

[83] *See* Technical Rationale, Exhibit E at 10 (citing NERC*, IBR Performance and Modeling, Level 3 Alert*. May 2025, https://www.nerc.com/pa/rrm/bpsa/Alerts%20DL/Level%203%20Alert%20Essential%20Actions%20IBR%20Performance%20and%20Modeling.pdf)

[84] *See* Technical Rationale, Exhibit E at 10 (citing NERC, *Lessons Learned: Incorrect IBR Primary Frequency Response Logic Caused Negative ACE*, https://www.nerc.com/pa/rrm/ea/Lessons%20Learned%20Document%20Library/LL20240501_Incorrect_IBR_Primary_Frequency_Response_Logic_Caused_Negative_ACE.pdf).

[85] Order No. 901 P 102 ("[W]e direct NERC to submit to the Commission for approval one or more new or modified Reliability Standards that require: (1) transmission owners to provide to Bulk-Power System planners and operators modeling data and parameters for unregistered IBRs in their transmission owner areas that, individually or in the aggregate, materially affect the reliable operation of the Bulk-Power System…").

b) DER Data

To improve Attachment 1 as it relates to DER data, new item 9 in the steady-state column addresses aggregate DER data, including location, Real Power capability, and DER type as required items. The drafting team selected these three items as the minimum information needed to use data and make assumptions for power system modeling and analysis, but the Planning Coordinator/Transmission Planner have the authority to request additional data items as deemed necessary. Notably, while Order No. 901 refers to data from "IBR-DER in the aggregate,"[86] the drafting team determined that proposed Reliability Standard MOD-032-2 should address all DER regardless of type. This change is consistent with one of the original Standard Authorization Requests initiating Project 2022-02 to improve how DER is reflected in system models and planning studies.

"Aggregate DER" is specified in steady-state column item 9 to indicate that aggregate DER data, rather than individual DER facilities, would be represented in most Planning Coordinator/Transmission Planner study models. This is consistent with Order No. 901 which required data and modeling of at a minimum "IBR-DER *in the aggregate*".[87] Required items include location, real power capability, and DER type. In certain circumstances, such as in the case of a large DER, the Planning Coordinator/Transmission Planner may decide to represent the individual DER given the potential impacts on the Bulk-Power System.

In the dynamics column, three items were updated, consistent with the Order No. 901 directive to "ensure that the proposed new or modified Reliability Standards account for the

---

[86] *See, e.g.*, *id.* ("[W]e direct NERC to submit to the Commission for approval one or more new or modified Reliability Standards that require:… (2) distribution providers to provide to Bulk-Power System planners and operators modeling data and parameters for IBR-DERs in the aggregate in their distribution provider areas where the IBR-DERs in the aggregate materially affect the reliable operation of the Bulk-Power System.")

[87] *See id.* (emphasis added).

dynamic performance of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System."[88] First, item 5, previously "demand", was updated to be "aggregate demand" to be consistent with the steady state column and general industry practices of modeling load dynamics for aggregate demand (e.g., composite load model). Second, Dynamics item 10 was updated to include "Aggregate Distributed Energy Resource (DER) data" along with the subitems: "parameters, settings, or capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control"; and "indication whether DERs are subject to tripping in conjunction with UFLS or UVLS". As explained in the Technical Rationale, information regarding momentary cessation, tripping, and ride-through of aggregate DERs is needed for dynamics studies; this inclusion is also consistent with paragraph 141 of Order No. 901.[89] Voltage control of DERs can alter the exchange of reactive power between distribution and transmission systems and may affect the results of reliability studies.[90] Frequency control must be accounted for because DER interconnections under different standards have different frequency response characteristics that may affect dynamics study results. Last, accurately representing DER tripping as part of UFLS or UVLS operation is necessary for designing and evaluating UFLS or UVLS programs. Third, item 10 in the dynamics column indicates that aggregate DER dynamics modeling data (parameters, settings, or capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control) may need to be inferred due to data availability and

88 *Id.* at P 141.

89 *See* Technical Rationale, Exhibit E at 12 (citing NERC's Lessons Learned, LL20220401 "Distributed Energy Resource Performance Characteristics during a Disturbance"). *See also* Order No. 901 at P 141 ("Further, we direct NERC to require distribution providers to provide…aggregated dynamic models that adequately represent the dynamic performance of IBR-DERs on their systems that in the aggregate have a material impact on the Bulk-Power System, including momentary cessation and/or tripping, and all ride through behavior.")

90 *See id.* at 12.

practical limitations. Further considerations for inferring data are described in the Technical Rationale.[91]

Proposed Attachment 1 also reflects several revisions and improvements in the table footnotes.

First, proposed footnote 3 associated with "aggregate demand" is modified to clarify that the gross demand is needed at each load serving bus. Collecting and modeling a net demand that incorporates offsets due to output from DERs is not consistent with a modeling framework that explicitly represents DERs. The proposed footnote also clarifies that this calculation may be impacted by an aggregation threshold for DER specified by the Planning Coordinator/Transmission Planner.

Second, proposed footnote 6 identifies that the Distribution Provider is the typical responsible entity for collecting and providing data for DERs connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider's system. Proposed footnote 6 also provides that the Transmission Owner would be the typical responsible entity for collecting and providing data for DERs where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner's system. This footnote addresses Order No. 901 paragraphs 102 and 108, requiring Distribution Providers to provide information regarding DERs in their areas, as well as paragraph 106, relating to the appropriate registered entity to provide information regarding DERs where there is no registered Distribution Provider responsible for providing the information.[92] This

---

91 Technical Rationale, Exhibit E at 12-13.

92 *See* Order No. 901 at PP 102, 106, and 108.

footnote also addresses similar aspects of the directives in paragraph 141 and 157.[93] While the proposed footnotes identify the "typical" entities for providing such data, the Planning Coordinator/Transmission Planner would have the flexibility under revised Requirement R1 to identify the most appropriate entity to provide such data in the planning area. The drafting team determined that such flexibility would be appropriate after considering comments during the standard development process suggesting that entities other than the Transmission Owner may be better positioned to provide data regarding DER in a given planning area.

Third, proposed footnote 7 clarifies that aggregation thresholds for DERs may be specified in the joint Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1. The drafting team considered that a determination of whether an "unregistered IBR" or aggregate IBR-DER would materially affect the Bulk-Power System as provided in Order No. 901 would require engineering judgment, and thus specifying precise thresholds in a Reliability Standard may not be appropriate. The NERC DER Modeling Study Report provides considerations for identifying appropriate thresholds for a planning area.[94]

In developing these revisions, the drafting team considered the Order No. 901 paragraph 146 directive to require the use of the DER-A model or successor models to represent the behaviors of IBR-DERs. As explained previously, proposed Reliability Standard MOD-032-2 would require

---

[93] *Id.* at P 141 ("Furthermore, we acknowledge that there may be areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider. Therefore, we…direct NERC to determine the appropriate registered entity responsible for providing adequate data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and to identify the registered entities for coordinating, verifying, and keeping up to date the respective dynamic models.") *See also id.* at P 157 ("Furthermore, for those areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we modify the NOPR proposal to direct NERC to determine the appropriate registered entity responsible for the data and parameters of IBR-DERs in the aggregate and to establish a process that requires identified registered entities to coordinate, validate, and keep up to date the system models.")

[94] *See* NERC, *DER Modeling Study: Investigating Modeling Thresholds* (Nov. 2022), https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf.

the modeling of aggregate DER data through the revisions to Requirement R1 and Attachment 1. (The provision of estimated data is addressed in Requirement R2, discussed in the following section). The drafting team considered that the currently available DER_A model is sufficient only for positive sequence phasor domain simulations. With the variety of other simulation domains (such as EMT and short circuit) necessary to study IBRs, mandating the use of this model could prevent Planning Coordinators/Transmission Planners from performing their studies. Further, given the pace at which models are rapidly evolving, specifying the use of one particular model or a successor model in a Reliability Standard could ultimately create challenges to accurate modeling. NERC would need to initiate its standard development process to accommodate higher fidelity models that are developed in the future, meaning any changes that could advance the state of modeling might be several years delayed. NERC's proposed framework for modeling in proposed Reliability Standard MOD-032-2 would not specify the use of specific models, models which might quickly become surpassed by better models, but rather define requirements for model quality and accuracy that would allow flexibility in model selection and advance the state of modeling now and into the future. For these reasons, the drafting team considered that its proposed approach represents an equally effective and efficient means of addressing the reliability concern underlying the Commission's directive regarding the use of the DER_A model.

E. Requirement R2

Proposed Reliability Standard MOD-032-2 Requirement R2 establishes requirements for Balancing Authorities, Distribution Providers, Generator Owners, Resource Planners, Transmission Owners, and Transmission Service Providers to provide data according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. Proposed Requirement R2 would revise the currently effective

requirement to address the provision of estimated data and the submission of models deemed generally unacceptable for studies as follows:

R2. Each Balancing Authority, Distribution Provider, Generator Owner, ~~Load Serving Entity,~~ Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient.

2.1. If a functional entity is required to provide data for one or more of the following and is unable to gather such data, the functional entity shall provide an estimate of the data, an explanation of the limitations of the estimated data, and the method used for estimation;

- Aggregate DER data; or
- Data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.

2.2. If a functional entity is required to provide dynamic models, the functional entity shall provide the models accepted by the Transmission Planner under MOD-026, where such models are available.

2.3. If a functional entity provides a model that is included on the Unacceptable Models List maintained by the ERO in accordance with the process described in the MOD-032 Supporting Document, the functional entity shall also provide a technical rationale justifying the use of that model.

Proposed Requirement R2 would replace the Load Serving Entity with the Distribution Provider, consistent with changes made to the Applicability of the standard and Attachment 1 discussed in previous sections.

Proposed Requirement R2 Part 2.1 is a new requirement part addressing how registered entities would provide estimated data for resources owned by unregistered entities if they are unable to gather the actual data. In Order No. 901, the Commission directed NERC to develop requirements addressing the provision of data related to "unregistered IBRs" and "IBR-DERs in

the aggregate that have a material impact on the BPS."[95] The Commission, however, recognized that NERC registered entities may be unable to gather such data from unregistered entities. Finding that estimated data would represent an improvement upon having no data at all, the Commission directed that NERC develop requirements addressing the provision of estimated data.[96] Similar directives address the provisions of dynamic models using estimated data.[97] Proposed Requirement R2 Part 2.1 would require the entity responsible for providing information regarding "unregistered IBR" or aggregate DER data under a Planning Coordinator/Transmission Planner data specification to estimate such data if it is unable to gather it, and to provide this estimate along with an explanation of the limitations of the estimated data and the method used for estimation to the Planning Coordinator/Transmission Planner. As explained in the Technical Rationale, proposed Requirement R2 Part 2.1 would allow entities flexibility to develop estimates from interconnection documentation, measured quantities, estimated quantities, or other sources. A combination of approaches may be appropriate due to data availability or sufficiency issues. The Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures may identify acceptable methods and their application.[98]

Additionally, and as further explained in the Technical Rationale, proposed Requirement R2 Part 2.1 addresses the estimation of aggregate DER data, regardless of resource type. While Order No. 901 directed NERC to develop requirements addressing the estimation of IBR-DER data in particular, Project 2022-02 was also charged with developing Reliability Standards modifications to improve how DER in general is reflected in system studies. In drafting proposed

95 Order No. 901 at P 161.

96 *Id.* at PP 104, 105, 106.

97 *See id.* at P 141.

98 *See* Technical Rationale, Exhibit E at 7-8.

Reliability Standard MOD-032-2, the drafting team determined to create a consistent estimation framework applicable for all DER technologies when DER data cannot be gathered.[99]

Proposed Requirement R2 Part 2.2 is a new requirement part intended to confirm the relationship between proposed Reliability Standard MOD-032-2 and the separately-filed proposed Reliability Standard MOD-026-2 addressing Order No. 901 directives related to establishing a standard uniform model verification process.[100] The intent of Order No. 901 is to ensure that accurate (i.e. validated and verified) models are collected under proposed Reliability Standard MOD-032-2. However, facility models submitted under the MOD-032 standard are often submitted before physical validation can be completed (e.g., for planned facilities). Proposed Requirement R2 Part 2.2 would require the model submitted by the functional entity be the model that was verified and validated (and accepted by the Transmission Planner) in accordance with MOD-026, if available.

Proposed Requirement R2 Part 2.3 provides that entities providing any model included on the Unacceptable Models List maintained by the ERO shall provide a technical justification supporting its use. The Unacceptable Models List is included as Exhibit F to this petition. The Unacceptable Models List is a successor to the NERC *Acceptable Models List*, which itself was a

---

[99] *See id.* at 7-8. As discussed in Section VIII below, NERC is including a Potential Noncompliance Abeyance Period for this requirement in proposed Reliability Standard MOD-032-2 to facilitate close monitoring of the implementation of these estimation provisions.

[100] *See* Order No. 901 at P 143 ("Regarding EPRI's recommendation to require appropriately parameterized plant models, we agree that the model verification process of an IBR model should include steps to ensure that responsible entities provide both verified and appropriately parameterized models. Additionally, we agree with IRC's recommendation that the plant model verification process should include requirements for equipment to be represented as installed in the field. While we decline to include this level of detail in the directive to NERC, we nonetheless direct NERC to establish a standard uniform model verification process. A uniform model verification process will ensure that all entities use the same set of minimum requirements to verify that all generation resource (i.e., synchronous and non-synchronous) models are complete and that the models accurately represent the dynamic behavior of all generation resources at a sufficient level of fidelity for Bulk-Power System planners and operators to perform valid interconnection-wide, planning, and operational studies. Therefore, we direct NERC to define the model verification process and to require consistency among the model verification processes for existing Reliability Standards (e.g., FAC-002, MOD-026, and MOD-027) and any new or modified Reliability Standards.")

successor to the NERC *Libraries of Standardized Powerflow Parameters and Dynamic Models*, a document created in 2015 by the Modeling Working Group of the former NERC Planning Committee[101] which was referenced in Order No. 901.[102] The Unacceptable Models List reflects models that have been identified as having known issues. As noted in Section VI.D discussing proposed Requirements R1 and Attachment 1, the drafting team considered the challenges of maintaining an up-to-date library of approved models in developing MOD-032 requirements responsive to the Commission's directives in Order No. 901. It was determined that a standard that would define both positive attributes for such models, as well as models that should not be used without caution, would represent an equally effective and efficient means of addressing the Commission's directives regarding the use of approved generic models.

Initially, the drafting team proposed to prohibit any use of a model on the Unacceptable Models List. However, the drafting team considered stakeholder comments noting that a model on the Unacceptable Models List may be the best or only available model for some generators, particularly for some synchronous generators and for units manufactured by companies that are no longer in business.[103] Proposed Requirement R2 Part 2.3 would allow for the submission of such a model if accompanied by a technical rationale justifying its use. This technical rationale would help ensure that models with known deficiencies are not being submitted without good reason. This requirement would thereby advance the state of modeling overall consistent with the intent of Order No. 901. This requirement is not intended to supplant the process described in

---

101 NERC Modeling Working Group, *NERC Libraries of Standardized Powerflow Parameters and Standardized Dynamics Models* version 1 (Oct. 15, 2015), available at https://www.nerc.com/comm/PC/Model%20Validation%20Working%20Group%20MVWG%202013/NERC%20Standardized%20Component%20Model%20Manual.pdf.

102 *See* Order No. 901 at P 122 n.232.

103 *See* Technical Rationale, Exhibit E at 9.

Requirement R3 by which the Planning Coordinator or Transmission Planner may identify technical concerns with the model or the supporting technical rationale.

NERC proposes to maintain the Unacceptable Models List separately from proposed Reliability Standard MOD-032-2. Maintaining the list separately would allow NERC to make updates more expeditiously than may be possible under the Reliability Standards development process. To balance concerns about due process for mandatory and enforceable elements of Reliability Standards with the need for agility, proposed Reliability Standard MOD-032-2 includes the process by which NERC would update the Unacceptable Models List. This process includes multiple steps intended to ensure fair and open vetting of any proposed changes to the Unacceptable Models List, including the technical basis for such changes.

To update the Unacceptable Models List, a person or entity would submit a detailed change request to NERC identifying the model, the nature of the request (i.e. add model as unacceptable model or remove model as unacceptable model), and technical supporting documentation describing the ability or inability of the model to appropriately represent small and large disturbance behavior. The review process contemplates engagement with the Reliability and Security Technical Committee or other industry subject matter experts in vetting each change request and recommending dispositive action. NERC would provide an opportunity for public comment on any proposed change request. Upon approving any change to the Unacceptable Models List, NERC would provide public notice through an announcement, a posting to the NERC website, and an informational filing to the applicable governmental authorities. This notice would include the effective date for any change, so that entities using models that are added to or removed from the Unacceptable Models List would have notice of when their obligations with respect to the submission of those models would change.

In recognition of concerns raised during the development process for proposed Reliability Standard MOD-032-2, it is NERC's intent that changes to the process for revising the Unacceptable Models List would be made through the standard development process, while changes to the Unacceptable Models List itself would be made according the more agile process specified in Reliability Standard MOD-032-2.

F. Requirement R3

Proposed Reliability Standard MOD-032-2 Requirement R3 addresses the identification of technical concerns with data submitted under Requirement R2. Proposed Requirement R3 would revise the currently effective requirement as follows:

> R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Distribution Provider, Generator Owner, ~~Load Serving Entity,~~ Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows:
>
> 3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data~~;~~, that is responsive to the technical concern.
>
> 3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

Revisions to replace the Load Serving Entity with the Distribution Provider are consistent with other revisions to the proposed standard discussed in previous sections. The addition of the phrase "responsive to the technical concern" in proposed Requirement R3 Part 3.1 would support the goal of Requirement R3, which is to resolve technical concerns that are identified by the Planning Coordinator or Transmission Planner with submitted data or models. Entities providing models may not always know that their update or explanation will resolve the technical concern. Adding the phrase "responsive to the technical concern" would convey that further information exchanges between the planning and submitted entities may be needed beyond the initial response.

G. Requirement R4

Proposed Reliability Standard MOD-032-2 Requirement R4 is carried forward unchanged from the currently effective standard, as follows:

> R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area.

As discussed more fully in Section VI.H.2, NERC determined that no revisions were needed to this requirement to address the Commission Order No. 901 directives; in particular, the paragraph 161 directive relating to the development of an "annual process to coordinate, validate, and keep-up-to date the transmission planning, operations, and interconnection-wide models."

H. Consideration of Order No. 901 Directives

Proposed Reliability Standard MOD-032-2 is responsive in whole or in part to multiple Commission directives regarding IBR data and models in Order No. 901.[104] In the preceding sections, NERC explained how proposed Reliability Standard MOD-032-2 addressed in whole or in part Commission directives in paragraphs 76, 78, 102, 106, 108, 122, 124, 125, 141, 146, and 157 of Order No. 901. The Commission's directive regarding the implementation of Reliability Standards responsive to its directives (paragraph 226) is addressed in Section IX below.

This section discusses how the drafting team for proposed Reliability Standard MOD-032-2 considered other Commission directives not specifically addressed above, including those in paragraph 77 and 161. Exhibit D provides NERC's consideration of the relevant directives in a directive-by-directive format.

---

[104] Order No. 901 at P 85.

1. Paragraph 77 Regarding Consideration of Transmission Owner Data Sharing

In paragraph 77 of Order No. 901, the Commission directed NERC to consider commenter suggestions in the underlying proceeding to add data sharing requirements from Transmission Owners to Generator Owners and Generator Operators.[105] The drafting team considered these suggestions as directed by the Commission. The drafting team determined that such a requirement would not align with the stated purpose of the MOD-032 standard, which is to establish consistent modeling data requirements and reporting procedures for the development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system. The drafting team further determined that requests for Transmission Owners to provide data to Generator Owners and Generator Operators are most appropriately addressed through processes that exist outside of the MOD-032 Reliability Standard, and it concurred with the Commission's suggestion in Order No. 901 paragraph 77 that these processes are already in place.

2. Paragraph 161 Regarding the Uniform Modeling Framework

In paragraph 161, the Commission directed NERC to develop new or modified Reliability Standards that:

> [R]equire planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities to establish for each interconnection a uniform framework with modeling criteria, a registered modeling designee, and necessary data exchange requirements both between themselves and with the generator owners, transmission owners, and distribution providers to coordinate the creation of transmission planning, operations, and interconnection-wide models (i.e., system models) and the validation of each respective system model.

Additional aspects of this directive address verification of data and models.

[105] *Id.* at P 77.

The proposed Reliability Standards discussed in Section V above collectively address the Commission's directive in Order No. 901 paragraph 161. The Project 2022-02 drafting team modified the MOD-032 standard to ensure it captures the uniform framework with modeling criteria and necessary data exchange requirements for registered IBRs, "unregistered IBRs", and DER (to include IBR-DER). Modifications in the TOP-003 and IRO-010 standards, addressed below, are intended to promote consistency in the models submitted for planning purposes and operations purposes so that the entities responsible for planning and operating the Bulk-Power System are all working from similar models that accurately represent the resources within their respective footprints.

A uniform modeling framework is established in the proposed Reliability Standard MOD-032-2 through improvements to Requirements R1, R2, and R3 and Attachment 1, discussed above. The inclusion of the ERO Unacceptable Models List (and the associated revision process) and additional requirement language aims to ensure uniformity in processes and models to facilitate the exchange of neighboring entities' respective planning/operation models and to build Interconnection-wide models. Where appropriate, there is flexibility built into this framework to accommodate differences in planning area modeling needs. The Planning Coordinator/Transmission Planner are allowed to require standard library models, but if user-defined models satisfy usability criteria and the standard's requirements, they are not prohibited. The framework explicitly allows for the submission of standard library models along with submission of user-defined models which allows for the use of standard library models when combining neighboring transmission system models and Interconnection-wide models. If user written models are accepted, the Planning Coordinator/Transmission Planner are required to share their usability criteria with other planning entities within the Interconnection upon request.

The drafting team added specific items regarding IBRs (including "unregistered IBRs") and DER (including IBR-DER) to Attachment 1 of the MOD-032 standard, thereby ensuring their inclusion in Planning Coordinator/Transmission Planner data specifications. While the Transmission Owner would be the typical entity for providing "unregistered IBR" data, and the Distribution Provider would be the typical entity to provide DER data, the drafting team recognized that there may be some variations as to whom might have the most accurate and usable data for unregistered resources in the planning area. Therefore, the drafting team modified the requirement language to provide the Planning Coordinator/Transmission Planner with the flexibility to identify the most appropriate entity to provide the listed data.

The Planning Coordinator/Transmission Planner may also specify DER thresholds that may be appropriate when considering impact on their local areas. A determination if an "unregistered IBR" or aggregate IBR-DER would "materially affect" the Bulk-Power System requires engineering judgment and the consideration of other material factors; the drafting team determined that it would not be prudent to prescribe any specific approach in a Reliability Standard. The drafting team added footnote 7 in Attachment 1 of proposed Reliability Standard MOD-032-2 to allow Transmission Planners and Planning Coordinators to specify DER thresholds that may be appropriate when considering impact to their local areas.

As discussed more fully in Section VII below, the drafting team also revised the IRO-010 and TOP-003 standards to include IBRs specifically. To the extent IBR modeling data is deemed necessary under the IRO-010 and TOP-003 standards, it should be consistent with modeling data provided for planning purposes. Consistency in models is important to ensure Bulk-Power System planners and operators are working from similar and high quality models; however, the drafting

team recognized that operations entities may require adjustments from the model submitted for planning purposes to satisfy the needs in an operations environment.

NERC considered the fidelity/accuracy components of the Order No. 901 directives to be within the scopes for Projects 2020-06 and 2021-01, rather than Project 2022-02. However, the model framework established with proposed Reliability Standard MOD-032-2 does facilitate model fidelity and accuracy by allowing flexibility in model selection, so that entities may select the most representative model for the resource meeting Planning Coordinator/Transmission Planner requirements (rather than mandating use of a defined set of models which may quickly become out-of-date). Models that are known to have fidelity issues (i.e. models on the Unacceptable Models List) are not to be submitted without technical justification. Models submitted under proposed Reliability Standard MOD-032-2 shall be the models verified under proposed Reliability Standard MOD-026-2, where available. System models validated under proposed Reliability Standard MOD-033-3 shall be developed in accordance with data provided under proposed Reliability Standards MOD-032-2 and MOD-033-3.

Regarding that part of the directive to keep models up to date, proposed Reliability Standard MOD-032-2 would continue to provide for timely updates by requiring a schedule for submission of data at least once every 13 calendar months. System models would thus be built on updated data and models, which are verified and validated in accordance with the proposed Reliability Standards MOD-033-2 and MOD-026-2.

Regarding that part of the directive addressing a "registered model designee" for building the Interconnection-wide cases, NERC considered the directive and concluded that the present MOD-032 ERO modeling designee framework, with notable enhancements since 2023, presents an equally effective and efficient alternative to designating an entity on the NERC Compliance

Registry to perform the tasks of Interconnection-wide model building. Further, the present framework, with these recent enhancements, has distinct advantages over designating a responsible entity in that it maintains ongoing, forward-looking oversight of the Interconnection case building process, with case quality or process issues addressed as they are identified, rather than compliance or audit-focused oversight of specific entities that by nature has a retroactive focus.

Currently effective Reliability Standard MOD-032-1 Requirement R4 requires each Planning Coordinator to make available models for its planning area provided under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support the creation of the Interconnection-wide cases. This is not changed in proposed Reliability Standard MOD-032-2 Requirement R4. Coordination and fidelity/accuracy concerns, however, are addressed throughout the process, which would result in better and higher quality models being submitted to the ERO or its designee. As noted above, proposed MOD-032-2 Requirement R1 Part 1.1 would require the Planning Coordinator/Transmission Planner to identify the entity responsible for each required item in Attachment 1, including the newly added items for IBR and DER. The entity must then provide the information in accordance with Requirement R2. A new Requirement R2 Part 2.2 has been added to require that if the entity is required to provide dynamic models, that these be the models accepted by the Transmission Planner under MOD-026, if available. This provision would provide for a clearer link between the two standards and facilitate coordination and model updates needed by registered entities. Proposed Reliability Standard MOD-032-2 Requirement R3 would continue to serve to address technical concerns with the data submitted under Requirement R2.

As to which entity builds the Interconnection-wide base case model, the ERO has designated entities with a sufficient wide area view and focus on reliability for each Interconnection to perform this work. For the Texas Interconnection, the Texas Regional Entity

performs this work in coordination with ERCOT. For the Western Interconnection, the Western Electric Coordinating Council (WECC) performs this work. For the Eastern Interconnection, the Eastern Interconnection Reliability Assessment Group (ERAG), consisting of Regional Entities Midwest Reliability Organization (MRO), Northeast Power Coordinating Council, Inc. (NPCC), ReliabilityFirst (RF), and SERC Reliability Corporation (SERC), performs this work.[106] The ERAG also performs the base-case model creator function for the Quebec Interconnection in Canada. NERC facilitates the group of Regional Entity staff who are responsible for designated entity activities. This group meets periodically to discuss case quality metrics and to improve the Interconnection case-building process.

As the ERO, NERC is responsible for overseeing and ensuring that these designated entities perform their activities in a satisfactory manner. In 2023, the Officers Leadership Team of the ERO Enterprise approved the MOD-032 Designee process document. This process document reflects the maturation of this aspect of the ERO's activities and contains clauses and processes that require the designee for the Interconnection to perform specific duties. Each designee must have certain attributes, including a governance structure responsive to the needs of Planning Coordinators, with clear roles and responsibilities for model creation, transparency in data requirements, establishing timeframes for review cycles, and defining security and access to models. This process document is very much a "living document," intended to be reviewed each year as part of coordinated ERO Enterprise assessments under the Regional Delegation

[106] Regarding the ERAG, there is also an Eastern Interconnection Regional Entity Agreement among MRO, NPCC, RF, and SERC. In this agreement, there are provisions for oversight and coordination in how this group exercises its authority as the MOD-032 designee. Additional information on the Eastern Interconnection Regional Entity Agreement is available at https://www.rfirst.org/wp-content/uploads/2025/10/Eastern-Interconnection-Regional-Entity-Agreement.pdf.

Agreements and updated as needed to help ensure that the process is responsive to the needs of the grid.[107]

The process requires the MOD-032 designee to develop certain core cases, including core cases for the ERO for use in seasonal planning studies and event analyses. Other core cases are required for validating Interconnection Frequency Response obligations and event analyses. The process also requires the development of typical cases to support implementation of the TPL-001 standard. NERC or the Regional Entities may request additional specialized cases as needed.

Designated entities have certain responsibilities under this process, which includes several controls to ensure quality. Designated entities are responsible for collecting data from all Planning Coordinators. They are also responsible for developing and maintaining a case creation manual including the process by which cases must be assembled, tested for quality, and tested for case fidelity according to ERO case quality metrics. NERC performs an annual case quality assessment tracking the quality of the base cases created by the MOD-032 designated entities for the purposes of Interconnection-wide modeling and subsequent system studies.[108] The designated entity is responsible for having a process to address any case quality deficiencies identified by NERC.

Additionally, the designated entity must have a process to incorporate improvements identified in NERC's independent modeling assessments. Each designated entity must have a process for addressing recurring data or model errors found during case creation or quality and validation testing with Planning Coordinators, as well as a process for correcting cases for current or future years created in the latest case creation cycle that are already in use.[109] Examples of

---

[107] To aid the Commission in understanding how NERC has considered this directive in developing proposed Reliability Standard MOD-032-2, NERC is filing, for informational purposes, the current version of the MOD-032 Designee Process Document as Exhibit D-1.

[108] *See, e.g.*, NERC, *Case Quality Metrics: Annual Interconnection-Wide Model Assessment* (Nov. 2024), available at https://www.nerc.com/pa/RAPA/ModelAssessment/Pages/default.aspx.

[109] For more information, see Consideration of Order No. 901 Directives, Exhibit D at 28-29.

processes maintained by the designated entities for carrying out their responsibilities are publicly available on their respective websites.[110]

Collectively, the revisions in the proposed suite of Milestone 3 Reliability Standards are expected to improve the quality of information provided to Planning Coordinators/Transmission Planners, particularly for IBRs and DERs, and thus the quality of models submitted to the ERO under Reliability Standard MOD-032-2 Requirement R4 for building the Interconnection-wide cases. These standards improvements are expected to address critical IBR-related issues that NERC has identified in previous case quality assessments. Nevertheless, NERC will continue to oversee the development of the Interconnection-wide cases and report on case quality metrics consistent with the MOD-032 Designee process document. To the extent NERC or the MOD-032 designated entities identify that further refinements to the MOD-032 standard are needed to ensure that model quality issues are addressed in a timely manner, NERC will consider them through its standard development process at that time.

In summary, the proposed revisions to the MOD-032, MOD-033, and MOD-026 Reliability Standards addressed in NERC's Order No. 901 Milestone 3 work, along with the ERO designated entity framework discussed above for building Interconnection-wide cases, address the concerns underlying the Commission's directive in paragraph 161 of Order No. 901 regarding the coordination, updating, and timely development of quality Interconnection-wide models that accurately represent the behavior of IBRs in the Interconnection. Further, this framework advances consistency in modeling used across planning and ERO assessment activities. NERC therefore

[110] *See, e.g.,* WECC System Review Subcommittee, *2025 Data Preparation Manual for Interconnection-wide Cases*, https://www.wecc.org/wecc-document/13661; ERCOT Dynamics Working Group, *Dynamics Working Group Procedure Manual* (revision 24), https://www.ercot.com/committees/ros/dwg; ERCOT Steady State Working Group, *Steady State Working Group Procedure Manual* (Sep. 11, 2025), https://www.ercot.com/committees/ros/sswg; *and* ERAG Multiregional Modeling Working Group (MMWG), *Procedure Manual* (version 41), https://www.rfirst.org/wp content/uploads/2025/08/MMWG_Procedural_Manual_v41.pdf.

submits that this framework, to the extent it relies upon ERO-designated entities rather than an entity represented on the NERC Compliance Registry, represents an equally effective and efficient approach to addressing the reliability concerns underlying the Commission's paragraph 161 directive and helps to assure accurate Interconnection-wide models for system planning studies.

VII. JUSTIFICATION FOR APPROVAL: PROPOSED RELIABILITY STANDARDS IRO-010-6 AND TOP-003-8

Proposed Reliability Standards IRO-010-6 and TOP-003-8 reflect revisions to establish the uniform framework for the development of planning and operations models and ensure that IBR-specific data and parameters are addressed in Reliability Coordinator, Balancing Authority, and Transmission Operator data specifications.

As explained in Exhibit H, NERC developed the proposed Reliability Standard using NERC's standard development process. This process included multiple public comment and ballot periods. The NERC Board of Trustees adopted the proposed Reliability Standard on October 31, 2025.

This section provides a summary of the revisions, which are identical in proposed Reliability Standards IRO-010-6 and TOP-003-8. The revisions are shown in redline in Exhibits A-2 and A-3. Additional information may be found in the Technical Rationale, included as Exhibit E to this petition, the Complete Record of Development, included as Exhibit H, and the Consideration of Order No. 901 Directives, included as Exhibit D.

A. Overview of Proposed Standards

The title of Reliability Standard IRO-010-6 is Reliability Coordinator Data and Information Specification and Collection. The purpose of the proposed standard remains unchanged: to prevent instability, uncontrolled separation, or Cascading outages that adversely impact reliability, by ensuring each Reliability Coordinator has the data and information it needs to plan, monitor and

assess the operation of its Reliability Coordinator Area. The standard remains applicable to the Reliability Coordinator, Balancing Authority, Generator Owner (to include newly-registered Generator Owners under the expanded NERC Registry criteria), Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider.

The title of Reliability Standard TOP-003-8 is Transmission Operator and Balancing Authority Data and Information Specification and Collection. The purpose of the proposed standard remains unchanged: To ensure that each Transmission Operator and Balancing Authority has the data and information it needs to plan, monitor, and assess the operation of its Transmission Operator Area or Balancing Authority Area. The standard remains applicable to the Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider.

B. Revisions to Address IBR-Specific Data and Parameters

In addressing the relevant directives from Order No. 901, the Project 2022-22 drafting team reviewed the currently effective versions of the IRO-010 and TOP-003 standards and concluded that both standards had broad requirements that would allow the Reliability Coordinator, Transmission Operator, or Balancing Authority to request data and information needed to support their respective operations planning, analysis, or Real-time activities from generation and storage resources, including IBR.

To avoid ambiguity and ensure Order No. 901 directives are addressed, however, proposed Reliability Standards IRO-010-6 and TOP-003-8 would add "Inverter-based Resource (IBR)-specific data and parameters" to the list of information the Reliability Coordinator, Transmission Operator, and Balancing Authority must address in its documented data specifications. To demonstrate, proposed Reliability Standard IRO-010-6 Requirement R1 Part 1.1 would revise the currently effective requirement as follows:

R1. The Reliability Coordinator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include but not be limited to:

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments, as deemed necessary by the Reliability Coordinator, including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification ~~as deemed necessary by the Reliability Coordinator~~.

***

As demonstrated in Exhibit A-3, NERC proposes these revisions in Reliability Standard TOP-003-8 Requirement R1 Part 1.1 and Requirement R2 Part 2.1.

These revisions would address the Order No. 901 directives related to the sharing of IBR data with Reliability Coordinators, Transmission Operators, and Balancing Authorities, including the Commission directive in paragraph 76,[111] as well as directives addressing IBRs in operations models, including those in Order No. 901 paragraphs 122 and 161.[112] The phrase "IBR-specific data and parameters" is intended to reflect what the Commission describes in the order as "IBR models that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions." The relocation of the phrase "as deemed necessary by the Reliability Coordinator" is intended to provide for clarity in the requirement.

[111] *See* Order No. 901 at P 76 ("Pursuant to section 215(d)(5) of the FPA, we…direct NERC to develop new or modified Reliability Standards that require registered IBR generator owners and operators to provide IBR-specific modeling data and parameters (e.g., steady-state, dynamic, and short circuit modeling information, and control settings for momentary cessation and ramp rates) that accurately represent the registered IBRs to their…reliability coordinators, transmission operators, and balancing authorities that are responsible for planning and operating the Bulk-Power System.")

[112] *See* Order No. 901 at P 122 ("Pursuant to section 215(d)(5) of the FPA, we…direct NERC to develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions when developing planning, *operations*, and interconnection-wide models." (emphasis added); *see also id.* at P 161 (directing NERC to develop standards that require Reliability Coordinators, Transmission Operators, and Balancing Authorities to establish "necessary data exchange requirements" for such models).

C. Revisions to Establish the Uniform Framework for Modeling

To address Commission directives regarding the usage of a uniform framework in the development of planning and operations models, proposed Reliability Standards IRO-010-6 and TOP-003-8 would add a new requirement part specifying that requirements for model submissions are to be consistent with the model submitted for planning purposes, as applicable. To demonstrate, proposed Reliability Standard IRO-010-6 Requirement R1 Part 1.5 would revise the currently effective requirement as follows:

> R1. The Reliability Coordinator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include but not be limited to:
>
> ***
>
> 1.5. Method(s) for the entity identified in Part 1.1 to provide data and information that includes, but is not limited to~~.~~:
>
> 1.5.1 Specific deadlines or periodicity in which data and information is to be provided;
>
> 1.5.2 Performance criteria for the availability and accuracy of data and information, as applicable;
>
> 1.5.3 Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operations purposes, as applicable;
>
> ~~1.5.3~~1.5.4 Provisions to update or correct data and information, as applicable or necessary~~.~~;
>
> ~~1.5.4~~1.5.5 A mutually agreeable format~~.~~; and
>
> ~~1.5.5~~1.5.6 A mutually agreeable method(s) for securely transferring data and information.

As demonstrated in Exhibit A-3, NERC also proposes these revisions in Reliability Standard TOP-003-8 Requirement R1 Part 1.5.3 and Requirement R2 Part 2.5.3.

These modifications were made in response to Order 901 directives related to usage of a uniform framework in the development of planning and operations models. Such directives include

those in Order No. 901 paragraphs 78, 104, 124, 125, 141, and 161. Planning model submissions in accordance with MOD-032-2 will reflect this uniform framework. Thus, requiring that any operations model submissions be consistent with planning model submissions would ensure that they also reflect the uniform framework as directed by the Commission in Order No. 901.

Models submitted for planning purposes are typically made in accordance with the MOD-032 standard, though additional standards or regional requirements may apply. Some modifications to these planning models may be necessary to reflect considerations for operations. For example, simulation time constraints in an online operations environment may warrant a reduced model structure complexity. Such models may differ from, but should still be consistent with, more complex modeling that is submitted under MOD-032. As another example, consistent models would not be appropriate if an update was made to a planning model for known pending changes, which should not be reflected in the operations models prior to implementation. The inclusion of "as applicable" allows for variation as necessary for application in the operations horizon as well as to reflect that entities may determine when such models are needed for their operations planning and Real-time functions.

D. Consideration of Additional Order No. 901 Directives

In addition to the Order No. 901 directives identified above, the Project 2022-02 drafting team considered the Commission's directive in paragraph 86 of Order No. 901 to consider "whether additional IBR data points (e.g., telemetry collections or other automated platform integrations) are needed to further enhance real-time visibility of Bulk-Power System operations."[113] The drafting team determined that the TOP-003 and IRO-010 Reliability Standards are already structured in an such a way that Reliability Coordinators, Balancing Authorities, and

[113] *Id.* at P 86.

Transmission Operators may request any type of data needed to support their operations planning, analysis, or Real-time functions. The drafting team considered that the transmission of information from the plant level is often addressed in interconnection agreements. The drafting team also considered that, under approved Reliability Standard PRC-028-1, each registered IBR will be required to have disturbance monitoring devices installed. Reliability Standard PRC-028-1 would require the Generator Owner to provide the data to a Transmission Planner, Planning Coordinator, Transmission Operator, Balancing Authority, Reliability Coordinator, Regional Entity, or NERC within 15 calendar days of a request. Following consideration of these factors, the standard drafting team concluded that the appropriate entities have the authority to gather the data deemed necessary for reliability without the need to impose an additional, uniform burden on all generating facilities.

VIII. ENFORCEABILITY OF THE PROPOSED RELIABILITY STANDARDS

The proposed Reliability Standards include measures that support each requirement by clearly identifying what is required and how the ERO will enforce the requirement. These measures help ensure that the requirements will be enforced in a clear, consistent, and non-preferential manner and without prejudice to any party.[114] Additionally, the proposed Reliability Standards include VRFs and VSLs. The VRFs and VSLs provide guidance on the way that NERC will enforce the requirements of the proposed Reliability Standards. The VRFs and VSLs for the proposed Reliability Standards comport with NERC and Commission guidelines related to their assignment. Exhibit G provides a detailed review of the VRFs and VSLs, and the analysis of how the VRFs and VSLs were determined using these guidelines.

NERC has included a Potential Noncompliance (PNC) abeyance period for proposed Reliability Standard MOD-032-2 Requirement R2 Part 2.1 with respect to the estimation of

[114] Order No. 672 at P 327.

aggregate DER data or data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes. During the standard development process, multiple commenters expressed concern about their ability to obtain or estimate data for IBRs or DERs that were owned by entities not registered for compliance with NERC as the Commission directed in Order No. 901. While the proposed standard provides flexibility to entities on how they would estimate such data when unable to gather it directly, NERC recognizes that some concern remains about how such data gathering or estimation activities will be reviewed during compliance monitoring activities. To address this concern, NERC has included a two-year Potential Noncompliance (PNC) abeyance period in Section C. Compliance of proposed Reliability Standard MOD-032-2 that would provide as follows:

> **Potential Noncompliance (PNC) Abeyance Period**: For a period of two years following the phased-in compliance date of Reliability Standard MOD-032-2 Requirement R2 under the associated implementation plan, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C to the Rules of Procedure for a failure to comply with Reliability Standard MOD-032-2 Requirement R2 Part 2.1 with respect to the provision of estimated aggregate DER data or estimated data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes against any entity acting in good faith to comply with the standard in accordance with the relevant implementation plan. "Good faith" in this context refers to a sincere intention to comply with Reliability Standard MOD-032-2 Requirement R2 Part 2.1, following a reasonable and serious assessment by the entity in determining how this Reliability Standard should be applied to its particular facts and circumstances. For example, the CEA may not pursue compliance enforcement actions during this period for entities who submit estimated data and include the supporting data explanation and methods used as detailed in Requirement R2 Part 2.1 in a timely manner. The CEA may pursue actions against entities who do not submit data with supporting explanation and methods in a timely manner. Entities shall participate in any compliance monitoring activities undertaken by the CEA during this potential

> noncompliance abeyance period and submit documentation as requested.

In NERC's November 8, 2024 supplemental filing to the Five-Year Performance Assessment required under 18 C.F.R. § 39.3(c), NERC described how it would begin using a "potential noncompliance abeyance period" to enhance NERC's standard development process agility, thereby reducing concerns over compliance risk during standards development so that the focus can be on addressing risks to reliability.[115] As NERC explained in that filing, this compliance abeyance period would encourage entities to share observations and experiences through implementation of new standards without fear of potential noncompliance (so long as they are acting in good faith) to mitigate reliability risks. This feedback loop, coupled with insights generated from more robust data collection from enforcement activities of trends, themes, and recommendations, would collectively be used to inform the standards development process after initial compliance of new standards to revise the standards prior to full enforcement.

The proposed estimation provisions in proposed Reliability Standard MOD-032-2 Requirement R1 Part 2.1 are novel requirements intended to improve how resources owned by non-registered entities are reflected in system studies in the absence of an enforceable requirement for the owner entities to provide it directly. As the Commission recognized in Order No. 901, estimated modeling data and parameters are approximations of actual modeling data and parameters, and there is some degree of error in estimated information.[116] However, the Commission also recognized that having estimated data would be an improvement upon having

---

115 *Supplemental Filing of NERC to the Five-Year ERO Performance Assessment Report*, Docket No. RR24-4-000 at 3, 10 (Nov. 8, 2024). The Commission accepted NERC's five year performance assessment filings on December 19, 2024. *N. Am. Elec. Reliability Corp*., 189 FERC ¶ 61,211 (2024).

116 Order No. 901 at P 104.

no data at all.[117] Given concerns raised about such estimations, a Potential Noncompliance Abeyance Period could provide two important benefits for reliability.

First, by temporarily removing concerns about compliance implications, a Potential Noncompliance Abeyance Period would encourage entities with concerns about their data gathering or estimation efforts to seek guidance from the ERO Enterprise. To the extent this guidance results in a better estimation, it would result in better system models and thus better system studies more quickly than if the issue had been discussed during compliance monitoring activities in future years.

Second, a Potential Noncompliance Abeyance Period would provide a focused means for the ERO Enterprise to gather information and feedback on this aspect of the proposed standard. This information and feedback could inform the development of guidance or lessons learned on estimation methods or future revisions to the standard. This information and feedback could also inform the development of future changes to NERC's registration criteria, if such changes are ultimately needed to ensure the provision of adequate modeling data and parameters from "unregistered IBRs" and IBR-DERs as the Commission indicated in Order No. 901.[118]

In determining the appropriate length of time for the Potential Noncompliance Abeyance Period, NERC considered the urgency in the need to fully implement proposed Reliability Standard MOD-032-2 and the time that may be needed for information collection and analysis. NERC also considered the Commission's expectation that the need for estimating data (in lieu of

---

117 *Id.*

118 *See id.* at P 109 ("We encourage NERC to continue its efforts to review and evaluate whether reliability gaps continue to remain and if new or modified functional registration categories or Reliability Standards are necessary to ensure the reliable operation of the Bulk-Power System. NERC may choose to revise, or the Commission may direct further revisions to, registration or Reliability Standards to ensure the provision of adequate modeling data and parameters from unregistered IBRs and/or IBR-DERs in the aggregate.")

having actual data) will decrease over time.[119] Based on these considerations, NERC determined that a two-year abeyance period, measured from the phased-in compliance date of Requirement R2 under the proposed implementation plan, would be appropriate.

IX. EFFECTIVE DATE OF THE PROPOSED RELIABILITY STANDARDS

NERC respectfully requests that the Commission approve the proposed Reliability Standards to become effective as set forth in the proposed Implementation Plan, provided in Exhibit B hereto. The proposed Implementation Plan provides that the proposed definition of Distributed Energy Resource (DER) would become effective on the first day of the first calendar quarter after the effective date of the Commission's order approving proposed Reliability Standard MOD-032-2. The proposed Reliability Standard MOD-032-2 would become effective on the first day of the first calendar quarter that is 24 months after the effective date of the Commission's order approving the proposed Reliability Standard.

During this implementation period, Planning Coordinators/Transmission Planners would develop revised data requirements and reporting procedures addressing each of the new and revised IBR and DER items in Requirement R1 and Attachment 1. Entities would not be required to comply with Requirements R2, R3, and R4 relating to these revised Planning Coordinator/Transmission Planner data requirements and reporting procedures until 12 months after the effective date of Reliability Standard MOD-032-2.

To ensure that there are no gaps in data reporting during the phased-in compliance period, entities shall continue to comply with Requirements R2, R3, and R4 related to Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under

[119] *Id.* at P 107 (discussing revisions to the NERC registration framework, *pro forma* Large Generator Interconnection Procedures and Small Generator Interconnection Procedures, and revised transmission provider interconnection agreements as reducing the need for estimated data over time).

MOD-032-1 Requirement R1 and Attachment 1 unless they are able to comply with the revised Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under Reliability Standard MOD-032-2 Requirement R1.

Proposed Reliability Standards IRO-010-6 and TOP-003-8 would become effective on the first day of the first calendar quarter that is 36 months after the effective date of the Commission's order approving the proposed Reliability Standards.

Reliability Standards MOD-032-1, IRO-010-5, and TOP-003-7 would each be retired immediately prior to the effective date of the revised successor standard.

The proposed implementation plan is just and reasonable. In Order No. 672, the Commission stated that it would consider how an implementation proposal balances "any urgency in the need to implement [a standard] against the reasonableness of the time allowed for those who must comply to develop the necessary procedures, software, facilities, staffing or other relevant capability." [120] In developing the proposed implementation timeframe, the drafting team considered the Commission's guidance in Order No. 901 to have all IBR standards developed in response to the Commission's directives in Order No. 901 to be implemented prior to 2030.[121] The drafting team also considered the time that would be necessary to update modeling data requirements and reporting procedures under proposed Reliability Standard MOD-032-2, including identifying the proper reporting entity for modeling data related to IBRs (including "unregistered IBRs" and aggregate DERs). Further, the drafting team considered that the MOD-032 standard would become applicable to the Distribution Provider for the first time.

---

120 *See* Order No. 672 at P 333 ("In considering whether a proposed Reliability Standard is just and reasonable, the Commission will consider also the timetable for implementation of the new requirements, including how the proposal balances any urgency in the need to implement it against the reasonableness of the time allowed for those who must comply to develop the necessary procedures, software, facilities, staffing or other relevant capability.")

121 Order No. 901 at P 226.

During the 24 months prior to the effective date of Requirement R1, applicable entities would be expected to participate in Planning Coordinator/Transmission Planner processes to change the modeling data reporting requirements related to IBRs and aggregate DERs and should be able to start working on data collection processes and methods. The applicable entities in Requirement R2 would then have an additional 12 months to complete and implement data collection prior to the compliance dates of Requirements R2, R3, and R4. This timeline would also allow for the development of new data estimation processes developed under proposed Reliability standard MOD-032-2 Requirement R2 Part 2.1 and for the development of technical rationale to support the use of models included on the Unacceptable Model List maintained by the ERO, where applicable.

The revised requirements in Reliability Standards IRO-010-6 and TOP-003-8 may not be practical to implement prior to full implementation of proposed Reliability Standard MOD-032-2; therefore, these standards were set to the same implementation timeline.

For the reasons stated above, the proposed implementation plan balances the urgency in the need to implement the Reliability Standards identified in Order No. 901 against the time needed to develop the necessary procedures or relevant capability. The proposed implementation plan for the proposed Reliability Standards is just and reasonable, consistent with Commission guidance in Order No. 672, and responsive to the Commission's guidance for the implementation of IBR standards in Order No. 901. NERC respectfully requests approval of the proposed implementation plan as submitted by NERC.

X. CONCLUSION

For the reasons set forth above, NERC respectfully requests that the Commission approve:

- proposed Reliability Standards MOD-032-2, IRO-010-6, TOP-003-8, the proposed definition of Distributed Energy Resource, and the associated elements included in Exhibit A, effective as proposed herein;
- the proposed Implementation Plan included in Exhibit B; and
- the retirement of Reliability Standards MOD-032-1, IRO-010-5, and TOP-003-7, effective as proposed herein.

Respectfully submitted,

/s/ Lauren A. Perotti

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

MOD-032-2 is posted for a 5-day final ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
(The above was Posted under IRPTF SAR pre–Order No. 901)	
30-day formal comment period with initial ballot	April 17 – May 16, 2025
34-day formal comment period with ballot	August 8 –September 10, 2025

Anticipated Actions	Date
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resource (DER): A generator or energy storage technology connected to a distribution system that is capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including one connected behind the meter of an end-use customer that is supplied from a distribution system.

A. Introduction

1. **Title:** Data for Power System Modeling and Analysis

2. **Number:** MOD-032-2

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Balancing Authority

   4.1.2 Distribution Provider

   4.1.3 Generator Owner

   4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

   4.1.5 Resource Planner

   4.1.6 Transmission Owner

   4.1.7 Transmission Planner

   4.1.8 Transmission Service Provider

5. **Effective Date:** See Implementation Plan for Project 2022-02.

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1, including the entity responsible for each required item.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

1.4. Specifications of the following items for dynamic model submissions:

1.4.1. Required submission of:

- standard library models incorporated within the software(s) utilized to create the Interconnection-wide case(s);
- user-defined models; or
- both standard library models and user-defined models.

1.4.2. Where user-defined models are accepted, usability requirements for any submitted user-defined models including, at a minimum, requirements to provide model documentation and instructions for model set up and use.

1.4.2.1. Each Planning Coordinator and Transmission Planner shall provide their user-defined model requirements within 90 calendar days of receiving a written request for such data from other Planning Coordinators and Transmission Planners within the Interconnection.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. If a functional entity is required to provide data for one or more of the following and is unable to gather such data, the functional entity shall provide an estimate of the data, an explanation of the limitations of the estimated data, and the method used for estimation;

- Aggregate DER data; or
- Data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.

2.2. If a functional entity is required to provide dynamic models, the functional entity shall provide the models accepted by the Transmission Planner under MOD-026, where such models are available.

2.3. If a functional entity provides a model that is included on the Unacceptable Models List maintained by the ERO in accordance with the process described in the MOD-032 Supporting Document, the functional entity shall also provide a technical rationale justifying the use of that model.

M2. Each functional entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data that is responsive to the technical concern.

3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each functional entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. **Compliance Monitoring Process**

   1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

   1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

   The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

   - Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

   If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

   The Compliance Enforcement Authority shall keep the last audit records, and all requested and submitted subsequent audit records.

2. **Compliance Monitoring and Enforcement Program:** Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

3. **Potential Noncompliance (PNC) Abeyance Period:**
Potential Noncompliance (PNC) Abeyance Period: For a period of two years following the phased-in compliance date of Reliability Standard MOD-032-2 Requirement R2 under the associated implementation plan, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C to the Rules of Procedure for a failure to comply with Reliability Standard MOD-032-2 Requirement R2 Part 2.1 with respect to the provision of estimated aggregate DER data or estimated data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes against any entity acting in good faith to comply with the standard in accordance with the relevant implementation plan. "Good faith" in this context refers to a sincere intention to

comply with Reliability Standard MOD-032-2 Requirement R2 Part 2.1, following a reasonable and serious assessment by the entity in determining how this Reliability Standard should be applied to its particular facts and circumstances. For example, the CEA may not pursue compliance enforcement actions during this period for entities who submit estimated data and include the supporting data explanation and methods used as detailed in Requirement R2 Part 2.1 in a timely manner. The CEA may pursue actions against entities who do not submit data with supporting explanation and methods in a timely manner. Entities shall participate in any compliance monitoring activities undertaken by the CEA during this potential noncompliance abeyance period and submit documentation as requested.

MOD-032-2 – ATTACHMENT 1
Data Reporting Requirements

The table below indicates the information[1] that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in Interconnection-wide cases. The joint Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1 will specify entity responsibility and data flow processes. The typical functional entity[2] responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The data reported shall be identified by the bus number, name, and/or identifier that is assigned in conjunction with the Planning Coordinator, Transmission Owner, or Transmission Planner.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics**	**short circuit**
1. Each bus [TO] a. Nominal voltage b. Area, zone and owner 2. Aggregate Demand[3] [DP] a. Real and reactive power* b. In-service status* 3. Generating and storage units[4] [GO, TO[5], RP (for future planned resources only)] a. Real power capabilities - gross maximum and minimum values b. Reactive power capabilities - maximum and minimum values at real power capabilities in 3a above c. Station service auxiliary load for normal plant configuration (provide data in the same manner as that required for aggregate Demand under item 2, above). d. Regulated bus* and voltage set point* (as typically provided by the TOP) e. Machine MVA base	1. Generator [GO, RP (for future planned resources only)] 2. Excitation System [GO, RP (for future planned resources only)] 3. Governor [GO, RP (for future planned resources only)] 4. Power System Stabilizer [GO, RP (for future planned resources only)] 5. Aggregate Demand[3] [DP] 6. Wind plant model (for plants with type 1 and type 2 wind turbines) [GO] 7. Inverter-Based Resource [GO, TO[5]] a. Parameters, settings, or capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control 8. Static Var Systems and FACTS [GO, TO, DP] 9. DC System Models [TO] 10. Aggregate Distributed Energy Resource (DER) data[7] [DP, TO][6]	1. Provide for all applicable elements in column "steady-state" [GO, RP, TO, DP] a. Positive sequence data b. Negative sequence data c. Zero sequence data 2. Mutual Line Impedance Data [TO] 3. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics**	**short circuit**
f. Generator step up transformer data (provide same data as that required for transformer under item 6, below) g. Generator type (hydro, wind, fossil, solar, nuclear, etc.) h. In-service status* 4. AC Transmission Line or Circuit [TO] a. Impedance parameters (positive sequence) b. Susceptance (line charging) c. Ratings (normal and emergency)* d. In-service status* 5. DC Transmission Systems [TO] 6. Transformer (voltage and phase-shifting) [TO] a. Nominal voltages of windings b. Impedance(s) c. Tap ratios (voltage or phase angle)* d. Minimum and maximum tap position limits e. Number of tap positions (for both the ULTC and NLTC) f. Regulated bus (for voltage regulating transformers)* g. Ratings (normal and emergency)* h. In-service status* 7. Reactive compensation (shunt capacitors and reactors) [TO] a. Admittances (MVars) of each capacitor and reactor b. Regulated voltage band limits* (if mode of operation not fixed) c. Mode of operation (fixed, discrete, continuous, etc.) d. Regulated bus* (if mode of operation not fixed) e. In-service status* 8. Static Var Systems [TO] a. Reactive limits b. Voltage set point* c. Fixed/switched shunt, if applicable d. In-service status* 9. Aggregate Distributed Energy Resource (DER) data[7] [DP, TO][6] a. Location (bus from item 1)	a. parameters, settings, or capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control or information that can be used to infer those items for modeling purposes. b. Indication whether DERs are subject to tripping in conjunction with UFLS or UVLS. 11. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]	

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics**	**short circuit**
b. Real power capability c. DER type (solar, battery, diesel generator, etc.) 10. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]		

Attachment 1 Data Reporting Requirements Footnotes

1. Data specified in the sub-bullets of each column that are required for both steady-state and dynamics are not duplicated in the table.
2. For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Distribution Provider (DP), Generator Owner (GO), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).
3. For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 under Steady State Column that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. (Note: This may be impacted by an aggregation threshold for DER specified under footnote 7.) A Distribution Provider is the typical responsible entity for providing this information, generally through coordination with the Transmission Owner.
4. Generating and storage units include IBRs and synchronous condensers.
5. The Transmission Owner is the typical entity responsible for collecting and providing data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.
6. The Distribution Provider is the typical responsible entity for collecting and providing data for DERs connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider’s system. The Transmission Owner is the typical responsible entity for collecting and providing data for DERs where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner’s system.
7. Aggregation thresholds for DERs may be specified in the joint Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1.

MOD-032 Supporting Document

Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO)

The Unacceptable Models List is maintained separately by NERC as the ERO. This Supporting Document describes the process by which changes may be made to the Unacceptable Models List. This process may only be revised through the NERC Standards Development Process.

The following steps shall be taken to add a model to or remove a model from the Unacceptable Models List:

1. Any person or entity may submit a request to the ERO to add or remove a model from the Unacceptable Models List. This request shall include, at a minimum:
    a. The model name;
    b. Alternative model name(s), if any;
    c. Organization(s) the submitting entity represents;
    d. Description of the model's stated intent;
    e. Request to add model as an "unacceptable" model or remove "unacceptable" model designation;
    f. Technical supporting documentation describing the ability or inability of the model to appropriately represent small and large disturbance behavior;
    g. Identification of any Confidential Information as defined in Section 1500 of the NERC Rules of Procedure; and
    h. An explanation, if any of the above technical support items are unavailable to the submitting entity.
2. ERO staff shall review and evaluate the information in the Unacceptable Models List change request, along with any group or subcommittee of the NERC Reliability and Security Technical Committee, or its successor (RSTC), charged with assisting in such reviews. If no such group or subcommittee has been identified, ERO staff may work with other industry subject matter experts as needed to review and evaluate the request.
3. ERO staff shall provide public notice that identifies the model being considered for addition to or removal from the list, includes a non-confidential summary of the rationale offered, and provides at least 30 days to submit comments.
4. The results of the ERO review and the recommended action shall be presented to the NERC RSTC in a duly noticed public meeting.
5. The NERC RSTC may recommend the NERC Vice President of Engineering and Standards approve the change request, reject the change request, or remand the application back to the ERO to work with the submitting entity. If the NERC RSTC recommends approving

the change request, the NERC RSTC shall also recommend an effective date for the change.

6. The NERC Vice President of Engineering and Standards, considering the recommendation of the NERC RSTC, shall approve the change request, reject the change request, or remand the application back to ERO staff to work with the submitting entity. If approved, the NERC Vice President of Engineering and Standards shall also determine the effective date for the change.
7. The ERO shall provide public notice of a change to the Unacceptable Models List along with the effective date of the change. The revised Unacceptable Models List shall be posted to the NERC website and filed with the applicable governmental authorities for informational purposes.

Version History

Version	Date	Action	Change Tracking
1	February 6, 2014	Adopted by the NERC Board of Trustees.	Developed to consolidate and replace MOD-010-0, MOD -011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1
1	May 1, 2014	FERC Order issued approving MOD-032-1.	See Implementation Plan posted on the Reliability Standards web page for details on enforcement dates for Requirements.
2	TBD	Adopted by the NERC Board of Trustees.	FERC Order No. 901 Revisions by Project 2022-02.

Exhibit A-1

Proposed Reliability Standard MOD-032-2
Redline to Last Approved (MOD-032-1)

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

MOD-032-2 is posted for a 5-day final ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
30-day formal comment period with initial ballot	April 17 – May 16, 2025
34-day formal comment period with ballot	August 8 –September 10, 2025

Anticipated Actions	Date
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resource (DER): A generator or energy storage technology connected to a distribution system that is capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including one connected behind the meter of an end-use customer that is supplied from a distribution system.

A. Introduction

1. **Title:** **Data for Power System Modeling and Analysis**

2. **Number:** **MOD-032-~~1~~2**

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   ~~1.1.~~4.1. Functional Entities:

   ~~1.1.1~~4.1.1 Balancing Authority

   4.1.2 Distribution Provider

   ~~1.1.2~~4.1.3 Generator Owner

   ~~**1.1.3** Load Serving Entity~~

   ~~1.1.4~~4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

   ~~This proposed standard combines "Planning Authority" with "Planning Coordinator" in the list of applicable functional entities. The NERC Functional Model lists "Planning Coordinator" while the registration criteria list "Planning Authority," and they are not yet synchronized. Until that occurs, the proposed standard applies to both Planning Authority and Planning Coordinator.~~

   ~~1.1.5~~4.1.5 Resource Planner

   ~~1.1.6~~4.1.6 Transmission Owner

   ~~1.1.7~~4.1.7 Transmission Planner

   ~~1.1.8~~4.1.8 Transmission Service Provider

5. **Effective Date:** See Implementation Plan for Project 2022-02.

   ~~MOD-032-1, Requirement R1 shall become effective on the first day of the first calendar quarter that is 12 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, MOD-032-1, Requirement R1 shall become effective on the first day of the first calendar quarter that is 12 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

   ~~MOD-032-1, Requirements R2, R3, and R4 shall become effective on the first day of the first calendar quarter that is 24 months after the date that the standard is~~

approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, MOD-032-1, Requirements R2, R3, and R4 shall become effective on the first day of the first calendar quarter that is 24 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Background:

MOD-032-1 exists in conjunction with MOD-033-1, both of which are related to system-level modeling and validation. Reliability Standard MOD-032-1 is a consolidation and replacement of existing MOD-010-0, MOD-011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1, and it requires data submission by applicable data owners to their respective Transmission Planners and Planning Coordinators to support the Interconnection-wide case building process in their Interconnection. Reliability Standard MOD-033-1 is a new standard, and it requires each Planning Coordinator to implement a documented process to perform model validation within its planning area.

The transition and focus of responsibility upon the Planning Coordinator function in both standards are driven by several recommendations and FERC directives from FERC Order No. 693, which are discussed in greater detail in the rationale sections of the standards. One of the most recent and significant set of recommendations came from the NERC Planning Committee's System Analysis and Modeling Subcommittee (SAMS). SAMS proposed several improvements to the modeling data standards, to include consolidation of the standards (the SAMS whitepaper is available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here: http://www.nerc.com/comm/PC/Agendas%20Highlights%20and%20Minutes%20DL/2012/2012_Dec_PC%20Agenda.pdf).

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1, including the entity responsible for each required item.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

1.4. Specifications of the following items for dynamic model submissions:

1.4.1. Required submission of:

- standard library models incorporated within the software(s) utilized to create the Interconnection-wide case(s);
- user-defined models; or
- both standard library models and user-defined models.

1.4.2. Where user-defined models are accepted, usability requirements for any submitted user-defined models including, at a minimum, requirements to provide model documentation and instructions for model set up and use.

1.4.2.1. Each Planning Coordinator and Transmission Planner shall provide their user-defined model requirements within 90 calendar days of receiving a written request for such data from other Planning Coordinators and Transmission Planners within the Interconnection.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. If a functional entity is required to provide data for one or more of the following and is unable to gather such data, the functional entity shall provide an estimate of the data, an explanation of the limitations of the estimated data, and the method used for estimation;

- Aggregate DER data; or
- Data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.

2.2. If a functional entity is required to provide dynamic models, the functional entity shall provide the models accepted by the Transmission Planner under MOD-026, where such models are available.

2.3. If a functional entity provides a model that is included on the Unacceptable Models List maintained by the ERO in accordance with the process described in the MOD-032 Supporting Document, the functional entity shall also provide a technical rationale justifying the use of that model.

M2. Each ~~registered~~functional entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

~~2.1.~~3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data~~;~~, that is responsive to the technical concern.

~~3.1.~~3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each ~~registered~~functional entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance ~~with~~ as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

2. Compliance Monitoring and ~~Assessment Processes~~ Enforcement Program:
Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for ~~a list of~~performing compliance monitoring and ~~assessment processes~~enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

~~**1.3. Additional Compliance Information**~~

~~None~~

3. Potential Noncompliance (PNC) Abeyance Period:
For a period of two years following the phased-in compliance date of Reliability Standard MOD-032-2 Requirement R2 under the associated implementation plan, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C to the Rules of Procedure for a failure to comply with Reliability Standard MOD-032-2 Requirement R2, Part 2.1 with respect to the provision of estimated aggregate DER data or

estimated data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes against any entity acting in good faith to comply with the standard in accordance with the relevant implementation plan. “Good faith” in this context refers to a sincere intention to comply with Reliability Standard MOD-032-2 ~~regarding the provision of aggregate DER data or data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes in accordance with the data requirements and reporting procedures for the Planning Coordinator’s planning area developed under Requirement R1, subject to the estimation requirements of~~ Requirement R2, Part 2.1, following a reasonable and serious assessment by the entity in determining how this Reliability Standard should be applied to its particular facts and circumstances. For example, the CEA may not pursue compliance enforcement actions during this period for entities who submit estimated data and include the supporting data explanation and methods used as detailed in Requirement R2 Part 2.1 in a timely manner. The CEA may pursue actions against entities who do not submit data with supporting explanation and methods in a timely manner. Entities shall participate in any compliance monitoring activities undertaken by the CEA during this potential noncompliance abeyance period and submit documentation as requested.

~~Table of Compliance Elements~~

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include less than or equal to 25% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 25%, but less than or equal to 50% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 50%, but less than or equal to 75% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) ~~Coordinator~~ did not develop any steady-state, dynamics, and short circuit modeling data requirements and reporting procedures required by Requirement R1; OR The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 75% of the required components specified in Requirement R1.

R2.	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide less than or equal to 25% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but less than or equal to 25% of	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 25%, but less than or equal to 50% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 50%, but less than or equal to 75% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider did not provide any steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s); OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 75% of the required data specified in Attachment 1;

	the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in less than or equal to 15 calendar days after the specified date.	greater than 25%, but less than or equal to 50% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 15, but less than or equal to 30 calendar days after the specified date.	greater than 50%, but less than or equal to 75% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 30, but less than or equal to 45 calendar days after the specified date.	OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 75% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner, ~~Load Serving Entity,~~ Resource Planner, Transmission Owner or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its

				Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 45 calendar days after the specified date.
R3.	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement ~~R4~~R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement ~~R4~~R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement ~~R4~~R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement ~~R4~~R3 within 135 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).

	within 105 calendar days (or within 15 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	within greater than 105 calendar days, but less than or equal to 120 calendar days (or within greater than 15 calendar days, but less than or equal to 30 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	within greater than 120 calendar days, but less than or equal to 135 calendar days (or within greater than 30 calendar days, but less than or equal to 45 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	
R4.	The Planning Coordinator made available the required data to the ERO or its designee, but failed to provide less than or equal to 25% of the required data in the format specified by the ERO or its designee. MOD-032-2 – ATTACHMENT 1~~:~~

Data Reporting Requirements

The table below indicates the information[1] that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in ~~*the*~~ Interconnection-wide cases. ~~*A*~~The joint Planning Coordinator ~~*may*~~/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1 will specify ~~*additional information that includes specific information required for each item in the table below. Each*~~entity responsibility and data flow processes. The typical functional *entity*~~[1]~~[2] responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The data reported shall be ~~*as*~~ identified by the bus number, name, and/or identifier that is assigned in conjunction with the ~~*PC, TO*~~Planning Coordinator, Transmission Owner, or ~~*TP.*~~ Transmission Planner.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** ~~*(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*~~	**short circuit**
1. Each bus [TO] a. ~~n~~Nominal voltage b. ~~a~~Area, zone and owner 2. Aggregate Demand~~[3]~~[2] [~~LSE~~DP] a. ~~r~~Real and reactive power* b. ~~i~~In-service status*	1. Generator [GO, RP (for future planned resources only)] 2. Excitation System [GO, RP (for future planned resources only)] 3. Governor [GO, RP (for future planned resources only)] 4. Power System ~~S~~stabilizer [GO, RP(for future planned resources only)]	1. Provide for all applicable elements in column "steady-state" [GO, RP, TO, DP] a. Positive Sequence Data b. Negative Sequence Data c. Zero Sequence Data 2. Mutual Line Impedance Data [TO]

~~[1] For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Generator Owner (GO), Load Serving Entity (LSE), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).~~

~~[2] For purposes of this item, aggregate Demand is the Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus. A Load Serving Entity is responsible for providing this information, generally through coordination with the Transmission Owner.~~

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	dynamics ~~*(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*~~	short circuit
3. Generating and storage Units[4] ~~3~~ [GO, TO[5], RP (for future planned resources only)] a. ~~r~~Real power capabilities - gross maximum and minimum values b. ~~r~~Reactive power capabilities - maximum and minimum values at real power capabilities in 3a above c. ~~s~~Station service auxiliary load for normal plant configuration (provide data in the same manner as that required for aggregate Demand under item 2, above). d. ~~r~~Regulated bus* and voltage set point* (as typically provided by the TOP) e. ~~m~~Machine MVA base f. ~~g~~Generator step up transformer data (provide same data as that required for transformer under item 6, below) g. ~~g~~Generator type (hydro, wind, fossil, solar, nuclear, etc) h. ~~i~~In-service status* 4. AC Transmission Line or Circuit [TO] a. ~~i~~Impedance parameters (positive sequence) b. ~~s~~Susceptance (line charging) c. ~~r~~Ratings (normal and emergency)* d. ~~i~~In-service status* 5. DC Transmission systems [TO] 6. Transformer (voltage and phase-shifting) [TO] a. ~~n~~Nominal voltages of windings	5. Aggregated Demand[3] [~~LSE~~DP] 6. Wind ~~T~~turbine ~~Data~~model (for plants with type 1 and type 2 wind turbines) [GO] 7. Inverter-Based Resource [GO, TO[5]]~~Photovoltaic systems [GO]~~ ~~7.~~a. Parameters, settings, or capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control. 8. Static Var Systems and FACTS [GO, TO, ~~LSE~~DP] 9. DC ~~s~~System models [TO] 10. Aggregate Distributed Energy Resource (DER) data[7] [DP, TO][6] a. Parameters, settings, or capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control or information that can be used to infer those items for modeling purposes. b. Indication whether DERs are subject to tripping in conjunction with UFLS or UVLS. ~~10.~~11. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, ~~LSE~~DP, TO, TSP]	3. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, ~~LSE~~DP, TO, TSP]

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	dynamics ~~*(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*~~	short circuit
~~9.~~10. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, ~~LSE~~DP, TO, TSP]		

~~Guidelines and Technical Basis~~

~~For purposes of jointly developing steady-state, dynamics, and short circuit modeling data requirements and reporting procedures under Requirement R1, if a Transmission Planner (TP) and Planning Coordinator (PC) mutually agree, a TP may collect and aggregate some or all data from providing entities, and the TP may then provide that data directly to the PC(s) on behalf of the providing entities. The submitting entities are responsible for getting the data to both the TP and the PC, but nothing precludes them from arriving at mutual agreements for them to provide it to the TP, who then provides it to the PC. Such agreement does not relieve the submitting entity from responsibility under the standard, nor does it make the consolidating entity liable for the submitting entities' compliance under the standard (in essence, nothing precludes parties from agreeing to consolidate or act as a conduit to pass the data, and it is in fact encouraged in certain circumstances, but the requirement is aimed at the act of submitting the data). Notably, there is no requirement for the TP to provide data to the PC. The intent, in part, is to address potential concerns from entities that they would otherwise be responsible for the quality, nature, and sufficiency of the data provided by other entities.~~

~~The requirement in Part 1.3 to include specifications for distribution or posting of the data requirements and reporting procedures could be accomplished in many ways, to include posting on a Web site, distributing directly, or through other methods that the Planning Coordinator and each of its Transmission Planners develop.~~

~~An entity submitting data per the requirements of this standard who needs to determine the PC for the area, as a starting point, should contact the local Transmission Owner (TO) for information on the TO's PC. Typically, the PC will be the same for both the local TO and those entities connected to the TO's system. If this is not the case, the local TO's PC can typically provide contact information on other PCs in the area. If the entity (e.g., a Generator Owner [GO]) is requesting connection of a new generator, the entity can determine who the PC is for that area at the time a generator connection request is submitted. Often the TO and PC are the same entity, or the TO can provide information on contacting the PC. The entity should specify as the reason for the request to the TO that the entity needs to provide data to the PC according to this standard. Nothing in the proposed requirement language of this standard is intended to preclude coordination between entities such that one entity, serving only as a conduit, provides the other entity's data to the PC. This can be accomplished if it is mutually agreeable by, for example, the GO (or other entity), TP, and the PC. This does not, however, relieve the original entity from its obligations under the standard to provide data, nor does it pass on the compliance obligation of the entity. The original entity is still accountable for making sure that the data has been provided to the PC according to the requirements of this standard.~~

~~The standard language recognizes that differences exist among the Interconnections. Presently, the Eastern/Quebec and Texas Interconnections build seasonal cases on an annual basis, while the Western Interconnection builds cases on a continuous basis throughout the year. The intent of the standard is not to change established processes and procedures in each of the Interconnections, but to create a framework to support both what is already in place or what it may transition into in the future, and~~

~~to provide further guidance in a common platform for the collection of data that is necessary for the building of the Interconnection-wide case(s).~~

~~The construct that these standards replace did not specifically list which Functional Entities were required to provide specific data. Attachment 1 specifically identifies the entities responsible for the data required for the building of the Interconnection-wide case(s).~~

~~Rationale:~~

~~During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.~~

~~Rationale for R1:~~

~~This requirement consolidates the concepts from the original data requirements from MOD-011-0, Requirement R1, and MOD-013-0, Requirement R1. The original requirements specified types of steady-state and dynamics data necessary to model and analyze the steady-state conditions and dynamic behavior or response within each Interconnection. The original requirements, however, did not account for the collection of short-circuit data also required to perform short-circuit studies. The addition of short-circuit data also addresses the outstanding directive from FERC Order No. 890, paragraph 290.~~

~~In developing a performance-based standard that would address the data requirements and reporting procedures for model data, it was prohibitively difficult to account for all of the detailed technical concerns associated with the preparation and submittal of model data given that many of these concerns are dependent upon evolving industry modeling needs and software vendor terminology and product capabilities.~~

~~This requirement establishes the Planning Coordinator jointly with its Transmission Planners as the developers of technical model data requirements and reporting procedures to be followed by the data owners in the Planning Coordinator's planning area. FERC Order No. 693, paragraphs 1155 and 1162, also direct that the standard apply to Planning Coordinators. The inclusion of Transmission Planners in the applicability section is intended to ensure that the Transmission Planners are able to participate jointly in the development of the data requirements and reporting procedures.~~

~~This requirement is also consistent with the recommendations from the NERC System Analysis and Modeling Subcommittee (SAMS) White Paper titled "Proposed Improvements for NERC MOD Standards", available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here:~~

Aside from recommendations in support of strengthening and improving MOD-010 through MOD-015, the SAMS paper included the following suggested improvements:

1) reduce the quantity of MOD standards;
2) add short circuit data as a requirement to the MOD standards; and
3) supply data and models:
    a. add requirement identifying who provides and who receives data;
    b. identify acceptability;
    c. standard format;
    d. how to deal with new technologies (user written models if no standard model exists); and
    e. shareability.
4) These suggested improvements are addressed by combining the existing standards into two new standards, one standard for the submission and collection of data, and one for the validation of the planning models. Adding the requirement for the submittal of short circuit data is also an improvement from the existing standards, consistent with FERC Order No. 890, paragraph 290. In supplying data, the approach clearly identifies what data is required and which Functional Entity is required to provide the data.
5) The requirement uses an attachment approach to support data collection. The attachment specifically lists the entities that are required to provide each type of data and the steady-state, dynamics, and short circuit data that is required.
6) Finally, the decision to combine steady-state, dynamics, and short circuit data requirements into one requirement rather than three reflects that they all support the requirement of submission of data in general.

Rationale for R2:

This requirement satisfies the directive from FERC Order No. 693, paragraph 1155, which directs that "the planning authority should be included in this Reliability Standard because the planning authority is the entity responsible for the coordination and integration of transmission facilities and resource plans, as well as one of the entities responsible for the integrity and consistency of the data."

Rationale for R3:

In order to maintain a certain level of accuracy in the representation of a power system, the data that is submitted must be correct, periodically checked, and updated. Data used to perform steady-state, dynamics, and short circuit studies can change, for example, as a result of new planned transmission construction (in comparison to as-built information) or changes performed during the restoration of the transmission network due to weather-related events. One set of data that changes on a more frequent basis is load data, and updates to load data are needed when new improved forecasts are created.

~~This requirement provides a mechanism for the Planning Coordinator and Transmission Planner (that does not exist in the current standards) to collect corrected data from the entities that have the data. It provides a feedback loop to address technical concerns related to the data when the Planning Coordinator or Transmission Planner identifies technical concerns, such as concerns about the usability of data or simply that the data is not in the correct format and cannot be used. The requirement also establishes a time-frame for response to address timeliness.~~

~~Rationale for R4:~~

~~This requirement will replace MOD-014 and MOD-015.~~

~~This requirement recognizes the differences among Interconnections in model building processes, and it creates an obligation for Planning Coordinators to make available data for its planning area.~~

~~The requirement creates a clear expectation that Planning Coordinators will make available data that they collect under Requirement R2 in support of their respective Interconnection-wide case(s). While different entities in each Interconnection create the Interconnection-wide case(s), the requirement to submit the data to the "ERO or its designee" supports a framework whereby NERC, in collaboration and agreement with those other organizations, can designate the appropriate organizations in each Interconnection to build the specific Interconnection-wide case(s). It does not prescribe a specific group or process to build the larger Interconnection-wide case(s), but only requires the Planning Coordinators to make available data in support of their creation, consistent with the SAMS Proposed Improvements to NERC MOD Standards (at page 3) that, "industry best practices and existing processes should be considered in the development of requirements, *as many entities are successfully coordinating their efforts.*" (Emphasis added).~~

~~This requirement is about the Planning Coordinator's obligation to make information available for use in the Interconnection-wide case(s); it is not a requirement to build the Interconnection-wide case(s).~~

~~For example, under current practice, the Eastern Interconnection Reliability Assessment Group (ERAG) builds the Eastern Interconnection and Quebec Interconnection-wide cases, the Western Electricity Coordinating Council (WECC) builds the Western Interconnection-wide cases, and the Electric Reliability Council of Texas (ERCOT) builds the Texas Interconnection-wide cases. This requirement does not require a change to that construct, and, assuming continued agreement by those organizations, ERAG, WECC, and ERCOT could be the "designee" for each Interconnection contemplated by this requirement. Similarly, the requirement does not prohibit transition, and the requirement remains for the Planning Coordinators to make available the information to the ERO or to whomever the ERO has coordinated with and designated as the recipient of such information for purposes of creation of each of the Interconnection–wide cases.~~

Attachment 1 Data Reporting Requirements Footnotes

1. Data specified in the sub-bullets of each column that are required for both steady-state and dynamics are not duplicated in the table.
2. For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Distribution Provider (DP), Generator Owner (GO), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).
3. For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 under Steady State Column that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. (Note: This may be impacted by an aggregation threshold for DER specified under footnote 7.) A Distribution Provider is the typical responsible entity for providing this information, generally through coordination with the Transmission Owner.
4. Generating and storage units include IBRs, and synchronous condensers.
5. The Transmission Owner is the typical entity responsible for collecting and providing data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.
6. The Distribution Provider is the typical responsible entity for collecting and providing data for DERs connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider's system. The Transmission Owner is the typical responsible entity for collecting and providing data for DERs where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner's system.
7. Aggregation thresholds for DERs may be specified in the joint Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1.

MOD-032 Supporting Document

Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO)

The Unacceptable Models List is maintained separately by NERC as the ERO. This Supporting Document describes the process by which changes may be made to the Unacceptable Models List. This process may only be revised through the NERC Standards Development Process.

The following steps shall be taken to add a model to or remove a model from the Unacceptable Models List:

1. Any person or entity may submit a request to the ERO to add or remove a model from the Unacceptable Models List. This request shall include, at a minimum:
   a. The model name;
   b. Alternative model name(s), if any;
   c. Organization(s) the submitting entity represents;
   d. Description of the model's stated intent;
   e. Request to add model as an "unacceptable" model or remove "unacceptable" model designation;
   f. Technical supporting documentation describing the ability or inability of the model to appropriately represent small and large disturbance behavior;
   g. Identification of any Confidential Information as defined in Section 1500 of the NERC Rules of Procedure; and
   h. An explanation, if any of the above technical support items are unavailable to the submitting entity.
2. ERO staff shall review and evaluate the information in the Unacceptable Models List change request, along with any group or subcommittee of the NERC Reliability and Security Technical Committee, or its successor (RSTC), charged with assisting in such reviews. If no such group or subcommittee has been identified, ERO staff may work with other industry subject matter experts as needed to review and evaluate the request.
3. ERO staff shall provide public notice that identifies the model being considered for addition to or removal from the list, includes a non-confidential summary of the rationale offered, and provides at least 30 days to submit comments.
4. The results of the ERO review and the recommended action shall be presented to the NERC RSTC in a duly noticed public meeting.

5. The NERC RSTC may recommend the NERC Vice President of Engineering and Standards approve the change request, reject the change request, or remand the application back to the ERO to work with the submitting entity. If the NERC RSTC recommends approving the change request, the NERC RSTC shall also recommend an effective date for the change.
6. The NERC Vice President of Engineering and Standards, considering the recommendation of the NERC RSTC, shall approve the change request, reject the change request, or remand the application back to ERO staff to work with the submitting entity. If approved, the NERC Vice President of Engineering and Standards shall also determine the effective date for the change.
7. The ERO shall provide public notice of a change to the Unacceptable Models List along with the effective date of the change. The revised Unacceptable Models List shall be posted to the NERC website and filed with the applicable governmental authorities for informational purposes.

Proposed Reliability Standard IRO-010-6
Clean

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

IRO-010-6 is posted for a 5-day ballot period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
30-day formal comment period with initial ballot	April 17 – May 16, 2025
25-day formal comment period with ballot	August 8 –September 10, 2025

Anticipated Actions	Date
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

A. Introduction

1. **Title:** Reliability Coordinator Data and information Specification and Collection
2. **Number:** IRO-010-6
3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact reliability, by ensuring each Reliability Coordinator has the data and information it needs to plan, monitor and assess the operation of its Reliability Coordinator Area.
4. **Applicability:**
   - **4.1.** Reliability Coordinator
   - **4.2.** Balancing Authority
   - **4.3.** Generator Owner
   - **4.4.** Generator Operator
   - **4.5.** Transmission Operator
   - **4.6.** Transmission Owner
   - **4.7.** Distribution Provider
5. **Effective Date:** See Implementation Plan for Project 2022-02.

B. Requirements

R1. The Reliability Coordinator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include, but not be limited to: *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments, as deemed necessary by the Reliability Coordinator, including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1 Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints.

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide data and information that includes, but is not limited to:

1.5.1 Specific deadlines or periodicity in which data and information is to be provided;

1.5.2 Performance criteria for the availability and accuracy of data and information, as applicable;

1.5.3 Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operations purposes, as applicable;

1.5.4 Provisions to update or correct data and information, as applicable or necessary;

1.5.5 A mutually agreeable format; and

1.5.6 A mutually agreeable method(s) for securely transferring data and information.

M1. The Reliability Coordinator shall make available its dated, current, in force documented specification(s) for data and information.

R2. The Reliability Coordinator shall distribute its data and information specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

M2. The Reliability Coordinator shall make available evidence that it has distributed its specification(s) to entities that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. This evidence could include, but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or email records.

R3. Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall satisfy the obligations of the documented specifications. *(Violation Risk Factor: Medium) (Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations)*

M3. The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall make available evidence that it satisfied the obligations of the documented specification using the specified criteria. Such evidence could include, but is not limited to electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain its dated, current, in force documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R1, Measure M1 as well as any documents in force since the last compliance audit.
- The Reliability Coordinator shall keep evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R2 and Measure M2.
- Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R3 and Measurement M3.

1.3. Compliance Monitoring and Enforcement Program:
"Compliance Monitoring and Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower	Moderate	High	Severe
R1	The Reliability Coordinator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Reliability Coordinator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
For the Requirement R2 VSLs only, the intent of the drafting team is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				

R#	Violation Severity Levels			
	Lower	Moderate	High	Severe
R2	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, and Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to four or more entities, or more than 15% of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R3	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications, but failed to meet one of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications, but failed to meet two of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications, but failed to meet any of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 did not satisfy the obligations of the documented specifications.

D. Regional Variances

Anticipated Actions	Date
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

A. Introduction

1. **Title:** Reliability Coordinator Data and information Specification and Collection

2. **Number:** IRO-010-~~5~~6

3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact reliability, by ensuring each Reliability Coordinator has the data and information it needs to plan, monitor and assess the operation of its Reliability Coordinator Area.

4. **Applicability:**

   4.1. Reliability Coordinator

   4.2. Balancing Authority

   4.3. Generator Owner

   4.4. Generator Operator

   4.5. Transmission Operator

   4.6. Transmission Owner

   4.7. Distribution Provider

5. **Effective Date:** See Implementation Plan for Project ~~2021-06.~~2022-02.

B. Requirements

R1. The Reliability Coordinator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include but not be limited to: *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments, as deemed necessary by the Reliability Coordinator, including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification ~~as deemed necessary by the Reliability Coordinator~~.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1 Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints.

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide data and information that includes, but is not limited to ~~.~~:

1.5.1 Specific deadlines or periodicity in which data and information is to be provided;

1.5.2 Performance criteria for the availability and accuracy of data and information, as applicable;

1.5.3 Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operations purposes, as applicable;

~~**1.5.3**~~**1.5.4** Provisions to update or correct data and information, as applicable or necessary ~~.~~;

~~1.5.4~~1.5.5 A mutually agreeable format~~.~~; and

~~1.5.5~~1.5.6 A mutually agreeable method(s) for securely transferring data and information.

M1. The Reliability Coordinator shall make available its dated, current, in force documented specification(s) for data and information.

R2. The Reliability Coordinator shall distribute its data and information specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

M2. The Reliability Coordinator shall make available evidence that it has distributed its specification(s) to entities that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. This evidence could include, but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or ~~e-mail~~email records.

R3. Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall satisfy the obligations of the documented specifications. *(Violation Risk Factor: Medium) (Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations)*

M3. The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, ~~Reliability Coordinator,~~ Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall make available evidence that it satisfied the obligations of the documented specification using the specified criteria. Such evidence could include, but is not limited to electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" ~~(CEA)~~ means NERC or the Regional Entity~~, or any entity as otherwise designated by an Applicable Governmental Authority,~~ in their respective roles of monitoring and~~/or~~ enforcing compliance with the ~~mandatory and enforceable~~NERC Reliability Standards ~~in their respective jurisdictions~~.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the ~~CEA~~Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain its dated, current, in force documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R1, Measure M1 as well as any documents in force since the last compliance audit.
- The Reliability Coordinator shall keep evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R2~~,~~ and Measure M2.
- Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R3 and Measurement M3.

1.3. Compliance Monitoring and Enforcement Program:
~~As defined in the NERC Rules of Procedure,~~ "Compliance Monitoring and Enforcement Program" ~~refers~~or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the ~~identification~~NERC Rules of Procedure) or the Commission-approved program of ~~the processes~~a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that ~~will be used to evaluate data or~~

~~information~~is responsible for ~~the purpose of assessing performance or outcomes~~performing compliance monitoring and enforcement activities with ~~the associated reliability standard~~respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower	Moderate	High	Severe
R1.	The Reliability Coordinator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Reliability Coordinator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
For the Requirement R2 VSLs only, the intent of the ~~SDT~~DT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				

R#	Violation Severity Levels			
	Lower	Moderate	High	Severe
R2.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, and Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to four or more entities, or more than 15% of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R3.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet one of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet two of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet any of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 did not satisfy the obligations of the documented specification.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

TOP-003-8 is posted for a 5-day final ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
30-day formal comment period with initial ballot	April 17 – May 16, 2025
34-day formal comment period with ballot	August 8 –September 10, 2025

Anticipated Actions	Date
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

A. Introduction

1. **Title:** Transmission Operator and Balancing Authority Data and Information Specification and Collection

2. **Number:** TOP-003-8

3. **Purpose:** To ensure that each Transmission Operator and Balancing Authority has the data and information it needs to plan, monitor, and assess the operation of its Transmission Operator Area or Balancing Authority Area.

4. **Applicability:**

   4.1 Functional Entities:

   4.1.1 Transmission Operator

   4.1.2 Balancing Authority

   4.1.3 Generator Owner

   4.1.4 Generator Operator

   4.1.5 Transmission Owner

   4.1.6 Distribution Provider

5. **Effective Date:** See Implementation Plan for Project 2022-02.

B. Requirements and Measures

R1. Each Transmission Operator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments, as deemed necessary by the Transmission Operator, including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1. Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide the data and information that includes, but is not limited to:

1.5.1. Specified deadlines or periodicity in which data and information is to be provided;

1.5.2. Performance criteria for the availability and accuracy of data and information as applicable;

1.5.3. Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operations purposes, as applicable;

1.5.4. Provisions to update or correct data and information, as applicable or

necessary;

1.5.5. A mutually agreeable format;

1.5.6. Mutually agreeable method(s) for securely transferring data and information.

M1. Each Transmission Operator shall make available its dated, current, in force documented specification(s) for data and information.

R2. Each Balancing Authority shall maintain documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. The data specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

2.1. A list of data and information needed by the Balancing Authority to support its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments, as deemed necessary by the Balancing Authority, including non-Bulk Electric System data and information, IBR-specific data and parameters, and external network data and information, and identification of the entity responsible for responding to the specification.

2.2. Provisions for notification of current Protection System and Remedial Action Scheme status or degradation that impacts System reliability.

2.3. Provisions for notification of BES generating unit(s) status during local forecasted cold weather to include:

2.3.1. Operating limitations based on:

2.3.1.1. capability and availability;

2.3.1.2. fuel supply and inventory concerns;

2.3.1.3. fuel switching capabilities; and

2.3.1.4. environmental constraints.

2.3.2. Generating unit(s) minimum:

2.3.2.1. design temperature; or

2.3.2.2. historical operating temperature; or

2.3.2.3. current cold weather performance temperature determined by an engineering analysis.

2.4. Identification of a mutually agreeable process in resolving conflicts;

2.5. Methods for the entity identified in Part 2.1 to provide data and information that includes, but is not limited to:

2.5.1. Specific deadlines or periodicity in which data and information is to be provided;

2.5.2. Performance criteria for the availability and accuracy of data and information, as applicable;

2.5.3. Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operations purposes, as applicable;

2.5.4. Provisions to update or correct data and information, as applicable or necessary.

2.5.5. A mutually agreeable format.

2.5.6. A mutually agreeable method(s) for securely transferring data and information.

M2. Each Balancing Authority shall make available its dated, current, in force documented specification(s) for data and information.

R3. Each Transmission Operator shall distribute its data and information specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M3. Each Transmission Operator shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or email records.

R4. Each Balancing Authority shall distribute its data and information specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. Each Balancing Authority shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, or email records.

R5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a data and information specification(s) in Requirement R3 or R4 shall satisfy the obligations of the documented specifications. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator

Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall make available evidence that it has satisfied the obligations of the documented specification. Such evidence could include, but is not limited to, electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority (CEA) may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Transmission Operator shall retain its dated, current, in force, documented specification for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R1 and Measurement M1 as well as any documents in force since the last compliance audit.
- Each Balancing Authority shall retain its dated, current, in force, documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R2 and Measurement M2, as well as any documents in force since the last compliance audit.
- Each Transmission Operator shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R3 and Measurement M3.
- Each Balancing Authority shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R4 and Measurement M4.
- Each Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R5 and Measurement M5.

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Transmission Operator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Transmission Operator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R2	The Balancing Authority did not include two or fewer of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include three of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include four of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include any of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. OR, The Balancing Authority did not have a documented specification(s) for the data and information necessary for it to perform its analysis functions,

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				Real-time monitoring, and Near-Term Energy Reliability Assessments.
For the Requirement R3 and R4 VSLs only, the intent of the drafting team is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				
R3	The Transmission Operator did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R4	The Balancing Authority did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term	The Balancing Authority did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time	The Balancing Authority did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability	The Balancing Authority did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
	Energy Reliability Assessments.	monitoring, and Near-Term Energy Reliability Assessments.	Assessments.	
R5	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet one of the parts in Requirement R1, Part1.5 or Requirement R2, Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet two of the parts in Requirement R1, Part 1.5 or Requirement R2, Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet three or more of the parts in Requirement R1, Part 1.5 or Requirement R2, Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 did not satisfy the obligations of the documented specifications.

A. Introduction

1. **Title:** Transmission Operator and Balancing Authority Data and Information Specification and Collection

2. **Number:** TOP-003-~~7~~8

3. **Purpose:** To ensure that each Transmission Operator and Balancing Authority has the data and information it needs to plan, monitor, and assess the operation of its Transmission Operator Area or Balancing Authority Area.

4. **Applicability:**

   4.1 Functional Entities:

   4.1.1 Transmission Operator

   4.1.2 Balancing Authority

   4.1.3 Generator Owner

   4.1.4 Generator Operator

   4.1.5 Transmission Owner

   4.1.6 Distribution Provider

5. **Effective Date:** See Implementation Plan for Project 2022-~~03~~02.

B. Requirements and Measures

R1. Each Transmission Operator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments, as deemed necessary by the Transmission Operator, including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification ~~as deemed necessary by the Transmission Operator~~.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1. Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide the data and information that includes, at a minimum, the following~~.~~:

1.5.1. Specified deadlines or periodicity in which data and information is to be provided;

1.5.2. Performance criteria for the availability and accuracy of data and information as applicable;

1.5.3. Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operations purposes, as applicable;

~~1.5.3.~~**1.5.4.** Provisions to update or correct data and information, as applicable

or necessary;

~~1.5.4.~~1.5.5. A mutually agreeable format;

~~1.5.5.~~1.5.6. Mutually agreeable method(s) for securely transferring data and information.

M1. Each Transmission Operator shall make available its dated, current, in force documented specification(s) for data and information.

R2. Each Balancing Authority shall maintain documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. The data specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

2.1. A list of data and information needed by the Balancing Authority to support its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments, as deemed necessary by the Balancing Authority, including non-Bulk Electric System data and information, IBR-specific data and parameters, and external network data and information, ~~as deemed necessary by the Balancing Authority,~~ and identification of the entity responsible for responding to the specification.

2.2. Provisions for notification of current Protection System and Remedial Action Scheme status or degradation that impacts System reliability.

2.3. Provisions for notification of BES generating unit(s) status during local forecasted cold weather to include:

2.3.1. Operating limitations based on:

2.3.1.1. capability and availability;

2.3.1.2. fuel supply and inventory concerns;

2.3.1.3. fuel switching capabilities; and

2.3.1.4. environmental constraints.

2.3.2. Generating unit(s) minimum:

2.3.2.1. design temperature; or

2.3.2.2. historical operating temperature; or

2.3.2.3. current cold weather performance temperature determined by an engineering analysis.

2.4. Identification of a mutually agreeable process in resolving conflicts;

2.5. Methods for the entity identified in Part 2.1 to provide data and information that includes at a minimum the following~~.~~:

2.5.1. Specific deadlines or periodicity in which data and information is to be provided;

2.5.2. Performance criteria for the availability and accuracy of data and information, as applicable;

2.5.3. Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operations purposes, as applicable;

~~**2.5.3.**~~**2.5.4.** Provisions to update or correct data and information, as applicable or necessary.

~~**2.5.4.**~~**2.5.5.** A mutually agreeable format.

~~**2.5.5.**~~**2.5.6.** A mutually agreeable method(s) for securely transferring data and information.

M2. Each Balancing Authority shall make available its dated, current, in force documented specification(s) for data and information.

R3. Each Transmission Operator shall distribute its data and information specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M3. Each Transmission Operator shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or ~~e-mail~~email records.

R4. Each Balancing Authority shall distribute its data and information specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. Each Balancing Authority shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, or ~~e-mail~~email records.

R5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a data and information specification(s) in Requirement R3 or R4 shall satisfy the obligations of the documented specifications. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in

Requirement R3 or R4 shall make available evidence that it has satisfied the obligations of the documented specification. Such evidence could include, but is not limited to, electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority (CEA) may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

~~Each responsible~~The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its ~~CEA~~Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Transmission Operator shall retain its dated, current, in force, documented specification for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R1 and Measurement M1 as well as any documents in force since the last compliance audit.
- Each Balancing Authority shall retain its dated, current, in force, documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R2 and Measurement M2, as well as any documents in force since the last compliance audit.
- Each Transmission Operator shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R3 and Measurement M3.
- Each Balancing Authority shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R4 and Measurement M4.
- Each Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall retain evidence

for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R5 and Measurement M5.

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Transmission Operator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Transmission Operator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R2	The Balancing Authority did not include two or fewer of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include three of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include four of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include any of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. OR, The Balancing Authority did not have a documented specification(s) for the data and information necessary for it to perform its analysis functions,

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				Real-time monitoring, and Near-Term Energy Reliability Assessments.
For the Requirement R3 and R4 VSLs only, the intent of the ~~Standard~~ Drafting Team (~~SDT~~DT) is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				
R3	The Transmission Operator did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R4	The Balancing Authority did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term	The Balancing Authority did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time	The Balancing Authority did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability	The Balancing Authority did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
	Energy Reliability Assessments.	monitoring, and Near-Term Energy Reliability Assessments.	Assessments.	
R5	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet one of the parts in Requirement R1 Part1.5 or Requirement R2 Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet two of the parts in Requirement R1 Part 1.5 or Requirement R2 Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet three or more of the parts in Requirement R1 Part 1.5 or Requirement R2 Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 did not satisfy the obligations of the documented specifications.

Implementation Plan

Project 2022-02 Uniform Modeling Framework for IBR

Applicable Standard(s)

- Reliability Standard MOD-032-2 Data for Power System Modeling and Analysis
- Reliability Standard IRO-010-6 Reliability Coordinator Data and information Specification and Collection
- Reliability Standard TOP-003-8 Transmission Operator and Balancing Authority Data and Information Specification and Collection

Requested Retirement(s)

- Reliability Standard MOD-032-1 Data for Power System Modeling and Analysis
- Reliability Standard IRO-010-5 Reliability Coordinator Data and information Specification and Collection
- Reliability Standard TOP-003-7 Transmission Operator and Balancing Authority Data and Information Specification and Collection

Prerequisite Standard(s)

These standard(s) or definitions must be approved before the Applicable Standard becomes effective:

- None

Applicable Entities

- See subject standards

Glossary of Terms used in NERC Reliability Standards

This section includes a newly defined term used in the NERC Reliability Standards. The new definition listed below becomes approved when the proposed standard is approved. When the standard becomes effective, the defined term will be removed from the individual standard and added to the NERC Glossary.

Proposed New Definition:

Distributed Energy Resource (DER):

A generator or energy storage technology connected to a distribution system that is capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including one connected behind the meter of an end-use customer that is supplied from a distribution system.

Background

As the penetration of DERs continues to increase across the many distribution systems connected both directly and indirectly to the North American Bulk-Power System (BPS), it is necessary to account for the potential impacts of DERs on reliability in the planning, operation, and design of the BPS. The NERC System Planning Impacts of Distributed Energy Resources Working Group (SPIDERWG) has identified the need for improved modeling of aggregate DERs for planning studies (including both utility-scale and retail-scale DERs) conducted by Transmission Planners (TPs) and Planning Coordinators (PCs), including updated modeling data requirements specific to DERs.

Further, in Order No. 901,[1] the U.S. Federal Energy Regulatory Commission ("FERC") found that it is imperative for NERC to develop new or modified Reliability Standards to address reliability concerns "related to IBRs at all stages of interconnection, planning, and operations."[2]. Among other things, FERC directed NERC to develop requirements addressing the provision of IBR and DER data to the entities responsible for the planning and operation of the BPS. Detailed information on the specific FERC Order No. 901 directives addressed through this project is available in Project 2022-02 Consideration of Order No. 901 Directives.

Proposed Reliability Standard MOD-032-2 replaces Load-Serving Entity with Distribution Provider as an applicable entity. Data items specific to IBRs and DERs were added to Attachment 1: Data Reporting Requirements, consistent with addressing the FERC Order No. 901 directives. Proposed Reliability Standard MOD-032-2 also adds a new Part 1.4 in Requirement R1, which would require the Planning Coordinator and Transmission Planner to specify submission of standard library dynamic models, user-defined models or both. Allowing the specification of standard library models incorporated within modeling software is responsive to FERC concerns about usability and allows PCs to maintain current requirements for generic models that may be necessary for the creation of large Interconnection-wide base cases. Allowing the specification of user-defined models is responsive to industry feedback expressed during the NERC Industry Engagement workshops. New Requirement R1, Part 1.4.2 is responsive to FERC concerns about model usability and non-convergence by requiring PCs and TPs that accept user-defined models to specify usability requirements and require appropriate model documentation and instructions. New Requirement R2, Part 2.1 addresses estimation of unregistered IBR or DER data where actual data is not available, consistent with the directives in Order No. 901. New Requirement R2, Part 2.2 addresses the provision of dynamic models accepted under the MOD-026 standard, and new Requirement R2, Part 2.3 requires any entity submitting a model included on the Unacceptable Model List maintained by the ERO to include a technical rationale with its submission supporting the use of the model. Altogether, these modifications establish a uniform modeling framework that incorporates both IBR and DER data and facilitates model accuracy in alignment with FERC Order No. 901.

[1] Reliability Standards to Address Inverter-Based Resources, Order No. 901, 185 FERC ¶ 61,042 (2023).
[2] Id. at P 25

Revisions in the Reliability Standards TOP-003-8 and IRO-010-6 data specification standards specify that entities responsible for developing and distributing data specifications shall include requirements for model submissions consistent with the model submitted for planning purposes, as applicable.

General Considerations

In developing this implementation plan, the drafting team (DT) considered the time that would be necessary to update modeling data requirements and reporting procedures for MOD-032-2, including identifying the proper reporting entity for modeling data related to IBRs (including IBRs that are not DERs and do not meet the criteria that would require the owner(s) to register with NERC for mandatory Reliability Standards compliance purposes) and aggregate DERs. The DT also considered that the standard would become applicable to the Distribution Provider (DP) for the first time. During the 24 months prior to the effective date of Requirement R1, the applicable entities would be expected to participate in PC/TP processes to change the modeling data reporting requirements related to IBRs and aggregate DERs and should be able to start working on data collection processes and methods. The applicable entities in Requirement R2 would then have an additional 12 months to complete and implement data collection prior to the compliance dates of Requirements R2, R3, and R4. This timeline also allows for the development of new data estimation processes developed under MOD-032-2 Requirement R2, Part 2.1 and for the development of technical rationale to support the use of models included on the Unacceptable Model List maintained by the ERO, where applicable. Requirements adjusted in Reliability Standards IRO-010-6 and TOP-003-8 may not be practical to implement prior to full implementation of MOD-032-2, and therefore were set to the same implementation timeline. One additional limitation the DT considered is the requirement for all FERC Order No. 901 directives to be fully implemented by January 1, 2030, including those to be addressed by future standard revisions that may be dependent upon the implementation of these standard revisions.

In summary, this implementation plan would provide a full 36 months for MOD-032 Requirements R2, R3, R4, IRO-010, and TOP-003 from FERC approval until data is required to be reported under the revised requirements. During the phased-in compliance period for Requirements R2-R4, entities shall continue to provide data and perform other required actions in accordance with specifications developed under Reliability Standard MOD-032-1, unless entities are able to comply with the revised requirements sooner.

Effective Date and Phased-In Compliance Dates

The effective date for the proposed Reliability Standard and NERC Glossary term Distributed Energy Resource is provided below. Where the DT identified the need for a longer implementation period for compliance with a particular section of a proposed Reliability Standard (i.e., an entire Requirement or a portion thereof), the additional time for compliance with that section is specified below. The phased-in compliance date for those particular sections represents the date that entities must begin to comply with that particular section of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

Reliability Standard MOD-032-2

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for Reliability Standard MOD-032-2 Requirements R2, R3, and R4

Entities shall not be required to comply with Requirements R2, R3, and R4 relating to revised Planning Coordinator and Transmission Planner data requirements and reporting procedures developed under MOD-032-2 Requirement R1 and Attachment 1 until 12 months after the effective date of Reliability Standard MOD-032-2.

During the phased-in compliance period, entities shall continue to comply with Requirements R2, R3, and R4 related to Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under MOD-032-1 Requirement R1 and Attachment 1 unless they are compliant with revised Planning Coordinator/Transmission Planner data requirements and reporting procedures under Reliability Standard MOD-032-2 Requirement R1.

Definition – Distributed Energy Resource (DER)

Where approval by an applicable governmental authority is required, the definition of Distributed Energy Resource (DER) shall become effective on the first day of the first calendar quarter that is after the effective date of the applicable governmental authority's order approving Reliability Standard MOD-032-2, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the definition shall become effective on the first day of the first calendar quarter that is after the date that Reliability Standard MOD-032-2 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Reliability Standard IRO-010-6

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Reliability Standard TOP-003-8

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Retirement Date

Reliability Standard MOD-032-1

Reliability Standard MOD-032-1 shall be retired immediately prior to the effective date of Reliability Standard MOD-032-2 in the particular jurisdiction in which the revised standard is becoming effective.

Reliability Standard IRO-010-5

Reliability Standard IRO-010-5 shall be retired immediately prior to the effective date of Reliability Standard IRO-010-6 in the particular jurisdiction in which the revised standard is becoming effective.

Reliability Standard TOP-003-7

Reliability Standard TOP-003-7 shall be retired immediately prior to the effective date of Reliability Standard TOP-003-8 in the particular jurisdiction in which the revised standard is becoming effective.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Exhibit C

Order No. 672 Criteria

EXHBIIT C

Order No. 672 Criteria

In Order No. 672,[1] the Commission identified a number of criteria it will use to analyze Reliability Standards proposed for approval to ensure they are just, reasonable, not unduly discriminatory or preferential, and in the public interest. The discussion below identifies these factors and explains how the proposed Reliability Standards have met or exceeded the criteria.

1. Proposed Reliability Standards must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve that goal.[2]

Models provide the foundation of virtually all power system studies used to assess the reliability of the Bulk-Power System. Power system studies rely on models to predict system performance under various conditions. It is therefore important that models, including all their data, are complete, accurate, and up to date. Over the last decade, the Bulk-Power System has undergone a remarkable transformation. The resource mix, once consisting generally of large, synchronous generators, is increasingly comprised of relatively smaller Inverter-Based Resources ("IBRs") and Distributed Energy Resources ("DERs"). Such resources have unique technical and

---

[1] *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672, 114 FERC ¶ 61,104, *order on reh'g*, Order No. 672-A, 114 FERC ¶ 61,328 (2006) [hereinafter Order No. 672].

[2] *See* Order No. 672, *supra* note 1, at P 321 ("The proposed Reliability Standard must address a reliability concern that falls within the requirements of section 215 of the FPA. That is, it must provide for the reliable operation of Bulk-Power System facilities. It may not extend beyond reliable operation of such facilities or apply to other facilities. Such facilities include all those necessary for operating an interconnected electric energy transmission network, or any portion of that network, including control systems. The proposed Reliability Standard may apply to any design of planned additions or modifications of such facilities that is necessary to provide for reliable operation. It may also apply to Cybersecurity protection.").

See Order No. 672, *supra* note 1, at P 324 ("The proposed Reliability Standard must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve this goal. Although any person may propose a topic for a Reliability Standard to the ERO, in the ERO's process, the specific proposed Reliability Standard should be developed initially by persons within the electric power industry and community with a high level of technical expertise and be based on sound technical and engineering criteria. It should be based on actual data and lessons learned from past operating incidents, where appropriate. The process for ERO approval of a proposed Reliability Standard should be fair and open to all interested persons.").

operational characteristics which must be modeled accurately in system studies. NERC and the Commission, however, have identified deficiencies in how these resources are modeled, deficiencies which have implications for the system studies that rely on these models and the actions that are taken in response to these studies. Several Bulk-Power System events in recent years have demonstrated the risks to reliability that may result from unexpected IBR performance. Further, failing to understand the nature and extent of the IBRs and DERs connected to or affecting the Bulk-Power System can affect how entities plan for reliable operation of the Bulk-Power System.

To address these issues, and in satisfaction of several directives in Order No. 901,[3] NERC proposes Reliability Standards MOD-032-2, IRO-010-6, and TOP-003-8. Proposed Reliability Standards MOD-032-2, IRO-010-6, and TOP-003-8 would advance the reliability of the Bulk-Power System by establishing a uniform modeling framework to improve how IBRs are accounted for in system models and, ultimately, the system studies in the operations and planning horizons that rely on those models.

Proposed Reliability Standard MOD-032-2 – Data for Power System Modeling and Analysis would advance reliability and improve upon the currently effective MOD-032 standard through requirements intended to ensure that the entities responsible for planning the Bulk-Power System have the data and information they need to build system models that accurately reflect the performance of IBRs on their portions of the Bulk-Power System, as well as the performance of DERs that can impact Bulk-Power System reliability. Proposed Reliability Standard MOD-032-2 consists of four requirements, an Attachment 1 describing the information required to effectively model the interconnected transmission system in the transmission planning horizons, and a new

[3] Order No. 901, *Reliability Standards to Address Inverter-Based Resources*, 185 FERC ¶ 61,042 at P 229 (2023) [hereinafter Order No. 901].

supporting document describing the ongoing process by which NERC will maintain a list of equipment models that structurally do not represent equipment to a suitable fidelity for use in building system models (called the "Unacceptable Models List").

Proposed Reliability Standards IRO-010-6 and TOP-003-8 reflect revisions to establish the uniform framework for the development of planning and operations models and ensure that IBR-specific data and parameters are addressed in Reliability Coordinator, Balancing Authority, and Transmission Operator data specifications. To avoid ambiguity and ensure Order No. 901 directives are addressed, proposed Reliability Standards IRO-010-6 and TOP-003-8 would add "Inverter-based Resource (IBR)-specific data and parameters" to the list of information the Reliability Coordinator, Transmission Operator, and Balancing Authority must address in its documented data specifications. To address Commission directives regarding the usage of a uniform framework in the development of planning and operations models, proposed Reliability Standards IRO-010-6 and TOP-003-8 would add a new requirement part specifying that requirements for model submissions are to be consistent with the model submitted for planning purposes, as applicable.

The proposed Reliability Standards address several Commission directives in Order No. 901 related to IBR data sharing and modeling, as well as several findings and recommendations from NERC reports and lessons learned on past Bulk-Power System events. As such, it provides an important foundation for completing the operation and planning studies contemplated in the next phase of standards development under NERC's Order No. 901 Work Plan. The proposed Reliability Standards are thus designed to achieve a specific reliability goal and contain a technically sound means to achieve that goal.

2. Proposed Reliability Standards must be applicable only to users, owners, and operators of the bulk power system, and must be clear and unambiguous as to what is required and who is required to comply.[4]

The proposed Reliability Standards are clear and unambiguous as to what is required and who is required to comply, in accordance with Order No. 672.

Proposed Reliability Standard MOD-032-2 would continue to apply to the Balancing Authority, Generator Owner, Planning Authority/Planning Coordinator, Resource Planner, Transmission Owner, Transmission Planner, and Transmission Service Provider, as in currently effective Reliability Standard MOD-032-1. Proposed Reliability Standard MOD-032-2 would replace the Load Serving Entity, an applicable functional entity identified in Reliability Standard MOD-032-1, with the Distribution Provider. The Load Serving Entity is a functional entity category that is no longer registered for mandatory standards compliance purposes. Following Commission approval of NERC's proposed revised *Glossary* definition of Generator Owner,[5] proposed Reliability Standard MOD-032-2 would apply to a broader category of Generator Owners than those subject to currently effective Reliability Standard MOD-032-1; specifically, the Generator Owners that own the non-Bulk Electric System IBRs that NERC will register in accordance with revisions to its Rules of Procedure approved by the Commission in 2024.

Proposed Reliability Standard IRO-010-6 would continue to apply to the Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator,

---

[4] *See* Order No. 672, *supra* note 1, at P 322 ("The proposed Reliability Standard may impose a requirement on any user, owner, or operator of such facilities, but not on others.").

See Order No. 672, *supra* note 1, at P 325 ("The proposed Reliability Standard should be clear and unambiguous regarding what is required and who is required to comply. Users, owners, and operators of the Bulk-Power System must know what they are required to do to maintain reliability.").

[5] In August 2025, NERC submitted a petition seeking Commission approval of revised definitions of the terms Generator Owner and Generator Operator used in the NERC Glossary. As explained in NERC's petition, the revised definitions are intended to align the definitions of those terms used in NERC Reliability Standards with the revised registration criteria approved by the Commission in 2024. *See Petition of NERC for Approval of Revised Terms "Generator Owner" and "Generator Operator" used in NERC Reliability Standards and Request for Expedited Action*, Docket No. RD25-10-000 (Aug. 27, 2025).

Transmission Owner, and Distribution Provider. Proposed Reliability Standard TOP-003-8 would continue to apply to the Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider.

The proposed Reliability Standards clearly articulate the actions that applicable entities must take to comply with the standards.

3. A proposed Reliability Standard must include clear and understandable consequences and a range of penalties (monetary and/or non-monetary) for a violation.[6]

The Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") for the proposed Reliability Standards comport with NERC and Commission guidelines related to their assignment, as discussed further in **Exhibit G**. The assignment of the severity level for each VSL is consistent with the corresponding requirement, and the VSLs should ensure uniformity and consistency in the determination of penalties. The VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations. For these reasons, the proposed Reliability Standards include clear and understandable consequences in accordance with Order No. 672.

4. A proposed Reliability Standard must identify clear and objective criteria or measures for compliance, so that it can be enforced in a consistent and non-preferential manner.[7]

The proposed Reliability Standards contain measures that support each requirement by clearly identifying what is required and how the requirement will be enforced. These measures help provide clarity regarding how the requirements would be enforced and help ensure that the

---

[6] *See* Order No. 672, *supra* note 1, at P 326 ("The possible consequences, including range of possible penalties, for violating a proposed Reliability Standard should be clear and understandable by those who must comply.").

[7] *See* Order No. 672, *supra* note 1, at P 327 ("There should be a clear criterion or measure of whether an entity is in compliance with a proposed Reliability Standard. It should contain or be accompanied by an objective measure of compliance so that it can be enforced and so that enforcement can be applied in a consistent and non-preferential manner.").

requirements would be enforced in a clear, consistent, and non-preferential manner and without prejudice to any party.

5. Proposed Reliability Standards should achieve a reliability goal effectively and efficiently, but do not necessarily have to reflect "best practices" without regard to implementation cost or historical regional infrastructure design.[8]

The proposed Reliability Standards achieve their reliability goals effectively and efficiently in accordance with Order No. 672. Proposed Reliability Standard MOD-032-2 would provide robust and technically justified requirements for Planning Coordinator/Transmission Planner data specifications, including minimum requirements for IBR and DER-specific data and modeling parameters. While establishing robust minimum requirements, the proposed standard also provides sufficient flexibility to account for differences in regional planning areas. Proposed Reliability Standards IRO-010-6 and TOP-003-8 address consideration of IBR-specific data and parameters and provide for consistency in model submissions across planning and operations standards, where applicable.

6. Proposed Reliability Standards cannot be "lowest common denominator," i.e., cannot reflect a compromise that does not adequately protect Bulk-Power System reliability. Proposed Reliability Standards can consider costs to implement for smaller entities, but not at consequences of less than excellence in operating system reliability.[9]

The proposed Reliability Standards do not reflect a "lowest common denominator"

---

[8] *See* Order No. 672, *supra* note 1, at P 328 ("The proposed Reliability Standard does not necessarily have to reflect the optimal method, or 'best practice,' for achieving its reliability goal without regard to implementation cost or historical regional infrastructure design. It should however achieve its reliability goal effectively and efficiently.").

[9] *See* Order No. 672, *supra* note 1, at P 329 ("The proposed Reliability Standard must not simply reflect a compromise in the ERO's Reliability Standard development process based on the least effective North American practice—the so-called 'lowest common denominator'—if such practice does not adequately protect Bulk-Power System reliability. Although the Commission will give due weight to the technical expertise of the ERO, we will not hesitate to remand a proposed Reliability Standard if we are convinced it is not adequate to protect reliability.").

See Order No. 672, *supra* note 1, at P 330 ("A proposed Reliability Standard may take into account the size of the entity that must comply with the Reliability Standard and the cost to those entities of implementing the proposed Reliability Standard. However, the ERO should not propose a 'lowest common denominator' Reliability Standard that would achieve less than excellence in operating system reliability solely to protect against reasonable expenses for supporting this vital national infrastructure. For example, a small owner or operator of the Bulk-Power System must bear the cost of complying with each Reliability Standard that applies to it.").

approach. In accordance with the Commission's direction in Order No. 901, proposed Reliability Standard MOD-032-2 would improve system models and the planning studies that rely on those models by improving the process for collecting data and models that reflect the unique operational characteristics of IBR and DER resources. The proposed standard accounts for differences across planning areas and the rapid pace of technological change. Proposed Reliability Standards IRO-010-6 and TOP-003-8 would improve how operations and Real-time data specifications account for IBR resources and ensure for consistency in models submissions across the planning and operations standards.

7. Proposed Reliability Standards must be designed to apply throughout North America to the maximum extent achievable with a single Reliability Standard while not favoring one geographic area or regional model. It should take into account regional variations in the organization and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.[10]

The proposed Reliability Standards would apply consistently throughout North America and do not favor one geographic area or regional model. While the penetration of IBRs and DERs may vary by region, proposed Reliability Standard MOD-032-2 would include minimum requirements that must be addressed in Planning Coordinator/Transmission Planner data specifications. The proposed standard would allow flexibility in identification of entities responsible for providing data, how planners account for the aggregate impact of DERs affecting reliability in their planning areas, and in the models submitted in satisfaction of Planning Coordinator/Transmission Planner data specifications. Proposed Reliability Standards IRO-010-6

[10] *See* Order No. 672, *supra* note 1, at P 331 ("A proposed Reliability Standard should be designed to apply throughout the interconnected North American Bulk-Power System, to the maximum extent this is achievable with a single Reliability Standard. The proposed Reliability Standard should not be based on a single geographic or regional model but should take into account geographic variations in grid characteristics, terrain, weather, and other such factors; it should also take into account regional variations in the organizational and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.").

and TOP-003-8 would apply consistently throughout North America while recognizing variations in the information that is required to perform Real-time and operations analysis in different areas.

8. Proposed Reliability Standards should cause no undue negative effect on competition or restriction of the grid beyond any restriction necessary for reliability.[11]

The proposed Reliability Standards would have no undue negative effect on competition and would not unreasonably restrict the available transmission capacity or limit the use of the BPS in a preferential manner. The proposed standards would require the same performance by each of the applicable entities.

9. The implementation time for the proposed Reliability Standard is reasonable.[12]

The implementation plan for the proposed Reliability Standards is just and reasonable and appropriately balances the urgency in the need to implement the standards against the reasonableness of the time allowed for those who must comply to develop necessary procedures or other relevant capability. The proposed Implementation Plan provides that the proposed definition of Distributed Energy Resource (DER) would become effective on the first day of the first calendar quarter after the effective date of the Commission's order approving proposed Reliability Standard MOD-032-2. The proposed Reliability Standard MOD-032-2 would become effective on the first day of the first calendar quarter that is 24 months after the effective date of the Commission's order approving the proposed Reliability Standard.

---

[11] *See* Order No. 672, *supra* note 1, at P 332 ("As directed by section 215 of the FPA, the Commission itself will give special attention to the effect of a proposed Reliability Standard on competition. The ERO should attempt to develop a proposed Reliability Standard that has no undue negative effect on competition. Among other possible considerations, a proposed Reliability Standard should not unreasonably restrict available transmission capability on the Bulk-Power System beyond any restriction necessary for reliability and should not limit use of the Bulk-Power System in an unduly preferential manner. It should not create an undue advantage for one competitor over another.").

[12] *See* Order No. 672, *supra* note 1, at P 333 ("In considering whether a proposed Reliability Standard is just and reasonable, the Commission will consider also the timetable for implementation of the new requirements, including how the proposal balances any urgency in the need to implement it against the reasonableness of the time allowed for those who must comply to develop the necessary procedures, software, facilities, staffing or other relevant capability.").

During this implementation period, Planning Coordinators/Transmission Planners would develop revised data requirements and reporting procedures addressing each of the new and revised IBR and DER items in Requirement R1 and Attachment 1. Entities would not be required to comply with Requirements R2, R3, and R4 relating to these revised Planning Coordinator/Transmission Planner data requirements and reporting procedures until 12 months after the effective date of Reliability Standard MOD-032-2.

Proposed Reliability Standards IRO-010-6 and TOP-003-8 would become effective on the first day of the first calendar quarter that is 36 months after the effective date of the Commission's order approving the proposed Reliability Standards. The revised requirements in Reliability Standards IRO-010-6 and TOP-003-8 may not be practical to implement prior to full implementation of proposed Reliability Standard MOD-032-2, and therefore were set to the same implementation timeline.

Reliability Standards MOD-032-1, IRO-010-5, and TOP-003-7 would each be retired immediately prior to the effective date of the revised successor standard.

The proposed implementation plan is attached as **Exhibit B** to this petition. As discussed more fully in Section IX of NERC's petition, the proposed implementation plan reflects a measured consideration of the factors influencing the reasonableness of the time provided for implementation, including the time that would be necessary to update modeling data requirements and reporting procedures under proposed Reliability Standard MOD-032-2, and time that would be needed to respond to those data requirements and reporting procedures. The drafting team considered the fact that the MOD-032 standard would become applicable to the Distribution Provider for the first time.

These factors are carefully balanced against the demonstrated reliability need to implement these requirements, which is reflected in the Commission's guidance in Order No. 901 to have all IBR standards developed in response to the Commission's directives in Order No. 901 to be implemented prior to 2030.[13]

10. The Reliability Standard was developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[14]

The proposed Reliability Standards were developed in accordance with NERC's Commission-approved processes for developing and approving Reliability Standards. **Exhibit H** includes a summary of the Reliability Standard development proceedings, and details the processes followed to develop the proposed Reliability Standards. These processes included, among other things, comment periods, pre-ballot review periods, and balloting periods. Additionally, all meetings of the standard drafting team were properly noticed and open to the public.

11. NERC must explain any balancing of vital public interests in the development of proposed Reliability Standards.[15]

NERC has identified no competing public interests regarding the request for approval of this proposed Reliability Standards. No comments were received that indicated that the proposed

[13] Order No. 901 at P 226.

[14] *See* Order No. 672, *supra* note 1, at P 334 ("Further, in considering whether a proposed Reliability Standard meets the legal standard of review, we will entertain comments about whether the ERO implemented its Commission-approved Reliability Standard development process for the development of the particular proposed Reliability Standard in a proper manner, especially whether the process was open and fair. However, we caution that we will not be sympathetic to arguments by interested parties that choose, for whatever reason, not to participate in the ERO's Reliability Standard development process if it is conducted in good faith in accordance with the procedures approved by the Commission.").

[15] *See* Order No. 672, *supra* note 1, at P 335 ("Finally, we understand that at times development of a proposed Reliability Standard may require that a particular reliability goal must be balanced against other vital public interests, such as environmental, social and other goals. We expect the ERO to explain any such balancing in its application for approval of a proposed Reliability Standard.").

Reliability Standards conflict with other vital public interests.

12. Proposed Reliability Standards must consider any other appropriate factors.[16]

No other negative factors relevant to whether the proposed Reliability Standards are just and reasonable were identified.

[16] *See* Order No. 672, *supra* note 1, at P 323 ("In considering whether a proposed Reliability Standard is just and reasonable, we will consider the following general factors, as well as other factors that are appropriate for the particular Reliability Standard proposed.").

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Exhibit D

Consideration of Order No. 901 Directives

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of FERC Order No. 901 Directives

Milestone 3: Project 2022-02 Uniform Modeling Framework for IBR
September 2025

On October 23, 2023, FERC issued a Final Rule, Order No. 901, directing the North American Electric Reliability Corporation (NERC) to develop new or modified Reliability Standards that address aggregation of data, parameters, and estimation methods to provide the Transmission Planner (TP) and Transmission Operator (TOP) with the estimate values, explanation for limitations on data availability, and the method used for all estimations. This project has a FERC regulatory deadline of November 4, 2025. Below provides the directives from FERC Order 901 along with the drafting team's (DT's) consideration of the directives.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
P7. "… Second, by November 4, 2025, NERC must submit new or modified Reliability Standards addressing the interrelated directives concerning: (1) data sharing for registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate…"	IRO-010 MOD-032 TOP-003	A timeline has been drafted to meet the regulatory deadline of November 4, 2025. Completed tasks listed below. • An industry workshop completed January 14-17, 2025. (outreach) • Many virtual DT meetings completed weekly from January – March 2025. (publicly posted) • In-person DT completed February 11-13, 2025. (publicly posted) • Industry Webinar March 6, 2025. (publicly posted) • DT outreach with trade groups and entities March 3-14, 2025 • Industry comment and ballot period April 17-May 16, 2025. (publicly posted)

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		• A second industry workshop completed June 3-5, 2025. (publicly posted) • Many virtual meetings were completed weekly from May 19-July 23, 2025. • Industry outreach with trade groups and entities July 3-23, 2025. • Industry comment and ballot period August 8-September 10, 2025.
P76. "Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require registered IBR generator owners and operators to provide IBR-specific modeling data and parameters (e.g., steady-state, dynamic, and short circuit modeling information, and control settings for momentary cessation and ramp rates) that accurately represent the registered IBRs to their planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities that are responsible for planning and operating the Bulk-Power System. As several commenters indicate, ensuring the sharing of appropriate IBR modeling data is critical to create and maintain the models used in reliability studies, and in turn to ensure that Bulk-Power System transmission planners or operators are able to plan for, operate, and reliably integrate IBRs onto the Bulk-Power System."	IRO-010 MOD-032 TOP-003	**Theme:** Inverter-Based Resource (IBR) /Generator Owner to provide specific modeling data. IRO-010 and TOP-003: • While TOP-003 and IRO-010 allow any data to be requested, the DT felt it was important to add "IBR-specific data and parameters" specifically to IRO-010-6 Requirements R1, subpart 1.1 and TOP-003-8 Requirement R1, subpart 1.1 and Requirement R2, subpart 2.1 to ensure it is clear what data may be specifically requested to address FERC Order No. 901. In addition, IBR encompasses IBR-DER, and this information could be requested. • The DT considered adding a new subpart at the end of Requirement R1 (e.g., Part 1.6), but after reviewing requirement language, the DT determined the data and information lists within the existing subparts were the appropriate place to capture IBR-specific modeling data and parameters.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		MOD-032: • Generator Owner and Generator Operator – The DT decided to maintain applicability for just the Generator Owner and did not add Generator Operator as a functional entity to the applicability section. If data is needed from the Generator Operator, then the Generator Owner can reach out to the Generator Operator for necessary data via contractual obligations, etc. The DT does not find it necessary to require two applicable entities when one oversees the other. • The DT modified Attachment 1 to include generation and storage units, removed photovoltaic system (covered within IBR) and added Inverter-Based Resources. The wind turbine was updated for clarity that it is for Type 1 and Type 2, which is not included in the IBR definition.
P77. "With regard to AEU and ACP/SEIA's comments that the Commission direct NERC to specify data sharing requirements from transmission owners to generator owners and operators, we believe that this request may already be addressed through each transmission planner's existing processes. For example, the New York Independent System Operator (NYISO) and CAISO both have processes for obtaining such data after demonstrating a need for the specific information requested and that the required information protection and non-disclosure agreements are signed. Nevertheless, to support accurate modeling and performance, we direct NERC to consider during its standards development process AEU and ACP/SEIA's	MOD-032	**Theme:** Information going from Transmission Owner to Generator Owner/Generator Operator (consider): MOD-032 • There is no specific requirement within MOD-032 that requires Transmission Owners to share data with the Generator Owners and Generator Operators (and such a requirement would not be aligned with the purpose of MOD-032). However, Transmission Planners and Planning coordinators have a framework where requests for data can be sent for inclusion for the Interconnection-wide models. At this time, the DT does not see a need for a requirement to be drafted requiring Transmission Owners to provide data to Generator Owners and Generator Operators. The DT believes this is most appropriately addressed

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
suggested data sharing requirements when developing the framework, criteria, and necessary data exchange requirements to meet the registered IBR data sharing directive." **P74.** "AEU and ACP/SEIA ask that, in addition to data provision requirements for generator owners and operators, the Commission direct NERC to specify data sharing requirements from transmission owners to generator owners. For example, AEU explains that generator owners and operators also require data from transmission owners to support accurate modeling and performance, e.g., short circuit data, grid data for offshore wind, information on other power electronic devices around the IBR plant, and voltage harmonics. AEU adds that putting requirements on transmission owners would be consistent with revisions being developed for NERC's Modeling, Data, and Analysis (MOD) Reliability Standards."		through processes that exist outside of the MOD-032 Reliability Standard and concurs with the suggestion in P77 that these processes are already in place.
P78. "Commenters raised general concerns that mandating specific modeling and data submissions would reduce the flexibility and discretion of transmission planners and operators to identify the information they need. We find that, given the need for IBRs to operate in a predictable and reliable manner to ensure the reliable operation of the Bulk-Power System, it is necessary to establish uniform, minimum categories or types of data that must be provided so that Bulk-Power System planners and operators can predict the behavior of all IBRs. As discussed in more	MOD-032 TOP-003 IRO-010	**Theme:** Individual use of approved IBR models. (Uniform modeling framework) **Applicability:** Transmission Planner and Transmission Operator • Modifications made to MOD-032, including incorporation of an ERO Unacceptable Models list, establish an improved uniform modeling framework. IBR has been included in Attachment 1 of MOD-032 under steady state (item 3), dynamics (item 7), and short circuit specifying the minimum types of IBR data and capabilities that need to be collected as required per FERC Order No. 901.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
detail in section IV.C of this final rule, we are also directing NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models that accurately reflect the behavior of all IBRs during steady state, short-circuit, and dynamic conditions."		• Explicit reference to IBR data was added to the TOP-003 and IRO-010 standards along with provisions to ensure that models submitted under these standards are consistent with the models submitted under the framework established in MOD-032.
P86. "As a general matter, we agree with ACP/SEIA regarding the need to balance the burden to generator owners of collecting and providing data collected by disturbance monitoring equipment with the benefit of that data to reliability. Thus, in developing the directed data collection requirements, we direct NERC to consider the burdens of generators collecting and providing data, while assuring that Bulk-Power System operators and planners have the data they need for accurate disturbance monitoring and analysis. Likewise, regarding CAISO's request that the Commission direct NERC to consider requiring registered IBRs to provide additional data, we agree that such data collections may be warranted, and direct **NERC to consider through its standards development process whether additional IBR data points (e.g., telemetry collections or other automated platform integrations) are needed to further enhance real-time visibility of Bulk-Power System operations."**	TOP-003 IRO-010	**Theme:** Disturbance and monitoring (Consider) (real-time operations) **Applicability:** Generator Owner TOP-003/IRO-010 • TOP-003 and IRO-010 Reliability Standards are already structured in an open way so that any type of data needed can be requested at any time. In addition, transmission of information from the plant level is generally dealt with via interconnection agreements and does not rise to the level of a requirement being needed at this time. Lastly, PRC-028 PMU devices must be installed for every IBR installation. These additional monitoring devices will allow additional data requests related to those devices, if the applicable entities find that useful. Because of the two items above (the open method for data requests and the PRC-028 PMU devices), the standard balances the needs for the Transmission Operator to gather the data deemed necessary for reliability without uniform burden on all generating facilities.
P102. "Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal, with modification. Specifically, as proposed in the NOPR, we direct NERC to submit to the Commission for approval one or more new or modified Reliability Standards that require: (1)	MOD-032 IRO-010 TOP-003	**Theme:** 1) Transmission Owner directed to provide data for unregistered IBR and 2) Distribution Provider directed to provide data for IBR-DER **Applicability:** Transmission Owner and Distribution Provider

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
transmission owners to provide to Bulk-Power System planners and operators modeling data and parameters for unregistered IBRs in their transmission owner areas that, individually or in the aggregate, materially affect the reliable operation of the Bulk-Power System and (2) distribution providers to provide to Bulk-Power System planners and operators modeling data and parameters for IBR-DERs in the aggregate in their distribution provider areas where the IBR-DERs in the aggregate materially affect the reliable operation of the Bulk-Power System."		• The DT focused on the MOD-032 standard to address this directive from FERC. The DT added IBRs (including unregistered-IBRs) and DER (including IBR-DER) to Attachment 1 of the MOD-032 standard. In response to comments seeking more precision, the MOD-032 standard uses the phrase "an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes" to refer to the IBR resources encompassed by the term "unregistered IBR" in Order No. 901. • While the DT agrees that the Transmission Owner would be the typical entity for providing unregistered IBR data and the Distribution Provider would be the typical entity to provide DER data (as noted in Attachment 1 of MOD-032), the DT modified the Requirement language in response to comments to allow the Planning Coordinator and each of its Transmission Planners to identify the most appropriate entity to provide the data listed in Attachment 1 of MOD-032-2. Determination if an unregistered IBR or aggregate IBR-DER would "materially affect" the Bulk-Power System, requires engineering judgment and is not something that would be appropriate to precisely specify in a reliability standard. Thus, Attachment 1 footnote 7 was added to explicitly allow Transmission Planners and Planning Coordinators to specify DER thresholds that may be appropriate when considering impact to their local areas. • The DT made changes to the IRO-010 and TOP-003 standards to include IBRs specifically (see R1 of each standard), and to add references back to the MOD-032 standard. The DT determined that the IRO-010 and TOP-003 standards already included language in place to address IBR impacts.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
P104. "Recognizing that there may be instances in which transmission owners are unable to gather adequate unregistered IBR modeling data and parameters to create and maintain unregistered IBR models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation. We believe that this directive appropriately balances commenters' concerns about data accessibility and burden with the established need for transmission owners to provide unregistered IBR modeling data and parameters to Bulk-Power System planners and operators in their transmission owner area. We recognize that estimated modeling data and parameters are approximations of actual modeling data and parameters. We further acknowledge that there is some degree of error in estimated modeling data and parameters. However, on balance we believe that requiring such estimates with explanation of any limitations is an improvement from not having any data at all; and that even estimates will increase the overall adequacy of models and improve	MOD-032 IRO-010 TOP-003	**Theme 1:** 1) Estimation, if not able to get data from unregistered IBRs, 2) an explanation of the limitations of the availability of data, 3) explanation of the limitations of any data provided by unregistered IBRs, and 4) method for estimation. (directive) **Theme 2:** Implement a process or mechanism by which Transmission Owners would receive modeling data and parameters. (consider) **Applicability:** TO • The DT added Requirement R2, Part 2.1 allowing the functional entity to use the method of estimation should it find itself in a place unable to gather unregistered IBR data or DER data. However, it must include an explanation of the limitations of the data provided for unregistered IBRs or DERs (limitations on the availability and of the data provided) and the method used for estimation. • In addition, the DT added an explanation of the resources that are intended to be captured. In proposed MOD-032, "unregistered IBR" are described as IBRs that are not Distributed Energy Resources, as the DT proposes to define that term, and that would not meet the criteria in the NERC Rules of Procedure to register the owner of the IBR for the Generator Owner functional entity registration (as owning either category 1 or category 2 assets). As suggested by commenters, the DT has removed the phrase "Bulk-Power System" from this description to remove any potential for ambiguity in application. • While previous drafts of the MOD-032 standard used the shorthand phrase "unregistered IBR" to establish consistency with FERC Order No. 901, with the more fulsome description of

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
the reliability of the Bulk-Power System. To support this data collection, we further direct **NERC to consider commenters suggestions to implement a process or mechanism by which transmission owners would receive modeling data and parameters."**		those resources in the footnote, the DT moved this description to the requirement text (in lieu of the phrase "unregistered IBR") in response to comments. • It is important to note that Order No. 901 predated the changes NERC made to the Rules of Procedure to ensure that the owners and operators of such IBR resources would be registered with NERC for mandatory compliance purposes. NERC does not register IBRs as resources, but rather the owners of such resources based on the registry criteria for Generator Owner and Generator Operator. There are two categories of each: owners and operators of BES Facilities (category 1 GOs/GOPs); and owners and operators of non-BES inverter based generating resources that either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV (category 2 GOs/GOPs). In Order No. 901 parlance, ownership or operation of IBR resources meeting these criteria would require owner/operator registration and therefore would be considered "registered IBRs". In Order No. 901 parlance, ownership or operation of IBR resources that do not meet these criteria but are connected to a transmission system (i.e., are not Distributed Energy Resources) would not require owner/operator registration and therefore would be considered "unregistered IBR." • The DT discussed implementing a process or mechanism by which Transmission Owners would receive modeling data and parameters in depth. It was determined that if a TO is unable to gather data for unregistered IBRs and DERs, it is better to not

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		mandate a specific process for how Transmission Owners acquire or estimate data. Obtaining data for unregistered IBRs should not pose a significant challenge because such facilities are likely directly connected to a TO system and provision of necessary data should be specified in interconnection agreements or other contracts. Obtaining data for DERs would be more challenging as these facilities are connected to the TO system through a separate unregistered DP. In such cases, it is prudent to allow various estimation methods to be used. • The IRO-010 and TOP-003 Reliability Standards are drafted in a way that is open-ended and allows the respective applicable entities to request data needed. However, project 2022-02 DT added "Inverter-based Resource (IBR) specific data and parameters" to ensure it is clear that entities can request data when needed for operations assessments. To the extent modeling is needed, it should be consistent with modeling data provided under MOD-032 modeling framework. Therefore, the DT made changes to the IRO-010 and TOP-003 standards to require that model submissions for operations purposes under IRO-010 and TOP-003 are consistent with the model submissions for planning purposes under MOD-032, as applicable.
P105. "We also recognize that there may be instances where distribution providers are similarly unable to gather adequate modeling data and parameters from IBR-DERs. Accordingly, to account for instances in which distribution providers are unable to gather adequate modeling data and parameters of IBR-DERs to create and maintain IBR-DER models, we modify the NOPR proposal and direct NERC to develop new or	MOD-032 IRO-010 TOP-003	**Theme 1:** 1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation. (Directive) **Theme 2:** Consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters. (Consider)

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
modified Reliability Standards that require that each distribution provider, if unable to gather accurate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation. In support of above, we further direct NERC to consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters."		**Applicability:** Distribution Provider The DT added a new Requirement R2, Part 2.1 that if the responsible entity is unable to gather unregistered IBR data (*see description above*) or DER data and provide it to the Transmission Planner and Planning Coordinator, as specified in the data requirements and reporting procedures developed under Requirement R1, the responsible entity shall provide an estimate of the modeling data and parameters and include an explanation of the limitations of the data provided for unregistered IBRs or DERs (limitations on the availability and of the data provided) and the method used for estimation. The DT discussed the possible mechanism by which Distribution Providers would receive modeling data and parameters. The DT did not feel this rose to the level of a requirement as the Distribution Provider can ask for the modeling data and parameters from the respective entity.
P106. "Finally, as noted by commenters, we recognize that there may be instances where IBR-DERs are connected to an entity that does not meet the criteria for registration with NERC as a distribution provider. For those areas with IBR-DERs that in the aggregate materially affect the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we direct NERC to determine the appropriate registered entity responsible for providing data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, or, when unable to gather such accurate IBR-DERs data, to provide instead	MOD-032 IRO-010 TOP-003	**Theme:** Who is the responsible entity when no registered DP of IBR-DER (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation. • After much deliberation, the DT determined that if there is no registered Distribution Provider, then the next best entity would be a Transmission Owner. The DT created a footnote to Attachment 1 stating: "The Distribution Provider is the typical responsible entity for collecting and providing data for DERs

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation."		connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider's system. The Transmission Owner is the typical responsible entity for collecting and providing data for DERs where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner's system." • The DT asked industry the following question: "Do you agree that the Transmission Owner (TO) is typically the appropriate responsible entity for collecting and providing data for DER where there is no associated registered DP between the DER connection point and the TO's system?" Some commenters agreed that the TO is the correct entity who should gather data if there is no associated registered DP between the DER connection point and the TO system. However, many comments received stated that the TO has no authority to collect data, and the following entities would be better suited to gather the data needed: Registered DP, Balancing Authority, Planning Coordinator, LSE, Generator Owner, Transmission Operator, and Resource Planner. Based on this feedback, the DT modified the Requirement language to allow the Planning Coordinator and each of its Transmission Planners to identify the most appropriate entity to provide the data listed in Attachment 1 of MOD-032-2.
P108. "Regarding CAISO's concern regarding the potential "compliance trap" where planners and operators rely on third-party data and IRC's request	MOD-032 IRO-010 TOP-003	**Theme:** Minimum categories or types of data that must be provided to transmission planners, transmission operators, transmission owners, and distribution providers that are necessary to predict the behavior of all

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
that the final rule specify the data to be submitted by all IBRs (i.e., registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate) and transmission devices using similar technologies, we direct NERC to determine through its standards development process the minimum categories or types of data that must be provided to transmission planners, transmission operators, transmission owners, and distribution providers necessary to predict the behavior of all IBRs and to ensure that compliance obligations are clear. As discussed in more detail in section IV.C of this final rule, we are also directing NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models that accurately reflect the behavior of all IBRs during steady state, short-circuit, and dynamic conditions. By contrast, we believe that a directive to task distribution providers as the appropriate registered entity to collect and share the modeling data and parameters of IBR-DERs in the aggregate is preferable to deferring to the stakeholder process as suggested by APS. The distribution provider, as the entity providing and operating the lines between the transmission and distribution systems, is the entity best situated to have access to the data necessary for accurate estimation and, other than Indicated Trade Associations that suggested the piecemeal approach already discussed above, no commenter identified other potential entities as an equally efficient option."		IBRs and to ensure that compliance obligations are clear (ERO Approved Acceptable Criteria for Models/IEEE1547 ref./modify req./Tech rationale) **Applicability:** Transmission Planners, Transmission Operators, Transmission Owners, and Distribution Providers • The DT added Requirement R1, Part 1.4 to specify dynamic model submission requirements in Planning Coordinator/Transmission Planner data requirements and reporting procedures. • The focus of Requirement R1 Part 1.4 is obtaining accurate and usable models for IBRs. New Requirement R2 Part 2.3 provides that models with known deficiencies, such that the ERO included them on the Unacceptable Model List, shall not be submitted without technical justification. • Attachment 1 was modified to categorize the types of data required as per the directive (IBR, aggregate DER, Storage) necessary to facilitate model development. • Requirement R2, Part 2.1 requires entities to estimate unregistered IBR and IBR-DER data if the entity responsible for providing such data is unable to gather it.
P122. "Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop	MOD-032 IRO-010	**Theme**: Require the use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady state, short-

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions when developing planning, operations, and interconnection-wide models. For example, the new or modified Reliability Standards could reference the NERC approved component model list, which defines the models that may be used, and those models that may not be used, for specific types of studies. This approved component model list includes WECC's IBR models. Without requiring the use of approved industry generic library models, Bulk-Power System planners and operators may not be able to create system models that adequately predict IBR behaviors and subsequent impacts on the Bulk-Power System."	TOP-003	circuit, and dynamic conditions when developing planning, operations, and Interconnection-wide models. While FERC Order No. 901 directed NERC to "develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions" (P 108), the DT determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their Interconnection-wide models and subsequently their planning cases. The DT considered that many entities have a different understanding for what is a "generic model", and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The DT further considered that NERC as the ERO does not presently maintain an "acceptable model library", but rather an "unacceptable model library", and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion. Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		To bookend these criteria for acceptable models, proposed Requirement R2 would also require any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The Unacceptable Models List includes models that NERC has identified over time as having known issues. While the DT initially proposed to foreclose the use of such models, the DT considered feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The DT believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns. The DT debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the DT ultimately decided to include this requirement in Requirement R2 as it relates to how entities respond to data specifications. The DT has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the DT has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for entities for Reliability Standards compliance purposes. As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the Reliability and Security Technical Committee. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations would then be considered by the ERO and published on the NERC website. NERC staff are currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing.
P124. "We direct NERC to determine through its standards development process which nation-wide approved component models are needed to build IBR plant models for steady state, short-circuit, and		**Theme:** Nation-wide approved component models are needed to build IBR plant models for steady state, short-circuit, and dynamics studies. (Uniform Modeling framework)

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
dynamics studies. We acknowledge NERC's comment that user-defined models may be helpful for specific local reliability studies; however, the user-defined model cannot be used in place of nation-wide approved component models for regional analysis or interconnection-wide analysis because the user-defined model may cause non-convergence and other issues. However, NERC may allow the submission of user-defined models alongside the approved industry generic IBR model. Various entities do not accept user-defined models or only accept them for limited instances along with the open-source code which then allows internal model components to be viewed and modified. For example, PJM does not accept user-defined models and requires generic models for model verification in accordance with currently effective Reliability Standards MOD-026-1 and MOD-027-1. NYISO accepts a user-defined model in limited instances but requires either the open-source code (allowing anyone to access the internal model) or dynamic link library data and code files (compiled code that must be decompiled to view the internal model) that must be supplied for existing power flow software and in perpetuity."		The uniform modeling framework established in the proposed MOD-032 will focus on the use and representation of positive sequence phasor domain (PSPD) models in registered entity footprints and in Interconnection-wide models. Interconnection-wide modeling may be different from the models used in specialized studies dedicated to a particular technical objective. The ERO Unacceptable Models List applies to the models where NERC Reliability Standards require its use (generally for planning and operation models where multiple entities share information beyond their portion of the electric system, which includes Interconnection-wide models). Further guidance for interconnection applications can be found in the *NERC Dynamic Model Recommendations*. The DT considered introducing an approved model list for use in building cases specifically for Interconnection-wide analysis through Requirement R1 Part R1.2 of the proposed MOD-032, however, pre-defining a limited set of models that could be used to represent generation and system components is potentially at odds with objectives to also have accurate models, especially as technology rapidly progresses. To meet this directive, the DT modified Requirement R1 of MOD-032 by specifying the use of standard library "generic" models in Interconnection-wide cases while allowing the use of user-defined models. This provision was careful to address typically reported issues associated with user-defined models (UDMs) including non-convergence, by requiring that TP/PCs establish usability requirements for UDMs while incorporating an open, transparent process of identifying deficient models through the use of the "MOD-032 Supporting Documentation – Process for Updating the Unacceptable Models List Maintained by the ERO" and the "ERO Unacceptable Model list". Any TPs/PCs accepting UDMs shall provide

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		their UDM requirements to other PCs/TPs within the Interconnection upon request. The DT believes this approach balances the practical limitations of "generic models" raised by industry at the January 15-16 NERC Industry Engagement Workshop and re-iterated at the June NERC Industry Engagement Workshop with the need for an improved uniform modeling framework. The combination of specifying the use of standard library component models approved and offered by software simulation tools, along with the ERO maintained Unacceptable Model List and its processes, will ensure that models used in interconnection wide analysis are robust enough while accuracy is not compromised to any level of detail deemed necessary. The introductions to this framework increase the data specifications requirements when user-defined models are used. TOP-003 and IRO-010 proposed standards were modified to ensure models submitted are consistent with models submitted under the framework established in MOD-032.
P125. "Accordingly, we direct NERC to develop new or modified Reliability Standards that require the sole use of nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build interconnection-wide models. One example of a way NERC could meet this directive would be to require an equivalent generic library model along with all submissions of user-defined models so that the generic library model can be used when combining	MOD-032 IRO-010 TOP-003	**Theme:** Nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build Interconnection-wide models. (Uniform Modeling framework /Req language) • Nation-wide approved components via generic library models are addressed via the development of a framework established in the proposed MOD-032-2 through improvements to Requirements R1, R2, and R3. The inclusion of ERO Unacceptable Models List, MOD-032 Supporting Document, and additional

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
neighboring transmission system models and in interconnection-wide models."		requirement language aims to ensure uniformity in processes and models to facilitate the exchange of neighboring entities' respective planning/operation models and to build Interconnection-wide models. • The PC and TP are allowed to require provision of generic models, but if equipment-specific models satisfy usability criteria, and processes established through Requirements R1, R2, and R3 of the proposed MOD-032 standard, they are not prohibited. The framework explicitly allows for the submission of equivalent generic library models along with submissions of user-defined models which allows for the use of generic library models when combining neighboring transmission system models and Interconnection-wide models. • TOP-003 and IRO-010 proposed standards were modified to ensure models submitted are consistent with models submitted under the framework established in MOD-032.
P141. "We also direct NERC to require the generator owners of registered IBRs and the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g., planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of registered and unregistered IBRs, including momentary cessation and/or tripping, and all ride through behavior. Recognizing that there may be instances in which transmission owners are unable to gather accurate unregistered IBR modeling data and parameters to	MOD-032 IRO-010 TOP-003	**Applicability**: GO • Nation-wide approved components via generic library models are addressed via the modifications made to MOD-032, including incorporation of an ERO Unacceptable Models list, establishing an improved uniform modeling framework. This approach is aligned with the FERC Order directives while addressing the practical limitations raised by industry at the January 15-16 NERC Industry Engagement Workshop and re-iterated at the June NERC Industry Engagement Workshop. • MOD-032, Attachment 1 was modified to specifically add that capabilities related to momentary cessation, tripping, and Ride-

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
create and maintain accurate unregistered IBR dynamic models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas, dynamic models of unregistered IBRs using estimated data in accordance with this final rule's section IV.B.3 data sharing directives. Further, we direct NERC to require distribution providers to provide to the planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities aggregated dynamic models that adequately represent the dynamic performance of IBR-DERs on their systems that in the aggregate have a material impact on the Bulk-Power System, including momentary cessation and/or tripping, and all ride through behavior (e.g., IBR-DERs in the aggregate modeled by interconnection requirements performance to represent different steady-state and dynamic behavior). Recognizing that there may be instances in which distribution providers are unable to gather data that accurately represents IBR-DERs in the aggregate, we modify the NOPR proposal and direct NERC to include in the proposed new or modified Reliability Standards a requirement that the distribution provider, if unable to gather data of IBR-DERs that in the aggregate have a material impact on		through, be reflected in the required model data for IBR and DER. • Explicit reference to IBR data was added to the TOP-003 and IRO-010 standards along with provisions to ensure that models submitted under these standards are consistent with the models submitted under the framework established in MOD-032.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
the Bulk-Power System, provide to the Bulk-Power System planners and operators (i.e., the data recipients) a dynamic model using estimated data for IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, in accordance with this final rule's section IV.B.3 data sharing directives. Furthermore, we acknowledge that there may be areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider. Therefore, we modify the NOPR proposal and direct NERC to determine the appropriate registered entity responsible for providing adequate data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and to identify the registered entities for coordinating, verifying, and keeping up to date the respective dynamic models. Finally, NERC must ensure that the proposed new or modified Reliability Standards account for the dynamic performance of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System."		
P146. Accordingly, **we direct NERC to develop new or modified Reliability Standards that require the use of the DER_A model or successor models to represent the behaviors of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System at a sufficient level of fidelity for Bulk-Power System planners and operators to create valid planning and operations and interconnection-wide models and to**	MOD-032 IRO-010 TOP-003	**Theme**: IBR-DER Model • As per the directive, the DT is requiring the modeling of aggregate DER through requirement R1 and Attachment 1. The currently available DER_A model is sufficient only for positive sequence phasor domain simulations. With the variety of other simulation domains (such as EMT and short circuit) necessary to study IBRs, mandating this model could prevent TPs or PCs from

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
be able to perform respective system studies. For example, the new or modified Reliability Standards could require models of IBR-DERs (i.e., DER_A model) to adequately reflect the steady-state and dynamic aggregate resource performance in both a transmission area and across the interconnection. Additionally, estimated modeling data and parameters of IBR-DERs that in the aggregate (i.e., DER_A model) have a material impact on the Bulk-Power System could be used where measured and collected data is not available. We believe requiring the DER_A model will address NERC's request for entities to work collaboratively with the state regulators to identify, implement, and perform an effective model validation approach for IBR-DERs in the aggregate as opposed to requiring validated models of IBR-DER in the aggregate that can have a material impact on the reliable operation of the Bulk-Power System.		performing their studies. This further reinforces the DT's election to not require the use of the DER_A model, but rather a model that achieves specific performance criteria and conforms with MOD-032 edits in Attachment 1 and Requirement R1. The fidelity/accuracy components of the FERC directives were generally considered to be within the SAR scopes for Projects 2020-06 and 2021-01, not Project 2022-02. However, the model framework established with the proposed MOD-032-2 does facilitate model fidelity and accuracy by allowing flexibility in model selection (rather than mandating use of a defined set of models). Specific fidelity/accuracy evaluations are beyond the scope of MOD-032. • The DT considered referencing the DER_A model specifically, but refrained due to the rapidly evolving nature of models and concerns for the time required to update such a reference in a NERC Standard. Additionally, the DT is not specifying particular library models for other resources, so specifying a particular model for DER will invite challenges. Further, challenges with precisely defining and determining what a "successor model" is could potentially create more future reliability risks. The standard as currently written allows for additional future models of higher fidelity to be accommodated.
P157. We believe the development of new or modified Reliability Standards is an important corollary to NERC's ongoing effort to identify and register generator owners and operators of IBRs. Although NERC's registration changes will not at this time address IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, we believe APS's concerns	MOD-032 TOP-003 IRO-010	**Theme:** The responsible entity for IBR-DER data when there is no registered DP. Upon a decent amount of conversation, the DT determined that if there is no registered Distribution Provider, then the next best entity would be a Transmission Owner. The DT created a footnote to Attachment 1 stating: "The Distribution Provider is the typical responsible entity for

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
regarding system-wide model validation is addressed in NERC's Reliability Guidelines and through the use of the EPRI DER Settings Database. We recognize that some distribution providers may not be able to provide a precise set of modeling data and parameters that accurately represent IBR-DERs in the aggregate. For these situations, NERC has provided a technical means to estimate in aggregating the needed IBR-DER modeling data and parameters (i.e., for the DER_A model) in the IBR-DER Data Collection Guideline. Further, NERC's 2021 Aggregate DER Model Verification Guideline provides transmission planners and planning coordinators with tools and techniques that can be adapted for their specific systems to verify that aggregate DER models (i.e., DER_A models) are a suitable representation of these resources in planning assessments. **Furthermore, for those areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we modify the NOPR proposal to direct NERC to determine the appropriate registered entity responsible for the data and parameters of IBR-DERs in the aggregate and to establish a process that requires identified registered entities to coordinate, validate, and keep up to date the system models.**		collecting and providing data for DERs connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider's system. The Transmission Owner is the typical responsible entity for collecting and providing data for DER where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner's system." The use of the word "typical" is intentional to indicate the most likely entity based on the DT's broad understanding but allows flexibility per Requirement 1 for the PC/TPs to select a more appropriate entity or entities in their area based on regional or jurisdictional differences.
P161. "Pursuant to section 215(d)(5) of the FPA, we modify the NOPR proposal to provide additional specificity to explain coordination and keep up to date in a timely manner the verified data and models of	MOD-032 IRO-010 TOP-003	The proposed Milestone 3 Reliability Standards collectively address the Commission's directives in Order No. 901 paragraph 161.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate in the system models. **Specifically, we direct NERC to develop new or modified Reliability Standards that require planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities to establish for each interconnection a uniform framework with modeling criteria, a registered modeling designee, and necessary data exchange requirements both between themselves and with the generator owners, transmission owners, and distribution providers to coordinate the creation of transmission planning, operations, and interconnection-wide models (i.e., system models) and the validation of each respective system model.** Further, we direct NERC to include in the new or modified Reliability Standards a requirement for generator owners, transmission owners, and distribution providers to regularly update and communicate the verified data and models of registered IBRs, unregistered IBRs, and IBR-DERs by comparing their resulting models against actual operational behavior to achieve and maintain necessary modeling accuracy for inclusion of these resources in the system models. For those areas with IBR-DERs in the aggregate that have a material impact on the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we modify the NOPR proposal to direct NERC to determine the appropriate registered entity		The Project 2022-02 DT modified MOD-032 to ensure it captures the uniform framework with modeling criteria, and necessary data exchange requirements for registered IBR, unregistered IBR, and DER (to include IBR-DER). Modifications in TOP-003 and IRO-010 are intended to promote consistency in models submitted for planning purposes and operations purposes so that entities responsible for planning and operating the BPS are all working from similar models that accurately represent the resources within their footprints. • A uniform modeling framework is established in the proposed MOD-032-2 through improvements to R1, R2, and R3 and Attachment 1. The inclusion of the ERO Unacceptable Models List (and additional revision process) and additional requirement language aims to ensure uniformity in processes and models to facilitate the exchange of neighboring entities' respective planning/operation models and to build Interconnection-wide models. Where appropriate, there are flexibilities built into this framework to accommodate differences in planning area modeling needs. • The PC and TP are allowed to require standard library models, but if user-written models satisfy usability criteria, and processes established through R1, R2, and R3 of the proposed MOD-032-2 standard, they are not prohibited. The framework explicitly allows for the submission of standard library models along with submission of user-written models which allows for the use of standard library models when combining neighboring transmission system models and Interconnection-wide models. If user written models are accepted, the PC and TP are required to share their usability criteria with other planning entities within the Interconnection upon request.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
responsible for the models of those IBR-DERs and to determine the registered entities responsible for updating, verifying, and coordinating models for IBR-DERs in the aggregate to meet the system models directives. NERC may implement this directive by modifying Reliability Standards MOD-032-1 and MOD-033-2 or by developing new Reliability Standards to establish requirements mandating an annual process to coordinate, validate, and keep up-to-date the transmission planning, operations, and interconnection-wide models."		• The DT added IBRs (including unregistered-IBRs) and DER (including IBR-DER) to Attachment 1 of the proposed MOD-032-2 standard. While the TO would be the typical entity for providing unregistered IBR data and the DP would be the typical entity to provide DER data (as noted in Attachment 1 of proposed MOD-032-2), the DT recognized that there may be some variations as to whom might have the most accurate and usable data for unregistered resources in the planning area. Therefore, the DT modified the Requirement language to allow the PC and each of its TPs to identify the most appropriate entity to provide the data listed in Attachment 1 of proposed MOD-032-2. • Similarly, a determination if an unregistered IBR or aggregate IBR-DER would "materially affect" the Bulk-Power System requires engineering judgment and the consideration of other material factors, which would not be prudent to prescribe in a Reliability Standard. Thus, Attachment 1 footnote 7 of proposed MOD-032-2 was added to explicitly allow PCs/TPs to specify DER thresholds that may be appropriate when considering impact to their local areas. • The DT made changes to the IRO-010 and TOP-003 standards to include IBRs specifically (see R1 of each standard). To the extent IBR modeling data is deemed necessary under IRO-010 and TOP-003, it should be consistent with modeling data provided for planning purposes. Therefore, the DT made changes to IRO-010 and TOP-003 to require that model submissions for operations purposes under IRO-010 and TOP-003 are consistent with the model submissions for planning purposes. Consistency in models is important to ensure BPS planners and operators are working from similar and high quality models; however, the DT recognized that operations entities may

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		require some adjustments from the model submitted for planning purposes to satisfy the needs in an operations environment. The fidelity/accuracy components of the FERC directives were generally considered to be within the SAR scopes for Projects 2020-06 and 2021-01, rather than Project 2022-02. However, the model framework established with the proposed MOD-032-2 does facilitate model fidelity and accuracy by allowing flexibility in model selection, so that entities may select the most representative model for the resource meeting PC/TP requirements (rather than mandating use of a defined set of models which may quickly become out-of-date). Models that are known to have fidelity issues are not to be submitted without technical justification. Specific fidelity/accuracy evaluations are beyond the scope of MOD-032, but are addressed in other proposed Milestone 3 Reliability Sstandards. The DT confirmed the link between these standards by requiring that models submitted under MOD-032 shall be the models verified under MOD-026, where available. System models developedvalidated under MOD-033 shall be developedperformed in accordance with data provided under MOD-032 and MOD-033. Regarding thate part of the directive to keep models up to date, MOD-032-1 already mandated a "schedule for submission of data at least once every 13 calendar months." This requirement is maintained in proposed MOD-032-2. System models will thus be built on updated data and models, which are verified and validated in accordance with the proposed MOD-033-2 and MOD-026-2 standards. With regards to that part of the p.161 directive addressing a "registered model designee" for building the Interconnection-wide cases, NERC considered the directive and concluded that the present ERO modeling

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		designee framework, with notable enhancements since 2023, presents an equally effective and efficient alternative to designating an entity on the NERC Compliance Registry to perform the tasks of Interconnection-wide model building. Further, the present framework, as enhanced since 2023, has distinct advantages over designating a responsible entity in that it maintains ongoing oversight of the Interconnection case building process, rather than compliance/audit-focused oversight with a retroactive focus. Additional explanation is provided below. **Registered Modeling Designee:** The current MOD-032-1 Requirement R4 requires each PC to make available models for its planning area provided under R2 to the Electric Reliability Organization (ERO) or its designee to support the creation of the Interconnection-wide cases. This is not changed in proposed MOD-032-2 R4. As noted above, proposed MOD-032-2 Requirement R1, Part 1.1 would require the PC and each of its TPs to identify the entity responsible for each required item in Attachment 1. That entity must provide the information under Requirement R2. A new Requirement R2, Part 2.2 has been added to require models provided under MOD-026 to be accepted by the TP, where available Requirement R3 requires notification from the PC or TP regarding technical concerns with the data submitted under Requirement R2. This improved framework for modeling contemplates coordination and model updates as needed by registered entities as models are collected to build the Interconnection-wide cases. As to who builds the Interconnction-wide base case model, the ERO has designated entities with a sufficient wide area view and focus on reliability for each Interconnection to perform this work. For the Texas Interconnection, the Texas Regional Entity performs this work in

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		coordination with ERCOT. For the Western Interconnection, the Western Electric Coordinating Council (WECC) performs this work. For the Eastern Interconnection, the Eastern Interconnection Reliability Assessment Group (ERAG) consisting of MRO, NPCC, RF, and SERC performs this work. The ERAG also performs the base-case model creator function for the Quebec Interconnection in Canada. As the ERO, NERC is responsible for overseeing and ensuring that these designated entities perform the proposed MOD-032-2 Requirement R4 activities. In 2023, the Officers Leadership Team of the ERO Enterprise approved the MOD-032 Designee process document. This process document reflects the maturation of this aspect of the ERO's activities and contains clauses and processes that require the designee for the Interconnection to perform specific duties. Each designee must have certain attributes, including a governance structure responsive to the needs of Planning Coordinators, with clear roles and responsibilities for model creation, transparency in data requirements, establishing timeframes for review cycles, and defining security and access to models. Certain core cases are required as part of this process, including core cases for the ERO for use in seasonal planning studies and event analyses. Other core cases are required for validating Interconnection Frequency Response obligations and event analyses. Lastly, the process requires the development of typical cases to support implementation of the TPL-001 standard. NERC or the Regional Entities may request additional specialized cases as needed. Designated entities have certain responsibilities under this framework, including developing a method for collecting data from all Planning Coordinators and developing and maintaining a case creation manual

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		including the process by which cases must be assembled, tested for quality, and tested for case fidelity according to ERO case quality metrics. NERC will perform an annual case quality assessment, and the designee must address any case model deficiencies identified by NERC. The process also contemplates feedback processes and processes for correcting cases or addressing recurring data or model errors with Planning Coordinators, among other controls, to ensure quality. Regarding the ERAG, there is also an Eastern Interconnection Regional Entity Agreement among MRO, NPCC, RF, and SERC[1]. In this agreement, there are provisions for oversight and coordination in how this group exercises its authority as the MOD-032 designee. Connections to MOD-032 are acknowledged, such as: • Oversight of the Multiregional Modeling Working Group[2] (MMWG, whose membership is comprised of one power flow representative and one dynamics representative from each of the Data Submitting Entities (comprised of Planning Coordinators or group of Planning Coordinators) and non-voting representatives as follows: one liaison representative each of the EI Regions and the ERAG Chair, a coordinator from each of the organizations that provides model development services to MMWG, and NERC and FERC staff liaisons. ○ The purpose of the MMWG is to coordinate, in a timely manner, the development of designated power flow and

2 ERAG-MMWG-Charter-2024.pdf

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		dynamics simulation base case models that realistically simulate steady state and dynamic bulk electric system behavior of the Eastern Interconnection. ○ To ensure cases and models are done in a consistent fashion, the MMWG holds three annual meetings along with conference calls as needed. The MMWG roster includes a FERC liaison who can attend all meetings. The group maintains a case building procedure manual[3] that is used by its members. The manual contains a set of data checks that are performed on the steady state and dynamic cases. • Oversight of the Acceptable Model Working Group (AMWG)[4], which is comprised of: (1) Planning Coordinators or group of Planning Coordinators who are responsible for the development and maintenance of an Eastern Interconnection dynamic acceptable model list, and (2) RE and NERC staff who are responsible for coordination and facilitation. ○ The group was formed in 2023 and recently published the first version of its acceptable model list which was posted to the public ERAG website[5]. As models are removed from the acceptable list, the group develops an industry communication to begin removing those models from the annual set of cases.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		○ Oversight includes review of all process changes made to the AMWG procedures to ensure consistency with the NERC case quality metrics. In addition, NERC further considered the following information provided by the MOD-032 Designee Group comprised of members from NERC and the Regional Entities: **MOD-032 Designee Group:** The electric grid is evolving at an unprecedented pace, driven by the rapid integration of inverter-based resources (IBRs), changing load characteristics, and emerging technologies. As the system transforms, the models we use to study and understand its behavior must also transform. We recognize the growing challenge of obtaining and coordinating accurate dynamic models for IBRs, including securing the appropriate parameters needed to ensure that simulation results reflect real-world system performance. Addressing these modeling challenges is essential to maintaining the reliability and resilience of the bulk power system and requires close collaboration, and the MOD-032 designees along with PCs are committed to and holding data providers accountable for model coordination and model quality. The MOD-032 designees are committed to ensuring that the model quality is maintained and there is a mechanism in place for the PC/TP to gather the appropriate information from the Generator Owners (GO). NERC facilitates the designee group of Regional Entity staff who are responsible for designee activities.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		*** In summary, the proposed revisions to the standards addressed in Milestone 3 work, along with the ERO designated entity framework discussed above for building Interconnection-wide cases, address the concerns underlying the Commission's directive in paragraph 161 of Order No. 901 regarding the coordination, updating, and timely development of quality Interconnection-wide models that accurately represent the behavior of IBRs in the Interconnection. Further, this framework advances consistency in modeling used across planning and ERO assessment activities. NERC therefore submits that this framework represents an equally effective and efficient approach to addressing this part of the Commission's paragraph 161 directive to identify a registered modeling designee in the MOD-032 standard.
P226. "Although we are not directing NERC to include implementation dates in its informational filing and are leaving determination of the proposed effective dates to the standards development process, we are concerned that the lack of a time limit for implementation could allow identified issues to remain unresolved for a significant and indefinite period. Therefore, we emphasize that industry has been aware of and alerted to the need to address the impacts of IBRs on the Bulk-Power System since at least 2016. The number of events, NERC Alerts, reports, whitepapers, guidelines, and ongoing standards projects more than demonstrate the need for the expeditious implementation of new or modified Reliability Standards addressing IBR data sharing, data and model validation, planning and operational studies, and performance requirements. Thus, in that light, the	MOD-032 IRO-010 TOP-003	**Theme:** Sufficient timeframe. The DT felt that four years was an appropriate timeframe for the MOD-032, IRO-010, and TOP-003 implementation times. It is understood that based on what is required via MOD-032, industry would need two years to hold meetings with stakeholders to establish processes for collecting the needed models and data, and then an additional two years to update models based on the new requirements, etc. However, taking into consideration the FERC Order 901 implementation deadline of 2030, the DT settled on a three-year implementation time knowing that milestone 4 revisions still need to be implemented by 2030 and are dependent on the Milestone 3 implementation plan time. Three- year implementation plans were also selected for TOP-003 and IRO-010 to align potential new data requests under TOP-003 and IRO-010 with the expected data availability under MOD-032 processes.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
Commission will consider the justness and reasonableness of each new or modified Reliability Standard's implementation plan when it is submitted for Commission approval. Further, we believe that there is a need to have all of the directed Reliability Standards effective and enforceable well in advance of 2030 and direct NERC to ensure that the associated implementation plans sequentially stagger the effective and enforceable dates to ensure an orderly industry transition for complying with the IBR directives in this final rule prior to that date."		

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Exhibit D-1

Current MOD-032 Designee Process Document
(*for informational purposes only*)

ERO Enterprise Designation
MOD-032-1

This Reliability Standard MOD-032-1 process document is being made pursuant to the certain Federal Energy Regulatory Commission ("FERC")-approved Regional Delegation Agreements ("RDA"), between the North American Electric Reliability Corporation ("NERC") and each of, Midwest Reliability Organization ("MRO"), Northeast Power Coordinating Council, Inc. ("NPCC"), ReliabilityFirst ("RF"), SERC Reliability Corporation ("SERC"), Texas Reliability Entity, Inc. ("Texas RE"), and the Western Electricity Coordinating Council ("WECC"), respectively (together the "Regional Entities"). The purpose of this process document is to establish the necessary procedures the Regional Entities, participating as Designated Entities as further described below and in **Attachment 1**, perform in supporting NERC's efforts to fulfill its regulatory obligations under Reliability Standard MOD-032-1 (or its successor) and associated events analysis activities. Together, NERC, as the Electric Reliability Organization ("ERO") and the six Regional Entities are referred to as the ERO Enterprise.

Reliability Standard MOD-032-1, requires NERC to establish consistent modeling data requirements and reporting procedures necessary to develop planning horizon cases necessary to support NERC's analysis of the reliability, resiliency, and security of the interconnected transmission system. Requirement R4 states that, "[e]ach Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the [ERO] or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area." NERC is designating the MOD-032-1 "Designated Entity" responsibilities to the Regional Entities to support NERC in fulfilling its obligations under Requirement R4 given their expertise in their respective geographic jurisdictions as follows:

1) MRO, NPCC, RF, and SERC collectively perform the Interconnection-wide, base-case model creator function for the Eastern Interconnection as the Eastern Interconnection Reliability Assessment Group ("ERAG"). The base-case model creator function for the Québec Interconnection is included in the work performed by ERAG.
2) Texas RE, in coordination with ERCOT, will perform the Interconnection-wide, base-case model creator function for the Texas Interconnection.
3) WECC will perform the Interconnection-wide, base-case model creator function for the Western Interconnection.

As the ERO, NERC is responsible for overseeing and ensuring that the Designated Entities perform the MOD-32-1 Requirement R4 activities. NERC therefore maintains its discretion and authority to determine the accuracy, completeness, and overall satisfaction of the functions outlined in **Attachment 1.** Per the process in Attachment 1, each Designated Entity shall: (i) create the interconnection-wide power flow and dynamics cases that include all of the Planning Coordinators in their respective Interconnection; (ii) be responsible for developing the required modeling cases; and (iii) coordinate with NERC to address and document variations in Interconnection modeling practices and considerations in light of Reliability Standards TPL-001, MOD-032, MOD-033, and other applicable Standards. Please note, NERC and the Designee(s) shall collaborate on how best to address any NERC request pertaining to modeling which goes beyond information obtained or created under NERC Reliability Standards, the RDAs, and NERC Rules of Procedure ("ROP"). NERC and the Regional Entities shall hold a joint periodic meeting to collaborate on modeling activities. This shall include annually assessing **Attachment 1** at the final ERO Enterprise meeting

each year to discuss lessons learned and process updates for the coming year. This process document is subject to periodic review and change. Any revisions to this process shall be presented to the Operations Leadership Team ("OLT").

For the avoidance of doubt, the RDAs and ROP shall continue to govern all delegated activities, including managing Confidential Information pursuant to Section 1500 of the ROP. The relevant regulatory structure and governing documents in each Canadian Province shall continue to govern the activities in those respective jurisdictions. This Process Document does not modify the rights and obligations of NERC and the Regional Entities as otherwise outlined in the RDA and ROP or other governing documents.

Attachment 1 on the Following Page.

Attachment 1:

Designated Entity Functions and Attributes

This Attachment 1 outlines the requirements for each Designated Entity as referenced in the accompanying process document. Any capitalized terms not defined in this Attachment 1 shall have the same meaning ascribed to them in the process document.

The Designated Entities assigned by NERC as ERO under Reliability Standard MOD-032-1 Requirement R4 to support the creation of Interconnection-wide planning cases shall have the following attributes:

- A governance structure responsive to the needs of the Planning Coordinators for its Interconnection, Regional Entities, and NERC.
    - Clear definition of roles and responsibilities related to the creation of the models
    - Transparency regarding the development of data requirements, sampling, testing, data correction, and feedback to applicable stakeholders
    - Establish timeframes that allow for the review cycle
    - Define security and access related to models
- In coordination with the Planning Coordinators of the Interconnection, Regional Entities, and NERC, annually create and make available a specific set of powerflow and dynamics cases that include, but are not limited to, the cases identified below.

Core Cases[1] for the ERO:

- Upcoming[2] winter peak-load case – for seasonal planning studies (interregional) and event analyses, and as external models of outside world for operational planning studies.
- Upcoming summer peak-load case – for seasonal planning studies (interregional) and event analyses, and as external models of outside world for operational planning studies.
- Upcoming year low Inertia / low load case – for use in validation of Interconnection Frequency Response Obligations and event analyses.

Typical Cases[3] to Support Standard TPL-001-5.1 – Transmission System Planning Performance Requirements:

TPL 001-5.1 calls for the following cases to be available. Each Designated Entity, in collaboration with its constituent Planning Coordinators, may add additional cases as desired and choose which cases to build where latitude is given in the Standard. Since current case building practices and schedules vary among the Interconnections, a separate guidance document will be provided by NERC on case creation timing, as applicable.

---

[1] Needed base cases for analyzing system events and testing frequency response obligations.

[2] Upcoming could be interpreted as Year 1

[3] ERO guidance for key years cited in Standard TPL-001-5.1, subject to enforcement July 1, 2023.

- Planning cases:
    - Planning case for year 1 or 2 system peak steady-state analysis[4]
    - Planning case for year 5 system peak steady-state analysis[5]
    - Planning case for near-term (1-5 years) system off-peak steady-state analysis[6]
    - Planning case for near-term (1-5 years) system peak stability analysis[7]
    - Planning case for near-term (1-5 years) system off-peak stability analysis[8]
    - Planning case for Long-term Transmission Planning Horizon system peak steady-state analysis[9]
    - Planning case for Long-term Transmission Planning Horizon system peak stability analysis[10]

Other cases and processes:

- Designated Entities shall have a process with appropriate controls consistent with Section 1500 of the ROP for identifying and vetting of qualified users of the powerflow and dynamics cases of the Interconnection. NERC, Regional Entities, Planning Coordinators, Reliability Coordinators, Transmission Operators, and Transmission Planners, within the Interconnection are pre-vetted users of the cases.
- Existing powerflow and dynamics cases shall be made available by the Designated Entity to NERC, the Regional Entities, Reliability Coordinators, Planning Coordinators, Transmission Operators, and Transmission Planners within the Interconnection under appropriate controls.
- NERC or Regional Entities may designate additional specialized cases; e.g., Year 10 off-peak load case with low inertia, high BPS-connected inverter-based resource, and representation of distributed energy resources (dynamics case, in particular). An example of special cases may include the following:
    - Year 5 low inertia/Minimum load case to produce the Frequency Measures 1, 2, and 4 of the Essential Reliability Taskforce for the NERC Long Term Reliability Assessment tracking and trending.
    - Upcoming summer short-circuit case – for use in specialized Inverter-Based Resources studies, event analysis, and designation of electromagnetic transient (EMT) zones. These would not be interconnection wide cases but collected from the PC or TO, depending on how they are currently being built.
    - Collection of EMT zones as designated by NERC, as needed

[4] Pursuant to R2.1.1 of TPL-001-4 and TPL-001-5.1
[5] Pursuant to R2.1.1 of TPL-001-4 and TPL-001-5.1
[6] Pursuant to R2.1.2 of TPL-001-4 and TPL-001-5.1
[7] Pursuant to R2.4.1 of TPL-001-4 and TPL-001-5.1
[8] Pursuant to R2.4.2 of TPL-001-4 and TPL-001-5.1
[9] Pursuant to R2.2.1 of TPL-001-4 and TPL-001-5.1
[10] Pursuant to R2.5 of TPL-001-4 and TPL-001-5.1

- EMT cases and any special cases beyond those listed will be requested by NERC or other Regional Entities with at least 60 days advanced written notice, provided that should a Designated Entity require additional time the relevant ERO Enterprise parties shall collaborate to determine the appropriate timeline.
- Designated Entities, in conjunction with the Reliability Coordinators, Balancing Authorities, Transmission Operators, Planning Coordinators, Regional Entities, and the ERO, shall develop a process for creating powerflow and dynamics cases for analysis of system events upon request of NERC or the Regional Entities.
    - These cases will be requested in accordance with the tenets of section 804, 807, and 808 of the NERC ROP. These cases are a distinctly separate effort from the annual case creation process, requiring additional manpower and time commitments. Such cases will typically only involve the entities in and surrounding the impacted area unless there are Interconnection-wide impacts (i.e., as inter-area oscillations).
- Designated Entities shall develop a process to ensure that all Planning Coordinators in their Interconnection and all system elements defined in the Planning Coordinator's modeling procedures[11] be included in the data collection process through a common method (e.g. MMWG case creation process) of collecting data and model(s).
- Designated Entities shall develop[12] and maintain a case creation manual for the Interconnection, including the process by which the designated cases must be assembled, tested for quality (e.g., MOD-033 or its successor), and tested for case fidelity (ERO Metric I[13]). NERC will conduct an annual case quality assessment compared to the criteria in this Attachment. The Designee shall have a process to address any case quality deficiencies identified by NERC. The Designated Entity shall collaborate with NERC to address any case and/or process deficiencies.
- Designated Entities shall develop a feedback process to incorporate improvements identified in NERC's independent modeling assessments on Interconnection-wide base cases. Any identified issues must be addressed by the Designated Entity in coordination with the asset/model owners.
- Designated Entities shall develop a feedback process including the Planning Coordinators of the Interconnection and their constituent equipment owners and operators to prevent recurring data or models problems found during case creation or quality and validation testing. The Designated Entity shall work with the Planning Coordinator on any recurring data or model errors in a timely manner.
- Designated Entities shall develop and maintain a list of acceptable dynamics models[14] for representing equipment in the base cases. The list shall be made available to all entities submitting models and shall be updated regularly to reflect changing industry practices. NERC may provide input such as the use of preferred models or may establish additional modeling requirements that shall be implemented by the Designated Entities. The Designated Entity will phase out models NERC has determined "unacceptable" in a timely manner.

[11] Pursuant to R1 of MOD-032

[12] The designee can either develop or adopt an existing regional or multi-regional process manual.

[13] https://www.nerc.com/pa/RAPA/ModelAssessment/ModAssessments/2022_Case_Quality_Metrics_Assessment-FINAL.pdf

[14] These lists will be maintained in a timely manner in collaboration with similar lists in the region(s).

- Designated Entities shall have a change-control process for dynamics models and/or parameters requiring appropriate documentation, with a subject matter expert peer group[15] to screen proposed changes.
- Designated Entities shall have a process for correcting cases for current or future years, created in the latest case creation cycle, that are already in use. The process shall include:
    - Coordination with the involved Planning Coordinator(s) and equipment owner(s) to resolve and correct problems found.
    - Timely posting of modifications made to cases to correct problems.
    - A method to notify case recipients of problems and solutions to known case recipients.

[15] Regional or Interconnection-wide.

NERC Project 2022-02 | MOD-032-2, TOP-003-8, and IRO-010-6
September 2025

MOD-032-2 – Data for Power System Modeling and Analysis

Rationale for Applicability Section

For MOD-032-2, Load-Serving Entity (LSE) was replaced with Distribution Provider (DP) because of the removal of LSEs from the NERC registry criteria. It should be noted that Generator Owner (GO) applicability includes both Category 1 GO and Category 2 GO consistent with proposed revisions to the definitions of those terms developed under Project 2024-01 Rules of Procedure Definitions Alignment.

Additionally, the drafting team (DT) reviewed the dual applicability to Planning Authority (PA) and Planning Coordinator and determined that it was most appropriate to reference both terms in the applicability section until NERC registration criteria are updated to use only a single term. The posted "Appendix 5B: Statement of Compliance Registry Criteria," dated June 27, 2024, still uses both terms and, arguably, the PA term is used more prominently. However, the explanation included in MOD-032-1 refers to synchronization between registration criteria and the NERC functional model which is not maintained, was never formally approved, and is only posted as a historical document. Therefore, the DT excluded the explanatory language from MOD-032-2 Applicability Section.

Rationale for Distributed Energy Resource (DER) Definition

The DT has proposed that a definition for DER be added to the *NERC Glossary of Terms used in Reliability Standards* (NERC Glossary of Terms). The approved standard authorization request (SAR) to revise MOD-032, submitted December 2021, noted that "it may be needed (based on the discretion of the DT) to add a definition for 'Distributed Energy Resource (DER)' to the NERC Glossary of Terms" in conjunction with adding DER data to Attachment 1, the main purpose of this SAR.[1] The DT found it necessary to draft a DER definition to clarify the usage of this term within the standard. Further, the DT recognized benefits of a NERC Glossary of Terms definition to bring alignment and consistency of term usage across Reliability Standards. Additionally, the term Inverter-Based Resource (IBR) was recently defined in the NERC Glossary of Terms under Project 2020-06 for a similar reason. Finally, the DT was comprised of team members with adequate experience to propose a definition, including members of the NERC SPIDERWG and IEEE 1547 working group.

The DT proposes to define Distributed Energy Resource (DER) as follows:

"A generator or energy storage technology connected to a distribution system that is capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including one connected behind the meter of an end-use customer that is supplied from a distribution system."

[1] SAR title "MOD-032-1 Data for Power System Modeling and Analysis", submitted 12/15/2021. Available at: https://www.nerc.com/pa/Stand/Project202202ModificationstoTPL00151andMOD0321DL/2022-02_MOD-032%20SAR%20SPIDERWG_020122.pdf

In developing this definition, the DT considered various DER definitions utilized in the industry and discussed in the NERC System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG) Terms and Definitions Working Document, including the six other definitions described in Appendix D that were not adopted by SPIDERWG. Through this review, the DT determined each of these seven definitions would benefit from refinement to be most suitable for application in MOD-032 and future reliability standards more broadly. It is expected that most reliability standard revision proposals related to DERs would originate from the SPIDERWG. Thus, the DT's intent was to propose a DER definition that aligned with the SPIDERWG working definition, which explicitly excludes demand response and clarifies what is in scope and out of scope with respect to where a DER is connected, rather than the technology type. The DT's concurrence in excluding demand response from the definition of DER is due to demand response characteristics that are typically reflected in base case study assumptions rather than requiring explicit modeling within reliability simulations.

The DT considered adopting a voltage threshold to define distribution. However, industry generally differentiates transmission from distribution based on the functional use of the system rather than technical specifications (e.g., voltage, active power, etc.). Setting aside the Bulk Electric System, that has a NERC definition, defining electric facilities as either transmission or distribution is often based on State law or regulations, ISO/RTO tariff, and/or utility tariffs. There are no conflicts in how applicable entities define distribution and transmission facilities for a given region, even if those definitions vary from region to region. Additionally, the DT considered an active power threshold to define DER and concluded that DER technologies can vary in size, and a threshold might inappropriately exclude technologies that are DER[2]. At the same time, the DT understands that certain applications of DER data, for instance determining when or how a Transmission Planning (TP) or Planning Coordinator (PC) includes DERs into planning processes (e.g., TPL-001), may include active power or other TP or PC defined thresholds.

The DT considered defining DER based on the resource not being connected to the Bulk Power System (BPS), similar to the IEEE 1547-2018 definition that uses "not directly connected to the BPS" to describe DERs. However, the NERC Glossary of Terms definition of BPS does not provide specificity that would enhance a definition of DER beyond an undefined term that is generally used in industry. The phrase "distribution system" was selected to expressly describe the type of electric facilities that would cause a resource to be defined as a DER, if interconnected to those facilities.

The DT recognizes that "distribution system" is not defined in the NERC Glossary of Terms and that the SPIDERWG proposed a definition.[3] The DT reviewed the SPIDERWG definition and concluded that it would not clarify the term DER. The SPIDERWG use of the term "transmission-distribution" interface within a definition of "distribution system" could be considered a circular reference that causes ambiguity. The DT is not proposing a definition for distribution system given any proposed definition could be of limited benefit for clarifying the proposed definition for DER.

[2] NERC has published a study recommending that a zero MVA threshold be used when collecting DER information: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf

[3] SPIDERWG definition of "distribution system": The electrical facilities that are located behind a transmission-distribution transformer that serves multiple end-use customers.
https://www.nerc.com/comm/RSTC/SPIDERWG/SPIDERWG%20Terms%20and%20Definitions%20Working%20Document.pdf

Below is a summary of the rationale for the DT departing from each of the seven definitions when proposing a new DER definition.

SPIDERWG definition
After considering the SPIDERWG definition, the DT determined it provided a useful foundation but needed refinement to be suitable for the intended use. Specifically, the SPIDERWG term included transient types of DER power beyond generation and storage, and it included sources of back-up power that would have no potential grid impacts.

The DT chose to refer to a generator or storage technology specifically, rather than use the SPIDERWG language of "source", to exclude devices or resources that only transiently inject real power (e.g., regenerative elevators, transition switches, etc.). A DER can use various technologies including synchronous machines, induction machines, and power inverters/converters (i.e., IBR). Different types of DERs can utilize a wide range of energy sources including, but not limited to, natural gas, diesel, hydro, storage, wind, and solar. Additionally, the DT intention was to ensure that the scope included facilities "connected behind the meter of an end use customer" that may export Real Power to the power system or offset Real Power load (e.g., residential solar or commercial rooftop solar). This would exclude technologies such as charging-only electric vehicle (EV) installations and controllable load. While not finalized, it is the drafting team's understanding that this determination is consistent with recent proceeding from the IEEE 1547 revision Working Group. To exclude transmission connected load customers that have onsite generation or storage resources, the DER definition clarifies that the behind-the-meter customer "is supplied from a distribution system".

The DT included the language "in non-isolated parallel operation with the Bulk-Power System" to indicate that a distributed energy resource with potential BPS reliability impacts is only one that has electrical connectivity to the BPS. A resource that is only operated in islanded or isolated mode (e.g., back-up generation that only operates when a facility is disconnected from the grid), will not have an impact to the BPS and, therefore, is not of interest from a BPS-reliability perspective. The DT understands the concepts of non-isolated parallel operation versus isolated parallel operation to be commonly understood within the industry. The DT intentionally avoided the term "directly connected" to differentiate electrical connectivity from an electrical connection point. The phrase "connected to the distribution system" speaks to electrical connectivity and the subsequent phrase "including one connected behind the meter of an end use customer" clarifies this connectivity includes a resource directly connected to a customer system (i.e., behind the meter).

IEEE 1547-2018
The DT reviewed the IEEE 1547-2018 definition and found that it contained elements that could supplement the SPIDERWG definition to address the issues identified above. The DT incorporated the explicit reference to generation and storage aspect of the IEEE definition. Further, the IEEE concept of "capable of exporting active power to an EPS" informed the need for capturing non-isolated, long-term paralleling and the sourcing of Real Power (i.e., active power) within the DT definition.

At the same time, the DT did not view the IEEE definition as suitable for the DT's intended use as written. The IEEE term qualifies the DER connection point as "not directly connected to a bulk power system" which the DT viewed as potentially ambiguous. Instead, the DT opted for the "connected to a distribution system" language to point to the electric system location, and how facilities at that location are classified, as a key concept in differentiating DERs from other generators and energy storage technology. The DT considered if it was necessary to define "supplemental DER devices" as part of the DER definition and determined this nuance is not needed for a NERC Glossary of Terms DER definition.

Federal Energy Regulatory Commission (FERC) Energy Primer
The DT identified the FERC Energy Primer definition as being inclusive of load resources (e.g., energy efficiency, demand response) which is not aligned with the SPIDERWG definition. Given the reliability use cases, the DT and SPIDERWG definitions target sources of electric power, with the DT narrowing this definition to be only sources "capable of providing Real Rower." After considering the FERC definition, the DT determined it was not suitable for the intended use.

National Association of Regulatory Utility Commissions (NARUC)
NARUC's definition is also inclusive of load resources (e.g., energy efficiency, demand response) and therefore, the DT concluded it is too broad.

NERC DERTF
The NERC DERTF definition uses the language "resource on the distribution system that produces electricity" which appears to exclude distributed energy storage, a technology necessary for inclusion in the DT definition. Further, the NERC DERTF definition defines DER as anything "not otherwise included in the formal NERC definition of the Bulk Electric System" which the DT views as overly broad.

California Public Utilities Commission (CPUC)
The CPUC definition appears to be based on California legislation and includes energy efficiency, EVs, demand response, renewable generation resources, and energy storage. As is the case for FERC and NARUC definitions above, the inclusion of load resources is overly broad for the NERC Glossary of Terms.

New York Independent System Operator (NYISO)
The NYISO definition only considers market-qualifying resources as DER. This definition's exclusion of a large portion of DER (i.e., retail participation) is too narrow for the reliability planning needs identified by the SPIDERWG DER Modeling Study.

Figure 1 below provides a graphic illustration of the DER definition and the intended scope of facilities that would fall under the proposed definition. Figure 2 below shows that the proposed DER and IBR definitions are compatible, but distinct. Some resources may be classified as a DER, but not an IBR; some resources may be classified as an IBR, but not a DER; some resources may be classified as both a DER and an IBR. Rather than separately define IBR-DER, the DT suggests IBR-DER should be used to reference those devices meeting both the definition of IBR and the definition of DER, as demonstrated by the overlapping area of Figure 2. This relationship between the definitions and the existence of non-IBR storage solutions informed the phrasing of "generator and energy storage technology" to ensure all generators and all storage devices

are included, even if they do not meet the definition of IBR. Note that in Figure 2, "distribution-connected" is shorthand for connected to the distribution system and "bulk system-connected" refers to resources connected to the transmission system.

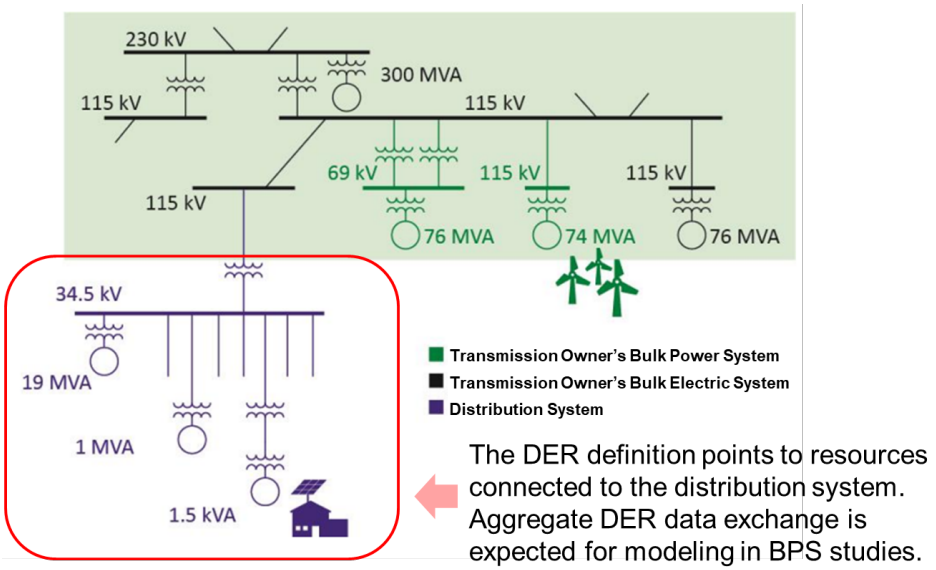

Figure 1: DER Definition Illustration

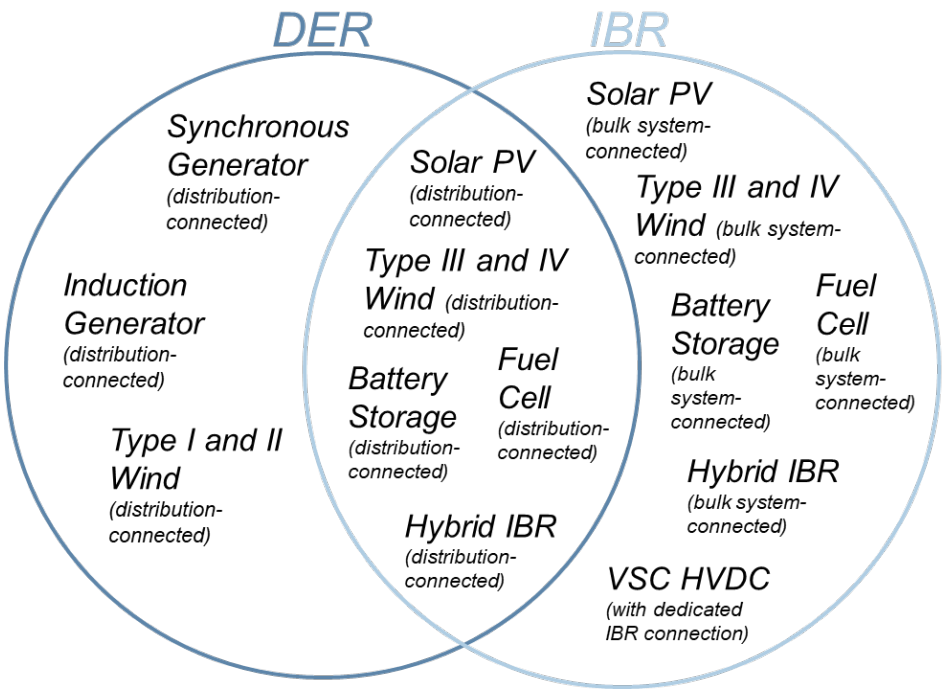

Figure 2: DER and IBR Definition Compatibility

Rationale for Modifications to Requirement R1

Requirement R1, Part 1.1 was modified to require that the PC and TP data requirements and reporting procedures include the responsible entity for data items listed in Attachment 1. To be clear, the "entity" to be identified would be the entity type or category (i.e., Transmission Owner), not specific companies for each data item. This modification aligns with changes made to the introductory paragraph in Attachment 1 clarifying that data obligations are established by the PC/TP modeling data requirements and reporting procedures rather than the listing of typical functional entities in Attachment 1. The intention of this addition is not to create an administrative requirement for the PC and TP to maintain separate lists identifying entity obligations, but to reinforce PC/TP authority to request data from appropriate entities, thereby creating obligations for those entities to provide the requested data. In most cases, it is expected that data requirements and reporting procedures would inherently identify the entities required to provide data. Further, this modification is intended to give the PC/TP flexibility to identify (and specify within their data requirements and reporting procedures) the best source for necessary data, even if that source is not a NERC functional entity. However, only NERC functional entities are subject to mandatory compliance with NERC Reliability Standards, so the PC/TP is unlikely to assign other entities without a local authority to create data obligations outside of NERC enforcement. Such flexibility could allow the TP or PC to directly estimate data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes and aggregated DERs connected to unregistered Distribution Providers based on any information received in accordance with their data requirements and reporting procedures. As an example, data received from DPs in the area that can be assumed to have similar DER adoption profiles. FERC Order 901 uses the phrase "unregistered IBR" but given this is an undefined term and the drafting team received opposition to explaining that term in a footnote, the phrase was replaced in the standard with "an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes." This is the intent of all further references to "unregistered IBR" in this technical rationale.

FERC Order 901 directs NERC to develop reliability standards that require "the use of approved industry generic library IBR models".[4] However, pre-defining a limited set of models (i.e., a library of models) that could be used to represent generation and system components is potentially at odds with objectives to also have accurate models, especially as technology rapidly progresses. To align with industry practices while addressing the directives of the FERC Order, the DT referenced standard library models incorporated within software as well as usability requirements for user-defined models (where accepted) in Requirement R1, Part 1.4, rather than defining an inclusive model library. The DT supports the approach and views it as aligned with the FERC Order directives while addressing the practical limitations raised by industry at the January 15-16 and June 3-5 NERC Industry Engagement Workshops.[5][6] For instance, Order 901 P125 requires "the sole use of nation-wide approved component generic library models" whereas workshop participants raised issues surrounding timelines for approving library models that reflect new IBR products, the accuracy of library models for certain products, timelines associated with updating library models, and referencing a document outside of the standard that could be changed by a process also outside the standard, among other issues.

[4] FERC Order 901 at Paragraph 122.
[5] NERC Industry Engagement Workshop–Reliable IBR Integration and Milestone 3 of FERC Order 901 Agenda
[6] Milestone 3 of FERC Order 901 NERC Industry Engagement Workshop June 3-4 PowerPoint

To address these concerns, Requirement R1, Part 1.4 includes requirements for the PC/TP to specify submission of standard library dynamic models, user-defined models, or both. The phrase user-defined models should be considered interchangeable with user-written models, equipment-specific models, and other such terms. The phrase "user-defined models" was used in MOD-032-2 based on language in FERC Order 901.[7] Allowing the specification of standard library models incorporated within modeling software is responsive to FERC concerns about usability and allows PCs to maintain current requirements for generic models that may be necessary for the creation of large Interconnection-wide base cases. Allowing the specification of user-defined models is responsive to industry feedback expressed during the NERC Industry Engagement workshops. The DT also explicitly ensured PC/TP authority to require submission of both model types, if deemed necessary. Requirement R1, Part 1.4.2 is responsive to FERC concerns about model usability and non-convergence by requiring PCs and TPs that accept user-defined models to specify usability requirements and require appropriate model documentation and instructions.

Rationale for Modifications to Requirement R2

Requirement R2 was modified to require estimation of modeling data if the functional entity required to provide it (typically the Transmission Owner or Distribution Provider) is unable to gather the required data. FERC Order 901 requires the provision of data related to unregistered-IBR and IBR-DER that in the aggregate have a material impact on the BPS.[8] If the data is estimated, Requirement R2 Part 2.1 also requires the entity to provide an explanation of the limitations of the estimated data and the method used for estimation in line with the Order 901 directives.[9] The requirement language intentionally uses the phrase "unable to gather" to mirror the FERC Order 901 language. Limitations of the estimated data is intended to capture both limitations of the availability of data (including instances where there are legal or contractual prohibitions on requesting certain data, no mechanism to enforce collection, or incomplete records of what is connected) and limitations of any data provided (including partially missing or suspect data).

The exact method used for estimation is intentionally left open given the varying levels of data available across the ERO footprint. A few possible examples include:

- A full list of DERs broken down by resource type with limited fields missing and assumed based on other characteristics.
- Real Power capability by resource type with approximate percentage of the resource compliance with various IEEE 1547 versions used for dynamic performance assumptions (known or assumed based on installation date).
- Count of resources by resource type with average size used to estimate Real Power capability.
- Derive values for unregistered DPs based on average of registered DPs in the area (scaled based on total system size).

[7] FERC Order 901 at P124
[8] FERC Order 901 at P104 and P105
[9] FERC Order 901 P104: "if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation."

- Solar capability estimated based on satellite imagery of rooftops.
- Assumptions of regional/national average IBR-DER penetration levels.

Additional guidance for DER estimation can be found in NERC SPIDERWG Reliability Guidelines on the topic.[10]

The DT views the introduction of this estimation provision as alleviating previously expressed compliance obligation concerns around challenges in collecting data for DERs connected to unregistered entities. Further, the addition of compliance abeyance language for the estimation process provides entities the opportunity to hone their estimation process without risk of penalty (provided they proceed in good faith). The approach directed by FERC is flexible as to whether the underlying unregistered IBR and DER data originates from interconnection documentation, measured quantities, estimated quantities, or other sources. Data availability or sufficiency issues, among other factors, may lead to the DP and TO applying a combination of approaches to source the data. The PC and TP modeling data requirements and reporting procedures should identify acceptable methods and their application.

While the FERC Order 901 directives only addressed IBR-DER, meaning that DER technologies based on induction generators or synchronous generators are not explicitly addressed, Project 2022-02 is also assigned a SAR that requires DERs to be addressed in MOD-032 more generally, and the inclusion of all DERs in this revision of the standard removes the need for a second modification under this project. The DT found it practical to have a consistent estimation framework applicable for all DER technologies when DER data cannot be gathered. Therefore, Requirement R2 was intentionally written to have requirements for estimating DER data regardless of the technology type, when an applicable entity is unable to gather the data. The approach FERC directed NERC to use forms the basis for this uniform approach.

Given the challenges with collecting complete and accurate DER data, the DT would still recommend that NERC consider a range of options that could include expanding DP registration criteria or registering DER-only DPs to reduce or eliminate this potential DER data collection gap. However, the process to modify NERC registry criteria and register new entities is beyond the scope of Project 2022-02 and would delay the project beyond the FERC Order 901 Milestone 3 timeline. The DT considered adding "UFLS-Only Distribution Provider" to MOD-032-2 applicability to reduce (but not necessarily eliminate) the potential gaps associated with DER connected to unregistered entities with no compliance obligation. However, the UFLS-Only Distribution Provider can only be obligated to provide data directly associated with UFLS programs (essentially the data identified in Attachment 1 Dynamics Column 10b). Provision of such data in the absence of the other DER data identified in Attachment 1 would not be particularly useful for planners.

Requirement R2, Part 2.2 was added to confirm the relationship and consistency between MOD-026 and MOD-032 indicated in FERC Order 901 Paragraph 143[11]. The DT believes that the intent of FERC Order 901

[10] Reliability Guidelines, Security Guidelines, Technical Reference Documents, and White Papers

[11] FERC Order 901 P143: ""Regarding EPRI's recommendation to require appropriately parameterized plant models, we agree that the model verification process of an IBR model should include steps to ensure that responsible entities provide both verified and appropriately parameterized models. Additionally, we agree with IRC's recommendation that the plant model verification process should include

is to ensure that accurate (validated and verified) models are collected under MOD-032. However, facility models submitted under MOD-032 are often submitted before physical validation can be completed (e.g., for planned facilities). Part 2.2 requires the model submitted by the functional entity be the model that was verified and validated (and accepted by the TP) in accordance with MOD-026, if available.

Requirement R2, Part 2.3 introduces a reference to the Unacceptable Models List (UML) maintained by the ERO. The DT concluded that it would be most appropriate for NERC to maintain the UML as a separate document that could be updated more quickly and frequently than the standard development process. However, any changes to the process for modifying the UML, that is incorporated into MOD-032-2 as a supporting document, would need to be approved through the standard development process.

It is also recognized that models on the UML may be the best available for some generators, particularly for some synchronous generators and for units manufactured by companies that are no longer in business. Part 2.3 allows for the submission of such a model if accompanied by a technical rationale justifying its use. The requirement does not intend any specific level of scrutiny for this rationale, but it also does not prevent the PC or TP from identifying technical concerns with the model or the rationale per Requirement R3. This rationale could include notation of prior usage for synchronous generation as well as models that have been recently added to the UML without time to procure an updated model prior to reporting. A MOD-032 supporting document defines the process for modifying the UML as a sufficient safeguard to prevent arbitrary or unvetted modifications being made to the UML.

Rationale for Modifications to Requirement R3

Requirement R3, Part 3.1 was modified to include the phrase “that is responsive to the technical concern”. The ultimate intent of R3 is to resolve technical concerns that are identified by the PC or TP. However, model providers may not always be able to know that their update or explanation will resolve the planner’s technical concern. The intent of this addition is to convey that the model provider’s obligation does not simply end with providing a response, but further information exchanges between the planner and model provider may be necessary to resolve the technical concern.

Rationale for Modifications to Attachment 1

Data items specific to IBRs and DERs were added to MOD-032-2 Attachment 1: Data Reporting Requirements.

The DT decided to maintain an approach similar to MOD-032-1 where more detailed sub-bullets associated with items are only presented in one column (i.e., some sub-bullets are only listed in the “steady state” column even though the data is also relevant to “dynamics” and/or “short circuit”). This long-standing approach was made explicit in footnote 1 of the MOD-032-2 Reliability Standard.

requirements for equipment to be represented as installed in the field. While we decline to include this level of detail in the directive to NERC, we nonetheless direct NERC to establish a standard uniform model verification process. A uniform model verification process will ensure that all entities use the same set of minimum requirements to verify that all generation resource (i.e., synchronous and non-synchronous) models are complete and that the models accurately represent the dynamic behavior of all generation resources at a sufficient level of fidelity for Bulk-Power System planners and operators to perform valid interconnection-wide, planning, and operational studies. Therefore, we direct NERC to define the model verification process and to require consistency among the model verification processes for existing Reliability Standards (e.g., FAC-002, MOD-026, and MOD-027) and any new or modified Reliability Standards.”

The format of Attachment 1 was modified to minimize replicating footnotes applicable to multiple items by adding a new footnotes section (Attachment 1 Data Reporting Requirements Footnotes) to the document. Along with the reformatting, language was added to the introductory paragraph to clarify that data obligations are established by the PC/TP modeling data requirements and reporting procedures rather than the listing of typical functional entities in Attachment 1. The expectation is that existing reporting requirements will remain the same, but previously implied flexibility is now explicitly granted as it is critical for regional consideration of the appropriate entities to provide information for unregistered IBR and DER.

Modifications for IBR

To incorporate IBR within Attachment 1, "and storage units" was added to generating units in the steady-state column under item 3. "Generating units" already incorporates IBR generators such as solar and wind. Storage is typically not classified as a generation resource because it has no primary energy source and consumes more energy than it injects when considering losses. Therefore, the DT found it necessary to include storage explicitly. Footnote 4, associated with "Generating units and storage", was also updated to explicitly identify IBR as an applicable technology for the item and remove pumped storage now that storage is explicitly identified.

The dynamics column was updated to replace "photovoltaic systems" (PV) with "Inverter-Based Resources" under item 7. IBR encompasses PV, resulting in PV technology still being included under this new item.
The three following sub-items were added to dynamics item 7 based on specific language from the FERC Order 901, Paragraph 141.[12]

- IBR capabilities related to momentary cessation,
- Tripping, and
- Ride-through

"Frequency control" was added as a sub-item because frequency response of IBR is important for studying system reliability. For instance, a 2024 NERC Lessons Learned report shows how IBR frequency response can affect system performance.[13] Frequency control encompasses primary frequency response, fast frequency response (e.g., IEEE 2800-2022, Subclause 6.2), and potentially other frequency responsive controls (e.g., "grid-forming" virtual synchronous machine controls).

"Voltage control" was added to encompass reactive power and voltage control that may affect the dynamic or steady state performance of the plant. NERC's Level 3 Alert on Inverter-Based Resource Performance and Modeling, issued May 2025, contains Essential Action #1 indicating the importance of voltage control performance for normal and post-disturbance operations.[14]

[12] FERC Order 901, P141 states that IBR and IBR-DER data must include "momentary cessation and/or tripping, and all ride through behavior."
[13] NERC, Lessons learned, Incorrect IBR Primary Frequency Response Logic Caused Negative ACE. Available at: https://www.nerc.com/pa/rrm/ea/Lessons%20Learned%20Document%20Library/LL20240501_Incorrect_IBR_Primary_Frequency_Response_Logic_Caused_Negative_ACE.pdf
[14] NERC, IBR Performance and Modeling, Level 3 Alert. May 2025. Available at: https://www.nerc.com/pa/rrm/bpsa/Alerts%20DL/Level%203%20Alert%20Essential%20Actions%20IBR%20Performance%20and%20Modeling.pdf

In order to clarify dynamics item 6, "wind plant model", to not overlap with the new IBR item 7, type 1 and type 2 wind turbines are specifically called out under item 6. These technologies are not IBR.

Footnote 5 indicates that the PC/TP data requirements and reporting procedures need to account for IBRs that are not DERs and do not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes. It also indicates that the TO is typically responsible for such data.

Modifications for DERs

Item 9, "Aggregate Distributed Energy Resource (DER) data" was added to the steady state column with location, real power capability, and DER type (solar, battery, diesel generator, etc.) specified as required subitems. The DT selected these subitems as the minimum information needed to use data and make assumptions for power system modeling and analysis; the PC/TP have the authority to request additional data items as deemed necessary.

The intent is that relevant DER data be available and represented in models of the interconnected transmission system consistent with the NERC approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies. Specific data items listed for DER reflect the minimum information needed to reasonably represent DER in transmission system models. "Aggregate DER" is specified in item 9 to indicate aggregate DER data, rather than individual DER facilities, would be represented in most PC/TP study models.[15] The word "aggregate" was specifically added to Attachment 1 to clarify this point based on industry comments and to align with FERC Order 901. However, Requirement R1 provides the PC and TP great flexibility in developing data requirements and reporting procedures that align with local practices and needs, in addition to the required items listed in the Requirement R1 Parts. Given industry comments on DER data availability, and FERC Order 901 directives, a process is needed for estimating DER data when an entity is unable to gather it. The process for estimating those values is referenced in Requirement R2, Part 2.1.

Footnote 3, associated with "aggregate demand", was modified to clarify that the gross demand is needed at each load serving bus. Collecting and modeling a net demand that incorporates offsets due to output from DERs is not consistent with a modeling framework that explicitly represents DERs. Given the allowance for a PC/TP to specify a threshold per footnote 7, they may confirm gross demand can be assumed to be equivalent to net demand when the difference is under that established threshold. This should be clarified in the level of detail of information requested in Requirement R1, Part 1.2.2.

Dynamics item 5, previously "demand", was updated to be "aggregate demand" to be consistent with the steady state column and general industry practices of modeling load dynamics for aggregate demand (e.g., composite load model).

[15] In certain circumstances (e.g., a very large DER), a TP or PC may decide to represent the individual DER. However, the DT anticipates most DER information will be aggregated based on PC and TP planning practices.

Dynamics item 10 was updated to include "Aggregate Distributed Energy Resource (DER) data" along with the subitems: "parameters, settings, or capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control"; and "indication whether DERs are subject to tripping in conjunction with UFLS or UVLS".

Momentary cessation, tripping, and ride-through of aggregate DERs is needed for dynamics studies. For instance, NERC's Lessons Learned, LL20220401 "Distributed Energy Resource Performance Characteristics during a Disturbance" provided information following the loss of 300 MW of DERs following a system fault. The report indicated that:

> "There is a need to understand how distribution system connected generation, and loads will behave and how they can accurately be modeled under expected system contingencies. Entities should know the behavioral characteristics of DER inverters on their system (both new and old) as well as their number, capabilities, and locations and then report that information to their Balancing Authorities and Reliability Coordinators so their models can be accurate".

Voltage control of DERs can alter the exchange of reactive power between distribution and transmission systems and may affect the results of reliability studies. Examples are described in the approved Reliability Guideline: Bulk Power System Planning under Increasing Penetration of Distributed Energy Resources.

Frequency control must be accounted for because DER interconnection under different standards (e.g., IEEE 1547-2003 versus IEEE 1547-2018) have different frequency response characteristics that may affect dynamics study results. Frequency control in this case typically refers to the frequency-droop characteristic outlined in IEEE 1547-2018, Subclause 6.5.2.7 and adopted in many jurisdictions. However, should other DER frequency controls become common in industry, those would also fall under this category.

As described in the approved Reliability Guideline: Recommended Approaches for UFLS Program Design with Increasing Penetrations of DERs, accurately representing DER tripping as part of UFLS operation is vital for designing and evaluating UFLS programs. Similarly, accurately representing DER tripping as part of UVLS operation is vital for designing and evaluating UVLS programs as described in the approved White Paper: DER Impact to Under Voltage Load Shedding Program Design. In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, the proportion of aggregate DERs subject to each UVLS/UFLS tripping stage should be identified.

In response to comments, the DT added Footnote 7, which explicitly confirms the PC/TPs discretion to specify aggregation thresholds below which they do not consider DER data necessary to collect. Based on the 0 MVA threshold recommendation noted previously, this threshold should only be established following consideration of that DER Modeling Study Report[16].

Inferring DER Capabilities

[16] https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf

Item 10 in the dynamics column indicates that aggregate DER dynamics modeling data may need to be inferred due to data availability and practical limitations. As suggested in the approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies, the in-service date for DERs may be used as a proxy for the PC/TP to make reasonable assumptions about DER capabilities. For example, in a certain jurisdiction DERs installed after a specified date may be required to have a certain ride-through characteristic. Thus, the appropriate Ride-through characteristic representation for DERs in that area could be inferred by the in-service date of the DERs. However, the PC/TP modeling data requirements and reporting procedures may require the provision of alternative information to achieve the same purpose. PC/TP modeling data requirements and reporting procedures may also require more detail and/or additional information. In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, it is expected that the proportion of aggregate DER amount with in-service dates before and after certain threshold dates would be needed (and specified in the PC/TP requirements) to make inferences regarding the overall aggregate DER response characteristics.

Entity responsibilities and coordination

Footnote 6 indicates that the PC/TP data requirements and reporting procedures need to account for situations where DERs are connected to the system of an unregistered DP. When a DER is connected through a registered DP (directly connected to that DP, connected to an unregistered DP that is connected to that DP, or behind the meter of an end-use customer of either) that DP is the typical responsible entity for collecting and providing the DER data. Further, the TO would be the typical responsible entity if there is no system owned by a registered DP between the DER connection point and TO system. This clarification is necessary to reduce the possibility of DERs on the system being unaccounted for by any entity. The DT was responsible for the FERC Order 901 directive requiring an entity to be identified when DERs had no registered DP. It is possible that a company that is a registered Generator Owner may also own resources that do not meet the criteria for registration. That would not change the responsible entity identified per R1, though the owner is encouraged to provide all relevant data to that responsible entity. This point applies broadly, where nothing in the standard is intended to preclude coordination among entities to make sure the responsible entity has the best available information to provide.

The PC/TP may have access to sufficient data for modeling certain DERs through alternative means (e.g., direct registration of DERs or DER aggregators in certain markets). In such cases, the DP (or TO) should not be obligated to provide duplicate DER modeling data, but care will be needed to ensure DERs are not double counted. The PC/TP modeling data requirements and reporting procedures should clearly identify if there are certain classifications of DERs that are excluded from the DP/TO obligation for providing DER modeling data. This in no way absolves a DP/TO from an obligation to provide DER data according to the data requirements and reporting procedures developed by its PC and TP under Requirement R1.

It should be noted that the MOD-032-2 modifications do not change the classification of unregistered IBRs or DERs to become BES facilities subject to NERC reliability standards. Instead, the modifications place a compliance obligation on NERC registered entities (typically DPs or TOs if identified as the responsible entity by the PC/TP) to provide basic information about unregistered IBRs or DERs that are connected to their systems so they can be properly represented in Interconnection-wide cases. There are already existing requirements for such entities to provide information about load connected to their systems. Like load,

unregistered IBRs and DERs are not generally considered to be BES facilities. However, BES reliability assessments require an accurate representation of aggregate load, unregistered IBR, and aggregate DER behavior. The modifications proposed in MOD-032-2 are intended to ensure sufficient data is available to the PC/TP so that appropriate unregistered IBR and DER representations can be included in their BES reliability assessments as required by FERC Order 901 and system planning needs.

IRO-010-6 – Reliability Coordinator Data Specification and Collection; and TOP-003-8 – Transmission Operator and Balancing Authority Data and Information Specification and Collection

The DT reviewed existing IRO-010 and TOP-003 versions and found that both standards had broad requirements language that encompassed generation and storage resources, including IBR as deemed necessary by the RC/TOP/BA. Nevertheless, to ensure no ambiguity that FERC Order 901 requirements are met, the DT included explicit references to IBR-specific data and parameters and pointed to the uniform framework through an alignment between planning and operations models.

Rationale for modifications to add "IBR-specific data and parameters"

The phrase "IBR-specific data and parameters" was added to the following requirements:

- IRO-010-6 Requirement R1, Part 1.1
- TOP-003-8 Requirement R1, Part 1.1
- TOP-003-8 Requirement R2, Part 2.1

These modifications were made in response to FERC Order 901 directives related to the inclusion of IBRs in operations models.[17] The phrase "IBR-specific data and parameters" in the revised IRO-010-06 and TOP-003-8 is intended to reflect what FERC describes in the order as "IBR models that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions". Given that the definition of IBR has no voltage threshold, the addition of IBR-specific data and parameters is inclusive of IBR-DER as referenced in FERC Order 901 and demonstrated by the overlapping area of Figure 2.

Rationale for modifications to add reference to consistency with planning models

"Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operation purposes, as applicable" was added to the following requirements:

- IRO-010-6 Requirement R1, Part 1.5.3
- TOP-003-8 Requirement R1, Part 1.5.3
- TOP-003-8 Requirement R2, Part 2.5.3

These modifications were made in response to FERC Order 901 directives related to usage of a uniform framework in the development of planning and operations models. Planning model submissions in accordance with MOD-032-2 will reflect this uniform framework, though additional standards or regional requirements may apply. Thus, requiring that operations model submissions be consistent with planning model submissions ensures that they also reflect the uniform framework as directed by FERC in Order 901. Simulation time constraints in an online operations environment may warrant a reduced model structure complexity; such models may differ from, but should still be consistent with, more complex modeling that is submitted under MOD-032. The inclusion of "as applicable" allows for variation as necessary for application in the operations horizon. For example, consistent models would not be appropriate if an

[17] FERC Order 901 Paragraph 122 and Paragraph 161

update was made to a planning model for known pending changes, which should not be reflected in the operations models prior to implementation.

Chapter 4: Version History 9

Overview/Introduction

FERC issued Order No. 901 on October 23, 2023, directing "NERC to develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions when developing planning, operations, and interconnection-wide models. For example, the new or modified Reliability Standards could reference the NERC approved component model list, which defines the models that may be used, and those models that may not be used, for specific types of studies. This approved component model list includes WECC's IBR models. Without requiring the use of approved industry generic library models, Bulk-Power System planners and operators may not be able to create system models that adequately predict IBR behaviors and subsequent impacts on the Bulk-Power System."

Proposed Reliability Standard MOD-032-2 addresses the reliability issue identified by FERC in Order No. 901 in a manner that considers advancements in user written models since the issuance of Order No. 901, perspectives of planning entities across North America, and the historical practice of the ERO, which has been to maintain a use of unacceptable models, rather than acceptable models, due to the practical difficulties of keeping an acceptable model library up to date in a timely manner.

Reliability Standard MOD-032-2 requires the Planning Coordinator and Transmission Planner to include specifications addressing the use of standard library models, user-written models meeting certain minimum usability requirements to minimize the risk of non-convergence, or both. To minimize the use of models with known deficiencies, Transmission Planners and Planning Coordinators must also include provisions to require any entity submitted on the Unacceptable Model List to include a technical rationale supporting its use.

The Unacceptable Models List identifies models that are generally considered not acceptable for purposes of model submissions under the MOD-032, TOP-003, and IRO-010 Reliability Standards due to identified issues with usability or accuracy impacting the ability to develop planning or operational horizon cases necessary to support analysis of the reliability of the interconnected transmission system. However, it is recognized that the use of such models may be appropriate in some cases, such as where there is no feasible means for procuring an alternative model that may better represent the behavior of legacy equipment. Any use of such models must include a technical rationale supporting its use.

Disclaimers

Interconnection-wide modeling requirements may differ from the requirements of specialized studies dedicated to a particular technical objective. Thus, models deemed acceptable for planning purposes may be deemed unacceptable by a receiving entity for certain operations applications.

Updates to the Unacceptable Models List

Refer to the Supporting Document section of MOD-032.

Chapter 1: Unacceptable Models List

Models that have been identified as unacceptable are listed in Table 1 below. Revisions to this list may be made in accordance with the process described in the Supporting Document section of the MOD-032 standard.

Table 1: Unacceptable Model List		
Known Unacceptable Model Name	**Model Description**	**Effective**
Renewable Energy Models		
WT3G1, WT3G2, wt3g	Generic Type 3 WTG Generator/Converter Model - Doubly-fed induction generator	Effective Date of MOD-032-2
WT4G1, WT4G2, wt4g	Generic Type 4 WTG Generator/Converter Model - Variable speed generator with full converter	Effective Date of MOD-032-2
WT3E1, wt3e	Generic Type 3 WTG Electrical Control Model	Effective Date of MOD-032-2
WT4E1, WT4E2, wt4e	Generic Type 4 WTG Electrical Control Model	Effective Date of MOD-032-2
WT3T1, wt3t	Generic Type 3 WTG Turbine Model	Effective Date of MOD-032-2
WT3P1, wt3p	Generic Type 3 WTG Pitch Control Model	Effective Date of MOD-032-2
WT12A1, wt1p, wt2p	Generic Type 1 and 2 WTG Pitch Control Model	Effective Date of MOD-032-2
WT4E1, wt4t	Generic Type 4 WTG Power Converter Model	Effective Date of MOD-032-2
wt4p	Generic Type 4 Pitch Control Model	Effective Date of MOD-032-2
REECB1, REECBU1, reec_b	Generic Phase 2 PV Electrical Controls Model	Effective Date of MOD-032-2
Machine Models		
GENSAL, gensal	Salient Pole Generator Model (IEEE Std 1110 §5.3.1 Model 2.1)	Effective Date of MOD-032-2
GENCLS, gencls	Classical Generator Model (IEEE Std 1110 §5.4.2)	Effective Date of MOD-032-2
GENTRA	Transient Level Generator Model	Effective Date of MOD-032-2
Excitation System Models		
texs	General Purpose Transformer Fed Excitation System	Effective Date of MOD-032-2
SEXS, sexs	Simplified Excitation System	Effective Date of MOD-032-2
EX2000	GE EX2000 Excitation System	Effective Date of MOD-032-2
Turbine-Governor Models		
lm2500	LM 2500 Aero-Derivative Gas Turbine Governor Model	Effective Date of MOD-032-2
Known Unacceptable Model Name	**Model Description**	**Effective**

Table 1: Unacceptable Model List		
lm6000	LM 6000 Aero-Derivative Gas Turbine Governor Model	Effective Date of MOD-032-2

GAST	Gas Turbine-Governor Model	Effective Date of MOD-032-2
GAST2A	Gas Turbine-Governor Model	Effective Date of MOD-032-2
GASTWD	Gas turbine-governor	Effective Date of MOD-032-2
IEEEG2	1981 IEEE Type 2 General Approx. Linear Ideal Hydro Model	Effective Date of MOD-032-2
WESGOV	Westinghouse Digital Governor Model for Gas Turbines	Effective Date of MOD-032-2
Load Models		
motorc	Phasor Model of Single-Phase Air-Conditioner Compressor Motor	Effective Date of MOD-032-2

Chapter 2: Unacceptable Models Technical Rationale

Table 2 below provides the technical rationale for each unacceptable model included on the current Unacceptable Models List.

The purpose of this list of unacceptable models is to develop and maintain a repository of models deemed acceptable by the ERO and industry stakeholders for use in developing interconnection-wide models developed by the MOD-032 Designee. The NERC System Analysis and Modeling Subcommittee (SAMS) initially developed this list, and it is now maintained and updated by ERO staff in accordance with MOD-032 Supporting Document. This list seeks to bring together multiple sources of data to ensure uniformity in the use of models across Interconnections. While models may be deemed 'obsolete' or 'deprecated' due to known issues, these models are not removed from the software vendor libraries for various reasons. However, these models should not be used to represent specific facilities within Interconnection-wide models. For additional information about this list, please contact NERC staff at advancedsystemanalyticsmodeling@nerc.net with any questions.

Table 2: Unacceptable Model List

Known Unacceptable Model Name	Rationale For Inclusion
Renewable Energy Models	
WT3G1, WT3G2, wt3g	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT4G1, WT4G2, wt4g	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT3E1, wt3e	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT4E1, WT4E2, wt4e	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT3T1, wt3t	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT3P1, wt3p	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT12A1, wt1p, wt2p	Unable to represent common Type 1 wind pitch control logic.
WT4E1, wt4t	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
wt4p	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
REECB1, REECBU1, reec_b	Inability to represent momentary cessation or other voltage dependent current logic common in the equipment the model was stated to represent.
Machine Models	

Table 2: Unacceptable Model List	
Known Unacceptable Model Name	**Rationale For Inclusion**
GENSAL, gensal	Uses simplifying approximations for saturation as additive terms over exponential or quadratic curves. Further, ignores the q-axis saturation completely.
GENCLS, gencls	Does not allow for representation of excitation system and turbine/speed governor models
GENTRA	Simplified model that ignores sub transient effects, leading to numerical instability problems.
Excitation System Models	
texs	Simplified, early generation model considered obsolete. Refer to IEEE Std 421.5
SEXS, sexs	Simplified, early generation model considered obsolete. Refer to IEEE Std 421.5
EX2000	Field current limiter latch in the model is unable to represent the field equipment for simulation in power system software. Replace with AC7B or ex21br
Turbine-Governor Models	
lm2500	No supporting documentation implemented in software, proprietary model with no added model support.
lm6000	No supporting documentation implemented in software, proprietary model with no added model support.
URGS3T, gast	Simple representation of steam turbine-governor system with insufficient model capability for modern digital controllers.
GAST	Simple representation of steam turbine-governor system with insufficient model capability for modern digital controllers.
GAST2A	Simple representation of steam turbine-governor system with insufficient model capability and flexibility for modern digital controllers.
GASTWD	Simple representation of steam turbine-governor system with insufficient model capability and flexibility for modern digital controllers.
IEEEG2	Model uses an oversimplified governor model applicable only to first swing stability. Deprecated with other hydro governor models.
WESGOV	Simple representation of steam turbine-governor system with insufficient model capability and flexibility for modern digital controllers.
Load Models	
motorc	Experimental load model. Should not be used for generation resources

Chapter 3: Sample Submission Form

This form is a sample to explain what is deemed a full application to change a model designation in the Unacceptable Models List.

Section 1: Submitting Entity Information			
Name of Person submitting			
Organization(s)			
Sector (if known)			
Telephone		Email	

Section 2: Model Identifying Information	
Model Name	
Alternative Model Name(s) as implemented in software	
Equipment Model is stated to represent	
Indicate desired Action	☐ Add model to the Unacceptable Models List ☐ Remove model from the Unacceptable Models List

Section 3: Technical Supporting Documentation and Description	
Description of model ability to meet small signal Disturbances	
Description of model ability to meet large signal Disturbances	
Please cite and link any industry approved documentation regarding this model's small and large signal disturbances	
Describe the technical document attachments that support the above questions	
Please identify any information in this application that may meet the criteria for Confidential Information, as defined in Section 1500 of the NERC Rules of Procedure	

Section 4: Process Tracking	
Date Submitted to ERO	
Model Status	☐ Submitted to the ERO ☐ Assigned ERO Review team ☐ Investigation and review by ERO and submitting entity ☐ Remanded by NERC RSTC (or its successor) ☐ Approved by the NERC RSTC (or its successor)
Date of Approval	
Date of Model Notice to Industry	

Attachments

If available, please include at least one report that uses Hardware-in-the-Loop, Software-in-the-Loop, or actual System response (e.g., in a commissioning test) to demonstrate the model's ability or inability to achieve its stated purpose. At least one attachment should detail the model's error boundaries to represent its stated equipment with the test description and procedure outlined in that report. Entities shall label any attachment that may meet the criteria for Confidential Information under NERC Rules of Procedure Section 1500, along with the basis for the designation (e.g., Confidential Business and Market Information, Critical Electric Infrastructure Information, etc.). If any of this information is not available to the supporting entity, please provide an explanation.

Violation Risk Factor and Violation Severity Level Justifications

Project 2022-02 Uniform Modeling Framework for IBR

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in Project 2022-02 Uniform Modeling Framework for Inverter-Based Resources (IBRs). Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in the Federal Energy Regulatory Commission (FERC)-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The drafting team applied the following North American Electric Reliability Corporation (NERC) criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on a Single Violation, not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

MOD-032-2

VRF Justification for MOD-032-2, Requirement R1

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard. The modifications made to Requirement R1 require model submission in accordance with the Criteria for Acceptable Models maintained by the ERO. This is similar to other sub-requirements in Requirements R1; therefore, the VRF remained a low.

VSL Justification for MOD-032-2, Requirement R1

Please refer to the VSL table below.

VRF Justification for MOD-032-2, Requirement R2

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard. “Load Serving Entity” was replaced with “Distribution Provider” from Requirement R2 in MOD-032-2. In addition, Requirement R2 added a sub-requirement requiring if entity is unable to gather unregistered IBR data or Distributed Energy Resource (DER) data to complete an estimate. These modifications align with the medium risk requirement and therefore, the VRF remained medium.

VSL Justification for MOD-032-2, Requirement R2

Please refer to the VSL table located below**.**

VRF Justification for MOD-032-2, Requirement R3

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard. The modifications made to Requirement R3 were administrative in nature; therefore, the VRF remained a low.

VSL Justification for MOD-032-2, Requirement R3

Please refer to the VSL table located below**.**

VRF Justification for MOD-032-2, Requirement R4

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R4

The VSL did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSLs for MOD-032-1, Requirement 1			
Lower	**Moderate**	**High**	**Severe**
The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include less than or equal to 25% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 25%, but less than or equal to 50% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 50%, but less than or equal to 75% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) did not develop any steady-state, dynamics, and short circuit modeling data requirements and reporting procedures required by Requirement R1; OR The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 75% of the required components specified in Requirement R1.

VSL Justifications for MOD-032-1, Requirement 1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement was modified by adding an additional sub-requirement to Requirement R1. The proposed VSL was modified to reflect the additional sub-requirement. It does not have an unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The updated sub-requirement requires the responsible entity to follow the Criteria for Acceptable Models document maintained by the Electric Reliability Organization. The VSLs are not binary and do not contain ambiguous language.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement; therefore, it is consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VSLs for MOD-032-1, Requirement 2			
Lower	**Moderate**	**High**	**Severe**
The Balancing Authority, Distribution Provider, Generator Owner Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide less than or equal to 25% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but less than or equal to 25% of the required data failed to meet data format, shareability, level	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 25%, but less than or equal to 50% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 25%, but less than or equal to 50% of the required data failed to meet data format,	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 50%, but less than or equal to 75% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 50%, but less than or equal to 75% of the required data failed to meet data format,	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider did not provide any steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s); OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 75% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner,

of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in less than or equal to 15 calendar days after the specified date.	shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 15, but less than or equal to 30 calendar days after the specified date.	shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 30, but less than or equal to 45 calendar days after the specified date.	Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 75% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 45 calendar days after the specified date.

VSL Justifications for MOD-032-1, Requirement 2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	"Load Serving Entity" was replaced with "Distribution Provider" from Requirement R2 and a sub-requirement was added requiring if entity is unable to gather unregistered IBR data or DER data to complete an estimate. The proposed VSL was modified to reflect the additional sub-requirement language. It does not have an unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The updated sub-requirement requires the entity if it is unable to gather unregistered IBR data or DER data to complete an estimate. The VSLs are not binary and do not contain ambiguous language.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement; therefore, it is consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VSLs for MOD-032-1, Requirement 3			
Lower	**Moderate**	**High**	**Severe**
The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response within 105 calendar days (or within 15 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response within greater than 105 calendar days, but less than or equal to 120 calendar days (or within greater than 15 calendar days, but less than or equal to 30 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response within greater than 120 calendar days, but less than or equal to 135 calendar days (or within greater than 30 calendar days, but less than or equal to 45 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R3 within 135 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).

VSL Justifications for MOD-032-1, Requirement 3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement was modified by replacing Load Serving Entity with Distribution provider. The proposed VSL was modified to reflect this modification. It does not have an unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The VSLs are not binary and do not contain ambiguous language.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement; therefore, it is consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

IRO-010-5

VRF Justification for IRO-010-5, Requirement R1

The VRF did not change from the previously FERC approved IRO-010-4 Reliability Standard. The modifications made to Requirement R1 require IBR-specific data and parameters to be added to the list of data and information needed by the Reliability Coordinator per Part 1.1. and model submission in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization per Part 1.5.3. This is similar to other sub-requirements in R1; therefore, the VRF remained a low.

VSL Justification for IRO-010-5, Requirement R1

Please refer to the VSL table located below.

VRF Justification for IRO-010-5, Requirement R1

The VRF did not change from the previously FERC approved IRO-010-4 Reliability Standard.

VSL Justification for IRO-010-5, Requirement R2

The VSL did not change from the previously FERC approved IRO-010-4 Reliability Standard.

VRF Justification for IRO-010-5, Requirement R3

The VRF did not change from the previously FERC approved IRO-010-4 Reliability Standard.

VSL Justification for IRO-010-5, Requirement R3

The VSL did not change from the previously FERC approved IRO-010-4 Reliability Standard.

VSLs for IRO-010-5, Requirement 1			
Lower	**Moderate**	**High**	**Severe**
The Reliability Coordinator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Reliability Coordinator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

VSL Justifications for IRO-010-5, Requirement 1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement was modified by adding additional sub-requirements to Requirement R1. The purposed VSL was modified to reflect the additional sub requirement. It does not have an unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The VSLs are not binary and do not contain ambiguous language.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement; therefore, it is consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

TOP-003-8

VRF Justification for TOP-003-8, Requirement R1

The VRF did not change from the previously FERC approved TOP-003-8 Reliability Standard. The modifications made to Requirement R1 require IBR-specific data and parameters to be added to the list of data and information needed by the Reliability Coordinator per Part 1.1. and model submission in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization per Part 1.5.3. This is similar to other sub-requirements in R1; therefore, the VRF remained a low.

VSL Justification for TOP-003-8, Requirement R1

Please refer to the VSL table located below.

VRF Justification for TOP-003-8, Requirement R2

The VRF did not change from the previously FERC approved TOP-003-8 Reliability Standard. The modifications made to Requirement R1 require IBR-specific data and parameters to be added to the list of data and information needed by the Reliability Coordinator per Part 1.1. and model submission in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization per Part 1.5.3. This is similar to other sub-requirements in R1; therefore, the VRF remained a low.

VSL Justification for TOP-003-8, Requirement R2

The VSL did not change from the previously FERC approved TOP-003-7 Reliability Standard.

VRF Justification for TOP-003-8, Requirement R3

The VRF did not change from the previously FERC approved TOP-003-7 Reliability Standard.

VSL Justification for TOP-003-8, Requirement R3

The VSL did not change from the previously FERC approved TOP-003-7 Reliability Standard.

VRF Justification for TOP-003-8, Requirement R4

The VRF did not change from the previously FERC approved TOP-003-7 Reliability Standard.

VSL Justification for TOP-003-8, Requirement R4

The VSL did not change from the previously FERC approved TOP-003-7 Reliability Standard.

VRF Justification for TOP-003-8, Requirement R5

The VRF did not change from the previously FERC approved TOP-003-7 Reliability Standard.

VSL Justification for TOP-003-8, Requirement R5

The VSL did not change from the previously FERC approved TOP-003-7 Reliability Standard.

VSLs for TOP-003-8, Requirement 1			
Lower	**Moderate**	**High**	**Severe**
The Transmission Operator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. Exhibit H

Summary of Development History
and Complete Record of Development

Summary of Development History

The following is a summary of the development record for the proposed Reliability Standards MOD-032-2, IRO-010-6, and TOP-003-8, developed through Project 2022-02 Uniform Modeling Framework for IBR (Phase One).

I. Overview of the Drafting Team

When evaluating a proposed Reliability Standard, the Commission is expected to give "due weight" to the technical expertise of the ERO.[1] The technical expertise of the ERO is derived from the drafting team selected to lead each project in accordance with Section 4.3 of the NERC Standard Processes Manual.[2] For this project, the drafting team consisted of industry experts, all with a diverse set of experiences. A roster of the Project 2022-02 drafting team members is included in **Exhibit I**.

II. Standard Development History

A. Standard Authorization Request Development – 2021/2022

The NERC Standards Committee ("SC") established Project 2022-02 in response to three Standard Authorization Requests ("SARs") submitted in December 2021 regarding impacts of Distributed Energy Resources and Inverter-Based Resources ("IBRs") on the Bulk-Power System. First, the NERC System Performance Impacts of Distributed Energy Resources Working Group ("SPIDERWG") submitted two SARs: one sought revisions to MOD-032 to address gaps in data collection for the purposes of modeling aggregate levels of distributed energy resources in planning assessments; the second sought revisions to TPL-001 to consider the impacts of these resources in planning assessments. A third SAR was submitted by the NERC Inverter-Based

[1] Section 215(d)(2) of the Federal Power Act; 16 U.S.C. § 824(d)(2).

[2] The NERC *Standard Processes Manual* is available at https://www.nerc.com/AboutNERC/Pages/Rules-of-Procedure.aspx.

Resource Performance Task Force ("IRPTF") seeking to revise TPL-001 to provide clarity and consistency for how BPS-connected IBRs are considered, modeled, and studied in transmission planning assessments.

At its January 19, 2022 meeting, the SC accepted the SARs, which were endorsed by the Reliability, Security, and Technology Committee, and authorized posting all three for a 30-day informal comment period, as well as authorized solicitation of drafting team ("DT") members.[3] The SARs and DT nominations were posted from February 1, 2022 – March 2, 2022. NERC received 39 sets of responses, including comments from approximately 126 different people from approximately 88 companies representing all 10 of the Industry Segments.[4]

At its April 20, 2022 meeting, the SC appointed members to the Project 2022-02 SARs drafting team.[5] The SARs DT considered industry comments and revised the SARs. The SC accepted the revised SARs at its September 21, 2022 meeting; authorized drafting revisions to the Reliability Standards identified in the SARs; and appointed the Project 2022-02 SARs Drafting Team as the Project 2022-02 Standard Drafting Team ("SDT").[6]

B. First Posting – Comment Period and Initial Ballot under Original Project Scope

At its May 17, 2023 meeting, the SC authorized posting of draft one of proposed Reliability Standard MOD-032-2 and the associated Implementation Plan for a 45-day formal comment period, with ballot pools formed in the first 30 days, and parallel initial ballots and non-binding polls on the Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs), conducted

[3] NERC Standards Committee Meeting Minutes (Jan. 19, 2022), Transmission System Planning and Modeling Improvements (Agenda Item 9).
[4] Exhibit H Item 6.
[5] NERC Standards Committee Meeting Minutes (Apr. 20, 2022), Project 2022-02 Modifications to TPL-001-5.1 and MOD-032-1 (agenda item 8).

during the last 10 days of the comment period.[7] The initial posting took place from May 31, 2023 – July 14, 2023, with an initial ballot taking place over the last 10 days.

There were 77 sets of responses, including comments from approximately 200 different people from approximately 126 companies representing 10 of the Industry Segments.[8]

Results for the initial ballot and non-binding poll are in the table below:[9]

Standard	Approval	Quorum	Non-binding Poll / Quorum
MOD-032-2	41.82%	84.54%	39.78% / 82.31%
Implementation Plan	41.48%	82.7%	N/A

C. Second Posting – Comment Period and Additional Ballot under Original Project Scope

After reviewing the comments received, the SDT revised proposed Reliability Standard MOD-032-2 and posted draft two of the standard and the associated Implementation Plan for a 45-day formal comment period and an additional ballot and non-binding poll. The posting took place from October 6, 2023 – November 20, 2023, with an additional ballot taking place over the last 10 days.

NERC received 71 sets of responses, including comments from approximately 185 different people from approximately 114 companies representing 10 of the Industry Segments.[10]

Results for the additional ballot and non-binding poll are in the table below:[11]

Standard	Approval	Quorum	Non-binding Poll / Quorum
MOD-032-2	39.52%	85.27%	41.24% / 83.09%
Implementation Plan	48.24%	84.83%	N/A

11 Exhibit H Items 45-47.

D. Order No. 901

While work was underway to revise Reliability Standard MOD-032-1 to account for distributed energy resources, the Commission issued Order No. 901 directing NERC to submit a series of proposed new or revised Reliability Standards to address IBR-related reliability issues, including data and modeling issues.[12]

Specifically, Order No. 901 included several directives related to IBR modelling and data sharing requirements. Project 2022-02 was assigned these directives, with the goal to establish new or revised Reliability Standards to ensure the usage of a uniform framework for data sharing and model development. The Order No. 901 directives would be addressed as Phase One of the project, and other remaining work from the original three SARs not addressed with the Order No. 901 directives would be assigned to Phase Two.

E. SAR for Addressing Order No. 901 Directives and Supplemental Drafting Team Nominations

NERC staff drafted a SAR addressing relevant directives from FERC Order No. 901 and renaming project 2022-02 to Uniform Modeling Framework for IBR. The SAR was posted for comment from May 17, 2024 – June 24, 2024. There were 34 sets of responses, including comments from approximately 113 different people from approximately 80 companies representing all 10 of the Industry Segments.[13]

Concurrently, supplemental drafting team nominations were posted from May 17, 2024 – June 24, 2024. The posting highlighted the high priority nature of the project and the need to meet

[12] Order No. 901, *Reliability Standards to Address Inverter-Based Resources*, 185 FERC ¶ 61,042 (2023).
[13] Exhibit H Item 53.

the November 4, 2025 FERC directive deadline. The SC appointed members to the Project 2022-02 SAR DT at its August 21, 2024 meeting.[14]

F. Third Posting – Comment Period and Additional Ballot under Original Project Scope

A third draft of proposed Reliability Standard MOD-032-2 (not considering the Order No. 901 directives) and the associated Implementation Plan were posted for 45-day formal comment period from August 27, 2024 – October 10, 2024, with an additional ballot conducted during the last 10 days of the comment period.

There were 55 sets of responses, including comments from approximately 140 different people from approximately 87 companies representing 7 of the Industry Segments.[15]

Results for the additional ballot and non-binding poll are in the table below:[16]

Standard	Approval	Quorum	Non-binding Poll / Quorum
MOD-032-2	41.9%	84.93%	41.57% / 82.01%
Implementation Plan	45.81%	83.79%	N/A

G. Revised SAR Addressing Order No. 901 Directives Accepted

As work continued on MOD-032-2, the project 2022-02 DT revised the SAR addressing directives from Order No. 901. The Standards Committee accepted the SAR on November 13, 2024 and authorized drafting revisions to the Reliability Standards.[17]

H. Waiver

At its April 16, 2025 meeting, the SC considered a waiver of certain provisions of the Standard Processes Manual relating to the lengths of comment periods and ballots in order to meet the Order No. 901 November 4, 2025 filing deadline. The Standards Committee approved the waiver on April 16, 2025.[18]

I. Phase One – Initial Comment Period and Initial Ballot for Standards Responsive to Order No. 901 Directives

After completing the SAR addressing Order No. 901 directives and splitting Project 2022-02 into two phases, work continued on Phase One of the project. The posting and ballot process was restarted.

Draft 1 of proposed Reliability Standards MOD-032-2, IRO-010-6, TOP-003-8 and the associated Implementation Plan were posted from April 17, 2025 – May 16, 2025 for an initial 30 day formal comment and ballot period, with ballot pools formed in the first 10 calendar days, and initial ballots conducted during the last 10 calendar days of the comment period.

There were 82 sets of responses, including comments from approximately 174 different people from approximately 105 companies representing 8 of the Industry Segments.[19]

Results for the initial ballots and non-binding polls are in the table below:[20]

Standard	Approval	Quorum	Non-binding Poll / Quorum
MOD-032-2	39.05%	87.86%	39.6% / 88.46%
IRO-010-6	41.62%	87.54%	87.36% / 49.74%
TOP-003-8	34.7%	87.9%	87.69% / 41.75%
Implementation Plan	39.46%	88%	N/A

[19] Exhibit H Item 88.

[20] Exhibit H Items 92-98.

J. Phase One – Additional Comment Period and Additional Ballot

A revised draft of proposed Reliability Standards MOD-032-2, IRO-010-5, TOP-003-8 and the associated Implementation Plan for a 30-day formal comment period, with an additional ballot conducted during the last 10 days of the comment period. The posting took place from August 8, 2025 – September 10, 2025, with an additional ballot taking place over the last 10 days.

There were 71 sets of responses, including comments from approximately 185 different people from approximately 114 companies representing 10 of the Industry Segments.[21]

Results for the additional ballots and non-binding polls are in the table below:[22]

Standard	Approval	Quorum	Non-binding Poll / Quorum
MOD-032-2	73.77%	91.79%	71.94% / 91.15%
IRO-010-6	86.15%	91.1%	93.26% / 90.42%
TOP-003-8	82.56%	91.46%	91.53% / 90.38%
Implementation Plan	76.84%	91.27%	N/A

K. Final Ballot

The proposed Reliability Standards, implementation plan, and supporting materials were posted for a five-day final ballot from September 29, 2025 – October 3, 2025. All items reached quorum and passed the ballot as indicated in the table below:[23]

Ballot	Quorum / Approval
MOD-032-2	93.21% / 78.73%
IRO-010-6	92.53% / 87.78%
TOP-003-8	92.88% / 84.3%
Implementation Plan	92.73% / 79.39%

[21] Exhibit H Item 116.
[22] Exhibit H Items 120-126.
[23] Exhibit H Items 143-146.

L. Board of Trustees Adoption

The NERC Board of Trustees adopted proposed Reliability Standards MOD-32-2, IRO-010-6, and TOP-003-8, as well as the implementation plan on October 31, 2025.[24]

[24] NERC, Board of Trustees Action without a Meeting (Oct. 31, 2025), available at https://www.nerc.com/gov/bot/Pages/Agenda-Highlights-and-Minutes-.aspx.

Project 2022-02 Uniform Modeling Framework for IBR

Related Files

Status
Final ballots for **Project 2022-02 Uniform Modeling Framework for IBR** concluded at **8 p.m. Eastern, Friday, October 3, 2025** for the following standards and implementation plan:

- MOD-032-2 – Data for Power System Modeling and Analysis
- IRO-010-6 – Reliability Coordinator Data and information Specification and Collection
- TOP-003-8 – Transmission Operator and Balancing Authority Data and Information Specification and Collection
- Implementation Plan

The standards will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

Project 2022-02 Uniform Modeling Framework for IBR has been assigned a new standard authorization request (SAR) addressing FERC Order 901 and has 24 regulatory directives. This project has been split into two phases. Phase one will address FERC Order 901, which has a regulatory deadline of November 4, 2025. Phase two will commence once phase one has been completed.

Background for Phase One
Project 2022-02 Uniform Modeling Framework for IBR will address 24 regulatory directives from FERC Order No. 901 – Milestone 3, Phase one. Specifically, modeling and data sharing requirements to establish sufficient IBR model data and parameters to assure accurate representation of IBR performance within the models. This project is intended to establish new or revised Reliability Standards to ensure the usage of a uniform framework for data sharing and model development. This uniform framework is to ensure the directives of Order No. 901 can be effectively met to ensure usage of generic model types for IBR in the Interconnection-wide models.

This project must ensure modeling revisions from other IBR performance requirements in other 901-related projects will utilize the uniform framework. For instance, performance of IBR during an event (grid disturbance) is identified and corrected within Milestone 2 of FERC Order No. 901. Evaluated performance within new PRC-029 or PRC-030 may necessitate some form of change to how specific IBRs are represented in the model; as the IBR should be modeled based on how it performs during a disturbance and/or new/changed equipment as a result of failing to ride through. However, any requisite changes to model data as a result of correcting IBR performance, must be communicated through a uniform model framework to assure all impacted entities and users of the approved models are adequately informed and provided updated models (as developed within this project). This project, Milestone 3 Phase one, will establish the uniform framework for data sharing and model development of future Order No. 901 related projects that will utilize performance data.

This project has been identified as high priority at this time. The project has a FERC deadline of November 4, 2025.

Standard(s) Affected for Phase One: MOD-032, IRO-010, and TOP-003

Background for Phase Two
Due to the priority of FERC Order 901 directives, the TPL-001 SARs will be addressed during Phase two for Project 2022-02 and is not expected to be a high priority project. While the current DT of Project 2022-02 is working on the project, a new SAR related to TPL-001-5.1 was approved for posting by the Standards Committee. The Standards Committee asked the current DT to include this SAR as part of the project rather than creating a new project. The new SAR will address Footnote 13d issue in Standard TPL-001-5.1. Please see the TPL-001 SAR for additional information.

Standard(s) Affected for Phase Two: TPL-001-5.1 and MOD-032-1

Purpose/Industry Need

Phase One
Phase one will provide industry with a uniform framework for each Interconnection that includes a minimum modeling criteria consistent with NERC's Dynamic Modeling Recommendations, a registered modeling designee, and necessary data exchange requirements.

Phase Two
Phase two will provide clarity, or in some cases, expand the scope of requirements when considering the performance of DERs to ensure the accuracy of Transmission System Planning Assessments.

Justification for this proposed standard development project (Check all that apply to help NERC prioritize development)			
☐ Regulatory Initiation ☒ Emerging Risk (Reliability Issues Steering Committee) Identified ☐ Reliability Standard Development Plan		☒ NERC Standing Committee Identified ☐ Enhanced Periodic Review Initiated ☒ Industry Stakeholder Identified	
Industry Need (What Bulk Electric System (BES) reliability benefit does the proposed project provide?):			
Many areas of the North American bulk power system (BPS) continue to experience an increase in BPS-connected inverter-based resources (e.g., wind, solar photovoltaic (PV), battery energy storage systems (BESS), and hybrid power plants). NERC Reliability Standard TPL-001-5.1 is a foundational standard used for "establishing transmission system performance requirements within the planning horizon to develop a bulk electric system (BES) that will operate reliably over a broad spectrum of system conditions and following a wide range of probable contingencies." Transmission Planners (TPs) and Planning Coordinators (PCs) develop and use models of the electrical grid to perform planning assessments (e.g., steady-state, dynamic, and short-circuit) to develop corrective action plans for future reliability issues identified. Ensuring that the TPL-001 standard is reflective of the evolving nature of the BPS and its resource mix is paramount to ensuring reliable operation and resilience of the BPS moving forward.			

Requested information
The NERC Inverter-Based Resource Performance Task Force (IRPTF)[1] undertook a complete review of the NERC Reliability Standards in the context of increasing levels of BPS-connected inverter-based resources and published a white paper on the outcomes and recommendations of this review in March 2020.[2] The review was approved by the NERC Planning Committee and served as the technical justification for future standards revision efforts. The white paper recommended modifications to seven standards, and IRPWG presented four SARs to the NERC Reliability and Security Technical Committee (RSTC) in June 2020 that addressed the deficiencies identified in six of the seven standards. Based on the outcome of the review, it was determined that the TPL-001-4/5[3] needed clarifications "to address terminology throughout the standard that is unclear with regards to inverter-based resources" the next time the standard is revised. The language used in the white paper regarding "the next time the standard is revised" was based on the understanding that the NERC System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG) was developing a SAR and that the recommended modifications to TPL-001-5 from IRPWG could be included in the SPIDERWG SAR. The combined SAR was presented to the NERC RSTC at their March 2021 meeting and was rejected. The overarching comments received were with regards to the DER-related issues and a comment was made that the recommendations pertaining to BPS-connected inverter-based resources were not the primary focus of concern. Therefore, IRPWG presents this SAR to move the effort forward regarding specifically BPS-connected inverter-based resources. This SAR does not include any modification to TPL-001-5 regarding the inclusion of distributed energy resources (DERs). IRPWG believes that industry needs to be proactive in addressing standards gaps, particularly, where lack of clarity and confusion may lead to studies not adequately capturing possible BPS reliability issues. As the North American BPS continues to experience rising penetration levels of BPS-connected inverter-based resources and is likely to do so into the foreseeable future, these changes are critical for overall BPS reliability and industry efforts to reliably integrate these resources.
Purpose or Goal (How does this proposed project provide the reliability-related benefit described above?):
This SAR revises requirements within the TPL-001-5 standard to provide clarity and consistency for how BPS-connected inverter-based resources are considered, modeled, and studied in planning assessments. The proposed revisions to TPL-001-5 will ensure industry is effectively and efficiently conducting planning assessments and that the requirements are equally suitable for inverter-based resources as they are for synchronous generation.

[1] The IRPTF has subsequently become the IRPWG under the NERC Reliability and Security Technical Committee (RSTC).
[2] NERC IRPTF, "IRPTF Review of NERC Reliability Standards," March 2020: https://www.nerc.com/comm/PC/InverterBased%20Resource%20Performance%20Task%20Force%20IRPT/Review_of_NERC_Reliability_Standards_White_Paper.pdf
[3] At the time of review, the TPL-001-5 standard had just recently been approved by FERC and was yet to be subject to enforcement.

Requested information
Project Scope (Define the parameters of the proposed project):
As described in further detail below, the scope of this project includes the following revisions to TPL-001-5.1: • Modify Requirements 3.3 and 4.3 and their applicable sub-requirements to make the term "GSU transformer" suitable for all generation types since it introduces confusion for BPS-connected inverter-based resources • Modify Requirements 4.1.1 and 4.1.2 regarding the use of the term "pulls out of synchronism," which is only applicable for synchronous generator technologies and is not suitable for BPS-connected inverter-based resources • Modify Requirement 4.3.2 so that the list of devices that impact the study area are inclusive of BPS-connected inverter-based resource technologies •
Detailed Description (Describe the proposed deliverable(s) with sufficient detail for a drafting team to execute the project. If you propose a new or substantially revised Reliability Standard or definition, provide: (1) a technical justification[4] which includes a discussion of the reliability-related benefits of developing a new or revised Reliability Standard or definition, and (2) a technical foundation document (*e.g.,* research paper) to guide development of the Standard or definition):
The following detailed description is copied verbatim from the IRPTF white paper that was approved by the NERC PC: TPL-001-4 requires Planning Coordinators (PCs) and TPs to assess the reliability of their portion of the BES for various conditions across several specified future years and to plan Corrective Action Plans to address identified performance deficiencies. The requirements and sub-requirements include, among other things, certain simulation assumptions to be used by the planner and performance requirements. Sub-requirements 3.3 and 4.3 describe simulation assumptions that the planner should use when performing contingency analysis for the steady-state and stability portion of the assessment, respectively. Sub-requirements 3.3.1.1 and 4.3.1.2 each require the planner to include the impact of the "tripping of generators where simulations show generator bus voltages or high side of the [GSU] voltages are less than known or assumed generator" low voltage ride-through capability. The term GSU transformer can be confusing to GOs of IBR facilities because they will often refer to the transformer that steps the voltage up from the individual inverter (e.g., 600 V) to the collector system voltage (e.g., 34.5 kV). In this case, there is usually another transformer (i.e., the main power transformer (MPT)) to step the voltage up from the collector system voltage to transmission system voltage. It was likely the intent of the TPL-001-2 SDT to be referring to transmission system voltages when drafting the language that refers to known or assumed

[4] The NERC Rules of Procedure require a technical justification for new or substantially revised Reliability Standards. Please attach pertinent information to this form before submittal to NERC.

Requested information
generator low voltage ride-through capability at the high-side of the GSU. Therefore, the language in these sub-requirements should be modified to provide clarity for inverter-based resources. Sub-requirements 4.1.1 and 4.1.2 provide stability performance criteria when a generator "pulls out of synchronism" in system simulations. Although an inverter-based resource does synchronize with the grid, the phrase "pulls out of synchronism" is typically applicable only to synchronous generators, referring to when a synchronous machine has an angular separation from the rest of the grid. Therefore, these sub-requirements could be clarified by clearly stating that this performance criteria is for synchronous generators. Sub-requirement 4.3.2 specifies that stability studies must "simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area." It then contains a list of example devices that have dynamic behavior. Not included in this list are power plant controllers and inverter controls, which often dominate the dynamic response of IBRs. While the sub-requirement does not preclude the simulation of plant-level controllers and inverter controls, it would add clarity if they were added to the list. The suggested clarifications for sub-requirements 3.3, 4.3, 4.1.1, 4.1.2, and 4.3.2 should be considered by a future SDT when editing the standard. However, the IRPTF does not believe the clarifications by themselves warrant changing the standard at this time. It should be noted that the identified issues with TPL-001-4 also apply to the draft TPL-001-5 standard that is awaiting FERC approval as of the publication of this whitepaper.
Cost Impact Assessment, if known (Provide a paragraph describing the potential cost impacts associated with the proposed project):
The cost impacts for the proposed changes to TPL-001-5 are expected to be minimal. The changes being proposed are clarifications that will bring consistency and effectiveness industry related to how planning assessments are conducted and how planning engineers set up and conduct those assessments.
Please describe any unique characteristics of the BES facilities that may be impacted by this proposed standard development project (*e.g.*, Dispersed Generation Resources):
None. This SAR will impact Transmission System Planning Assessments, not any specific BES facilities.
To assist the NERC Standards Committee in appointing a drafting team with the appropriate members, please indicate to which Functional Entities the proposed standard(s) should apply (*e.g.*, Transmission Operator, Reliability Coordinator, etc. See the most recent version of the NERC Functional Model for definitions):
Planning Coordinators, Transmission Planners, and Generator Owners of inverter-based resources

Requested information
Do you know of any consensus building activities[5] in connection with this SAR? If so, please provide any recommendations or findings resulting from the consensus building activity.
This SAR is an outcome of the white paper produced by the NERC IRPTF and approved by the NERC PC, which can be found here: https://www.nerc.com/comm/PC/InverterBased%20Resource%20Performance%20Task%20Force%20IRPT/Review_of_NERC_Reliability_Standards_White_Paper.pdf The SAR is a follow-on to the recommendation contained within the white paper, developed by the NERC IRPWG under the NERC RSTC.
Are there any related standards or SARs that should be assessed for impact as a result of this proposed project? If so, which standard(s) or project number(s)?
No
Are there alternatives (e.g., guidelines, white paper, alerts, etc.) that have been considered or could meet the objectives? If so, please list the alternatives.
The NERC IRPWG (previously IRPTF) has published multiple technical reference documents, white papers, and reliability guidelines related to the performance, modeling, and studies of BPS-connected inverter-based resources. These technical materials are used widely by industry and have provided significant value for improving planning practices. However, those efforts do not address the larger issue related to the TPL-001 standards language being written predominantly for synchronous generation technology and not adequately considering or clarifying how the requirements relate to BPS-connected inverter-based resource technologies.

Reliability Principles	
Does this proposed standard development project support at least one of the following Reliability Principles (Reliability Interface Principles)? Please check all those that apply.	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.

[5] Consensus building activities are occasionally conducted by NERC and/or project review teams. They typically are conducted to obtain industry inputs prior to proposing any standard development project to revise, or develop a standard or definition.

Requested information	
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Market Interface Principles	
Does the proposed standard development project comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

Identified Existing or Potential Regional or Interconnection Variances	
Region(s)/ Interconnection	Explanation
None	None

Industry Need (What Bulk Electric System (BES) reliability benefit does the proposed project provide?):			
Many areas of the North American BES are experiencing increasing penetrations of distributed energy resources (DERs). NERC Reliability Standard TPL-001-5.1[1] was developed under a paradigm of predominantly BPS-connected generation, particularly synchronous generation, when penetrations of DERs were significantly lower than current and future projections. Considering current trends, the NERC SPIDERWG undertook a review of the TPL-001 standard considering the potential impact of DERs. This review is captured in the following RSTC-approved white paper and serves as the technical justification for the revisions suggested in this SAR: • SPIDERWG: Assessment of DER impacts on NERC Reliability Standard TPL-001 (here)			

[1] The scope of recent modifications to TPL-001-5 did not include considering the impacts of DER on BPS planning.

Requested information

This SAR proposes to update TPL-001-5.1 to address some of the issues identified in the white paper.

TPL-001-5.1 does not currently require Planning Coordinators and Transmission Planners to complete Planning Assessments with adequate representation of the dynamic behavior of DERs. As the penetration of DERs increases, and based on the DER data and models available, Planning Assessments should include DERs that can potentially impact Transmission System performance assessment. NERC's "Lesson Learned: Single Phase Fault Precipitates Loss of Generation and Load", evaluating a 2019 frequency event in Southern England exacerbated by the unexpected reduction of 725 MW of IBR output and the unexpected loss of 350 MW of DER, highlights the critical importance of accurate Transmission System Planning Assessments.[2] In July 2020, a significant quantity of solar PV facilities across a large geographic area in Southern CA reduced about 1000 MW output due to a disturbance on the bulk power system[3]. Subsequent event analysis revealed that it was the consequence of momentary cessation and slow recovery of power. Standards enhancement has been one of the recommendations after the event analysis to ensure reliable operation of the bulk power system.

In general, the impact of DERs on the BES should be included in planning assessments if DER data and models are available. Any choice to exclude the consideration of the impact of DER on the BES should be supported by a technical rationale and/or justification.

Purpose or Goal (How does this proposed project provide the reliability-related benefit described above?):

The purpose of this SAR is to revise requirements to provide clarity or, in some cases, expand the scope of requirements when considering the performance of DERs to ensure the accuracy of Transmission System Planning Assessments.

Project Scope (Define the parameters of the proposed project):

As identified by SPIDERWG, the following sections of TPL-001-5.1 should be revised to ensure the accuracy of Transmission System Planning Assessments:

a. R2.1 and R2.2, the use of phrase "System peak Load"
b. R3.3.1.1 and R4.3.1.2, the "tripping of generators" in steady state and stability contingency analysis should include tripping of DER if data and models are available. The SDT can consider whether a threshold needs to be established.
c. R4.1.1 and 4.1.2, the stability performance criteria should be applicable to both synchronous and asynchronous generation, inclusive of DER.

[2] https://www.nerc.com/pa/rrm/ea/Lessons%20Learned%20Document%20Library/LL20201001_Single_Phase_Fault_Precipitates_Loss_of_Generation_and_Load.pdf

[3] https://www.nerc.com/pa/rrm/ea/Pages/July_2020_San_Fernando_Disturbance_Report.aspx

Requested information
d. R4.3.2, the list of dynamic control devices should include DER so that the expected automatic operation of DER (e.g., DER tripping, dynamic voltage and frequency controls, momentary cessation, etc.) can be considered in stability analyses.
Detailed Description (Describe the proposed deliverable(s) with sufficient detail for a drafting team to execute the project. If you propose a new or substantially revised Reliability Standard or definition, provide: (1) a technical justification[4] which includes a discussion of the reliability-related benefits of developing a new or revised Reliability Standard or definition, and (2) a technical foundation document (*e.g.,* research paper) to guide development of the Standard or definition):
A detailed description of each Project Scope item is given below: a. R2.1 and R2.2, the use of phrase "System peak Load" With increased penetration of DER, the load that transmission system supplies is the net load (net load = gross load – DER output) as seen at the T-D interface, which might reach its peak during operating conditions that are not at the peak gross load hour. As such, there is a need for individual TPs to be required to document and define their peak load conditions (e.g., gross or net) in their assessments. The SDT should consider adding the terms "Gross Load" and "Net Load" to the NERC Glossary of Terms and updating the term "System peak Load" in the standard to "System peak net Load". In addition, a high gross load hour may be the most stressed load driven condition for contingencies that may trip large amounts of DER. High system peak gross load may be studied as additional scenarios as required by current standard under R2.1.3. b. R3.3.1.1 and R4.3.1.2, the "tripping of generators" in steady state and stability contingency analysis should include tripping of DER if data is available. The SDT can consider whether a threshold needs to be established. The terms "generators" in Sub-requirements 3.3.1.1 and 4.3.1.2 should be clarified. DERs that are explicitly modeled as generators should be tripped where simulations show bus voltages that are less than known or assumed minimum DER steady-state or ride-through voltage limits. It is also recommended to consider inclusion in the assessment any assumptions made in estimating DER bus voltage. c. R4.1.1 and 4.1.2, the stability performance criteria should be applicable to both synchronous and asynchronous generation, inclusive of DER. For example, the language referring to "pulls out of synchronism" is only relevant to synchronous generation and is not applicable to inverter-based generation (including inverter-based DER). However, large amounts of asynchronous DER tripping on low/high voltage/frequency conditions

[4] The NERC Rules of Procedure require a technical justification for new or substantially revised Reliability Standards. Please attach pertinent information to this form before submittal to NERC.

Requested information
can also adversely affect BES performance and may pose a risk to system instability for conditions such as cascading, voltage instability, or uncontrolled islanding if not properly studied and identified ahead of real-time operations. It is recommended to expand the stability performance criteria to include both synchronous and asynchronous generation. d. R4.3.2, the standard should recognize that the list of dynamic control devices should consider the expected automatic operation of DER (e.g., DER tripping, dynamic voltage and frequency controls, momentary cessation, etc.) in stability analyses. The SDT can consider adding asynchronous generator related devices like inverter, plant controller, etc.
Cost Impact Assessment, if known (Provide a paragraph describing the potential cost impacts associated with the proposed project):
Although the cost impact is unknown, costs to Planning Coordinators and Transmission Planners will increase as Transmission System Planning Assessments reflect additional dynamic components and controls. It is anticipated that this cost will vary depending on training, tools, scenario development, and other factors in each Planning Coordinators and Transmission Planners' area.
Please describe any unique characteristics of the BES facilities that may be impacted by this proposed standard development project (*e.g.*, Dispersed Generation Resources):
None. This SAR will primarily impact Transmission System Planning Assessments, not any specific BES facilities, although as individual IBRs continue to increase in size (e.g. 14MW wind turbines), there may be some impact in the near future.
To assist the NERC Standards Committee in appointing a drafting team with the appropriate members, please indicate to which Functional Entities the proposed standard(s) should apply (*e.g.*, Transmission Operator, Reliability Coordinator, etc. See the most recent version of the NERC Functional Model for definitions):
Planning Coordinators and Transmission Planners, i.e. the applicable entities for this standard. Additionally, Distribution Providers, Generator Owners, and DER aggregators participating in markets- i.e. not an applicable entity to this standard, would be useful to include.
Do you know of any consensus building activities[5] in connection with this SAR? If so, please provide any recommendations or findings resulting from the consensus building activity.
This SAR is the outcome of the following white paper that was developed by the NERC technical sub-group under the RSTC.

[5] Consensus building activities are occasionally conducted by NERC and/or project review teams. They typically are conducted to obtain industry inputs prior to proposing any standard development project to revise, or develop a standard or definition.

Requested information
• SPIDERWG: Assessment of DER impacts on NERC Reliability Standard TPL-001 (here) Deliverables, and the key findings and recommendations contained within, were thoroughly reviewed and approved by the RSTC.
Are there any related standards or SARs that should be assessed for impact as a result of this proposed project? If so, which standard(s) or project number(s)?
No
Are there alternatives (e.g., guidelines, white paper, alerts, etc.) that have been considered or could meet the objectives? If so, please list the alternatives.
Among all the issues identified in the NERC SPIDERWG white paper, the ones included in this SAR cannot be addressed by any alternatives. Standard language change will ensure DER impacts being considered appropriately. NERC SPIDERWG will prepare a Reliability Guideline to address the rest of the findings from their white paper.

Reliability Principles	
Does this proposed standard development project support at least one of the following Reliability Principles (Reliability Interface Principles)? Please check all those that apply.	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☐	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Market Interface Principles	
Does the proposed standard development project comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes

Market Interface Principles	
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

Justification for this proposed standard development project (Check all that apply to help NERC prioritize development)			
☐ Regulatory Initiation ☒ Emerging Risk (Reliability Issues Steering Committee) Identified ☐ Reliability Standard Development Plan		☒ NERC Standing Committee Identified ☐ Enhanced Periodic Review Initiated ☒ Industry Stakeholder Identified	
Industry Need (What Bulk Electric System (BES) reliability benefit does the proposed project provide?):			
As the penetration of distributed energy resources (DERs) continues to increase across the North American bulk power system (BPS), it is necessary to account for the potential impacts of DERs on reliability in the planning, operation, and design of the BES. The NERC System Planning Impacts of Distributed Energy Resources Working Group (SPIDERWG) has identified the need for improved modeling of aggregate DER for planning studies (including both utility-scale and retail-scale DER) conducted by Transmission Planners (TPs) and Planning Coordinators (PCs). MOD-032-1 addresses the gathering of modeling data to perform planning assessments but the standard currently has no specific reference to DER data. This SAR proposes to update MOD-032-1 to: (1) include "data requirements and reporting			

Requested information
procedures"[1] for DER that are necessary to support the development of accurate interconnection-wide models, (2) replace Load-Serving Entity (LSE) with Distribution Provider (DP) because of the removal of LSEs from the NERC registry criteria, (3) enable the SDT to review any additional gaps in DER data collection with the de-registration of LSE.
Purpose or Goal (How does this proposed project provide the reliability-related benefit described above?):
This SAR proposes to revise MOD-032-1 to address gaps in data collection for the purposes of modeling aggregate levels of DERs in planning assessments. The goal is to provide clarity and consistency for data collection across PCs and TPs when coordinating with the DP to gather aggregate load and aggregate DER data.
Project Scope (Define the parameters of the proposed project):
The proposed scope of this project is as follows: a. The table in Attachment 1 should be updated to include DER in the steady-state and dynamics columns. Details of the changes to be considered by the Standard Drafting Team are included in the "Detailed Description" below. b. Based on item a.) and the detailed description below, the SDT should consider whether including a definition for "Distributed Energy Resource (DER)" in the NERC Glossary of Terms is necessary. c. In alignment with the SAR submitted by the previous NERC Essential Reliability Services Working Group (ERSWG), LSE should be removed and replaced by DP as the applicable entity in Section 4.1.3 and all instances in the standard requirements and attachments. d. The SDT should review any potential gaps regarding data collection for aggregate DER data with the de-registration of LSE or based on applicability transfer from LSE to DP (item c in this list).
Detailed Description (Describe the proposed deliverable(s) with sufficient detail for a drafting team to execute the project. If you propose a new or substantially revised Reliability Standard or definition, provide: (1) a technical justification[2] which includes a discussion of the reliability-related benefits of developing a new or revised Reliability Standard or definition, and (2) a technical foundation document (e.g., research paper) to guide development of the Standard or definition):
This SAR proposes to address the issues identified in the project scope above. Specifically, the following details should be considered and addressed by the drafting team: • In the Applicability section of MOD-032-1, LSE should be replaced with DP, in alignment with the SAR previously submitted by ERSWG. Similarly, all relevant uses of LSE should be replaced with DP.

[1] See Requirement R1 of MOD-032-1, which requires each TP and PC to develop data requirements and reporting procedures for the collection of modeling data used for the development of models for each PC footprint.
[2] The NERC Rules of Procedure require a technical justification for new or substantially revised Reliability Standards. Please attach pertinent information to this form before submittal to NERC.

Requested information
▪ The table in Attachment 1 should include references to aggregate DER in the steady-state and dynamics columns. The drafting team should consider the data needed for modeling aggregate DER for the purposes of reliability studies. In particular, the drafting team should consider the recommendations set forth in *NERC Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies*. • Note that the SPIDERWG does not see a need to modify the short circuit column of Attachment 1 because #1 already states "all applicable elements" in the steady-state column should have necessary information related to positive, negative, and zero sequence data provided accordingly. If the TP/PC determines that aggregate DER is needed for these studies, then they have the capability to request such data. However, this is not a prevalent issue currently. • In alignment with adding "DER" to the Attachment 1 table regarding necessary data for modeling purposes, it may be needed (based on the discretion of the SDT) to add a definition for "Distributed Energy Resource (DER)" to the NERC Glossary of Terms. As stated, SPIDERWG has published *NERC Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies* that includes recommended practices and for the collection of aggregate DER data for transmission planning studies. **These materials are not intended to dilute the criticality of this SAR to address the issues identified above within MOD-032-1 itself. Rather, the SDT can use these materials when determining the specific language for inclusion in the standard requirements revisions.**
Cost Impact Assessment, if known (Provide a paragraph describing the potential cost impacts associated with the proposed project):
Cost impacts are not fully known. However, due to the limited scope of the requested data, cost impact is expected to be minimal to all entities. DPs typically collect the information need to model aggregate levels of DERs in planning assessments. Therefore, data collection effort by the DP would be minimal additional effort. DPs already have processes to provide load data to the TP and PC, so DER data can be managed in a similar manner to reduce cost and effort. If the scope of the required data is expanded, cost impact would likely increase.
Please describe any unique characteristics of the BES facilities that may be impacted by this proposed standard development project (*e.g*. Dispersed Generation Resources):
DER owners are not subject to NERC Reliability Standards. However, SPIDERWG believes the DP (a NERC Registered Entity) has the information regarding DER connected to its distribution system that is needed for modeling the aggregate behavior of DER for the purposes of BES reliability planning studies. The DP should provide that information to the TP and PC accordingly.
To assist the NERC Standards Committee in appointing a drafting team with the appropriate members, please indicate to which Functional Entities the proposed standard(s) should apply (*e.g*. Transmission Operator, Reliability Coordinator, etc. See the most recent version of the NERC Functional Model for definitions):
Transmission Planner, Planning Coordinator, Distribution Provider

Requested information
While not a Functional Entity per the NERC Functional Model, the "MOD-032 Designees" that are designated by the ERO to develop interconnection-wide base cases (i.e., the Regional Entities), will also be affected by these changes and should be considered for appointment to the Standard Drafting Team.
Do you know of any consensus building activities[3] in connection with this SAR? If so, please provide any recommendations or findings resulting from the consensus building activity.
The proposals in this SAR were developed by the NERC SPIDERWG, a stakeholder group under the NERC Planning Committee.
Are there any related standards or SARs that should be assessed for impact as a result of this proposed project? If so which standard(s) or project number(s)?
The ERSWG submitted a SAR related to MOD-032-1, as described above. This SAR supports those changes, and further expands on a few necessary additional changes related to DER modeling.
Are there alternatives (e.g. guidelines, white paper, alerts, etc.) that have been considered or could meet the objectives? If so, please list the alternatives.
The NERC SPIDERWG is preparing a Reliability Guideline on data collection for DER modeling. That guideline will provide recommendations for improvements to the data requirements and reporting procedures developed jointly by PCs and their TPs. However, updates to MOD-032-1 are also needed to ensure minimum planning consideration and reporting requirement on DER, particularly in Attachment 1. Therefore, this SAR aligns with the necessary changes to meet the objective.

Reliability Principles	
Does this proposed standard development project support at least one of the following Reliability Principles (Reliability Interface Principles)? Please check all those that apply.	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.

[3] Consensus building activities are occasionally conducted by NERC and/or project review teams. They typically are conducted to obtain industry inputs prior to proposing any standard development project to revise, or develop a standard or definition.

Reliability Principles	
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Unofficial Comment Form

Project 2022-02 Modifications to TPL-001-5.1 and MOD-032-1

Do not use this form for submitting comments. Use the Standards Balloting and Commenting System (SBS) to submit comments on **Project 2022-02 Modifications to TPL-001-5.1 and MOD-032-1 Standard Authorization Requests (SARs).** Comments must be submitted by **8 p.m. Eastern, Wednesday, March 02, 2022.**

Additional information is available on the project page. If you have questions, contact Senior Standards Developer, Ben Wu (via email), or at 404-446-9618.

Background Information

Many areas of the North American bulk power system (BPS) continue to experience an increase in BPS-connected inverter-based resources (e.g., wind, solar photovoltaic (PV), battery energy storage systems (BESS), and hybrid power plants). NERC Reliability Standard TPL-001-5.1 is a foundational standard used for "establishing transmission system performance requirements within the planning horizon to develop a bulk electric system (BES) that will operate reliably over a broad spectrum of system conditions and following a wide range of probable contingencies." Transmission Planners (TPs) and Planning Coordinators (PCs) develop and use models of the electrical grid to perform planning assessments (e.g., steady-state, dynamic, and short-circuit) to develop corrective action plans for future reliability issues identified. Ensuring that the TPL-001 standard is reflective of the evolving nature of the BPS and its resource mix is paramount to ensuring reliable operation and resilience of the BPS moving forward.

In general, the impact of DERs on the BES should be included in planning assessments if DER data and models are available. Any choice to exclude the consideration of the impact of DER on the BES should be supported by a technical rationale and/or justification.

Questions

1. Do you agree with the proposed scope as described in the SARs? If you do not agree, or if you agree but have comments or suggestions for the project scope please provide your recommendation and explanation.

   ☐ Yes
   ☐ No

   Comments:

2. Provide any additional comments for the SARs drafting team to consider, if desired.

   Comments:

Standards Announcement

Project 2022-02 Modifications to TPL-001-5.1 and MOD-032-1 Standard Authorization Request

Comment Period Open through March 02, 2022

Now Available

An informal comment period for the **Project 2022-02 Modifications to TPL-001-5.1 and MOD-032-1** Standard Authorization Requests (SARs), is open through **8 p.m. Eastern, Wednesday, March 02, 2022**.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The drafting team will review all responses received during the comment period and determine the next steps of the project.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Ben Wu (via email) or at 404-446-9618. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2022-02 Modifications to TPL-001-5.1 and MOD-032-1 observer list” in the Description Box.

1. Do you agree with the proposed scope as described in the SARs? If you do not agree, or if you agree but have comments or suggestions for the project scope please provide your recommendation and explanation.

Thomas Foltz - AEP - 3,5,6	
Answer	No
Document Name	
Comment	

AEP is in agreement with the scopes and directions of the two proposed SARs for TPL-001, and recommends that Project 2022-02 be governed by their content. This would presumably be done by combining the content of these two unique SARs into a single SAR. AEP is not in agreement however with the proposed SAR for MOD-032, and recommends it *not* be pursued for this project for the reasons and rationale provided below.

1) As stated in a previous comment period for Project 2020-01, we believe MOD-032 is already written in a way that allows DER data to be obtained for power system modeling and analysis, if that data is available. The existing requirements for Transmission bus delivery points already include obligations for the Distribution Provider (DP) at that Transmission bus to separate out in its report to the RTO, the Distribution-connected generation capacity from the demand capacity appearing at that Transmission bus.

2) While the SPIDERWG SAR for MOD-032 does correctly acknowledge that DER owners are not themselves subject to NERC Reliability Standards, it incorrectly presumes that a) the data is already being provided by all entities who are not required to provide it, b) the DPs currently possess all the desired DER data, and c) the “data collection effort by the DP would be minimal additional effort.” This is simply not the case, and was voiced by industry in the comments provided two years ago when the MOD-032 SAR was proposed for Project 2020-01 (the Standards Committee eventually rejected the SAR that year “for good cause” in their letter to the SAR’s authors). In addition, the SPIDERWG SAR for TPL-001 states “In general, the impact of DERs on the BES should be included in planning assessments *if* DER data and models are available.” Contrary to the SAR for MOD-032, this quote does correctly acknowledge that the DER data will not always be available, but that same understanding is not also applied to the SAR for MOD-032. Many of the entities that the TP would rely on for this DER data are not themselves NERC Functional Entities, nor are they obligated by NERC requirement(s) to provide such data. In addition, many generators that have historically been considered load-augmenting in most cases, would now qualify as DER. As a result, these entities which have had no previous obligations to provide information to NERC Registered Entities would now be relied on to do so. However even after MOD-032’s potential revision, since they are not NERC registered entities, these generators would still have no NERC obligations to provide such data. This being the case, if this SAR is pursued as currently drafted, the Transmission Planner presumably bears all risk associated with whether or not that data is provided to them. If this SAR is indeed pursued, the SDT must ensure the Transmission Planner does not assume any risk associated with “non-obligated entities” not providing that data to the TP.

DER data is uniquely specified by RTO tariffs, and authorized by each state’s commission. This data is provided to the RTOs by NERC-registered entities as well as entities which are *not* registered as NERC entities. As such, if any entity should be responsible for the collection and dissemination of such data for system modeling purposes within NERC obligations, it should be the RTO and *not* the Distribution Provider.

TPL-001-5.1 IRPWG SAR Comments: Suggest adding clarity that TP depends on the data provided by the GO for an IBR facility (i.e., the trip settings at the low side of the GSU). The TP should not be expected to convert the data to the high-side. (R4.3.1.2) **TPL-001-5.1 SPIDERWG SAR Comments:** R4.1.1 & R4.1.2 language does not align with changes proposed in the TPL-001-5.1 IRPWG SAR. Some DERs with legacy settings (not required to abide by PRC-024) may not be able to ride through a close fault in any circumstance. These DERs will not be able to meet P1 criteria and need to be clearly excluded in the performance requirements. **MOD-032-1 SAR Comments:** The definition of DER should make a distinction between aggregated customer solar installations (e.g., residential rooftop solar, etc.) and commercial solar installations connected to distribution.

With respect to the proposed SAR, MOD-032-1 Data for Power System Modeling and Analysis, the only suggested modification that we agree with in the list of proposed work is adding the Distribution Provider (DP) to the scope of applicability so that modeling information can be obtained by the planners for retail connected distributed energy resources (DER). We believe that everything else in the proposed work is not needed. The specification of DER equipment and details related to it are not needed in the standard. Requirement R1 of the existing version specifies that the PC/TP develop modeling data requirements and reporting procedures including the data in Attachment 1. The steady state and dynamic sections of Attachment 1 both include this line item: "Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, LSE, TO, TSP]" This item gives the PC/TP the authority to ask for the modeling information they deem necessary to build the cases and to perform their studies. Because of this, no modification to the standard is needed to itemize the DER modeling information. In summary, including the Distribution Provider in the applicability section of MOD-032, in Requirements R2 & R3 of MOD-032, in item 9 of the steady-state data column of Attachment 1 of MOD-032, and in item 10 of the dynamic data column of Attachment 1 of MOD-032 will sufficiently permit the PC/TP to request what modeling data it needs for DER from the DP and from the GO. With respect to the proposed modifications to TPL-001-5 described in separate SARs of the same title and submitted by representatives of the IRPWG and SPIDERWG, TPL-001-5.1 Transmission System Planning Performance Requirements, clarifications to terminology (e.g., “pulls out of synchronism” and “GSU transformer”) does not address an immediate risk to BPS reliability. These types of modifications should be considered in a future revision to the standard.

MOD-032 SAR:

- Modification to MOD-032 appear to be prudent to ensure clarity on what entities should provide the PC regarding DER.

IRPWG TPL SAR:

- In general, the recommendations in the SAR are aimed at clarifying the requirements to ensure they are inclusive of IBR. These modifications do not appear to change the intent of the current standard language so they should not prompt the opening of the TPL standard but should be considered whenever the standard is open for more substantive modifications.
- The SAR cites the IRPTF whitepaper and states, “the term GSU transformer can be confusing to GOs…” The GO function is not applicable to the TPL standard so it is not clear how this term being included in the TPL standard would be confusing to GOs.
- The recommendations regarding “pulls out of synchronism” and the proposed modification to R4.3.2 provide clarifications that are appropriate for the standard and should be considered if the TPL standard is open for more substantive updates.

SPIDER TPL SAR:

- The comments for the IRPWG apply here as well.
- The recommendations around “System Peak Load” refer to potential new glossary terms and a change of the use of the term within the TPL standard. The benefits of adding qualifiers like “net” or “gross” are not clear relative to the time and effort modifications to the TPL standard would require. The current language in the standard allows a measure of discretion in the determination of “peak” load to be modeled that planners can use as appropriate in their respective areas.
- The penetration levels of DER at which potential BPS problems occur and the resulting impacts to the BPS are not clear. Prior to opening the TPL standard for substantial modifications, more guidance is needed for different sections of the industry (with varying penetration levels of DER) that define potentially problematic penetration levels of DER.

SPIDERWG MOD-032-1 SAR Comments

{C}· ATC supports the collection of DER data for steady-state and dynamics modeling. Setting a guideline that calls out best practices for DERs is a very important step toward obtaining detailed and representative modeling data. This will hopefully get industry moving in the right direction so that Transmission Planners and Planning Coordinators have something to leverage with Distribution Providers when collecting information.

- A mechanism to require behind-the-meter IBR and DER to report data to Distribution Provider does not exist.
  - ATC supports SAR language to use the DER data if it is available. ATC cautions against requiring Transmission Planners to have/ use data that may not be obtainable from the Distribution Provider (who may not be able to collect it from the DER).
  - Planning Coordinators should require DER data collection in their MOD-032 data collection requirements.
  - Due to the challenges associated with the collection of distribution-level data, consideration needs to be given to screening criteria and/or the ability to aggregate data to allow for efficiency and effectiveness such that the technical benefits received are commensurate with the cost of obtaining the data.
- ATC agrees with Item D of the Scope: "The SDT should review any potential gaps regarding data collection for aggregate DER data with the de-registration of LSE or based on applicability transfer from LSE to DP."
- ATC supports the SAR scope's proposal to consider including a definition for "Distributed Energy Resource (DER)" in the NERC Glossary of Terms.
- The SAR drafting should consider the inclusion on non-BES generators in the scope.

IRPWG and SPIDERWG TPL-001-5 SAR Comments

- ATC supports setting a guideline that calls out best practices for DERs is a very important step toward obtaining detailed and representative modeling data. This will hopefully get industry moving in the right direction so that Transmission Planners and Planning Coordinators have something to leverage with Distribution Providers when collecting information.
- Under SPIDERWG TPL-001-5 SAR Item C of the Scope "R4.1.1 and 4.1.2, the stability performance criteria should be applicable to both synchronous and asynchronous generation, inclusive of DER", if tripping criteria is required for DERs, it should *only* be applicable under NERC cascading conditions.
- PRC-024-3 differentiates GSU from Main Power Transformer for Quebec but FERC documents with (LGIAs, 661-A, etc.) use GSU to mean Main Power Transformer.
  - The SAR and/ or Drafting Team could consider the language PRC-024-3 uses in Attachment 2: "… voltages at the high side of the GSU/MPT. For generating resources with multiple stages of step up to reach interconnecting voltage, this is the high side of the transformer with a low side below 100 kV and a high side 100kV or above."
- ATC agrees that the terms Gross Load and Net Load should be defined in the NERC Glossary of Terms, and consideration should be given to the timing of peak load occurrence shifts with increased DER presence. However, if the requirements are changed to specify "System peak net load", then Gross Load conditions would only be studied as a sensitivity and may not be considered under latter requirement (such as development of associated Corrective Action Plans).

Comment

Constellation has concerns on the expansion of scope in the SAR to include all DER's as that can expand further than DER's subject the NERC Compliance under MOD-032-1.
Constellation agrees with NAGF's comments regarding the majority of DERs are not subject to NERC compliance. "Though the NAGF generally agrees with the proposed scopes of these SARs, the NAGF has concerns with the DERs providing information as DERs are not subject to NERC compliance or these standards. As such, requiring entities (i.e. DPs) to acquire such data should not have compliance obligations or accountability in situations where the DERs do not comply with the request(s)."
Constellation also asserts that the NERC Reliability Guidance "Improvements to Interconnection Requirements for BPS-Connected Inverter Based Resources" of Sept 2019 has good guidance to Transmission Owners to derive the data that is being considered in this SAR.

Comment

EEI does not support the entirety of the proposed scopes of the three SARs. All references to BPS should be removed from these SARs. While we understand the motivations and perceived need for including this language, the scope of NERC Reliability Standards, as defined in FERC Order 693 (see P75), is limited to the Bulk Electric System. Moreover, the scope of these Reliability Standards cannot be expanded within the scope of a single NERC Standards project.

Additionally, EEI suggests the use of composite load models as a viable option to address the difficulties of collecting DER information from unregistered entities. Such an approach is a reasonable option until the jurisdictional issues can be resolved.

Please see EEI’s comments for the three SARs in our response to question 2 below.

Comment

AZPS does not agree with the scope of the proposed SARs as written. AZPS is particularly concerned with references to the BPS instead of the BES which is commonly used through the NERC Reliability Standards. This is problematic because registered entities such as the PC, TP, and DP do not have any authority to collect data from non-BES resources as they are not registered and have no obligation to provide requested data.

AZPS agrees with EEI's comments that "the scope of NERC Reliability Standards, as defined in FERC Order 693, page 75, is limited to the Bulk Electric System. Moreover, the scope of these Reliability Standards cannot be expanded within the scope of a single NERC Standard project."

TPL-001-5.1 IRPWG SAR

AZPS recommends that BPS-connected inverter-based resources should be changed to BES inverter-based resources throughout the SAR. This is consistent with the statement in the last paragraph of the Industry Need Section which states, "This SAR does not include any modification to TPL-001-5 regarding the inclusion of distributed energy resources (DERs)."

AZPS believes that expanding the scope of the term "GSU Transformer" within the standard would create unnecessary confusion. AZPS recommends adding the term Main Power Transformer (MPT) to the standard as was done in PRC-024-3 (see Section 4.2.1.6 and footnote 1), instead of expanding the scope of the term GSU.

In regard to the Project Scope section, AZPS agrees with EEI's comment that entities should not be "required to maintain lists of all devices that might impact the study area inclusive of BPS-connected inverter-based resource technologies. This represents a substantial burden that goes beyond what entities can reliably collect."

TPL-001-5.1 SPIDERWG SAR

AZPS recommends that the term BPS-connected generation be changed to BES-connected generation in the first paragraph of the Industry Need section and that the term BPS Planning be changed to BES Planning in Footnote 1.

In regard to Item b of the Project Scope section, AZPS supports the following EEI comments:

The SAR “does not clarify the concern contained in the reference SPIDERWG whitepaper or provide clear language that an SDT could act upon.”

The SAR also “states that the SDT should “include tripping of DER if data and models are available,” however, there are no methods contained within any Reliability Standard that would define how PCs or TPs could collect this data. While we understand that some transmission tariffs may provide viable methods for collecting some of this data from Transmission Service Providers (TSP), this is tariff dependent and cannot be universally relied upon. Therefore, it is unclear how these two entities would have sufficient data to perform an effective planning study in most regions.

The second sentence in Item b states that the SDT should consider whether a threshold needs to be established, however, the SAR does not clarify what threshold should be considered. In the whitepaper, it states that “no specific threshold for DER modeling is suggested, each entity should keep track of DER to make such determinations.” Given the whitepaper is the basis for the SAR and “no specific threshold is suggested” we suggest this statement be removed.”

In regard to Item C, AZPS recommends that the language contained in subparts 4.1.1 and 4.1.2 be changed to consider BES Inverter-based resources only as there are currently no provisions that would ensure that PCs, TPs, or DPs have any ability through the NERC Reliability Standards to collect sufficient data to conduct the planning studies envisioned.

In regard to Item D, AZPS does not agree that DER’s should be included as they are outside the registration criteria and are not required to provide the data required to perform an accurate stability analysis. To address this concern, AZPS suggests a more practical approach is to use generic load models such as the composite load model based on known nameplate data using engineering judgement.

MOD-032-1 SPIDERWG SAR

AZPS supports the addition of the DP function to support the deregistration of the LSE function but does not support the proposed SAR because it lacks supporting technical justifications, such as a white paper describing what, if any, reliability gap exists.

AZPS also supports the following comments submitted by EEI:

EEI disagrees with Item 3 contained within the Industry Need statement. There is no need to “review any additional gaps in DER data collection with the de-registration of LSE.” Such a review is inconsistent with the FERC order (153 FERC ¶ 61,024) approving the removal of LSEs from the functional registration. Notably, RCs, BAs, and REs and other affected entities that need the information from LSEs had no concerns if LSEs were no longer registered. The working group should take notice of the FERC conclusions and findings in this order.

EEI disagrees with the Purpose and Goal statement. Specifically, it is not clear what gaps within the currently approved MOD-032-1 beyond the need to add the DP function, exist.

Attachment 1 – Data Reporting Requirements within MOD-032-1 do not need to be updated. Steady-State (Item 2 and Item 9), and Dynamics (Item 10) provide sufficient flexibility for PCs and TPs to ensure that DER data is collected. We further note that these items provide sufficient latitude in what is collected. “Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, LSE, TO, TSP].

Wayne Sipperly - North American Generator Forum - 5 - MRO,WECC,Texas RE,NPCC,SERC,RF

Answer	No
Document Name	

Comment

The North American Generator Forum (NAGF) understands the need for and supports including Distributed Energy Resources (DERs) and BPS connected inverter-based resources in planning assessments where such data is made available. The NAGF has concerns as it relates to the SAR proposed for MOD-032-1 as well as the TPL-001-5.1 SAR proposed by the SPIDERWG:

- *The NAGF has concerns with the DERs providing information as DERs are not subject to NERC compliance or these standards. As such, requiring entities (i.e. DPs) to acquire such data should not have compliance obligations or accountability in situations where the DERs do not comply with the request(s).*
- *The steady-state and dynamic sections of Attachment 1 for MOD-032-1 already contain the following line item: "Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes [BA, GO, LSE, TO, TSP]." This item provides the PC/TP the authority to ask for modeling information they deem necessary to build the cases and to perform studies. Therefore, no modification to the standard is needed to itemize DER modeling information.*

The NAGF agrees with the proposed scope of the TPL-001-5.1 IRPWG SAR to improve language and provide clarity for inverter-based resources.

Kendra Buesgens - MRO - 1,2,3,4,5,6 - MRO, Group Name MRO NSRF

Answer	No
Document Name	

Comment

The MRO NSRF understands the IPRWG concerns and intent to consider Distributed Energy Resources (DERs). While the MRO NSRF appreciates the issues the SARs are attempting to solve and good intentions, NERC regulated entities must deal with the final zero-defect product enforced by auditors for a large, diverse, and rapidly changing population. This is a poor fit for zero-defect standards.

IRPWG SAR Responses:

- The MRO NSRF believes that a solution can be achieved, but the SAR as currently written must be revised.
- BPS cannot be allowed and needs to be replaced with BES.
- Lists cannot be allowed and maintained to zero-defect due to the large, diverse, and ever-changing nature of DERs.
- Regulatory jurisdiction issues must be overcome.
- At least one solution in any future NERC standard requirements must allow flexibility for the DP, TP, and PC to use its engineering best judgment to develop composite load models and the SAR scope must explicitly state that.

IPRWG SAR Required Modifications for NERC standards and DER to be enforceable:

- The MRO NSRF can support certain aspects of the IPRWG SAR, but not the SAR itself without modifications.

o Bulk Power System (BPS) cannot be used in SARs or NERC standards and must be replaced with Bulk Electric System.

o BPS is undefined, which is why BES was created and debated carefully.

o Distributed Energy Resources are by NERC's own definition are part of the distribution system.

- A Distributed Energy Resource (DER) is any resource on the distribution system that produces electricity and is not otherwise included in the formal NERC definition of the Bulk Electric System (BES).
- https://www.nerc.com/comm/Other/essntlrlbltysrvcstskfrcDL/Distributed_Energy_Resources_Report.pdf

o The 2015 Federal Power Act (FPA) forbids "facilities used in the local distribution of electric energy" to which DERs are connected.

- DERs must first be subject to the same regulatory penalty structure as NERC registered entities or zero-defect standards are unenforceable.

o Regardless of good intentions, without equal enforcement penalties, DERs do not have the same incentive to provide data to NERC Distribution Providers, Transmission Planners, or Planning Coordinators.

o Zero-defect is by definition, without error.

o DERs are small and will change constantly, rendering lists useless. When a DER goes bankrupt, disappears or changes, data may not be communicated.

- Listing BPS devices cannot be required.

o For the reasons stated above, a zero-defect list cannot be perfectly maintained.

MRO NSRF Can Support:

- Clarifying pulling out of synchronism is for synchronous generators only.
- Modify Requirements 3.3 and 4.3 and their applicable sub-requirements to make the term "GSU transformer" suitable for all generation types.

Technical Issues:

The SAR had requested entities note any technical issues.

- Decades of load research have shown that generic load model assumptions provide the best approach to simulating loads.
- Whether mercury vapor lights, compact fluorescent lights, LEDs, or power electronics, achieving a good cost-to-benefit ratio for specific load data has always been difficult. Detailed load surveys are expensive and time-consuming, often yielding only marginal benefits above engineering judgment by experienced Transmission Planners.

Alternatives:

- A revised SAR must state specifically the resulting NERC standard requirements will explicitly allow flexibility with DP, TP, and PC engineering judgment discretion for composite load models as a solution.
- FERC could require FERC registered entities to submit DER data to DPs, TPs, and PCs or face penalties similar to NERC registered entities to provide the same incentives to the small DERs to provide the required data.
- NERC could publish a white paper on best practices, not subject to mandatory enforcement that NERC DPs, TPs, and PCs provide their best estimates of DER impacts in composite load models.

SPIDERWG and MOD-032 SAR Responses:

The MRO NSRF supports the intent of the SARs. Following the repeated recurrence of major events involving Inverter-Based Resources (IBRs), there is an industry need to be able to accurately model IBRs and aggregated Distributed Energy Resources (DERs) in the planning horizon to identify risks and develop plans to mitigate them prior to those risks giving rise to events in the operating horizon, particularly with respect to IBRs. However, there are two main issues that should be addressed by the SDT:

- **Approach to data collection/modeling**
- **Replace all references to Bulk Power System with Bulk Electric System**

Approach to Data Collection / Modeling:

The NSRF proposes the SAR not require a granular approach to data collection which contemplates zero-defect compliance and instead focus on a risk-based approach that would result in efficient and effective aggregated modeling data. Due to the challenges associated with the collection of distribution data, consideration needs to be given to screening criteria and/or the ability to aggregate data to allow for efficiency and effectiveness such that the technical benefits received are commensurate with the cost of obtaining the data. These fundamental issues (a better framework, better performance standards and better enforcement that recognizes most data collection issues are low risk) must be implemented for industry or regulators to avoid being pulled into the meticulous examination of each piece of data provided.

Donna Wood - Tri-State G and T Association, Inc. - 1,3,5	
Answer	No
Document Name	
Comment	

Tri-State appreciates the opportunity to comment on the three SARs and understands the concerns with Distributed Energy Resources (DER).

IRPWG SAR

Tri-State generally agrees with the SAR except for the below:

- Bulk Power System (BPS) should be replaced with Bulk Electric System (BES). BPS is not defined and should not be used in the SAR.

SPIDERWG/MOD-032 SAR

Tri-State does not agree with the SPIDERWG SARs:

- Unless you reach a certain threshold DER models are not required so more times than not you will not have a model. Concern is how do you monitor performance if you don't have model data. There has to be certain thresholds in place and also what changes a threshold. Most importantly, because DERs are not being subject to any regulation the incentive to provide data/modeling is very small. There has to be an incentive for DERs to provide data.
- Bulk Power System (BPS) should be replaced with Bulk Electric System (BES). BPS is not defined and should not be used in the SAR.

Comment	
Texas RE appreciates the drafting team’s efforts to account for inverter-based resources (IBR). Texas RE agrees with the purpose and justification of the three SARs presented. Texas RE has a few specific comments regarding the SAR scopes.	

First, Texas RE noticed that the IRPWG SAR discusses clarifying the term “GSU transformer”. Texas RE generally supports clarifying terms, and appreciates the SDT’s efforts in this regard.

Second, Texas RE also agrees the requirements should clarify whether they are applicable to DERs. As part of this process, the SDT could consider defining the term “DER.”

Finally, while Texas RE agrees with the TPL-001-5 IRPWG SAR regarding synchronization being more applicable to non-IBR machines, the SAR team should consider evaluating whether there is a corresponding attribute of IBRs that needs to be captured effectively in planning reliable operation of the grid. The SPIDERWG SAR partially addresses this issue with the recommendation to expand the stability performance criteria for synchronous and asynchronous generation.

FMPA generally supports the present high-level proposals in the SARs. As details are developed in the actual standard language, we will review to ensure we agree with the way the changes are implemented. We explicitly support the concept of including thresholds for DER inclusion, since in many regions penetrations are still very low.

For the MOD-032 SAR, we generally agree with the proposed project scope but have the following comments:

The *NERC Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies* referenced in the SAR notes a distinction between utility-scale DERs (U-DERs) and retail-scale DERs (R-DERs). It states that the distinction is "based on their size, impact, or location on the distribution system". We suggest that another distinction to consider is ownership of the DER. Is the DER owned by an electric utility, an end-use (industrial, commercial, residential) consumer of electricity, or a DER owner/aggregator/provider? The project proposal to "consider whether including a definition for "Distributed Energy Resource (DER)" in the NERC Glossary of Terms is necessary" is perhaps all that can be stated at the SAR stage; however we believe an industry vetted definition is important if the term is going to be added to the MOD-032 standard. It is presumed that modeling data for U-DERs will be more readily obtainable than for R-DERs.

The SAR states that "The goal is to provide clarity and consistency for data collection across PCs and TPs when coordinating with the DP to gather aggregate load and aggregate DER data." There may be instances where DERs are owned by or installed under programs coordinated by a utility that is registered for a broader set of NERC functions (not just registered as a DP). In such instances, a registrant that is only registered as a DP may not be the most practical source for the modeling data needed by the PC and TP, but they would be subject to the standard. The NERC Compliance Registry dated 2/11/2022 reflects there are 316 registered DPs, of which 68 are registered only as a DP. An additional 70 entities are registered as "UFLS-Only DPs". Could a new "DER-only DP" registration sub-category be needed for the DP? An alternative approach for the MOD-032 standard would be to add a "DER data entity" to the applicability section (similar to PRC-006-5's section 4.2). Then such entities "could include one or more of the following.... (DP, UFLS-Only DP, TO, RP, GO, ???)".

The MOD-032 SAR should also include removal of the "Planning Authority" and related PA / PC explanation from section 4.1.4 of MOD-032 within the scope. This would be consistent with action taken on MOD-031 and MOD-033 under Project 2017-07, Standards Alignment with Registration.

For the TPL-001 SARs, we generally agree with the proposed project scopes but have the following comments:

The SAR submitted by the SPIDERWG proposes to replace the phrase "System peak Load" with "System peak net Load" in TPL-001-5.1, R2.1/2.1.1 and R2.2/2.2.1. We interpret this to mean that models representing DER adjusted loads would be treated as the "baseline" representation for assessing the system and scenarios without DER adjusted loads would be treated as a sensitivity case (with sensitivity cases only required for the Near-Term Transmission Planning Horizon). We believe that each TP, in consultation with their PC, should be allowed to determine the appropriate assumption for DERs to be used in their baseline study models. Some may prefer to utilize models with DER adjusted loads represented as a sensitivity case. As greater confidence is gained in the DER data received by the PC/TP, along with a review of historical DER performance/event response, using models with DER adjusted loads as the "baseline" could become the norm.

The SAR submitted by the SPIDERWG proposes that the "tripping of generators" in steady state (R3/3.3.1.1) and stability (R4/4.3.1.2) contingency analysis should include tripping of DER if data is available. We believe the phrase "if data and models are available" is an important distinction that should carry over into the standard. This tripping of generators makes sense if the planners have the data, a definition of DER; and a specified threshold.

The SAR submitted by the SPIDERWG proposes that the stability performance criteria (R4/4.1.1, 4.1.2) should be applicable to both synchronous and asynchronous generation, inclusive of DER. The standard currently states that a generator disconnected by "fault clearing action or by a Remedial Action Scheme is not considered pulling out of synchronism." This language appropriately emphasizes that pulling out of synchronism is the consequence to be avoided. While loss of inverter-based generation could cause challenges for system operators, that impact is similar to the loss of generation due to fault clearing or a Remedial Action Scheme; it is not the angular stability of any generating unit that is at risk, but instead a possible

power deficit that must be supplied from other generators. The original intent of the standard was to distinguish the extra impact to the grid when the swing of a synchronous generator was pulling out of synchronism and causing a potential low voltage and out of step condition. This type of impact is not present when a nonsynchronous generator is tripped offline due to an event. Moreover, specifically in respect to DERs being included in R4.1.1 and R4.1.2, these generators are not part of the BES. While tripping these resources may be appropriate to understand BES impacts, the loss of non-BES generation should never be considered a BES violation.

The SAR submitted by the SPIDERWG proposes that for R4/4.3.2, the list of dynamic control devices should include DER so that the expected automatic operation of DER (e.g., DER tripping, dynamic voltage and frequency controls, momentary cessation, etc.) can be considered in stability analyses. The standard currently states that the operation of dynamic control devices is required when "such devices impact the study area." It is important that planners be able to rely on documented assumptions in determining which devices should be modeled. Obtaining accurate modeling data for DERs is challenging and for many DERs may result in negligible impact to the BES. Thus, it is important that the addition of DER controls to R4.3.2: 1) be accompanied by a qualification that the modeling data is available, and 2) retain the ability to exclude facilities where the dynamic control devices do not impact the study area.

Comment

NCEMC generally agrees with the proposed scope as described in the SARs, but we have concerns about how these 3 SARs have been proposed to be addressed with only one SAR SDT, mainly that the make-up of the SDT will most likely be a majority of PC/TP representatives and not very many DPs will participate as very few DPs will be interesting in working on activities they are not subject to or have much interest (since there are two SARs for TPL-001-5.1 in this case). Plus the amount of time it may take to address the various and complex issues in the TPL SARs and the MOD SAR may take many meetings over numerous months and very few companies if any has sufficient resources to allow a staff representative to be out-of-pocket working on this project for numerous months. We strongly suggest that NERC and the leaders of this SAR SDT carefully consider how best to address the specific items identified within the SAR and make every effort for this Project not to wander beyond what is specifically stated in the SARs to do.

Additionally, because of what happened on the 2020-01 Project SAR SDT for MOD-032-1 only seeking "informal comments", we would have preferred that NERC had requested "formal comments" first for each of these SARs as a possible means to better gauge industry support to avoid the potential situation of having the SAR being rejected as what happened for Project 2020-01. For Project 2022-02, we would strongly encourage NERC to consider having multiple comment rounds before these SARs are taken back to the NERC Standards Committee for vote/approval on how to move forward. As a member of that SAR SDT, it was disappointing when the NERC SC decided to reject the SAR completely and disband the SAR SDT when only "informal comments" were requested. Maybe NERC has already addressed this in the SPM manual to prevent this incident from being repeated. Many of the reliability issues regarding DERs re-surfaced in the NERC Odessa Disturbance report as well as the NERC Inverter-Based Resource Performance Task Force (IRPTF) White Paper before the Odessa event occurred. In our opinion, coordinated Transmission - Distribution Planning is not being done in a proactive manner as it once was and it needs to be for various reasons, but one reason has to do with a lack of consistency and uniformity for how increasing DERs are accounted for that have already interconnected to the BPS and are still being interconnected. Additionally, it seems that DERs are being allowed to exhaust any and all surplus/overhead capacity to the BPS and as a result, network and native load is continuing to be put at risk if they don't have sufficient resources to back-up their primary supply source located at or near the load delivery points.

As for extending the MOD-032-1 to the Distribution Providers (DP) since the Load-Serving Entity (LSE) function was retired by NERC (LSEs still exists in the OATT world for NITS customers performing the DP function), simply extending this standard and several other standards as noted in the NERC Inverter-Based Resource Performance Task Force (IRPTF) White Paper to the DP function does not go far enough to address the ongoing complex

issues associated with collecting and modeling of aggregate DERs in powerflow models used for seasonal reliability assessments and long-term transmission planning. PC/TP entities are responsible for providing a procedure and mechanism for collecting any and all modeling data needed for carrying out long-term planning. Today, the modeling standards MOD-031 and MOD-032 each already allow the PC/TP to request this DER/DR data from anyone taking transmission service from their grid. They have item 9 in Table 1 of MOD-032-1 which allows to ask for “any other data” and that can include DER, DSM or DR or any behind-the-meter resource for that matter. Distribution Providers are not always party to the DERs interconnected to the Transmission or Distribution so assuming that DPs have the authority to request data from DERs is not an accurate assumption. Does every standard have to explicitly include a reference to DERs to allow the PC/TP to request it? There has to be additional accountability to address the coordination issues (or lack thereof) between DPs and GOs (or “data providers”) and TOs and their respective PCs/TPs to accurately account for DERs explicitly or in aggregate. We have observed that often the “model builders” may not account for the full MW capacity value of the DERs interconnected to the BES or BPS as they appear to be assuming either ELCC or a “Capacity Value at Peak” Study for DERs or IBRs or assuming some sort of “engineering judgment” to reflect something less than the full MW output of DERs coincident with the transmission/system peaks (winter and summer). It seems to be something that is far less than what the DER or IBR was studied during interconnection and is capable of producing to the grid. This is “without” any discussion or exchange of information between the DER and/or asset owners of this facility or the local Distribution Provider. Why is that? Why not account for the max output of the DERs or IBRs during sensitivities assumed for “worse case” under contingency “stress tests” for identifying system weaknesses rather than simply “assuming” that scenario may never happen OR the grid is suddenly in an unanalyzed state(s) and you would then have to resort to curtailment of that DER/IBR assuming there is proper SCADA or isolating devices to enable the DER/IBR to be reduced or tripped offline? Why assume this rather than test for the possibility and mitigate it the best you can? Collectively, all utilities in all states should not and cannot simply rely on the LGIA and SGIA agreements and GI queue processes that “sometimes” trigger “affected system studies” to properly account for DERs needed to be modeled in powerflow models used for reliability assessments and long-term planning.

For the TPL SAR, we still have concerns about the TPL standard being revised to allow for only planning to the “net load” (defined as “net load = gross load – DER output”) as seen at the T-D interfaces versus gross load observed during the transmission system peaks. The load profile at the T-D interface is NOT or is rarely going to be the same as the energy profile of any behind-the-meter DER. From recent comments shared with the RSTC about this SAR, it seems to be proposing a provision to allow the PC/TP entities to ONLY plan for high system “net” load (whatever that means) that may or may not account for periods when the sun is NOT shining thus no output provided by that solar DER. If PC/TP entities only plan to trigger upgrades for the “net load” then this may drive us all to a point where the net T-D interface load at all T-D substation/delivery points become flat or even decreasing over time (if it is not already experiencing that phenomena) which could mask loading and stability issues that would have otherwise been accelerated needed network transmission upgrades had it not been for the modeling practice of accounting for DERs below the BPS “only” in the substation/POD load forecasts assumed across the planning horizon.

Perhaps it may take a FERC Technical Conference (there may have already been some at this point) to reach a point where dealing with the “identified reliability gap claimed by NERC” in a manner such that it is not overly burdensome to any NERC-registered reliability party while also accounting for non-FERC and non-NERC registered DER/IBR asset owners and developers. If that is what is needed, then NCEMC would like for NERC and FERC to hold such conference(s) with local/state regulators sooner rather than allowing this “reliability gap” to continue to persist and trigger yet another reliability event like the ones in Southern California and Odessa, Texas.

Response

John Pearson - ISO New England, Inc. - 2

Answer	Yes
Document Name	

Comment

Recognizing the impact of increased use of inverter-based resources, ISO New England supports the proposed SARs to modify the MOD-032 and TPL-001 Standards. Since many inverter based resources are less than 20 MVA for a single unit or 75 MVA aggregate with connections at less than 100 kV, these smaller resources should be taken into consideration when revising the TPL-001 and MOD-032 Standards.

Dana Showalter - Electric Reliability Council of Texas, Inc. - 2, Group Name ISO/RTO Council (IRC) Standards Review Committee (SRC) 2022-02 SAR

Answer	Yes
Document Name	

Comment

The Standards Review Committee (SRC) of the ISO/RTO Council supports the need to modify TPL-001-5.1, as identified in the IRPWG and the SPIDERWG Standard Authorization Requests (SARs) associated with this project. With the continued increase of Inverter-Based Resources (IBRs) and Distributed Energy Resources (DERs), Planning Assessments require consideration of the reliability impact of these facilities on the BPS. However, additional data is required to ensure useful assessments, which leads into the importance of modifying the data collection requirements of MOD-032.

TPL-001 (IRPWG and SPIDERWG SARs)

The SRC believes TPL-001 Requirements 4.1.1 and 4.1.2 should be addressed, but could be clearer on the direction. The IRPWG SAR stated the requirement should be clarified to address only synchronous generators. The SPIDERWG SAR stated that these requirements should be expanded to include asynchronous generation. There are two issues embedded here and the SRC believes each should be addressed separately by the Standard Drafting Team: (1) Requirements 4.1.1 and 4.1.2 should be clarified to apply to synchronous generators only and (2) additional criteria should be established for asynchronous generation and inverter-based resources connected at both the BPS level and at the transmission/distribution interface.

For Requirement 4.3.2, both SARS suggested expansion of the list of devices to be considered in the analyses to include the impact of automatic operation of DERs and IBRs. The SRC suggests that, in addition to the scope of the SARs provided by the IRPTF and SPIDERWG, the Standard Drafting Team consider a stronger stance than the current “devices may include . . .” if these devices are expected to be included in the contingency analysis required in Requirement 4.3. Otherwise, this seems to be optional or informative and would be better to be in a guidance document.

Regarding Requirements 3.3.1.1 and 4.3.1.2, the SRC would like to ensure the Standard Drafting Team ensures the standard includes large DERs as well as aggregation of smaller DERs. Further, the SRC would like to see the SAR provide for a standard broad enough to allow appropriate Responsible Entities the ability to develop a pre-screening process, methodology and/or criteria to identify when there is a need to further study DERs that could have a meaningful impact on the reliability of the BES, as opposed to requiring a comprehensive study be done to assess all DERs regardless of impact. With this methodology or criteria, Responsible Entities such as the Planning Coordinators (PCs) could establish both a voltage threshold as well as a MW threshold to focus the efforts on meaningful impacts to their Planning Assessments while at the same time minimizing the burden on entities required to provide the data.

MOD-032 (SPIDERWG SAR)

The SRC sees significant value in ensuring that PCs and Transmission Planners (TPs) have the DER data contemplated by the SAR; as such, the SRC supports the proposed changes to MOD-032-1.

It is important from a reliability perspective for the PC and TP to have information regarding DERs with the potential to impact reliable operation of the BPS to accurately model load and generation. As is recognized under current NERC standards, NERC requirements are not limited to managing BES

facilities only; e.g., loads connected at 100 kV or above and resources equal or greater than 75 MVA. As identified in the FERC/NERC Staff Report in the September 8, 2011 Blackout report, an underlying cause of the event was “not identifying and studying the impact on Bulk-Power System (BPS) reliability of sub-100 kV facilities in planning and operations.” Therefore, to the extent a non-BES facility has the ability to impact the reliability of the BES, NERC has the ability to require it be identified and studied. This is already the case in existing NERC standards, e.g., TOP-001-5, Transmission Operations, requirement R10, Part 10.3:

“Each Transmission Operator shall perform the following for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: Monitor non-BES facilities within its Transmission Operator Area identified as necessary by the Transmission Operator.”

The reliability of the BPS would be improved with the modeling of DER generation (e.g., as equivalents on a substation low voltage bus) separate from the distribution load, which ultimately leads to modifying MOD-032’s data collection requirements. As the amount of DERs increases on a system, netting generation from load leads to modeling inaccuracies and the potential of masking performance issues that would not otherwise be taken into consideration, such as times when the DERs are not able to generate; netting generation from load is not a preferred method. Modeling DERs explicitly as generator equivalents and separating them from load gives an opportunity to enhance case fidelity, improve Planning Assessments and mitigate overall system impact.

The SRC recognizes that the LSE function is retired, however, the SRC notes that simply replacing Load Serving Entity (LSE) function with Distribution Provider (DP) function may not be the optimum solution. Accordingly, while the information contemplated in the SAR would no doubt benefit PCs, that information may be incomplete due to gaps in the data collection process. The SRC recommends the Standard Drafting Team spend time to review the reliability impact of the LSE tasks as they exist before a blanket DP replacement. The SRC also recommends that this effort be followed by the identification of information and data availability gaps for DERs and the provision of recommendations or guidance to resolve the identified gaps.

The SRC believes the Standard Drafting Team should also consider assigning the responsibility of DER data collection to the Transmission Owner (TO) rather than the PC or TP. The TO has direct contact with DPs and is in a better position in terms of visibility to account for what is being connected at the distribution level and provide a suitable, aggregated modeling information to the PC and TP for inclusion in system impact studies. The table in Attachment 1 should include references to aggregate DER, categorized by intermittent resources and dispatchable resources, in the steady-state and dynamics columns and be assigned to the DP and TO. Ideally, the DP provides the data to the TO and the TO includes that data in their submission to the TP/PC. DPs must also provide their total system load absent any DER modification, unless approved to be netted by the TP/PC. The DPs and TOs must timely provide the data to meet the annual model build schedule established by the TP/PC.

The SRC also asks that the SAR scope specifically states that requirements will be created for data needed from the appropriate functional entities, as implied by the box checked in the SAR form: “Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.”

[The IRC SRC includes the following entities: CAISO, ERCOT, IESO, MISO, ISO-NE, NYISO, PJM and SPP.]

Comment	

MOD-032 SAR

Data collection requirements should be kept within practical reason. DP's cannot be expected to collect detailed information for every rooftop solar installation on their system. Considering the broad scope of DER's, the standard should set a reasonable expectation for the level of information required to be collected per Attachment 1 of the standard.

DER data collection and modeling requirements should consider the existing processes of all PC's. For example, there are DERs registered with ERCOT, typically U-DER, where the DER owners are required to provide DER mapping and modeling data directly to ERCOT, and ERCOT is responsible for mapping and modeling these types of DERs in the operations and planning models. ERCOT is provided residential and small commercial DER, typically R-DER, in aggregate for mapping to the network operations model. Any deviation from the existing ERCOT processes may cause more confusion and inefficiency.

TPL-001 SAR

Given the broad scope of the topic of DER, the standard language should set a reasonable expectation for the level of detail required in simulation regarding DER's.

Because of the nature of DER, it is possible for a single distribution bus to connect U-DER installations with different inverters, legacy IEEE standards, and protective settings. R-DER may also differ and may require aggregations by inverters with similar performance characteristics. During the modeling process these installations may be aggregated into a single unit modeled at the bus in order to avoid having many different generator models on a single bus. A requirement to explicitly simulate the protection and behavior of all these inverters would require a much greater modeling burden.

Given the broad scope of the topic of DER, the standard language should set a reasonable expectation for stability performance criteria. Inverter based generation, and especially DER's, are prone to tripping for many transmission level events on the system. A requirement to mitigate for every observed inverter based trip may be impractical for Transmission Planners to execute.

Texas's Substantive Rules require highly sensitive DER tripping standards for Voltage and Frequency protection. Transmission level faults are likely to cause DER tripping in the area. There should not be a requirement to mitigate every DER trip that is observed, even if it is for a P1 event.

Suggest changing the **SAR titled, 'TPL-001-5.1 Transmission System Planning Performance Requirements' (dated 12/15/2021)** to TPL-001-5.1 SPIDERWG SAR since this currently shares the same SAR title as the TPL-001-5.1 IRPWG SAR.

Since not all DER is inverter-based, suggest changing:

· The SDT can consider adding asynchronous generator related devices like inverter, plant controller, etc.

to:

· The SDT can consider adding synchronous generator over-excitation limiters (OELs), under-excitation limiters (UELs) and asynchronous generator related devices like inverter, plant controller, etc.

Suggest changing the **SAR titled, 'TPL-001-5.1 Transmission System Planning Performance Requirements' (dated 12/16/2021)** to TPL-001-5.1 IRPWG SAR since this currently shares the same SAR title as the TPL-001-5.1 SPIDERWG SAR.

Since the impacts to the BES are coming from high/low-voltage connected inverter-based utility-scale inverter-based resources, suggest changing:

- Many areas of the North American bulk power system (BPS) continue to experience an increase in BPS-connected inverter-based resources

to:

- Many areas of the North American bulk power system (BPS) continue to experience an increase in directly and indirectly BPS-connected, utility scale inverter-based resources.

Suggest changing:

- Not included in this list are power plant controllers and inverter controls, which often dominate the dynamic response of IBRs.

to:

- Not included in this list are power plant controllers, inverter controls, limiters, etc., which often dominate the dynamic response of IBRs and can also be applicable to synchronous generators.

SAR "MOD-032-1 Data for Power System Modeling and Analysis"

Suggest changing:

- that are necessary to support the development of accurate interconnection-wide models

to:

- that are necessary to support the development of accurate regional and interconnection-wide models

Suggest there should be modifications to the short circuit column of Attachment 1 because while #1 already states "all applicable elements" in the steady-state column, that does not mean we have necessary information related to positive, negative, and zero sequence data. In areas with low short-circuit margins, the impact of DER can make/break the system.

Answer	
Document Name	

Comment

The SRC believes the PC and TP need to have information on all DERs impacting the BPS, as load and generation have distinct impacts on the accuracy of the study results. A standard addressing modeling should not limit what information may be required to accurately model the BES. Nor should it be restricted to modeling only data tied to the BES Definition thresholds – as the electrical properties of the grid are not limited to the BES Definition. In load forecasts today, the planning models are not limited to modeling only loads above 100KV and resources above 75 MVA. The same should be true for DERs. Due to the growing DER impact, the potential significant impact of DERs on the system, and the "invisibility" of these resources to the PCs and TPs, this project needs to find a way for PCs and TPs to acquire and model DERs separate from load, even though they fall outside the definition of BES.

The SRC recognizes that too much data is cumbersome to collect and manage, and can be a hindrance to all involved. Thus, the SRC proposes the Standard Drafting Team avoid a granular approach to data collection, which may contemplate zero-defect compliance, but instead focus on a risk-based approach that would result in efficient and effective collection of large DER and aggregated DER modeling data, in light of the use of the data for

planning models. Planning models are forward looking (versus real-time) using existing system information and forecasts, so awareness and knowledge of the current system is important, but perfect knowledge is not necessary.

In addition, the SRC acknowledges that there are challenges associated with collecting distribution data, so due consideration should be given to Responsible Entities to establish screening criteria and/or to aggregate data to allow for modeling efficiency such that the technical benefits received are commensurate with the cost and effort of obtaining the data. A granular approach to modeling data would only serve to "clutter" the model, making it impractical and resource-intensive to maintain.

The fundamental issues of a modeling framework, risk-based performance standards, and appropriate enforcement for low-risk issues must be clearly addressed and implemented for industry and regulators to avoid being pulled into the meticulous examination of each piece of data provided.

Finally, the SRC recommends the consistent use of "inverter-based resource" by the SARs and the Standard Drafting Team rather than asynchronous resource.

Comment

The SPIDERWG SAR only states that DERs should be modeled if data is available, and not all DERs in the "Requested Information Section". Therefore, the statement, "*In general, the impact of DERs on the BES should be included in planning assessments if DER data and models are available. Any choice to exclude the consideration of the impact of DER on the BES should be supported by a technical rationale and/or justification*", should be included in the standard in addition to the changes.

I do not agree with tripping DERs in R3.3.1.1 and R4.3.1.2. I agree that DERs should be monitored after transmission and/or generators fault, but not tripped. Additionally, in R4.1.1 and R4.1.2, I do not agree DERs should be included in the stability performance criteria of the TPL. We, as planners, will be required to make correction action plans based on our studies, but we are not the owners of the DERs.

SPP recommends that the drafting team take into consideration coordinating with the Project 2021-06 Modifications to IRO-010 and TOP-003 (drafting team) and their efforts in reference to their IRO-010 SAR. We understand that IRO-010 doesn't meet the scope of this project. However, at this point, our concern is that both standards are used in the process for data acquisition and doesn't have the foundational language to enable an entity to obtain the pertinent data needed to perform accurate studies (for example- planning and/or ops modeling data) to maintain the reliability of the grid. From our perspective, there is an opportunity for both drafting teams to work together and learn about the needs of both the requesting and sharing entities perspective in reference to data acquisition as well as ensuring the appropriate data exchange is accomplished with the common goal of maintaining the reliability of the grid.

Furthermore, SPP recommends that the drafting team take into consideration including the EMT (Electromagnetic Transient Studies) data into the scope of the MOD-032 efforts. Again, we understand that this effort is not currently included into the scope of the MOD-032 SAR. However, this is a form of data collection that is applicable to a study that's more granular than the dynamic study listed in the attachment 1 of the MOD-032 Standard.

SPP is concerned that entities like the TP and PC cannot obtain modeling data such as phase lock loop parameters to conduct appropriate inverter instability screening studies and EMT models to perform EMT studies, for example. Further, there are other concerns as follows:

•Spurious spikes in electrical quantities in positive sequence RMS (Root-Mean-Square) simulations can occur at any bus. This is caused by sudden changes in inverter terminal voltage phase angle due to network bus voltages being algebraic variables in the RMS simulation instead of differential equations that offer the true response. Without EMT studies, these disturbances may not be recognized.

•Dynamics models do not include the real-code behavior of inverter-based resources and often involve engineering judgment based on controller block diagrams used in representing the actual performance of these complex power electronic resources. Gaps exists in identifying the exact thresholds at which inverter and plant protection would activate that could be dependent on knowledge of the real code within the control systems.

Additionally, SPP's interpretation is that the MOD-032 Standard (attachment 1) does not give entities, like the TP and PC, the complete support to obtain this type of modeling data. As an example, our organization has requested the phase lock loop data from the Interconnection Customers and the OEMs (Original Equipment Manufacturer) only to have our request denied due to "proprietary legalities". At this point, SPP is not confident the GO will provide this modeling data to help ensure quality results from the study.

As for the SPIDERWG TPL-001-5 SAR, SPP recommends that the drafting team takes into consideration adding more clarity pertaining to the resources that the DER definition is applicable to. From our perspective, it is unclear about the DER's definitional stance in reference to the inclusion or exclusion of Demand Response. For example, the SPIDERWG Terms and Definition Document (notes: Loads and Demand Response do not produce electric power and are therefore not included in the definition of DER). Does this note have merit? We have a concern that the inclusion\exclusion of Demand Response data will impact the model's accuracy when performing planning assessments. We would hope to have a clear direction of how to appropriately handle this data so we provide quality planning assessments.

Furthermore, we would recommend that drafting team take into consideration of adding clarity in reference to the inclusion\exclusion of R-DERs and U-DER in the applicability of the DER definition. We understand that the DER Parameterization guideline discusses the R-DERs and U-DERs. However, our concern is basically the same for the R-DERs and U-DERs as mentioned in the previous paragraph.

The existing MOD-032-1 standard already allows PCs/TPs to request the DER information contemplated in the SAR. Modifications to the standards should be focused on obtaining modeling data and not dictate what must be included in the model or how assessments are performed. That should be left up to the PC/TP.

In the interest of standardization of general process flow across all the NERC standards, the NAGF suggests that language/requirements be added to MOD-032, similar to IRO-010-3 R2 and TOP-003-4 R3 and R4, which requires the PC and TP to ***distribute*** *its data specification to entities that are required to submit data to be used in the models.*

Attachment 1 for MOD-032 is very high level and allows the PC/TP discretion to request DER data already. The proposed changes to MOD-032 only increase industry awareness and establish a minimum bar. There are regions where the current levels of penetration are far too low for any real impact. SPIDERWG SAR acknowledges this by allowing for the SDT to establish thresholds for when DER may be required to be included. If any changes are made to Attachment 1 to MOD-032, such thresholds should be coordinated. That is, if for example TPL-001 language is drafted that states that DER need to be explicitly modeled only when above 10% penetration, then data should only be mandatory from MOD-032 for that same level.

Other issues presently in MOD-032 that ought to be cleaned up if Attachment 1 is modified.

1) Attachment 1 still refers to LSE as does the overall standard. We are aware this reference was previously intended to be removed.

2) Positive sequence branch impedance / shunt admittance data really ought to be listed in steady state, and then negative and zero added in short circuit.

EEI offers comments on each of the individual SARs below:

TPL-001-5.1 IRPWG SAR Comments

EEI could support this SAR if the following changes were incorporated within the next version of the SAR.

- **Industry Need:** As noted in our response to question 1, references to the Bulk Power System (BPS) should be changed to Bulk Electric System (BES). Often, responsible entities find it difficult, and in some cases impossible, to obtain data from non-BES resources because they are not registered and do not have any regulatory obligation to provide data when requested. For this reason, we do not support the statement in paragraph 3 which requires the TPL-001-5.1 Reliability Standard be modified to address all “BPS-connected inverter-based resources”, and request the scope be limited to all BES inverter-based resources.
- **Purpose or Goal:** BPS-connected inverter-based resources should be changed to BES inverter-based resources.
- **Project Scope:** EEI supports making the term “GSU transformer” suitable for all generation types and suggests that the SDT consider an approach similar to what was done to address this issue in PRC-024-3 (see main power transformer definition). Additionally, BPS-connected inverter-based resources should be changed to BES inverter-based resources. We also support the proposed changes to 4.1.1 and 4.1.2. Lastly, we do not agree that entities should be required to maintain lists of all devices that might impact the study area inclusive of BPS-connected inverter-based resource technologies. This represents a substantial burden that goes beyond what entities can reliably collect.
- **Detailed Description:** EEI supports the detailed description provide in the SAR which we note was “copied verbatim from the IRPTF white paper that was approved by the NERC PC” and does not specify BPS-connected inverter-based resources.

TPL-001-5.1 SPIDERWG SAR Comments

EEI recognizes the importance of accurately planning transmission system performance and the impacts of Inverter-based resources, including DERs. However, there are substantial issues and challenges for the industry because many of these newer resources fall outside of NERC's jurisdiction or the ability of responsible entities to collect the needed data. Nevertheless, we could support the proposed SAR with the following changes:

- **Industry Need:** Footnote 1 should be corrected by replacing BPS with BES. EEI notes that the Purpose statement in TPL-001-5.1 states the scope of this Reliability Standard as: "Establish Transmission system planning performance requirements within the planning horizon to develop a **Bulk Electric System (BES)** that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies."
- **Project Scope:** EEI offers the following changes to the SAR Project Scope:
    - **Item a**: identifies Requirement 2, subparts 2.1 and 2.2 as using the phrase "System peak Load" but the subparts that use this term include: 2.1.1, 2.2.1 and 2.4.1. The SAR scope should be changed to reflect the correct subparts where the phrase is used.
    - **Item b:** EEI does not support the language because it does not clarify the concern contained in the reference SPIDERWG whitepaper or provide clear language that an SDT could act upon.

1. The SAR states that the SDT should "include tripping of DER if data and models are available", however, there are no methods contained with the any Reliability Standard that would define how PCs or TPs could collect this data. While we understand that some transmission tariffs may provide viable methods for collecting some of this data from Transmission Service Providers (TSP), this is tariff dependent and cannot be universally relied upon. Therefore, it is unclear how these two entities would have sufficient data to perform an effective planning study in most regions.
2. The second sentence in Item b states that the SDT should consider whether a threshold needs to be established, however, the SAR does not clarify what threshold should be considered. In the whitepaper, it states that "no specific threshold for DER modeling is suggested, each entity should keep track of DER to make such determinations". Given the whitepaper is the basis for the SAR and "no specific threshold is suggested" we suggest this statement be removed.

- **Item c:** The language contained in Requirement R4, subparts 4.1.1 and 4.1.2 should be clarified to consider Inverter-based resources. Relative to DERs, these resources are part of the distribution system and currently, there are no provision that would ensure that PCs or TPs have any ability through the NERC Reliability Standards to collect sufficient data to conduct the planning studies envisioned. Even obligating DPs to collect this data is unlikely to solve the problem since many of the DER owners have no regulatory obligation to provide this data to the DPs.
- **Item d:** EEI agrees that the automatic performance of Inverter-based resources, including DERs, is important to accurately develop planning performance requirements for the BES, however, the industry's ability to accurately accomplish this is tied to their ability to gather accurate data on DERs, which are often outside of the registration criteria. For this reason, we suggest that the language be tempered to ensure that entities are only held responsible for the data they gather. To address this concern, EEI suggests a more practical approach is to use composite load models based on known nameplate data using engineering judgement.

MOD-032-1 (SPIDERWG SAR) Comments

EEI's position on this SAR it the same as the last time it was posted for comment. EEI does not support the proposed SAR as currently written, however, we support adding the DP function to MOD-032 to address a potential reliability gap related to data that can only be effectively collected by the DP, since the deregistration of the LSE. For this reason, we would support a limited SAR that only addresses this issue. Once this is done, we believe the existing MOD-032 Reliability Standard should provide adequate protections to ensure that the Planning Coordinators (PC) and Transmission Planners (TP) are able to collect data necessary to account for distributed energy resources (DER) to develop planning models in a manner sufficient to support the reliable operation of the interconnected transmission system under their purview.

Additionally, the SAR still lacks supporting technical justifications, such as a white papers, describing what if any reliability gap exists. For these reasons, we ask that the proposed SAR not be approved. We support the good work being done by the SPIDER Working Group (SPIDERWG), including the development of a draft Reliability Guideline that have been issued for industry review and comment for the collection of DER data for modeling transmission planning studies. We additionally recommend the SPIDERWG develop Implementation Guidance to support the existing MOD-032-1 Reliability Standard and associated Reliability Guideline. Additionally, we would support a NERC initiative to evaluate the effectiveness of the above referenced Reliability Guideline (see Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies dated Sept. 2020) to determine if there are reliability gaps or issues with the PCs and TPs obtaining the necessary modeling data needed for grid reliability. As noted above, EEI encourages the SPIDERWG to develop Implementation Guidance to provide clear examples and approaches to better inform planners on

possible methods to ensure MOD-032-1, as currently written and approved, more effectively addresses the collection of specific DER data as well as provides guidance on how to ensure consistency in DER modeling data requirements and reporting procedures, particularly among adjoining PCs.

In addition to the above comments on this SAR, we offer the following additional concerns:

1. EEI disagrees with Item 3 contained within the Industry Need statement. There is no need to "review any additional gaps in DER data collection with the de-registration of LSE." Such a review is inconsistent with the FERC order (153 FERC ¶ 61,024) approving the removal of LSEs from the functional registration. Notably, RCs, BAs, and REs and other affected entities that need the information from LSEs had no concerns if LSEs were no longer registered. The working group should take notice of the FERC conclusions and findings in this order. EEI also disagrees with the following statement in this section: "As the penetration of distributed energy resources (DERs) **continues to increase across the North American bulk power system (BPS)**, it is necessary to account for the potential impacts of DERs on reliability in the planning, operation, and design of the BES." A more accurate statement would be: As the penetration of distributed energy resources (DERs) continues to increase **across the many distribution systems**, it is necessary to account for the potential impacts of DERs on reliability in the planning, operation, and design of the BES.
2. EEI disagrees with the Purpose and Goal statement. Specifically, it is not clear what gaps within the currently approved MOD-032-1 beyond the need to add the DP function, exist.
3. EEI does not support the Project Scope as defined in the SAR.
    i. Attachment 1 – Data Reporting Requirements within MOD-032-1 do not need to be updated. Steady-State (Item 2 and Item 9), and Dynamics (Item 10) provide sufficient flexibility for PCs and TPs to ensure that DER data is collected. We further note that these items provide sufficient latitude in what is collected. "Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, LSE, TO, TSP]".
    ii. EEI does not see a need to define the term Distributed Energy Resource (DER) but does not oppose a drafting team evaluating it and offering the industry a proposed definition.

Comment	
The SARs (and ultimately any Standards drafted or revised as a result of the SARs) should not use the term Bulk Power System (BPS). The SARs should adhere to the term Bulk Electric System (BES), as the BES is what NERC Standards apply to. Compliance with NERC Requirements is enforced on the BES. BES is also extensively defined by NERC and well understood by registered entities. The term BPS is too vague and its use in the SARs and any subsequent Standards will lead to confusion and a general lack of clarity regarding the applicability of assets and Facilities. DERs are generally connected to the Low and Medium-voltage distribution voltages and many of them may be insignificant for BES. Hence, the SARs should include a requirement to properly define DER that shall be included as an Inclusion in the BES Definition to be providers of data as per the requirements of NERC Standards. This will ensure that DERs are required to provide that data.

• Time and cost requirements for the submitted SARs appear to be under stated. Adding glossary terms, as the SAR suggests, and modifying standard requirements would almost certainly lead to more significant coordination efforts with other standards and definitions. • There also needs to be consideration to have region-specific efforts to address DER penetration to account for the system differences. • GTC supports the comments submitted by Southern Company.

We offer the following additional (a-f) comments for consideration by the SAR drafting team: a) We do not support a SAR that dictates overly prescriptive data requirements that the TP/PC must request from the DP, as the existing MOD-032 standard already allows PCs/TPs to request the type of information contemplated in the SAR; b) Any modifications to the standard should be focused on obtaining modeling data and should not dictate what must be included in the model and how assessments are performed; c) Any modifications to the standard related to DER should recognize that a small quantity of DERs could have no impact on BES studies, especially for low penetration regions, and thus could be netted out with load with no impact to reliability. That determination should be left up to the individual TP/PC; d) Cost impact may not be minimal depending on the scope of data being requested; e) We endorse the comments developed by EEI; f) We support the comments submitted by Georgia Transmission Corporation.

Comment	
Seattle City Light is largely in agreement with the direction of this SAR, and we understand the desire to include DERs in modelling efforts in the continued pursuit towards a secure and reliable grid. That being said, greater clarification in the Standard is desired around minimum penetration levels of DERs on the system and minimum capacity requirements. While we see the importance of this effort, without setting thresholds, as we have on the generation side, entities will be putting a lot of time, effort, and resources into modelling DER related data that may have little to no impact on the reliability of the grid, and whether there will be any deference given to region specific needs.

Unofficial Nomination Form

Project 2022-02 Modifications to TPL-001-5.1 and MOD-032-1

Do not use this form for submitting nominations. Use the electronic form to submit nominations by **8 p.m. Eastern, Wednesday, March 02, 2022.** This unofficial version is provided to assist nominees in compiling the information necessary to submit the electronic form.

Additional information about this project is available on the project page. If you have questions, contact Senior Standards Developer, Ben Wu (via email), or at 404-446-9618.

By submitting a nomination form, you are indicating your willingness and agreement to actively participate in face-to-face meetings and conference calls.

Previous drafting or review team experience is beneficial, but not required. A brief description of the desired qualifications, expected commitment, and other pertinent information is included below.

Modifications to TPL-001-5.1 and MOD-032-1

Many areas of the North American bulk power system (BPS) continue to experience an increase in BPS-connected inverter-based resources (e.g., wind, solar photovoltaic (PV), battery energy storage systems (BESS), and hybrid power plants). NERC Reliability Standard TPL-001-5.1 is a foundational standard used for "establishing transmission system performance requirements within the planning horizon to develop a bulk electric system (BES) that will operate reliably over a broad spectrum of system conditions and following a wide range of probable contingencies." Transmission Planners (TPs) and Planning Coordinators (PCs) develop and use models of the electrical grid to perform planning assessments (e.g., steady-state, dynamic, and short-circuit) to develop corrective action plans for future reliability issues identified. Ensuring that the TPL-001 standard is reflective of the evolving nature of the BPS and its resource mix is paramount to ensuring reliable operation and resilience of the BPS moving forward.

The NERC Inverter-Based Resource Performance Task Force (IRPTF)[1] undertook a complete review of the NERC Reliability Standards in the context of increasing levels of BPS-connected inverter-based resources and published a white paper on the outcomes and recommendations of this review in March 2020.[2] Based on the outcome of the review, it was determined that the TPL-001-4/5[3] needed clarifications "to address terminology throughout the standard that is unclear with regards to inverter-based resources" the next time the standard is revised.

As the penetration of distributed energy resources (DERs) continues to increase across the North American bulk power system (BPS), it is necessary to account for the potential impacts of DERs on

[1] The IRPTF has subsequently become the IRPWG under the NERC Reliability and Security Technical Committee (RSTC).

[2] NERC IRPTF, "IRPTF Review of NERC Reliability Standards," March 2020: https://www.nerc.com/comm/PC/InverterBased%20Resource%20Performance%20Task%20Force%20IRPT/Review_of_NERC_Reliability_Standards_White_Paper.pdf

[3] At the time of review, the TPL-001-5 standard had just recently been approved by FERC and was yet to be subject to enforcement.

reliability in the planning, operation, and design of the BES. The NERC System Planning Impacts of Distributed Energy Resources Working Group (SPIDERWG) has identified the need for improved modeling of aggregate DER for planning studies (including both utility-scale and retail-scale DER) conducted by Transmission Planners (TPs) and Planning Coordinators (PCs). MOD-032-1 addresses the gathering of modeling data to perform planning assessments but the standard currently has no specific reference to DER data. This SAR proposes to update MOD-032-1 to: (1) include "data requirements and reporting procedures"[4] for DER that are necessary to support the development of accurate interconnection-wide models, (2) replace Load-Serving Entity (LSE) with Distribution Provider (DP) because of the removal of LSEs from the NERC registry criteria, and (3) enable the SDT to review any additional gaps in DER data collection with the de-registration of LSE.

Standards affected: TPL-001-5.1 and MOD-032-1

The time commitment for this project is expected to be one meeting per quarter (on average two and a half full working days each meeting) with calls scheduled as needed to meet the agreed-upon timeline the review or drafting team sets forth. Team members may also have side projects, either individually or by subgroup, to present to the larger team for discussion and review. Lastly, an important component of the review and drafting team effort is outreach. Members of the team will be expected to conduct industry outreach during the development process to support a successful project outcome. NERC is seeking individuals who have subject matter expertise with Transmission Planning, Modeling, and are familiar with NERC Standards TPL-001 and MOD-032.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2022-02 Modifications to TPL-001-5.1 and MOD-032-1

Nomination Period Open through March 02, 2022

Now Available

Nominations are being sought for Standard Authorization Request (SAR) drafting team members through **8 p.m. Eastern, Wednesday, March 02, 2022**.

Use the electronic form to submit a nomination. Contact Linda Jenkins regarding issues using the electronic form. An unofficial Word version of the nomination form is posted on the Standard Drafting Team Vacancies page and the project page.

By submitting a nomination form, you are indicating your willingness and agreement to actively participate in face-to-face meetings and conference calls.

This team will meet regularly, up to twice a week on conference calls, with face-to-face meetings scheduled as the members' schedule and the pandemic allow, to meet the agreed-upon timeline the drafting team sets forth. Team members may also have side projects, either individually or by sub-group, to present for discussion and review. Lastly, an important component of the team effort is outreach. Members of the team will be expected to conduct industry outreach during the development process to support a successful ballot.

Previous drafting team experience is beneficial but not required. See the project page and nomination form for additional information.

Next Steps

The Standards Committee is expected to appoint members to the SAR drafting team in April 2022. Nominees will be notified shortly after they have been appointed.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Ben Wu (via email) or at 404-446-9618. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify "Project 2022-02 Modifications to TPL-001-5.1 and MOD-032-1 observer list" in the Description Box.

Industry Need (What Bulk Electric System (BES) reliability benefit does the proposed project provide?):

Many areas of the North American bulk power system (BPS) continue to experience an increase in BPS-connected inverter-based resources (e.g., wind, solar photovoltaic (PV), battery energy storage systems (BESS), and hybrid power plants). NERC Reliability Standard TPL-001-5.1 is a foundational standard used for "establishing transmission system performance requirements within the planning horizon to develop a bulk electric system (BES) that will operate reliably over a broad spectrum of system conditions and following a wide range of probable contingencies." Transmission Planners (TPs) and Planning Coordinators (PCs) develop and use models of the electrical grid to perform planning assessments (e.g., steady-state, dynamic, and short-circuit) to develop corrective action plans for future reliability issues identified. Ensuring that the TPL-001 standard is reflective of the evolving nature of the BPS and its resource mix is paramount to ensuring reliable operation and resilience of the BPS moving forward.

Requested information
The NERC Inverter-Based Resource Performance Task Force (IRPTF)[1] undertook a complete review of the NERC Reliability Standards in the context of increasing levels of BPS-connected inverter-based resources and published a white paper on the outcomes and recommendations of this review in March 2020.[2] The review was approved by the NERC Planning Committee and served as the technical justification for future standards revision efforts. The white paper recommended modifications to seven standards, and IRPWG presented four SARs to the NERC Reliability and Security Technical Committee (RSTC) in June 2020 that addressed the deficiencies identified in six of the seven standards. Based on the outcome of the review, it was determined that the TPL-001-4/5[3] needed clarifications "to address terminology throughout the standard that is unclear with regards to inverter-based resources" the next time the standard is revised. The language used in the white paper regarding "the next time the standard is revised" was based on the understanding that the NERC System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG) was developing a SAR and that the recommended modifications to TPL-001-5 from IRPWG could be included in the SPIDERWG SAR. The combined SAR was presented to the NERC RSTC at their March 2021 meeting and was rejected. The overarching comments received were with regards to the DER-related issues and a comment was made that the recommendations pertaining to BPS-connected inverter-based resources were not the primary focus of concern. Therefore, IRPWG presents this SAR to move the effort forward regarding specifically BPS-connected inverter-based resources. This SAR does not include any modification to TPL-001-5 regarding the inclusion of distributed energy resources (DERs). IRPWG believes that industry needs to be proactive in addressing standards gaps, particularly, where lack of clarity and confusion may lead to studies not adequately capturing possible BPS reliability issues. As the North American BPS continues to experience rising penetration levels of BPS-connected inverter-based resources and is likely to do so into the foreseeable future, these changes are critical for overall BPS reliability and industry efforts to reliably integrate these resources.
Purpose or Goal (How does this proposed project provide the reliability-related benefit described above?):
This SAR revises requirements within the TPL-001-5 standard to provide clarity and consistency for how BPS-connected inverter-based resources are considered, modeled, and studied in planning assessments. The proposed revisions to TPL-001-5 will ensure industry is effectively and efficiently conducting planning assessments and that the requirements are equally suitable for inverter-based resources as they are for synchronous generation.

[1] The IRPTF has subsequently become the IRPWG under the NERC Reliability and Security Technical Committee (RSTC).
[2] NERC IRPTF, "IRPTF Review of NERC Reliability Standards," March 2020: https://www.nerc.com/comm/PC/InverterBased%20Resource%20Performance%20Task%20Force%20IRPT/Review_of_NERC_Reliability_Standards_White_Paper.pdf
[3] At the time of review, the TPL-001-5 standard had just recently been approved by FERC and was yet to be subject to enforcement.

Requested information
Project Scope (Define the parameters of the proposed project):
As described in further detail below, the scope of this project includes consideration of the following revisions to TPL-001-5.1: • Modify Requirements 3.3 and 4.3 and their applicable sub-requirements to make the term "GSU transformer" suitable for all generation types since it introduces confusion for BPS-connected inverter-based resources • Modify Requirements 4.1.1 and 4.1.2 regarding the use of the term "pulls out of synchronism," which is only applicable for synchronous generator technologies and is not suitable for BPS-connected inverter-based resources • Modify Requirement 4.3.2 so that the list of devices that impact the study area are inclusive of BPS-connected inverter-based resource technologies •
Detailed Description (Describe the proposed deliverable(s) with sufficient detail for a drafting team to execute the project. If you propose a new or substantially revised Reliability Standard or definition, provide: (1) a technical justification[4] which includes a discussion of the reliability-related benefits of developing a new or revised Reliability Standard or definition, and (2) a technical foundation document (*e.g.,* research paper) to guide development of the Standard or definition):
The following detailed description is copied verbatim from the IRPTF white paper that was approved by the NERC PC: TPL-001-4 requires Planning Coordinators (PCs) and TPs to assess the reliability of their portion of the BES for various conditions across several specified future years and to plan Corrective Action Plans to address identified performance deficiencies. The requirements and sub-requirements include, among other things, certain simulation assumptions to be used by the planner and performance requirements. Sub-requirements 3.3 and 4.3 describe simulation assumptions that the planner should use when performing contingency analysis for the steady-state and stability portion of the assessment, respectively. Sub-requirements 3.3.1.1 and 4.3.1.2 each require the planner to include the impact of the "tripping of generators where simulations show generator bus voltages or high side of the [GSU] voltages are less than known or assumed generator" low voltage ride-through capability. The term GSU transformer can be confusing to GOs of IBR facilities because they will often refer to the transformer that steps the voltage up from the individual inverter (e.g., 600 V) to the collector system voltage (e.g., 34.5 kV). In this case, there is usually another transformer (i.e., the main power transformer (MPT)) to step the voltage up from the collector system voltage to transmission system voltage. It was likely the intent of the TPL-001-2 SDT to be referring to transmission system voltages when drafting the language that refers to known or assumed

[4] The NERC Rules of Procedure require a technical justification for new or substantially revised Reliability Standards. Please attach pertinent information to this form before submittal to NERC.

Requested information
generator low voltage ride-through capability at the high-side of the GSU. Therefore, the language in these sub-requirements should be modified to provide clarity for inverter-based resources. Sub-requirements 4.1.1 and 4.1.2 provide stability performance criteria when a generator "pulls out of synchronism" in system simulations. Although an inverter-based resource does synchronize with the grid, the phrase "pulls out of synchronism" is typically applicable only to synchronous generators, referring to when a synchronous machine has an angular separation from the rest of the grid. Therefore, these sub-requirements could be clarified by clearly stating that this performance criteria is for synchronous generators. Sub-requirement 4.3.2 specifies that stability studies must "simulate the expected automatic operation of existing and planned devices designed to provide dynamic control of electrical system quantities when such devices impact the study area." It then contains a list of example devices that have dynamic behavior. Not included in this list are power plant controllers and inverter controls, which often dominate the dynamic response of IBRs. While the sub-requirement does not preclude the simulation of plant-level controllers and inverter controls, it would add clarity if they were added to the list. The suggested clarifications for sub-requirements 3.3, 4.3, 4.1.1, 4.1.2, and 4.3.2 should be considered by a future SDT when editing the standard. However, the IRPTF does not believe the clarifications by themselves warrant changing the standard at this time. It should be noted that the identified issues with TPL-001-4 also apply to the draft TPL-001-5 standard that is awaiting FERC approval as of the publication of this whitepaper.
Cost Impact Assessment, if known (Provide a paragraph describing the potential cost impacts associated with the proposed project):
The cost impacts for the proposed changes to TPL-001-5 are expected to be minimal. The changes being proposed are clarifications that will bring consistency and effectiveness industry related to how planning assessments are conducted and how planning engineers set up and conduct those assessments.
Please describe any unique characteristics of the BES facilities that may be impacted by this proposed standard development project (*e.g.*, Dispersed Generation Resources):
None. This SAR will impact Transmission System Planning Assessments, not any specific BES facilities.
To assist the NERC Standards Committee in appointing a drafting team with the appropriate members, please indicate to which Functional Entities the proposed standard(s) should apply (*e.g.*, Transmission Operator, Reliability Coordinator, etc. See the most recent version of the NERC Functional Model for definitions):
Planning Coordinators, Transmission Planners, and Generator Owners of inverter-based resources

Requested information
Do you know of any consensus building activities[5] in connection with this SAR? If so, please provide any recommendations or findings resulting from the consensus building activity.
This SAR is an outcome of the white paper produced by the NERC IRPTF and approved by the NERC PC, which can be found here: https://www.nerc.com/comm/PC/InverterBased%20Resource%20Performance%20Task%20Force%20IRPT/Review_of_NERC_Reliability_Standards_White_Paper.pdf The SAR is a follow-on to the recommendation contained within the white paper, developed by the NERC IRPWG under the NERC RSTC.
Are there any related standards or SARs that should be assessed for impact as a result of this proposed project? If so, which standard(s) or project number(s)?
No
Are there alternatives (e.g., guidelines, white paper, alerts, etc.) that have been considered or could meet the objectives? If so, please list the alternatives.
The NERC IRPWG (previously IRPTF) has published multiple technical reference documents, white papers, and reliability guidelines related to the performance, modeling, and studies of BPS-connected inverter-based resources. These technical materials are used widely by industry and have provided significant value for improving planning practices. However, those efforts do not address the larger issue related to the TPL-001 standards language being written predominantly for synchronous generation technology and not adequately considering or clarifying how the requirements relate to BPS-connected inverter-based resource technologies.

Reliability Principles	
Does this proposed standard development project support at least one of the following Reliability Principles (Reliability Interface Principles)? Please check all those that apply.	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.

[5] Consensus building activities are occasionally conducted by NERC and/or project review teams. They typically are conducted to obtain industry inputs prior to proposing any standard development project to revise, or develop a standard or definition.

Requested information	
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Market Interface Principles	
Does the proposed standard development project comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

Industry Need (What Bulk Electric System (BES) reliability benefit does the proposed project provide?):

Many areas of the North American bulk power system (BPS) continue to experience an increase in BPS-connected inverter-based resources (e.g., wind, solar photovoltaic (PV), battery energy storage systems (BESS), and hybrid power plants). NERC Reliability Standard TPL-001-5.1 is a foundational standard used for "establishing transmission system performance requirements within the planning horizon to develop a bulk electric system (BES) that will operate reliably over a broad spectrum of system conditions and following a wide range of probable contingencies." Transmission Planners (TPs) and Planning Coordinators (PCs) develop and use models of the electrical grid to perform planning assessments (e.g., steady-state, dynamic, and short-circuit) to develop corrective action plans for future reliability issues identified. Ensuring that the TPL-001 standard is reflective of the evolving nature of the BPS and its resource mix is paramount to ensuring reliable operation and resilience of the BPS moving forward.

Requested information
The NERC Inverter-Based Resource Performance Task Force (IRPTF)[1] undertook a complete review of the NERC Reliability Standards in the context of increasing levels of BPS-connected inverter-based resources and published a white paper on the outcomes and recommendations of this review in March 2020.[2] The review was approved by the NERC Planning Committee and served as the technical justification for future standards revision efforts. The white paper recommended modifications to seven standards, and IRPWG presented four SARs to the NERC Reliability and Security Technical Committee (RSTC) in June 2020 that addressed the deficiencies identified in six of the seven standards. Based on the outcome of the review, it was determined that the TPL-001-4/5[3] needed clarifications "to address terminology throughout the standard that is unclear with regards to inverter-based resources" the next time the standard is revised. The language used in the white paper regarding "the next time the standard is revised" was based on the understanding that the NERC System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG) was developing a SAR and that the recommended modifications to TPL-001-5 from IRPWG could be included in the SPIDERWG SAR. The combined SAR was presented to the NERC RSTC at their March 2021 meeting and was rejected. The overarching comments received were with regards to the DER-related issues and a comment was made that the recommendations pertaining to BPS-connected inverter-based resources were not the primary focus of concern. Therefore, IRPWG presents this SAR to move the effort forward regarding specifically BPS-connected inverter-based resources. This SAR does not include any modification to TPL-001-5 regarding the inclusion of distributed energy resources (DERs). IRPWG believes that industry needs to be proactive in addressing standards gaps, particularly, where lack of clarity and confusion may lead to studies not adequately capturing possible BPS reliability issues. As the North American BPS continues to experience rising penetration levels of BPS-connected inverter-based resources and is likely to do so into the foreseeable future, these changes are critical for overall BPS reliability and industry efforts to reliably integrate these resources.
Purpose or Goal (How does this proposed project provide the reliability-related benefit described above?):
This SAR revises requirements within the TPL-001-5 standard to provide clarity and consistency for how BPS-connected inverter-based resources are considered, modeled, and studied in planning assessments. The proposed revisions to TPL-001-5 will ensure industry is effectively and efficiently conducting planning assessments and that the requirements are equally suitable for inverter-based resources as they are for synchronous generation.

Industry Need (What Bulk Electric System (BES) reliability benefit does the proposed project provide?):

Many distribution systems connected both directly and indirectly to the North American BES are experiencing increasing penetrations of distributed energy resources (DERs). NERC Reliability Standard TPL-001-5.1[1] was developed under a paradigm of predominantly BPS-connected generation, particularly synchronous generation, when penetrations of DERs were significantly lower than current and future projections.

Considering current trends, the NERC SPIDERWG undertook a review of the TPL-001 standard considering the potential impact of DERs. This review is captured in the following RSTC-approved white paper and serves as the technical justification for the revisions suggested in this SAR:

[1] The scope of recent modifications to TPL-001-5 did not include considering the impacts of DER on BES planning.

Requested information

- SPIDERWG: Assessment of DER impacts on NERC Reliability Standard TPL-001 (here)

This SAR proposes to update TPL-001-5.1 to address some of the issues identified in the white paper.

TPL-001-5.1 does not currently require Planning Coordinators and Transmission Planners to complete Planning Assessments with adequate representation of the dynamic behavior of DERs. As the penetration of DERs increases, and based on the DER data and models available, Planning Assessments should include DERs that can potentially impact Transmission System performance assessment. NERC's "Lesson Learned: Single Phase Fault Precipitates Loss of Generation and Load", evaluating a 2019 frequency event in Southern England exacerbated by the unexpected reduction of 725 MW of IBR output and the unexpected loss of 350 MW of DER, highlights the critical importance of accurate Transmission System Planning Assessments.[2] In July 2020, a significant quantity of solar PV facilities across a large geographic area in Southern CA reduced about 1000 MW output due to a disturbance on the bulk power system[3]. Subsequent event analysis revealed that it was the consequence of momentary cessation and slow recovery of power. Standards enhancement has been one of the recommendations after the event analysis to ensure reliable operation of the bulk power system.

In general, the impact of DERs on the BES should be included in planning assessments if DER data and models are available. Any choice to exclude the consideration of the impact of DER on the BES should be supported by a technical rationale and/or justification.

Purpose or Goal (How does this proposed project provide the reliability-related benefit described above?):

The purpose of this SAR is to revise requirements to provide clarity or, in some cases, expand the scope of requirements when considering the performance of DERs to ensure the accuracy of Transmission System Planning Assessments.

Project Scope (Define the parameters of the proposed project):

As identified by SPIDERWG, revision to the following sections of TPL-001-5.1 should be considered to ensure the accuracy of Transmission System Planning Assessments:

a. R2.1, R2.2, and R2.4, the use of phrase "System peak Load"
b. R3.3.1.1 and R4.3.1.2, the "tripping of generators" in steady state and stability contingency analysis should include tripping of DER if data and models are available. The SDT can consider whether a threshold needs to be established.

[3] https://www.nerc.com/pa/rrm/ea/Pages/July_2020_San_Fernando_Disturbance_Report.aspx

Requested information
c. R4.1.1 and 4.1.2, the stability performance criteria should be applicable to both synchronous and asynchronous generation, inclusive of DER. d. R4.3.2, the list of dynamic control devices should include DER so that the expected automatic operation of DER (e.g., DER tripping, dynamic voltage and frequency controls, momentary cessation, etc.) can be considered in stability analyses. e. Assuming that revisions to the MOD-032 standard ensure that DER model data is available, modification to the TPL-001 standard should give consideration to potential exclusions of explicit DER modeling based on technical rationale.
Detailed Description (Describe the proposed deliverable(s) with sufficient detail for a drafting team to execute the project. If you propose a new or substantially revised Reliability Standard or definition, provide: (1) a technical justification[4] which includes a discussion of the reliability-related benefits of developing a new or revised Reliability Standard or definition, and (2) a technical foundation document (*e.g.,* research paper) to guide development of the Standard or definition):
A detailed description of each Project Scope item is given below: a. R2.1 and R2.2, the use of phrase "System peak Load" With increased penetration of DER, the load that transmission system supplies is the net load (net load = gross load – DER output) as seen at the T-D interface, which might reach its peak during operating conditions that are not at the peak gross load hour. As such, there is a need for individual TPs to be required to document and define their peak load conditions (e.g., gross or net) in their assessments. The SDT should consider adding the terms "Gross Load" and "Net Load" to the NERC Glossary of Terms and updating the term "System peak Load" in the standard to "System peak net Load". In addition, a high gross load hour may be the most stressed load driven condition for contingencies that may trip large amounts of DER. High system peak gross load may be studied as additional scenarios as required by current standard under R2.1.3. b. R3.3.1.1 and R4.3.1.2, the "tripping of generators" in steady state and stability contingency analysis should include tripping of DER if data is available. The SDT can consider whether a threshold needs to be established. The terms "generators" in Sub-requirements 3.3.1.1 and 4.3.1.2 should be clarified. DERs that are explicitly modeled as generators should be tripped where simulations show bus voltages that are less than known or assumed minimum DER steady-state or ride-through voltage limits. It is also recommended to consider inclusion in the assessment any assumptions made in estimating DER bus voltage.

[4] The NERC Rules of Procedure require a technical justification for new or substantially revised Reliability Standards. Please attach pertinent information to this form before submittal to NERC.

Requested information
c. R4.1.1 and 4.1.2, the stability performance criteria should be applicable to both synchronous and asynchronous generation, inclusive of DER. For example, the language referring to "pulls out of synchronism" is only relevant to synchronous generation and is not applicable to inverter-based generation (including inverter-based DER). However, large amounts of asynchronous DER tripping on low/high voltage/frequency conditions can also adversely affect BES performance and may pose a risk to system instability for conditions such as cascading, voltage instability, or uncontrolled islanding if not properly studied and identified ahead of real-time operations. It is recommended to expand the stability performance criteria to include both synchronous and asynchronous generation. d. R4.3.2, the standard should recognize that the list of dynamic control devices should consider the expected automatic operation of DER (e.g., DER tripping, dynamic voltage and frequency controls, momentary cessation, etc.) in stability analyses. The SDT can consider adding asynchronous generator related devices like inverter, plant controller, etc.
Cost Impact Assessment, if known (Provide a paragraph describing the potential cost impacts associated with the proposed project):
Although the cost impact is unknown, costs to Planning Coordinators and Transmission Planners will increase as Transmission System Planning Assessments reflect additional dynamic components and controls. It is anticipated that this cost will vary depending on training, tools, scenario development, and other factors in each Planning Coordinators and Transmission Planners' area.
Please describe any unique characteristics of the BES facilities that may be impacted by this proposed standard development project (*e.g.*, Dispersed Generation Resources):
None. This SAR will primarily impact Transmission System Planning Assessments, not any specific BES facilities, although as individual IBRs continue to increase in size (e.g. 14MW wind turbines), there may be some impact in the near future.
To assist the NERC Standards Committee in appointing a drafting team with the appropriate members, please indicate to which Functional Entities the proposed standard(s) should apply (*e.g.*, Transmission Operator, Reliability Coordinator, etc. See the most recent version of the NERC Functional Model for definitions):
Planning Coordinators and Transmission Planners, i.e. the applicable entities for this standard. Additionally, Distribution Providers, Generator Owners, and DER aggregators participating in markets- i.e. not an applicable entity to this standard, would be useful to include.

Requested information
Do you know of any consensus building activities[5] in connection with this SAR? If so, please provide any recommendations or findings resulting from the consensus building activity.
This SAR is the outcome of the following white paper that was developed by the NERC technical sub-group under the RSTC. • SPIDERWG: Assessment of DER impacts on NERC Reliability Standard TPL-001 (here) Deliverables, and the key findings and recommendations contained within, were thoroughly reviewed and approved by the RSTC.
Are there any related standards or SARs that should be assessed for impact as a result of this proposed project? If so, which standard(s) or project number(s)?
No
Are there alternatives (e.g., guidelines, white paper, alerts, etc.) that have been considered or could meet the objectives? If so, please list the alternatives.
Among all the issues identified in the NERC SPIDERWG white paper, the ones included in this SAR cannot be addressed by any alternatives. Standard language change will ensure DER impacts being considered appropriately. NERC SPIDERWG will prepare a Reliability Guideline to address the rest of the findings from their white paper.

Reliability Principles	
Does this proposed standard development project support at least one of the following Reliability Principles (Reliability Interface Principles)? Please check all those that apply.	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☐	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

[5] Consensus building activities are occasionally conducted by NERC and/or project review teams. They typically are conducted to obtain industry inputs prior to proposing any standard development project to revise, or develop a standard or definition.

Market Interface Principles	
Does the proposed standard development project comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

☒ Add, Modify or Retire a Glossary Term	☐ Other (Please specify)
☐ Withdraw/retire an Existing Standard	

Justification for this proposed standard development project (Check all that apply to help NERC prioritize development)	
☐ Regulatory Initiation	☒ NERC Standing Committee Identified
☒ Emerging Risk (Reliability Issues Steering Committee) Identified	☐ Enhanced Periodic Review Initiated
☐ Reliability Standard Development Plan	☒ Industry Stakeholder Identified

Industry Need (What Bulk Electric System (BES) reliability benefit does the proposed project provide?):

Many distribution systems connected both directly and indirectly ~~areas of~~ to the North American BES are experiencing increasing penetrations of distributed energy resources (DERs). NERC Reliability Standard TPL-001-5.1[1] was developed under a paradigm of predominantly BPS-connected generation, particularly synchronous generation, when penetrations of DERs were significantly lower than current and future projections.

Considering current trends, the NERC SPIDERWG undertook a review of the TPL-001 standard considering the potential impact of DERs. This review is captured in the following RSTC-approved white paper and serves as the technical justification for the revisions suggested in this SAR:

[1] The scope of recent modifications to TPL-001-5 did not include considering the impacts of DER on BES~~BPS~~ planning.

Requested information
• SPIDERWG: Assessment of DER impacts on NERC Reliability Standard TPL-001 (here) This SAR proposes to update TPL-001-5.1 to address some of the issues identified in the white paper. TPL-001-5.1 does not currently require Planning Coordinators and Transmission Planners to complete Planning Assessments with adequate representation of the dynamic behavior of DERs. As the penetration of DERs increases, and based on the DER data and models available, Planning Assessments should include DERs that can potentially impact Transmission System performance assessment. NERC's "Lesson Learned: Single Phase Fault Precipitates Loss of Generation and Load", evaluating a 2019 frequency event in Southern England exacerbated by the unexpected reduction of 725 MW of IBR output and the unexpected loss of 350 MW of DER, highlights the critical importance of accurate Transmission System Planning Assessments.[2] In July 2020, a significant quantity of solar PV facilities across a large geographic area in Southern CA reduced about 1000 MW output due to a disturbance on the bulk power system[3]. Subsequent event analysis revealed that it was the consequence of momentary cessation and slow recovery of power. Standards enhancement has been one of the recommendations after the event analysis to ensure reliable operation of the bulk power system. In general, the impact of DERs on the BES should be included in planning assessments if DER data and models are available. Any choice to exclude the consideration of the impact of DER on the BES should be supported by a technical rationale and/or justification.
Purpose or Goal (How does this proposed project provide the reliability-related benefit described above?):
The purpose of this SAR is to revise requirements to provide clarity or, in some cases, expand the scope of requirements when considering the performance of DERs to ensure the accuracy of Transmission System Planning Assessments.
Project Scope (Define the parameters of the proposed project):
As identified by SPIDERWG, revision to the following sections of TPL-001-5.1 should be considered~~revised~~ to ensure the accuracy of Transmission System Planning Assessments: a. R2.1, R2.2, and R2.4~~2~~, the use of phrase "System peak Load" b. R3.3.1.1 and R4.3.1.2, the "tripping of generators" in steady state and stability contingency analysis should include tripping of DER if data and models are available. The SDT can consider whether a threshold needs to be established.

Requested information
c. R4.1.1 and 4.1.2, the stability performance criteria should be applicable to both synchronous and asynchronous generation, inclusive of DER. d. R4.3.2, the list of dynamic control devices should include DER so that the expected automatic operation of DER (e.g., DER tripping, dynamic voltage and frequency controls, momentary cessation, etc.) can be considered in stability analyses. ~~d.~~e. Assuming that revisions to the MOD-032 standard ensure that DER model data is available, modification to the TPL-001 standard should give consideration to potential exclusions of explicit DER modeling based on technical rationale.
Detailed Description (Describe the proposed deliverable(s) with sufficient detail for a drafting team to execute the project. If you propose a new or substantially revised Reliability Standard or definition, provide: (1) a technical justification[4] which includes a discussion of the reliability-related benefits of developing a new or revised Reliability Standard or definition, and (2) a technical foundation document (*e.g.,* research paper) to guide development of the Standard or definition):
A detailed description of each Project Scope item is given below: a. R2.1 and R2.2, the use of phrase "System peak Load" With increased penetration of DER, the load that transmission system supplies is the net load (net load = gross load – DER output) as seen at the T-D interface, which might reach its peak during operating conditions that are not at the peak gross load hour. As such, there is a need for individual TPs to be required to document and define their peak load conditions (e.g., gross or net) in their assessments. The SDT should consider adding the terms "Gross Load" and "Net Load" to the NERC Glossary of Terms and updating the term "System peak Load" in the standard to "System peak net Load". In addition, a high gross load hour may be the most stressed load driven condition for contingencies that may trip large amounts of DER. High system peak gross load may be studied as additional scenarios as required by current standard under R2.1.3. b. R3.3.1.1 and R4.3.1.2, the "tripping of generators" in steady state and stability contingency analysis should include tripping of DER if data is available. The SDT can consider whether a threshold needs to be established. The terms "generators" in Sub-requirements 3.3.1.1 and 4.3.1.2 should be clarified. DERs that are explicitly modeled as generators should be tripped where simulations show bus voltages that are less than known or assumed minimum DER steady-state or ride-through voltage limits. It is also recommended to consider inclusion in the assessment any assumptions made in estimating DER bus voltage.

[4] The NERC Rules of Procedure require a technical justification for new or substantially revised Reliability Standards. Please attach pertinent information to this form before submittal to NERC.

Requested information
c. R4.1.1 and 4.1.2, the stability performance criteria should be applicable to both synchronous and asynchronous generation, inclusive of DER. For example, the language referring to "pulls out of synchronism" is only relevant to synchronous generation and is not applicable to inverter-based generation (including inverter-based DER). However, large amounts of asynchronous DER tripping on low/high voltage/frequency conditions can also adversely affect BES performance and may pose a risk to system instability for conditions such as cascading, voltage instability, or uncontrolled islanding if not properly studied and identified ahead of real-time operations. It is recommended to expand the stability performance criteria to include both synchronous and asynchronous generation. d. R4.3.2, the standard should recognize that the list of dynamic control devices should consider the expected automatic operation of DER (e.g., DER tripping, dynamic voltage and frequency controls, momentary cessation, etc.) in stability analyses. The SDT can consider adding asynchronous generator related devices like inverter, plant controller, etc.
Cost Impact Assessment, if known (Provide a paragraph describing the potential cost impacts associated with the proposed project):
Although the cost impact is unknown, costs to Planning Coordinators and Transmission Planners will increase as Transmission System Planning Assessments reflect additional dynamic components and controls. It is anticipated that this cost will vary depending on training, tools, scenario development, and other factors in each Planning Coordinators and Transmission Planners' area.
Please describe any unique characteristics of the BES facilities that may be impacted by this proposed standard development project (*e.g.*, Dispersed Generation Resources):
None. This SAR will primarily impact Transmission System Planning Assessments, not any specific BES facilities, although as individual IBRs continue to increase in size (e.g. 14MW wind turbines), there may be some impact in the near future.
To assist the NERC Standards Committee in appointing a drafting team with the appropriate members, please indicate to which Functional Entities the proposed standard(s) should apply (*e.g.*, Transmission Operator, Reliability Coordinator, etc. See the most recent version of the NERC Functional Model for definitions):
Planning Coordinators and Transmission Planners, i.e. the applicable entities for this standard. Additionally, Distribution Providers, Generator Owners, and DER aggregators participating in markets- i.e. not an applicable entity to this standard, would be useful to include.

Requested information
Do you know of any consensus building activities[5] in connection with this SAR? If so, please provide any recommendations or findings resulting from the consensus building activity.
This SAR is the outcome of the following white paper that was developed by the NERC technical sub-group under the RSTC. • SPIDERWG: Assessment of DER impacts on NERC Reliability Standard TPL-001 (here) Deliverables, and the key findings and recommendations contained within, were thoroughly reviewed and approved by the RSTC.
Are there any related standards or SARs that should be assessed for impact as a result of this proposed project? If so, which standard(s) or project number(s)?
No
Are there alternatives (e.g., guidelines, white paper, alerts, etc.) that have been considered or could meet the objectives? If so, please list the alternatives.
Among all the issues identified in the NERC SPIDERWG white paper, the ones included in this SAR cannot be addressed by any alternatives. Standard language change will ensure DER impacts being considered appropriately. NERC SPIDERWG will prepare a Reliability Guideline to address the rest of the findings from their white paper.

Reliability Principles	
Does this proposed standard development project support at least one of the following Reliability Principles (Reliability Interface Principles)? Please check all those that apply.	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☐	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

[5] Consensus building activities are occasionally conducted by NERC and/or project review teams. They typically are conducted to obtain industry inputs prior to proposing any standard development project to revise, or develop a standard or definition.

Market Interface Principles	
Does the proposed standard development project comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

☐ New Standard ☒ Revision to Existing Standard ☐ Add, Modify or Retire a Glossary Term ☐ Withdraw/retire an Existing Standard		☐ Imminent Action/ Confidential Issue (SPM Section 10) ☐ Variance development or revision ☐ Other (Please specify)	
Justification for this proposed standard development project (Check all that apply to help NERC prioritize development)			
☐ Regulatory Initiation ☒ Emerging Risk (Reliability Issues Steering Committee) Identified ☐ Reliability Standard Development Plan		☒ NERC Standing Committee Identified ☐ Enhanced Periodic Review Initiated ☒ Industry Stakeholder Identified	
Industry Need (What Bulk Electric System (BES) reliability benefit does the proposed project provide?):			
As the penetration of distributed energy resources (DERs) continues to increase across many distribution systems connected both directly and indirectly to the BES, it is necessary to account for the potential impacts of DERs on reliability in the planning, operation, and design of the BES. The NERC System Planning Impacts of Distributed Energy Resources Working Group (SPIDERWG) has identified the need for improved modeling of aggregate DER for planning studies (including both utility-scale and retail-scale DER) conducted by Transmission Planners (TPs) and Planning Coordinators (PCs). MOD-032-1 addresses the gathering of modeling data to perform planning assessments but the standard currently has no specific reference to DER data. This SAR proposes to update MOD-032-1 to: (1) include "data			

Requested information
requirements and reporting procedures"[1] for DER that are necessary to support the development of accurate interconnection-wide models, (2) replace Load-Serving Entity (LSE) with Distribution Provider (DP) because of the removal of LSEs from the NERC registry criteria, (3) enable the SDT to review any additional gaps in DER data collection with the de-registration of LSE.
Purpose or Goal (How does this proposed project provide the reliability-related benefit described above?):
This SAR proposes to revise MOD-032-1 to address gaps in data collection for the purposes of modeling aggregate levels of DERs in planning assessments. The goal is to provide clarity and consistency for data collection across PCs and TPs when coordinating with the DP to gather aggregate load and aggregate DER data.
Project Scope (Define the parameters of the proposed project):
The proposed scope of this project is as follows: a. The table in Attachment 1 should be updated to include DER in the steady-state and dynamics columns. Details of the changes to be considered by the Standard Drafting Team are included in the "Detailed Description" below. Revision to requirements should also be considered if necessary. b. Based on item a.) and the detailed description below, the SDT should consider whether including a definition for "Distributed Energy Resource (DER)" in the NERC Glossary of Terms is necessary. c. In alignment with the SAR submitted by the previous NERC Essential Reliability Services Working Group (ERSWG), LSE should be removed and replaced by DP as the applicable entity in Section 4.1.3 and all instances in the standard requirements and attachments. d. The SDT should review any potential gaps regarding the de-registration of LSE or based on applicability transfer from LSE to DP (item c in this list), including but not limited to data collection for aggregate DER data. e. Consider modification to the applicability section of the standard that would remove the reference to the Planning Authority and align the applicable entities with the NERC functional model of Planning Coordinator.

[1] See Requirement R1 of MOD-032-1, which requires each TP and PC to develop data requirements and reporting procedures for the collection of modeling data used for the development of models for each PC footprint.

Requested information
Detailed Description (Describe the proposed deliverable(s) with sufficient detail for a drafting team to execute the project. If you propose a new or substantially revised Reliability Standard or definition, provide: (1) a technical justification[2] which includes a discussion of the reliability-related benefits of developing a new or revised Reliability Standard or definition, and (2) a technical foundation document (e.g., research paper) to guide development of the Standard or definition):
This SAR proposes to address the issues identified in the project scope above. Specifically, the following details should be considered and addressed by the drafting team: • In the Applicability section of MOD-032-1, LSE should be replaced with DP, in alignment with the SAR previously submitted by ERSWG. Similarly, all relevant uses of LSE should be replaced with DP. ▪ The table in Attachment 1 should include references to aggregate DER in the steady-state and dynamics columns. The drafting team should consider the data needed for modeling aggregate DER for the purposes of reliability studies. In particular, the drafting team should consider the recommendations set forth in *NERC Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies*. • Note that the SPIDERWG does not see a need to modify the short circuit column of Attachment 1 because #1 already states "all applicable elements" in the steady-state column should have necessary information related to positive, negative, and zero sequence data provided accordingly. If the TP/PC determines that aggregate DER is needed for these studies, then they have the capability to request such data. However, this is not a prevalent issue currently. • In alignment with adding "DER" to the Attachment 1 table regarding necessary data for modeling purposes, it may be needed (based on the discretion of the SDT) to add a definition for "Distributed Energy Resource (DER)" to the NERC Glossary of Terms. As stated, SPIDERWG has published *NERC Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies* that includes recommended practices and for the collection of aggregate DER data for transmission planning studies. **These materials are not intended to dilute the criticality of this SAR to address the issues identified above within MOD-032-1 itself. Rather, the SDT can use these materials when determining the specific language for inclusion in the standard requirements revisions.**
Cost Impact Assessment, if known (Provide a paragraph describing the potential cost impacts associated with the proposed project):
Cost impacts are not fully known.
Please describe any unique characteristics of the BES facilities that may be impacted by this proposed standard development project (*e.g.* Dispersed Generation Resources):

[2] The NERC Rules of Procedure require a technical justification for new or substantially revised Reliability Standards. Please attach pertinent information to this form before submittal to NERC.

Requested information
DER owners are not subject to NERC Reliability Standards. However, SPIDERWG believes the DP (a NERC Registered Entity) has the information regarding DER connected to its distribution system that is needed for modeling the aggregate behavior of DER for the purposes of BES reliability planning studies. The DP should provide that information to the TP and PC accordingly.
To assist the NERC Standards Committee in appointing a drafting team with the appropriate members, please indicate to which Functional Entities the proposed standard(s) should apply (*e.g*. Transmission Operator, Reliability Coordinator, etc. See the most recent version of the NERC Functional Model for definitions):
Transmission Planner, Planning Coordinator, Distribution Provider While not a Functional Entity per the NERC Functional Model, the "MOD-032 Designees" that are designated by the ERO to develop interconnection-wide base cases (i.e., the Regional Entities), will also be affected by these changes and should be considered for appointment to the Standard Drafting Team.
Do you know of any consensus building activities[3] in connection with this SAR? If so, please provide any recommendations or findings resulting from the consensus building activity.
The proposals in this SAR were developed by the NERC SPIDERWG, a stakeholder group under the NERC Planning Committee.
Are there any related standards or SARs that should be assessed for impact as a result of this proposed project? If so which standard(s) or project number(s)?
The ERSWG submitted a SAR related to MOD-032-1, as described above. This SAR supports those changes, and further expands on a few necessary additional changes related to DER modeling.
Are there alternatives (e.g. guidelines, white paper, alerts, etc.) that have been considered or could meet the objectives? If so, please list the alternatives.
The NERC SPIDERWG is preparing a Reliability Guideline on data collection for DER modeling. That guideline will provide recommendations for improvements to the data requirements and reporting procedures developed jointly by PCs and their TPs. However, updates to MOD-032-1 are also needed to ensure minimum planning consideration and reporting requirement on DER, particularly in Attachment 1. Therefore, this SAR aligns with the necessary changes to meet the objective.

Reliability Principles	
Does this proposed standard development project support at least one of the following Reliability Principles (Reliability Interface Principles)? Please check all those that apply.	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.

[3] Consensus building activities are occasionally conducted by NERC and/or project review teams. They typically are conducted to obtain industry inputs prior to proposing any standard development project to revise, or develop a standard or definition.

Reliability Principles	
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Market Interface Principles	
Does the proposed standard development project comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standard Authorization Request (SAR)

Complete and submit this form, with attachment(s) to the NERC Help Desk. Upon entering the Captcha, please type in your contact information, and attach the SAR to your ticket. Once submitted, you will receive a confirmation number which you can use to track your request.

The North American Electric Reliability Corporation (NERC) welcomes suggestions to improve the reliability of the bulk power system through improved Reliability Standards.

Requested information			
SAR Title:	MOD-032-1 Data for Power System Modeling and Analysis		
Date Submitted:	12/15/2021 (Revised on June 22, 2022)		
SAR Requester			
Name:	Kun Zhu (NERC SPIDERWG Chair) Bill Quaintance (NERC SPIDERWG Vice Chair) (Revised by Project 2022-02 SAR Drafting Team)		
Organization:	Kun Zhu – MISO Bill Quaintance – Duke Energy Progress		
Telephone:	Kun – 317-249-5789 Bill – 919-546-4810	Email:	kzhu@misoenergy.org william.quaintance@duke-energy.com

Justification for this proposed standard development project (Check all that apply to help NERC prioritize development)			
☐ Regulatory Initiation ☒ Emerging Risk (Reliability Issues Steering Committee) Identified ☐ Reliability Standard Development Plan		☒ NERC Standing Committee Identified ☐ Enhanced Periodic Review Initiated ☒ Industry Stakeholder Identified	
Industry Need (What Bulk Electric System (BES) reliability benefit does the proposed project provide?):			
As the penetration of distributed energy resources (DERs) continues to increase across ~~the~~ many distribution systems connected both directly and indirectly to the BES~~North American bulk power system (BPS)~~, it is necessary to account for the potential impacts of DERs on reliability in the planning, operation, and design of the BES. The NERC System Planning Impacts of Distributed Energy Resources Working Group (SPIDERWG) has identified the need for improved modeling of aggregate DER for planning studies (including both utility-scale and retail-scale DER) conducted by Transmission Planners (TPs) and Planning Coordinators (PCs). MOD-032-1 addresses the gathering of modeling data to perform planning assessments but the standard currently has no specific reference to DER data. This SAR proposes to			

Requested information
update MOD-032-1 to: (1) include "data requirements and reporting procedures"[1] for DER that are necessary to support the development of accurate interconnection-wide models, (2) replace Load-Serving Entity (LSE) with Distribution Provider (DP) because of the removal of LSEs from the NERC registry criteria, (3) enable the SDT to review any additional gaps in DER data collection with the de-registration of LSE.
Purpose or Goal (How does this proposed project provide the reliability-related benefit described above?):
This SAR proposes to revise MOD-032-1 to address gaps in data collection for the purposes of modeling aggregate levels of DERs in planning assessments. The goal is to provide clarity and consistency for data collection across PCs and TPs when coordinating with the DP to gather aggregate load and aggregate DER data.
Project Scope (Define the parameters of the proposed project):
The proposed scope of this project is as follows: a. The table in Attachment 1 should be updated to include DER in the steady-state and dynamics columns. Details of the changes to be considered by the Standard Drafting Team are included in the "Detailed Description" below. Revision to requirements should also be considered if necessary. b. Based on item a.) and the detailed description below, the SDT should consider whether including a definition for "Distributed Energy Resource (DER)" in the NERC Glossary of Terms is necessary. c. In alignment with the SAR submitted by the previous NERC Essential Reliability Services Working Group (ERSWG), LSE should be removed and replaced by DP as the applicable entity in Section 4.1.3 and all instances in the standard requirements and attachments. d. The SDT should review any potential gaps regarding ~~data collection for aggregate DER data with~~ the de-registration of LSE or based on applicability transfer from LSE to DP (item c in this list), including but not limited to data collection for aggregate DER data. ~~d.~~e. Consider modification to the applicability section of the standard that would remove the reference to the Planning Authority and align the applicable entities with the NERC functional model of Planning Coordinator.

[1] See Requirement R1 of MOD-032-1, which requires each TP and PC to develop data requirements and reporting procedures for the collection of modeling data used for the development of models for each PC footprint.

Requested information
Detailed Description (Describe the proposed deliverable(s) with sufficient detail for a drafting team to execute the project. If you propose a new or substantially revised Reliability Standard or definition, provide: (1) a technical justification[2] which includes a discussion of the reliability-related benefits of developing a new or revised Reliability Standard or definition, and (2) a technical foundation document (e.g., research paper) to guide development of the Standard or definition):
This SAR proposes to address the issues identified in the project scope above. Specifically, the following details should be considered and addressed by the drafting team: • In the Applicability section of MOD-032-1, LSE should be replaced with DP, in alignment with the SAR previously submitted by ERSWG. Similarly, all relevant uses of LSE should be replaced with DP. ▪ The table in Attachment 1 should include references to aggregate DER in the steady-state and dynamics columns. The drafting team should consider the data needed for modeling aggregate DER for the purposes of reliability studies. In particular, the drafting team should consider the recommendations set forth in *NERC Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies*. • Note that the SPIDERWG does not see a need to modify the short circuit column of Attachment 1 because #1 already states "all applicable elements" in the steady-state column should have necessary information related to positive, negative, and zero sequence data provided accordingly. If the TP/PC determines that aggregate DER is needed for these studies, then they have the capability to request such data. However, this is not a prevalent issue currently. • In alignment with adding "DER" to the Attachment 1 table regarding necessary data for modeling purposes, it may be needed (based on the discretion of the SDT) to add a definition for "Distributed Energy Resource (DER)" to the NERC Glossary of Terms. As stated, SPIDERWG has published *NERC Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies* that includes recommended practices and for the collection of aggregate DER data for transmission planning studies. **These materials are not intended to dilute the criticality of this SAR to address the issues identified above within MOD-032-1 itself. Rather, the SDT can use these materials when determining the specific language for inclusion in the standard requirements revisions.**
Cost Impact Assessment, if known (Provide a paragraph describing the potential cost impacts associated with the proposed project):
Cost impacts are not fully known. ~~However, due to the limited scope of the requested data, cost impact is expected to be minimal to all entities. DPs typically collect the information need to model aggregate levels of DERs in planning assessments. Therefore, data collection effort by the DP would be minimal additional effort. DPs already have processes to provide load data to the TP and PC, so DER data can be~~

[2] The NERC Rules of Procedure require a technical justification for new or substantially revised Reliability Standards. Please attach pertinent information to this form before submittal to NERC.

Requested information
~~managed in a similar manner to reduce cost and effort. If the scope of the required data is expanded, cost impact would likely increase.~~
Please describe any unique characteristics of the BES facilities that may be impacted by this proposed standard development project (*e.g*. Dispersed Generation Resources):
DER owners are not subject to NERC Reliability Standards. However, SPIDERWG believes the DP (a NERC Registered Entity) has the information regarding DER connected to its distribution system that is needed for modeling the aggregate behavior of DER for the purposes of BES reliability planning studies. The DP should provide that information to the TP and PC accordingly.
To assist the NERC Standards Committee in appointing a drafting team with the appropriate members, please indicate to which Functional Entities the proposed standard(s) should apply (*e.g*. Transmission Operator, Reliability Coordinator, etc. See the most recent version of the NERC Functional Model for definitions):
Transmission Planner, Planning Coordinator, Distribution Provider While not a Functional Entity per the NERC Functional Model, the "MOD-032 Designees" that are designated by the ERO to develop interconnection-wide base cases (i.e., the Regional Entities), will also be affected by these changes and should be considered for appointment to the Standard Drafting Team.
Do you know of any consensus building activities[3] in connection with this SAR? If so, please provide any recommendations or findings resulting from the consensus building activity.
The proposals in this SAR were developed by the NERC SPIDERWG, a stakeholder group under the NERC Planning Committee.
Are there any related standards or SARs that should be assessed for impact as a result of this proposed project? If so which standard(s) or project number(s)?
The ERSWG submitted a SAR related to MOD-032-1, as described above. This SAR supports those changes, and further expands on a few necessary additional changes related to DER modeling.
Are there alternatives (e.g. guidelines, white paper, alerts, etc.) that have been considered or could meet the objectives? If so, please list the alternatives.
The NERC SPIDERWG is preparing a Reliability Guideline on data collection for DER modeling. That guideline will provide recommendations for improvements to the data requirements and reporting procedures developed jointly by PCs and their TPs. However, updates to MOD-032-1 are also needed to ensure minimum planning consideration and reporting requirement on DER, particularly in Attachment 1. Therefore, this SAR aligns with the necessary changes to meet the objective.

[3] Consensus building activities are occasionally conducted by NERC and/or project review teams. They typically are conducted to obtain industry inputs prior to proposing any standard development project to revise, or develop a standard or definition.

Reliability Principles	
Does this proposed standard development project support at least one of the following Reliability Principles (Reliability Interface Principles)? Please check all those that apply.	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☐	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Market Interface Principles	
Does the proposed standard development project comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

2	June 28, 2017	Standards Information Staff	Updated template

A. Introduction

1. **Title: Data for Power System Modeling and Analysis**

2. **Number: MOD-032-1**

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Balancing Authority

   4.1.2 Generator Owner

   4.1.3 Load Serving Entity

   4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

   This proposed standard combines "Planning Authority" with "Planning Coordinator" in the list of applicable functional entities. The NERC Functional Model lists "Planning Coordinator" while the registration criteria list "Planning Authority," and they are not yet synchronized. Until that occurs, the proposed standard applies to both Planning Authority and Planning Coordinator.

   4.1.5 Resource Planner

   4.1.6 Transmission Owner

   4.1.7 Transmission Planner

   4.1.8 Transmission Service Provider

5. **Effective Date:**

   MOD-032-1, Requirement R1 shall become effective on the first day of the first calendar quarter that is 12 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, MOD-032-1, Requirement R1 shall become effective on the first day of the first calendar quarter that is 12 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

   MOD-032-1, Requirements R2, R3, and R4 shall become effective on the first day of the first calendar quarter that is 24 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority

is not required, MOD-032-1, Requirements R2, R3, and R4 shall become effective on the first day of the first calendar quarter that is 24 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

6. Background:

MOD-032-1 exists in conjunction with MOD-033-1, both of which are related to system-level modeling and validation. Reliability Standard MOD-032-1 is a consolidation and replacement of existing MOD-010-0, MOD-011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1, and it requires data submission by applicable data owners to their respective Transmission Planners and Planning Coordinators to support the Interconnection-wide case building process in their Interconnection. Reliability Standard MOD-033-1 is a new standard, and it requires each Planning Coordinator to implement a documented process to perform model validation within its planning area.

The transition and focus of responsibility upon the Planning Coordinator function in both standards are driven by several recommendations and FERC directives from FERC Order No. 693, which are discussed in greater detail in the rationale sections of the standards. One of the most recent and significant set of recommendations came from the NERC Planning Committee's System Analysis and Modeling Subcommittee (SAMS). SAMS proposed several improvements to the modeling data standards, to include consolidation of the standards (the SAMS whitepaper is available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here: http://www.nerc.com/comm/PC/Agendas%20Highlights%20and%20Minutes%20DL/2012/2012_Dec_PC%20Agenda.pdf).

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M2. Each registered entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data;

3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each registered entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

"Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance with Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Refer to the NERC Rules of Procedure for a list of compliance monitoring and assessment processes.

1.4. Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long-term Planning**	**Lower**	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include less than or equal to 25% of the required components specified in Requirement R1. MOD-032-01 – ATTACHMENT 1:

Data Reporting Requirements

The table, below, indicates the information that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in the Interconnection-wide cases. A Planning Coordinator may specify additional information that includes specific information required for each item in the table below. Each functional entity[1] responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The data reported shall be as identified by the bus number, name, and/or identifier that is assigned in conjunction with the PC, TO, or TP.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
1. Each bus [TO] a. nominal voltage b. area, zone and owner 2. Aggregate Demand[2] [LSE] a. real and reactive power* b. in-service status* 3. Generating Units[3] [GO, RP (for future planned resources only)] a. real power capabilities - gross maximum and minimum values b. reactive power capabilities - maximum and minimum values at	1. Generator [GO, RP (for future planned resources only)] 2. Excitation System [GO, RP(for future planned resources only)] 3. Governor [GO, RP(for future planned resources only)] 4. Power System Stabilizer [GO, RP(for future planned resources only)] 5. Demand [LSE]	1. Provide for all applicable elements in column "steady-state" [GO, RP, TO] a. Positive Sequence Data b. Negative Sequence Data c. Zero Sequence Data 2. Mutual Line Impedance Data [TO] 3. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling

[1] For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Generator Owner (GO), Load Serving Entity (LSE), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).

[2] For purposes of this item, aggregate Demand is the Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus. A Load Serving Entity is responsible for providing this information, generally through coordination with the Transmission Owner.

[3] Including synchronous condensers and pumped storage.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	dynamics *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	short circuit

Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
a. reactive limits b. voltage set point* c. fixed/switched shunt, if applicable d. in-service status* 9. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, LSE, TO, TSP]		

Guidelines and Technical Basis

For purposes of jointly developing steady-state, dynamics, and short circuit modeling data requirements and reporting procedures under Requirement R1, if a Transmission Planner (TP) and Planning Coordinator (PC) mutually agree, a TP may collect and aggregate some or all data from providing entities, and the TP may then provide that data directly to the PC(s) on behalf of the providing entities. The submitting entities are responsible for getting the data to both the TP and the PC, but nothing precludes them from arriving at mutual agreements for them to provide it to the TP, who then provides it to the PC. Such agreement does not relieve the submitting entity from responsibility under the standard, nor does it make the consolidating entity liable for the submitting entities' compliance under the standard (in essence, nothing precludes parties from agreeing to consolidate or act as a conduit to pass the data, and it is in fact encouraged in certain circumstances, but the requirement is aimed at the act of submitting the data). Notably, there is no requirement for the TP to provide data to the PC. The intent, in part, is to address potential concerns from entities that they would otherwise be responsible for the quality, nature, and sufficiency of the data provided by other entities.

The requirement in Part 1.3 to include specifications for distribution or posting of the data requirements and reporting procedures could be accomplished in many ways, to include posting on a Web site, distributing directly, or through other methods that the Planning Coordinator and each of its Transmission Planners develop.

An entity submitting data per the requirements of this standard who needs to determine the PC for the area, as a starting point, should contact the local Transmission Owner (TO) for information on the TO's PC. Typically, the PC will be the same for both the local TO and those entities connected to the TO's system. If this is not the case, the local TO's PC can typically provide contact information on other PCs in the area. If the entity (e.g., a Generator Owner [GO]) is requesting connection of a new generator, the entity can determine who the PC is for that area at the time a generator connection request is submitted. Often the TO and PC are the same entity, or the TO can provide information on contacting the PC. The entity should specify as the reason for the request to the TO that the entity needs to provide data to the PC according to this standard. Nothing in the proposed requirement language of this standard is intended to preclude coordination between entities such that one entity, serving only as a conduit, provides the other entity's data to the PC. This can be accomplished if it is mutually agreeable by, for example, the GO (or other entity), TP, and the PC. This does not, however, relieve the original entity from its obligations under the standard to provide data, nor does it pass on the compliance obligation of the entity. The original entity is still accountable for making sure that the data has been provided to the PC according to the requirements of this standard.

The standard language recognizes that differences exist among the Interconnections. Presently, the Eastern/Quebec and Texas Interconnections build seasonal cases on an annual basis, while the Western Interconnection builds cases on a continuous basis throughout the year. The intent of the standard is not to change established processes and procedures in each of the Interconnections, but to create a framework to support both what is already in place or

what it may transition into in the future, and to provide further guidance in a common platform for the collection of data that is necessary for the building of the Interconnection-wide case(s).

The construct that these standards replace did not specifically list which Functional Entities were required to provide specific data. Attachment 1 specifically identifies the entities responsible for the data required for the building of the Interconnection-wide case(s).

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:

This requirement consolidates the concepts from the original data requirements from MOD-011-0, Requirement R1, and MOD-013-0, Requirement R1. The original requirements specified types of steady-state and dynamics data necessary to model and analyze the steady-state conditions and dynamic behavior or response within each Interconnection. The original requirements, however, did not account for the collection of short circuit data also required to perform short circuit studies. The addition of short circuit data also addresses the outstanding directive from FERC Order No. 890, paragraph 290.

In developing a performance-based standard that would address the data requirements and reporting procedures for model data, it was prohibitively difficult to account for all of the detailed technical concerns associated with the preparation and submittal of model data given that many of these concerns are dependent upon evolving industry modeling needs and software vendor terminology and product capabilities.

This requirement establishes the Planning Coordinator jointly with its Transmission Planners as the developers of technical model data requirements and reporting procedures to be followed by the data owners in the Planning Coordinator's planning area. FERC Order No. 693, paragraphs 1155 and 1162, also direct that the standard apply to Planning Coordinators. The inclusion of Transmission Planners in the applicability section is intended to ensure that the Transmission Planners are able to participate jointly in the development of the data requirements and reporting procedures.

This requirement is also consistent with the recommendations from the NERC System Analysis and Modeling Subcommittee (SAMS) White Paper titled "Proposed Improvements for NERC MOD Standards", available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here:

Aside from recommendations in support of strengthening and improving MOD-010 through MOD-015, the SAMS paper included the following suggested improvements:

1) reduce the quantity of MOD standards;
2) add short circuit data as a requirement to the MOD standards; and
3) supply data and models:

   a. add requirement identifying who provides and who receives data;
   b. identify acceptability;
   c. standard format;
   d. how to deal with new technologies (user written models if no standard model exists); and
   e. shareability.

4) These suggested improvements are addressed by combining the existing standards into two new standards, one standard for the submission and collection of data, and one for the validation of the planning models. Adding the requirement for the submittal of short circuit data is also an improvement from the existing standards, consistent with FERC Order No. 890, paragraph 290. In supplying data, the approach clearly identifies what data is required and which Functional Entity is required to provide the data.
5) The requirement uses an attachment approach to support data collection. The attachment specifically lists the entities that are required to provide each type of data and the steady-state, dynamics, and short circuit data that is required.
6) Finally, the decision to combine steady-state, dynamics, and short circuit data requirements into one requirement rather than three reflects that they all support the requirement of submission of data in general.

Rationale for R2:

This requirement satisfies the directive from FERC Order No. 693, paragraph 1155, which directs that "the planning authority should be included in this Reliability Standard because the planning authority is the entity responsible for the coordination and integration of transmission facilities and resource plans, as well as one of the entities responsible for the integrity and consistency of the data."

Rationale for R3:

In order to maintain a certain level of accuracy in the representation of a power system, the data that is submitted must be correct, periodically checked, and updated. Data used to perform steady-state, dynamics, and short circuit studies can change, for example, as a result of new planned transmission construction (in comparison to as-built information) or changes performed during the restoration of the transmission network due to weather-related events. One set of data that changes on a more frequent basis is load data, and updates to load data are needed when new improved forecasts are created.

This requirement provides a mechanism for the Planning Coordinator and Transmission Planner (that does not exist in the current standards) to collect corrected data from the entities that have the data. It provides a feedback loop to address technical concerns related to the data when the Planning Coordinator or Transmission Planner identifies technical concerns, such as concerns about the usability of data or simply that the data is not in the correct format and cannot be used. The requirement also establishes a time-frame for response to address timeliness.

Rationale for R4:

This requirement will replace MOD-014 and MOD-015.

This requirement recognizes the differences among Interconnections in model building processes, and it creates an obligation for Planning Coordinators to make available data for its planning area.

The requirement creates a clear expectation that Planning Coordinators will make available data that they collect under Requirement R2 in support of their respective Interconnection-wide case(s). While different entities in each Interconnection create the Interconnection-wide case(s), the requirement to submit the data to the "ERO or its designee" supports a framework whereby NERC, in collaboration and agreement with those other organizations, can designate the appropriate organizations in each Interconnection to build the specific Interconnection-wide case(s). It does not prescribe a specific group or process to build the larger Interconnection-wide case(s), but only requires the Planning Coordinators to make available data in support of their creation, consistent with the SAMS Proposed Improvements to NERC MOD Standards (at page 3) that, "industry best practices and existing processes should be considered in the development of requirements, *as many entities are successfully coordinating their efforts.*" (Emphasis added).

This requirement is about the Planning Coordinator's obligation to make information available for use in the Interconnection-wide case(s); it is not a requirement to build the Interconnection-wide case(s).

For example, under current practice, the Eastern Interconnection Reliability Assessment Group (ERAG) builds the Eastern Interconnection and Quebec Interconnection-wide cases, the Western Electricity Coordinating Council (WECC) builds the Western Interconnection-wide cases, and the Electric Reliability Council of Texas (ERCOT) builds the Texas Interconnection-wide cases. This requirement does not require a change to that construct, and, assuming continued agreement by those organizations, ERAG, WECC, and ERCOT could be the "designee" for each Interconnection contemplated by this requirement. Similarly, the requirement does not prohibit transition, and the requirement remains for the Planning Coordinators to make available the information to the ERO or to whomever the ERO has coordinated with and designated as the recipient of such information for purposes of creation of each of the Interconnection–wide cases.

Version History

Version	Date	Action	Change Tracking
1	February 6, 2014	Adopted by the NERC Board of Trustees.	Developed to consolidate and replace MOD-010-0, MOD -011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1
1	May 1, 2014	FERC Order issued approving	See Implementation Plan

		MOD-032-1.	posted on the Reliability Standards web page for details on enforcement dates for Requirements.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the first draft of the proposed standard for a formal 45-day comment period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	01/19/2022
SAR posted for comment	2/1/2022 – 3/02/2022

Anticipated Actions	Date
45-day formal or informal comment period with ballot	6/1/2023 – 7/17/2023
45-day formal or informal comment period with additional ballot	9/1/2023 – 10/15/2023
XX-day final ballot	
Board adoption	12/12/2023

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resource (DER)

Generators and energy storage technologies connected to the Distribution Provider's system that are capable of providing active power in non-isolated parallel operation with the Bulk Electric System.

A. Introduction

1. **Title: Data for Power System Modeling and Analysis**

2. **Number: MOD-032-2**

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Balancing Authority

   4.1.2 Generator Owner

   4.1.3 Distribution Provider

   4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

   This standard combines "Planning Authority" with "Planning Coordinator" in the list of applicable functional entities. The NERC Functional Model lists "Planning Coordinator" while the registration criteria list "Planning Authority," and they are not yet synchronized. Until that occurs, the standard applies to both Planning Authority and Planning Coordinator.

   4.1.5 Resource Planner

   4.1.6 Transmission Owner

   4.1.7 Transmission Planner

   4.1.8 Transmission Service Provider

5. **Effective Date: See Implementation Plan.**

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M2. Each registered entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data;

3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each registered entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar

days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance with Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

MOD-032-2 – ATTACHMENT 1:

Data Reporting Requirements

The table, below, indicates the information that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in the Interconnection-wide cases. A Planning Coordinator may specify additional information that includes specific information required for each item in the table below. Each functional entity[1] responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The data reported shall be as identified by the bus number, name, and/or identifier that is assigned in conjunction with the PC, TO, or TP.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
1. Each bus [TO] a. nominal voltage b. area, zone and owner 2. Aggregate Demand[2] [DP, TO (when a Demand is not associated with a registered DP)] a. real and reactive power* b. in-service status* 3. Generating Units[3] [GO, RP (for future planned resources only)] a. real power capabilities - gross maximum and minimum values b. reactive power capabilities - maximum and minimum values at real power capabilities in 3a above	1. Generator [GO, RP (for future planned resources only)] 2. Excitation System [GO, RP (for future planned resources only)] 3. Governor [GO, RP (for future planned resources only)] 4. Power System Stabilizer [GO, RP (for future planned resources only)] 5. Demand [DP, TO (when a Demand is not associated with a registered DP)] 6. Wind Turbine Data [GO] 7. Photovoltaic systems [GO]	1. Provide for all applicable elements in column "steady-state" [GO, RP, TO] a. Positive Sequence Data b. Negative Sequence Data

[1] For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Generator Owner (GO), Distribution Provider (DP), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).

[2] For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. A Distribution Provider is responsible for providing this information, generally through coordination with the Transmission Owner.

[3] Including synchronous condensers and pumped storage.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
c. station service auxiliary load for normal plant configuration (provide data in the same manner as that required for aggregate Demand under item 2, above). d. regulated bus* and voltage set point* (as typically provided by the TOP) e. machine MVA base f. generator step up transformer data (provide same data as that required for transformer under item 6, below) g. generator type (hydro, wind, fossil, solar, nuclear, etc) h. in-service status* 4. AC Transmission Line or Circuit [TO] a. impedance parameters (positive sequence) b. susceptance (line charging) c. ratings (normal and emergency)* d. in-service status* 5. DC Transmission systems [TO] 6. Transformer (voltage and phase-shifting) [TO] a. nominal voltages of windings b. impedance(s) c. tap ratios (voltage or phase angle)* d. minimum and maximum tap position limits e. number of tap positions (for both the ULTC and NLTC) f. regulated bus (for voltage regulating transformers)* g. ratings (normal and emergency)* h. in-service status* 7. Reactive compensation (shunt capacitors and reactors) [TO] a. admittances (MVars) of each capacitor and reactor b. regulated voltage band limits* (if mode of operation not fixed) c. mode of operation (fixed, discrete, continuous, etc.) d. regulated bus* (if mode of operation not fixed) e. in-service status* 8. Static Var Systems [TO] a. reactive limits b. voltage set point* c. fixed/switched shunt, if applicable d. in-service status*	8. Static Var Systems and FACTS [GO, TO, DP] 9. DC system models [TO] 10. Distributed Energy Resource (DER) data [DP, TO (when DER is not associated with a registered DP)] 11. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]	c. Zero Sequence Data 2. Mutual Line Impedance Data [TO] 3. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
9. Distributed Energy Resource (DER) data[4] [DP, TO (when DER is not associated with a registered DP)] a. Location (bus from item 1) and if DER feeder is subject to UFLS and/or UVLS b. Real power capability (minimum and maximum) c. Reactive power capability (minimum and maximum) d. Generator type (solar, battery, etc.) e. In-service date or other information to be used to make assumptions about DER capabilities related to ride-through, voltage control and/or frequency control. 10. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]		

[4]The TP/PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary for local practices and the TP/PC may need to coordinate with the DP/TO to determine appropriate assumptions for equivalent distribution system impedance.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the first draft of the proposed standard for a formal 45-day comment period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	01/19/2022
SAR posted for comment	2/1/2022 – 3/02/2022

Anticipated Actions	Date
45-day formal or informal comment period with ballot	6/1/2023 – 7/17/2023
45-day formal or informal comment period with additional ballot	9/1/2023 – 10/15/2023
XX-day final ballot	
Board adoption	12/12/2023

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resource (DER)

Generators and energy storage technologies connected to the Distribution Provider's system that are capable of providing active power in non-isolated parallel operation with the Bulk Electric System.

A. Introduction

1. **Title: Data for Power System Modeling and Analysis**

2. **Number: MOD-032-~~1~~2**

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Balancing Authority

   4.1.2 Generator Owner

   4.1.3 ~~Load Serving Entity~~Distribution Provider

   4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

   This ~~proposed~~ standard combines "Planning Authority" with "Planning Coordinator" in the list of applicable functional entities. The NERC Functional Model lists "Planning Coordinator" while the registration criteria list "Planning Authority," and they are not yet synchronized. Until that occurs, the ~~proposed~~ standard applies to both Planning Authority and Planning Coordinator.

   4.1.5 Resource Planner

   4.1.6 Transmission Owner

   4.1.7 Transmission Planner

   4.1.8 Transmission Service Provider

5. **Effective Date: See Implementation Plan.**

   ~~MOD-032-21, Requirement R1 shall become effective on the first day of the first calendar quarter that is 12 24 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, MOD-032-21, Requirement R1 shall become effective on the first day of the first calendar quarter that is 12 24 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

   ~~MOD-032-21, Requirements R2, R3, and R4 shall become effective on the first day of the first calendar quarter that is 24 36 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a~~

~~standard to go into effect. Where approval by an applicable governmental authority is not required, MOD-032-21, Requirements R2, R3, and R4 shall become effective on the first day of the first calendar quarter that is 24 36 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

~~**6. Background:**~~

~~MOD-032-1 exists in conjunction with MOD-033-1, both of which are related to system-level modeling and validation. Reliability Standard MOD-032-1 is a consolidation and replacement of existing MOD-010-0, MOD-011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1, and it requires data submission by applicable data owners to their respective Transmission Planners and Planning Coordinators to support the Interconnection-wide case building process in their Interconnection. Reliability Standard MOD-033-1 is a new standard, and it requires each Planning Coordinator to implement a documented process to perform model validation within its planning area.~~

~~The transition and focus of responsibility upon the Planning Coordinator function in both standards are driven by several recommendations and FERC directives from FERC Order No. 693, which are discussed in greater detail in the rationale sections of the standards. One of the most recent and significant set of recommendations came from the NERC Planning Committee's System Analysis and Modeling Subcommittee (SAMS). SAMS proposed several improvements to the modeling data standards, to include consolidation of the standards (the SAMS whitepaper is available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here: http://www.nerc.com/comm/PC/Agendas%20Highlights%20and%20Minutes%20DL/2012/2012_Dec_PC%20Agenda.pdf).~~

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Generator Owner, ~~Load Serving Entity~~Distribution Provider, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M2. Each registered entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Generator Owner, ~~Load Serving Entity~~Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data;

3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each registered entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying

Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

~~"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions. "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.~~

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance with Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and ~~Assessment~~ Enforcement Program~~Processes~~: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

~~Refer to the NERC Rules of Procedure for a list of compliance monitoring and assessment processes.~~

~~**1.4. Additional Compliance Information**~~

~~None~~

NERC Reliability Standard MOD-032-2 Implementation Plan

NERC Reliability Standard MOD-032-2 Technical Rationale

~~None.~~

Guidelines and Technical Basis

For purposes of jointly developing steady-state, dynamics, and short circuit modeling data requirements and reporting procedures under Requirement R1, if a Transmission Planner (TP) and Planning Coordinator (PC) mutually agree, a TP may collect and aggregate some or all data from providing entities, and the TP may then provide that data directly to the PC(s) on behalf of the providing entities. The submitting entities are responsible for getting the data to both the TP and the PC, but nothing precludes them from arriving at mutual agreements for them to provide it to the TP, who then provides it to the PC. Such agreement does not relieve the submitting entity from responsibility under the standard, nor does it make the consolidating entity liable for the submitting entities' compliance under the standard (in essence, nothing precludes parties from agreeing to consolidate or act as a conduit to pass the data, and it is in fact encouraged in certain circumstances, but the requirement is aimed at the act of submitting the data). Notably, there is no requirement for the TP to provide data to the PC. The intent, in part, is to address potential concerns from entities that they would otherwise be responsible for the quality, nature, and sufficiency of the data provided by other entities.

The requirement in Part 1.3 to include specifications for distribution or posting of the data requirements and reporting procedures could be accomplished in many ways, to include posting on a Web site, distributing directly, or through other methods that the Planning Coordinator and each of its Transmission Planners develop.

An entity submitting data per the requirements of this standard who needs to determine the PC for the area, as a starting point, should contact the local Transmission Owner (TO) for information on the TO's PC. Typically, the PC will be the same for both the local TO and those entities connected to the TO's system. If this is not the case, the local TO's PC can typically provide contact information on other PCs in the area. If the entity (e.g., a Generator Owner [GO]) is requesting connection of a new generator, the entity can determine who the PC is for that area at the time a generator connection request is submitted. Often the TO and PC are the same entity, or the TO can provide information on contacting the PC. The entity should specify as the reason for the request to the TO that the entity needs to provide data to the PC according to this standard. Nothing in the proposed requirement language of this standard is intended to preclude coordination between entities such that one entity, serving only as a conduit, provides the other entity's data to the PC. This can be accomplished if it is mutually agreeable by, for example, the GO (or other entity), TP, and the PC. This does not, however, relieve the original entity from its obligations under the standard to provide data, nor does it pass on the compliance obligation of the entity. The original entity is still accountable for making sure that the data has been provided to the PC according to the requirements of this standard.

The standard language recognizes that differences exist among the Interconnections. Presently, the Eastern/Quebec and Texas Interconnections build seasonal cases on an annual basis, while the Western Interconnection builds cases on a continuous basis throughout the year. The intent of the standard is not to change established processes and procedures in each of the Interconnections, but to create a framework to support both what is already in place or

what it may transition into in the future, and to provide further guidance in a common platform for the collection of data that is necessary for the building of the Interconnection-wide case(s).

The construct that these standards replace did not specifically list which Functional Entities were required to provide specific data. Attachment 1 specifically identifies the entities responsible for the data required for the building of the Interconnection-wide case(s).

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:

This requirement consolidates the concepts from the original data requirements from MOD-011-0, Requirement R1, and MOD-013-0, Requirement R1. The original requirements specified types of steady-state and dynamics data necessary to model and analyze the steady-state conditions and dynamic behavior or response within each Interconnection. The original requirements, however, did not account for the collection of short circuit data also required to perform short circuit studies. The addition of short circuit data also addresses the outstanding directive from FERC Order No. 890, paragraph 290.

In developing a performance-based standard that would address the data requirements and reporting procedures for model data, it was prohibitively difficult to account for all of the detailed technical concerns associated with the preparation and submittal of model data given that many of these concerns are dependent upon evolving industry modeling needs and software vendor terminology and product capabilities.

This requirement establishes the Planning Coordinator jointly with its Transmission Planners as the developers of technical model data requirements and reporting procedures to be followed by the data owners in the Planning Coordinator's planning area. FERC Order No. 693, paragraphs 1155 and 1162, also direct that the standard apply to Planning Coordinators. The inclusion of Transmission Planners in the applicability section is intended to ensure that the Transmission Planners are able to participate jointly in the development of the data requirements and reporting procedures.

This requirement is also consistent with the recommendations from the NERC System Analysis and Modeling Subcommittee (SAMS) White Paper titled "Proposed Improvements for NERC MOD Standards", available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here:

Aside from recommendations in support of strengthening and improving MOD-010 through MOD-015, the SAMS paper included the following suggested improvements:

reduce the quantity of MOD standards;

add short circuit data as a requirement to the MOD standards; and

supply data and models:

add requirement identifying who provides and who receives data;

identify acceptability;

standard format;

how to deal with new technologies (user written models if no standard model exists); and

a. shareability.
b. These suggested improvements are addressed by combining the existing standards into two new standards, one standard for the submission and collection of data, and one for the validation of the planning models. Adding the requirement for the submittal of short circuit data is also an improvement from the existing standards, consistent with FERC Order No. 890, paragraph 290. In supplying data, the approach clearly identifies what data is required and which Functional Entity is required to provide the data.
c. The requirement uses an attachment approach to support data collection. The attachment specifically lists the entities that are required to provide each type of data and the steady-state, dynamics, and short circuit data that is required.
d. Finally, the decision to combine steady-state, dynamics, and short circuit data requirements into one requirement rather than three reflects that they all support the requirement of submission of data in general.
e. Rationale for R2:
f. This requirement satisfies the directive from FERC Order No. 693, paragraph 1155, which directs that "the planning authority should be included in this Reliability Standard because the planning authority is the entity responsible for the coordination and integration of transmission facilities and resource plans, as well as one of the entities responsible for the integrity and consistency of the data."
g. **Rationale for R3:**
h. In order to maintain a certain level of accuracy in the representation of a power system, the data that is submitted must be correct, periodically checked, and updated. Data used to perform steady-state, dynamics, and short circuit studies can change, for example, as a result of new planned transmission construction (in comparison to as-built information) or changes performed during the restoration of the transmission network due to weather-related events. One set of data that changes on a more frequent basis is load data, and updates to load data are needed when new improved forecasts are created.
i. This requirement provides a mechanism for the Planning Coordinator and Transmission Planner (that does not exist in the current standards) to collect corrected data from the entities that have the data. It provides a feedback loop to address technical concerns related to the data when the Planning Coordinator or Transmission Planner identifies technical concerns, such as concerns about

the usability of data or simply that the data is not in the correct format and cannot be used. The requirement also establishes a time-frame for response to address timeliness.

Rationale for R4:

This requirement will replace MOD-014 and MOD-015.

This requirement recognizes the differences among Interconnections in model building processes, and it creates an obligation for Planning Coordinators to make available data for its planning area.

The requirement creates a clear expectation that Planning Coordinators will make available data that they collect under Requirement R2 in support of their respective Interconnection-wide case(s). While different entities in each Interconnection create the Interconnection-wide case(s), the requirement to submit the data to the "ERO or its designee" supports a framework whereby NERC, in collaboration and agreement with those other organizations, can designate the appropriate organizations in each Interconnection to build the specific Interconnection-wide case(s). It does not prescribe a specific group or process to build the larger Interconnection-wide case(s), but only requires the Planning Coordinators to make available data in support of their creation, consistent with the SAMS Proposed Improvements to NERC MOD Standards (at page 3) that, "industry best practices and existing processes should be considered in the development of requirements, *as many entities are successfully coordinating their efforts."* (Emphasis added).

This requirement is about the Planning Coordinator's obligation to make information available for use in the Interconnection-wide case(s); it is not a requirement to build the Interconnection-wide case(s).

For example, under current practice, the Eastern Interconnection Reliability Assessment Group (ERAG) builds the Eastern Interconnection and Quebec Interconnection-wide cases, the Western Electricity Coordinating Council (WECC) builds the Western Interconnection-wide cases, and the Electric Reliability Council of Texas (ERCOT) builds the Texas Interconnection-wide cases. This requirement does not require a change to that construct, and, assuming continued agreement by those organizations, ERAG, WECC, and ERCOT could be the "designee" for each Interconnection contemplated by this requirement. Similarly, the requirement does not prohibit transition, and the requirement remains for the Planning Coordinators to make available the information to the ERO or to whomever the ERO has coordinated with and designated as the recipient of such information for purposes of creation of each of the Interconnection-wide cases.

Version History

Version	Date	Action	Change Tracking
1	February 6, 2014	Adopted by the NERC Board of Trustees.	Developed to consolidate and replace MOD-010-0, MOD -011-0, MOD-012-0,

			MOD-013-1, MOD-014-0, and MOD-015-0.1
1	May 1, 2014	FERC Order issued approving MOD-032-1.	See Implementation Plan posted on the Reliability Standards web page for details on enforcement dates for Requirements.

MOD-032-~~01~~ 2 – ATTACHMENT 1:

Data Reporting Requirements

The table, below, indicates the information that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in the Interconnection-wide cases. A Planning Coordinator may specify additional information that includes specific information required for each item in the table below. Each functional entity[1] responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The data reported shall be as identified by the bus number, name, and/or identifier that is assigned in conjunction with the PC, TO, or TP.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
1. Each bus [TO] a. nominal voltage b. area, zone and owner 2. Aggregate Demand[2] [~~LSE~~DP, TO (when a Demand is not associated with a registered DP)] a. real and reactive power* b. in-service status* 3. Generating Units[3] [GO, RP (for future planned resources only)] a. real power capabilities - gross maximum and minimum values	1. Generator [GO, RP (for future planned resources only)] 2. Excitation System [GO, RP (for future planned resources only)] 3. Governor [GO, RP (for future planned resources only)] 4. Power System Stabilizer [GO, RP (for future planned resources only)] 5. Demand [~~LSE~~DP, TO (when a Demand is not associated with a registered DP)] 6. Wind Turbine Data [GO]	1. Provide for all applicable elements in column "steady-state" [GO, RP, TO] a. Positive Sequence Data b. Negative Sequence Data

[1] For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Generator Owner (GO), ~~Load Serving Entity~~Distribution Provider (~~LSE~~DP), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).

[2] For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. A ~~Load Serving Entity~~Distribution Provider is responsible for providing this information, generally through coordination with the Transmission Owner.

[3] Including synchronous condensers and pumped storage.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. - Transmission Owner
- Transmission Planner
- Transmission Service Provider

NERC Glossary of Terms

This section includes a newly defined term used in the NERC Reliability Standard. The new definition listed below becomes approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Proposed New Definition(s):
Distributed Energy Resource (DER):

Generators and energy storage technologies connected to the Distribution Provider's system that are capable of providing active power in non-isolated parallel operation with the Bulk Power System.

Background

As the penetration of distributed energy resources (DERs) continues to increase across the many distribution systems connected both directly and indirectly to the North American Bulk Power System (BPS), it is necessary to account for the potential impacts of DERs on reliability in the planning, operation, and design of the Bulk Electric System. The NERC System Planning Impacts of Distributed Energy Resources Working Group (SPIDERWG) has identified the need for improved modeling of aggregate DER for planning studies (including both utility-scale and retail-scale DER) conducted by Transmission Planners (TPs) and Planning Coordinators (PCs), including updated modeling data requirements specific to DER.

Proposed Reliability Standard MOD-032-2 replaces the Load-Serving Entity as an applicable entity with the Distribution Provider and updates Attachment 1: Data Reporting Requirements with data specific to DERs.

General Considerations

In developing this implementation plan, the standard drafting team considered the time that would be necessary to develop data requirements and reporting procedures for data related to DERs, including identifying the proper reporting entity. The standard drafting team also considered that the standard would become applicable to the Distribution Provider for the first time.

Effective Date and Phased-In Compliance Dates

The effective date for the proposed Reliability Standard and NERC Glossary term Distributed Energy Resource is provided below. Where the standard drafting team identified the need for a longer implementation period for compliance with a particular section of a proposed Reliability Standard (i.e., an entire Requirement or a portion thereof), the additional time for compliance with that section is specified below. The phased-in compliance date for those particular sections represents the date that entities must begin to comply with that particular section of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

Reliability Standard MOD-032-2

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for Reliability Standard MOD-032-2 Requirements R2, R3, and R4

Entities shall not be required to comply with Requirements R2, R3, and R4 relating to revised Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under MOD-032-2 Requirement R1 and Attachment 1 until 12 months after the effective date of Reliability Standard MOD-032-2.

Definition – Distributed Energy Resource (DER)

Where approval by an applicable governmental authority is required, the definition of Distributed Energy Resource (DER) shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving Reliability Standard MOD-032-2, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the definition shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date that Reliability Standard MOD-032-2 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Retirement Date

Reliability Standard MOD-032-1

Reliability Standard MOD-032-1 shall be retired immediately prior to the effective date of Reliability Standard MOD-032-2 in the particular jurisdiction in which the revised standard is becoming effective.

Initial Performance Dates

Entities shall not be required to comply with Requirements R2, R3, and R4 relating to revised Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under MOD-032-2 Requirement R1 and Attachment 1 until 12 months after the effective date of Reliability Standard MOD-032-2.

Entities shall continue to comply with Requirements R2, R3, and R4 related to Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under MOD-032-1 Requirement R1 and Attachment 1 during the phased-in compliance period for MOD-032-2.

Unofficial Comment Form

Project 2022-02 Modifications to TPL-001 and MOD-032

Do not use this form for submitting comments. Use the Standards Balloting and Commenting System (SBS) to submit comments on **Project 2022-02 Modifications to TPL-001 and MOD-032** by **8 p.m. Eastern, Friday, July 14, 2023.**

Additional information is available on the project page. If you have questions, contact Senior Standards Developer, Ben Wu (via email), or at 470-542-6882.

Background Information

Project 2022-02 addresses multiple Standard Authorization Requests (SARs) related to transmission planning and modeling data and analysis (MOD-032-1 Data for Power System Modeling and Analysis SAR from the NERC System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG); TPL-001-5.1 Transmission System Planning Performance Requirements SAR from NERC Inverter-Based Resource Performance Working Group (IRPWG); and TPL-001-5.1 Transmission System Planning Performance Requirements SAR from the SPIDERWG).

The Project 2022-02 Standard Drafting Team decided to break this project into two phases since there are two Reliability Standards involved and the project scopes are quite different. Phase one addresses MOD-032-1 in data collection and phase two will address TPL-001-5.1 in the accuracy of transmission system planning assessments. This posting affects phase one of this project only (MOD-032). TPL-001 will be addressed during phase two of this project.

Questions

1. Do you agree with the modification to remove “Load Serving Entity” and replace with “Distribution Provider” in MOD-032-2?

   ☐ Yes
   ☐ No

   Comments:

2. Provide any additional comments for the standard drafting team to consider, if desired.

Violation Risk Factor and Violation Severity Level Justifications

Project 2022-02 Modifications to MOD-032-2

This document provides the standard drafting team's (SDT's) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in MOD-032-2. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

MOD-032-2

VRF Justification for MOD-032-2, Requirement R1

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R1

The VSL did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VRF Justification for MOD-032-2, Requirement R2

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R2

"Load Serving Entity" was replaced with "Distribution Provider" from Requirement R2 in MOD-032-2.

VRF Justification for MOD-032-2, Requirement R3

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R3

"Load Serving Entity" was replaced with "Distribution Provider" from Requirement R2 in MOD-032-2.

VRF Justification for MOD-032-2, Requirement R4

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R4

The VSL did not change from the previously FERC approved MOD-032-1 Reliability Standard.

Technical Rationale for Reliability Standard MOD-032-2

May 2023

MOD-032-2 – Data for Power System Modeling and Analysis

Rationale for Applicability Section

For MOD-032-2, Load-Serving Entity (LSE) was replaced with Distribution Provider (DP) because of the removal of LSEs from the NERC registry criteria. Items in Attachment 1 that were previously required to be provided by the LSE are now required to be provided by the DP. It is recognized that some distribution facilities do not have an associated DP that meets the NERC registration criteria. In such instances, the specified data is required to be provided by the Transmission Owner (TO) or registered DP to which those facilities are connected. It is expected that TOs (or registered DPs) may need to coordinate with the owners of distribution facilities that do not have an associated NERC-registered DP to ensure the availability of the necessary data, either through interconnection agreements or other binding contracts.

Additionally, the standard drafting team (SDT) reviewed the dual applicability to Planning Authority and Planning Coordinator and determined that that the explanation from MOD-032-1 is still correct and valid with minor edits as proposed. The posted "Appendix 5B: Statement of Compliance Registry Criteria", dated January 19, 2021, still uses the Planning Authority term.

Rationale for Distributed Energy Resource (DER) Definition

The SDT considered various DER definitions utilized in the industry and discussed in the SPIDERWG Terms and Definitions Working Document. The SDT chose to refer to technologies connected to the DP's system to avoid ambiguities associated with defining a distribution system. The NERC glossary definition for DP notes that the DP is defined by providing the distribution function (this includes entities that may not be NERC-registered DPs). Additionally, by specifying facilities that produce active power, the scope is focused on only those facilities that may be exporting real power to the power system or offsetting real power load (e.g., residential solar or commercial rooftop solar, even if they only operate at unity power factor or don't have any reactive power capability). This would exclude examples such as charging-only electric vehicle (EV) installations and controllable load options. The SDT included "in non-isolated parallel operation with the Bulk Power System." to indicate that distributed energy resources with potential BES reliability impacts are those that are actually electrically connected to the BES. Resources that are only operated in an islanded or isolated mode (e.g., back-up generation that only operates when a facility is disconnected from the grid), will not have an impact to the BES and therefore are not of interest from a BES-reliability perspective. The SDT understands the concepts of non-isolated parallel operation versus isolated parallel operation to be commonly understood within the industry.

The SDT consensus is that this definition clarifies what is in scope and out of scope with respect to where DER is connected rather than the technology type. Utilizing the existing NERC definition for DP and the associated area of responsibility aligns with the scope of DER data collection and modeling activities and

provides clarity for the industry to aid in gathering this information. It should be clear that MOD-032-2 applicability and compliance obligations refer to NERC-registered DPs; the use of the DP term in the DER definition does not in itself imply any compliance obligation.

Rationale for Modifications to Attachment 1

MOD-032-2 Attachment 1: Data Reporting Requirements was updated with data specific to DERs. The intent is that all relevant DER data including both utility scale facilities (commonly referred to as U-DER) and smaller behind-the meter facilities (commonly referred to as R-DER) be available and represented in models of the interconnected transmission system consistent with the approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies. Specific data items listed for DER reflect the minimum amount of information expected to be needed to reasonably represent DER in transmission system models. It is expected that aggregate DER (rather than individual DER facilities) would be represented in most Planning Coordinator/Transmission Planner (PC/TP) study models. However, footnote 4 explicitly allows the PC/TP to require either aggregated or unaggregated DER data. This provides flexibility for local practices wherein the PC/TP may elect to apply DER aggregation assumptions rather than depend on the DP/TO to apply aggregation assumptions.

The PC/TP may have access to sufficient data for modeling certain DER through alternative means (e.g., direct registration of DER in certain markets). In such cases, the DP (or TO) should not be obligated to provide duplicate DER modeling data. The PC/TP modeling data requirements and reporting procedures should clearly identify if there are certain classifications of DER that are excluded from the DP/TO obligation for providing DER modeling data. This in no way absolves a DP/TO from an obligation to provide DER data according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1.

The SDT decided to maintain an approach similar to MOD-032-1 where more detailed sub-bullets associated with the required data are only presented in the “steady state” column (though arguably such data is also relevant to “dynamics” and/or “short circuit”). The addition to the “dynamics” column was limited to the “Distributed Energy Resource (DER) data” line item. The SDT concluded that this was appropriate and consistent with other “dynamics” line items such as “Wind Turbine Data” and “Photovoltaic systems” that are listed without detailed sub-bullets. Drastically altering the structure of Attachment 1 or adding DER data to the “short circuit” column was beyond the scope of the Project 2022-02 SAR.

It should be noted that the modifications do not make DER facilities subject to NERC reliability standards. Instead, the modifications place a compliance obligation on NERC registered DPs (or TOs) to provide basic information about DER that are connected to their systems so that DER can be properly represented in interconnection-wide cases. There are already existing requirements for DPs (or TOs) to provide information about load connected to their systems. Similar to load, DER is not generally considered to be a BES facility. However, BES reliability assessments require an accurate representation of both aggregate load and aggregate DER behavior. The modifications proposed in MOD-032-2 are intended to ensure sufficient DER data is available to the PC/TP so that appropriate DER representations can be included in their BES reliability assessments.

- **Inclusion of In-Service Date or Other Information**

As suggested in the approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies, the in-service date for DER may be used as a proxy for the PC/TP to make reasonable assumptions about DER capabilities. For example, in a certain jurisdiction DER installed after a specified date may be required to have a certain ride-through characteristic. Thus, the appropriate ride-through characteristic representation for DER in that area could be inferred by the in-service date of the DER. However, the PC/TP modeling data requirements and reporting procedures may require the provision of alternative information to achieve the same purpose. PC/TP modeling data requirements and reporting procedures may also require more detail and/or additional information. In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, it is expected that the proportion of aggregate DER amount with in-service dates before and after certain threshold dates would be needed to make inferences regarding the overall aggregate DER response characteristics.

- **Inclusion of Data Related to DER Feeders Subject to UFLS and/or UVLS**

There is a reliability need for the DP/TO to convey this information to the PC/TP. As described in the approved Reliability Guideline: Recommended Approaches for UFLS Program Design with Increasing Penetrations of DERs, accurately representing DER tripping as part of UFLS operation is vital for designing and evaluating UFLS programs. Similarly, accurately representing DER tripping as part of UVLS operation is vital for designing and evaluating UVLS programs as described in the approved White Paper: DER Impact to Under Voltage Load Shedding Program Design. In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, the proportion of aggregate DER subject to each UVLS/UFLS tripping stage should be identified.

- **Inclusion of Aggregate Demand Clarification**

Footnote 2 was modified to clarify that the gross demand is needed at each load serving bus. Collecting and modeling a net demand that incorporates offsets due to output from DER is not consistent with a modeling framework that explicitly represents DER.

Standards Announcement

Project 2022-02 Modifications to TPL-001 and MOD-032

Formal Comment Period Open through July 14, 2023
Ballot Pools Forming through June 29, 2023

Now Available

A 45-day formal comment period for **Project 2022-02 Modifications to TPL-001 and MOD-032** is open through **8 p.m. Eastern, Friday, July 14, 2023** for the following standard and implementation plan:

- MOD-032-2 – Data for Power System Modeling and Analysis
- Implementation Plan

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact **ballotadmin@nerc.net** to assist with the removal of any duplicate registrations.

Ballot Pools

Ballot pools are being formed through **8 p.m. Eastern, Thursday, June 29, 2023.** Registered Ballot Body members can join the ballot pools here.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Initial ballots for the standard and implementation plan, as well as the non-binding polls of the associated Violation Risk Factors and Violation Severity Levels will be conducted **July 5 - 14, 2023**.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer**,** Ben Wu (via email) or at 470-542-6882. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2022-02 Modifications to TPL-001 and MOD-032 observer list” in the Description Box.

1. Do you agree with the modification to remove "Load Serving Entity" and replace with "Distribution Provider" in MOD-032-2?

Ben Hammer - Ben Hammer On Behalf of: Sean Erickson, Western Area Power Administration, 1, 6; - Ben Hammer

Answer	No
Document Name	

Comment

To be clear, the Project 2022-02 SDT added both TO and DP to replace LSE in the proposed MOD-032-2 Attachment 1 revision. This proposed change is incomplete, misappropriates modeling data responsibilities for Aggregate Demand, Demand, and Distributed Energy Resource (DER) modeling data, as well as retains a significant reliability gap.

Transmission Owners who are not Distribution Providers likely have no knowledge or capability to provide data for planned demand or DER constituents served from the transmission system. Transmission Owner visibility for load demand is typically limited to historical telemetered MW and MVAR data. This finding, especially with regards to DERs, has already been well-documented. A key recommendation in the NERC Reliability and Security Technical Committee (RSTC) subcommittee approved the "Model Verification of Aggregate DER Models used in Planning Studies - Reliability Guideline" developed by the System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG) was:

"TPs, PCs, TOs, and other applicable entities that may need DER information should coordinate with DPs for facilities connected to distribution systems to determine the necessary measurement information that would be of use for DER modeling and model verification and jointly develop requirements or practices that will ensure this data is available. ***As the TPs, PCs, and TOs are dependent on the DP to have the data made available****, this will likely require actions from state regulatory bodies and DPs to establish requirements to gather this information" (page 7 of 61).*

The SDT should consider that Transmission Owners should not be held accountable for demand and DER data that they have no cognizance of. Additionally, the SDT should remember that most DER are smaller than the BES resource threshold or reside on a distribution system. The threshold for an entity to be registered as a Distribution Provider is 75 MW of load. This implies that the majority of DERs are and will be connected to systems outside the scope and visibility of Transmission Owners, as well as existing Distribution Providers. To emphasize this reality: as of 15 May 2023, there were 314 Distribution Providers registered with NERC (excluding UFLS-only DPs). Of those DPs, 96 were not otherwise registered as either a PC, TP, or TO. While it may be misunderstood that only 96 DPs may become newly applicable and participatory in model data collection given the draft changes to MOD-032-2, this ignores that the latest EIA 861 data (collected in 2021; published in 2022) reflects about 1,190 distribution utilities reflecting almost 197,000 distribution circuits in the continental US. In other words, it may be reasonable to conclude that 74% of the distribution utilities in the US do not meet the NERC registration threshold. Furthermore, PCs, TPs, and TOs have no regulatory relationship with these unregistered entities and cannot be held responsible for DER data for which that are not aware.

In June 2022, NERC published its "Inverter-Based Resource Strategy" that recognized efforts necessary to analyze the breakdown of resource size, location, type, and applicability with the BES definition to make a determination of whether the current BES threshold should be updated to reflect the changing resource mix" (page 9 of 10). Subsequently, the NERC Member Representatives Committee (MRC) and Board of Trustees (BOT) technical session on inverter-based resources in February 2023 emphasized the need for a focus on functional registration noting: "industry is increasingly challenged with addressing reliability issues for unregistered inverter-based resources, and those resources are reaching critical mass in some parts of the country. The lack of requirements currently imposed on those resources creates local and regional reliability risks to the BPS in aggregate. This issue compounds in many areas with the growing presence of distributed energy resources (DERs) connected to the distribution system." In response to the FERC directive "Registration of Inverter-based Resources", NERC filed a proposal to modify its Rules of Procedure to "include a new function comprised of owners of IBRs interconnected to the BPS." The Generator Owner – Inverter-Based Resource (GO-IBR) registration would include "owners of IBRs which have aggregate nameplate capacity of less than or equal to 75 MVA and greater than or equal to 20 MVA interconnected at a voltage greater than or equal to 100 kV; or Owners of IBRs which have aggregate nameplate capacity of greater than or equal to 20 MVA interconnected at a voltage less than 100 kV."

Given the anticipated GO-IBR functional registration, the NERC Project 2022-02 SDT should modify MOD-032-2 Attachment 1 to specify **DP, GO-IBR** are responsible for Aggregate Demand, Demand, and Distributed Energy Resource (DER) data, as well as other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes.

Steven Rueckert - Western Electricity Coordinating Council - 10, Group Name WECC Entity Monitoring

Answer	No
Document Name	

Comment

WECC supports the removal of Load Serving Entity as that registration no longer exists. However, WECC believes that adding Distribution Provider is not necessary as explained below.

Including the registered Distribtuion Provider in the applicability of the standard complicates compliance applicability and monitoring. It requires two processes and two monitoring mithods instead of one.

The technical rational for the standard states that for distribution facilities which have no Distribution Provider, or which do not connect to a Distribution Provider, the Transmission Owner is responsible for coordinating to obtain the necessary data. If the TO can perform this for distrbution facilities that do not have a registered DP, they can use the same process to obtain the data from a registered DP.

This removes the need of potentially complex determination of standard applicability and the research needed to determine applicability for each Transmission Owner based on the existence of registered Distribution Providers or any other non-BES load that has no registered DP. It also makes clear that the Planning Coordinator and Transmission Planner would be receiving bus level demand data from a single source (The Transmission Owner) rather than obtaining data from multiple DP’s and TO’s.

If there is a concern that without a standard requirement to support it, a registered DP would not provide the required data to a TO or TP then how could it be expected that a non-registered entity would provide this information. The TO has the authority to obtain this data for any entities connected to its system via FAC-002.

If it is decided to continue to include Distribution Providers in the applicability, please clarify the applicability and obligation of the “registered” (USLF)-Only DP. Would MOD-032 now be applicable to all USLF only Distribution Providers?

Comment

The definition of Distribution Providers is limited by the current definition of Distribution providers to the entity that operates the wires between the Transmission system and the end-user. This is a short-cut to getting the DERs included in the standard. I recommend editing the definition of Distribution Provider to include those entities that are responsible for the operation and balancing of DERs if this is how the SDT wants to address this issue.

Thomas Standifur - Austin Energy - 1

Answer	No
Document Name	

Comment

Austin Energy supports APPA's comments.

Austin Energy is concerned about having the DP responsible for significant data collection from DER that it doesn't have control over, may be difficult to attain, not available or inaccurate. The SDT should, at minimum revise the proposed standard to indicate that (a) DPs’ and TOs’ responsibility with respect to DER data is limited to passing along any responsive data they have received from DER owners, without vouching for the data’s completeness or accuracy”

Kacie Fischer - Kacie Fischer On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Kacie Fischer

Answer	No
Document Name	

Comment

Oncor does not agree with the Load Serving Entity ("LSE") to Distribution Provider ("DP") terminology modification. Even for Transmission Owners that are also DP (like Oncor), there are many instances in which we interconnect and deliver transmission-level service to another DP. In these cases, Oncor would not have access to the DER modeling parameters listed in Attachment 1 or visibility into the other DP's system other than the aggregated load provided.

We further disagree with the changes outlined in Attachment 1 in the Steady-State column of Table – #9, which are being proposed in conjunction with the change in terminology from LSE to DP. It will be more appropriate to specify general model requirements in MOD-032 and allow Planning Coordinators and Transmission Planners to determine model details that are appropriate for their established processes and methodologies. Also, it may be impossible to provide individual specifications for Retail Scale DER such as reactive capability and in-service date.

Also, Oncor would like further clarification on the following:

1. "a. Location (bus from item 1) and if DER feeder is subject to UFLS and/or UVLS"
    - Could the SDT elaborate on how knowing that a DER is on a UFLS feeder could impact the results of a Steady State analysis? We do not see the need for the UFLS data in the Steady State column.
2. "b. Real power capability (minimum and maximum)"
    - Is this referring to the nameplate or approved capacity?

- Is the meaning of *minimum* equivalent to approved capacity? And is *maximum* equivalent to nameplate capacity?

3. “c. Reactive capability (minimum and maximum)”
   - Oncor does not typically track reactive power data for currently installed DER.
4. “d. Generator type (solar, battery, etc.)”
   - Oncor recommends modifying this statement to give instruction on how to report a single location with multiple types of DER.
5. “e. In-service date or other information to be used to make assumptions about DER capabilities related to ride-through, voltage control and/or frequency control.”
   - Can you define the in-service date? In Oncor’s experience, some DER projects will connect to our system, test, and then permission is granted to operate. For some of the DER projects, we give permission for them to operate; but the project is not energized until the DER facility is ready on their end. Typically, the registered resources that participate in ancillary services go in-service before they are permitted to operate for testing purposes.
   - This is not practical for DERs that are modeled in an aggregated manner.

Comment
Load Serving Entity is no longer an active NERC registration code. BPA agrees that replacement is appropriate. However, Attachment A adds a parenthetical that states the Transmission Owner (TO) is responsible when a Demand or DER is not associated with a registered DP. That would put the responsibility on BPA as the TO. What if the TO cannot get non-BES DER data from an unregistered customer? As long as BPA is held responsible for providing data as the TO (that we do not have the authority to require from an unregistered DP), our vote will be NO.

Agree with EEI comment: {C}· To better clarify the extent of DER resources that must be reported under MOD-032, EEI suggests that a Facilities section be added to this Reliability Standard.	

{C}· Footnote 2 – EEI asks that the SDT provide additional clarity regarding the intent of Footnote 2. Footnote 2 appears to require DPs (or TOs) to supply Aggregate Demand data that has been manipulated to exclude all DER offsets. While we understand why this would be desirable, most small DERs are not metered except for billing meters. Billing meters are not synchronized with SCADA data, diminishing the value of any data supplied by the reporting entities. We are further concerned that the manhours required to account for these DER offsets could be substantial adding excessive costs while providing questionable value to this change. As an alternative, EEI suggests that DPs and TOs could provide estimated DER offset values, which would require fewer manhours to develop and should provide sufficient value to the planning models.

{C}· Steady-state and Dynamic columns

EEI is concerned that the data requests identified in Item 9 (Steady-state), and Item 10 (Dynamic) seek non-aggregated data, while the SAR specifies that aggregated DER data is to be supplied. To address this concern, we ask that both Items 9 and 10 be edited to make it clear that data requests to DPs and TOs are to be limited to aggregate DER data.

{C}· Footnote 4: EEI is concerned that footnote 4 does not align with the SAR. In the SAR, data requests for DERs appear to be limited to aggregated DER data, however, in footnote 4 it states “TP/PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary”. This appears to go beyond the approved limits of this SAR and should therefore be removed.

Comment	

The The **ISO/RTO Council Standards Review Committee ("SRC")** [1] supports the replacement of "Load Serving Entity (LSE)" with "Distribution Provider (DP)." This is a vast improvement over where MOD-032 stands today as this will fill the gap left by the retirement of the LSE function.

[1] For purposes of these comments, the IRC SRC includes the following entities: CAISO, IESO, ISO-NE, MISO, NYISO, PJM, SPP and ERCOT (with the exception of the response to question 2).

This modification appears to meet the intent of the SAR by addressing the paralleled DERs that are presently not modelled within Distribution Provider's system models. While some argument could be made concerning the minimal impact on system planning studies caused by Distribution Customer's DER deployment, it is important to set a standard approach toward assessing potential impacts, and these requirements are not substantially burdensome.

Texas RE supports the modification to remove Load Serving Entity (LSE) and replace with Distribution Provider (DP) as LSE is no longer a registered function. Texas RE has some concerns, however, regarding the actions required by the DP in gathering Distributed Energy Resource (DER) data. There seems to be a potential gap for getting the DER data for Power System Modeling and Analysis as written. DPs are not typically the owners of the DER data and there are no current NERC registration or requirements for the owners of the DER data to provide the data to DPs. As written, the compliance responsibility for providing the DER data falls on the DP who may not authority or a robust process to get the data from the current and future DER owners. Texas RE recommends a requirement that the registered entity managing DERs provide the data to the DPs. Additionally, that non-registered DERs should be captured effectively to ensure reliability operations.

Texas RE does agree that the DPs should be responsible for providing the equivalent system impedance data (distribution feeder, power transformer, etc.) for the DER connections.

The Standard does not specify a threshold limit for the DER facilities required to provide the data. Texas RE recommends the ‘Term(s)’ section include a distinction between utility scale DERs (commercial level DERs, utility scale solar facilities, etc.) and aggregated level DERs (residential rooftop solar, small generators, residential batteries, etc.).

Texas RE understands the intention of the modifications to MOD-032 is to provide visibility of DER in planning models and achieve consistency in representation of various types of DER. To avoid double-counting DERs in the models, Texas RE recommends identifying whether or not the DER outputs are embedded in the load forecasts used in the models and that this is aligned with the demand and energy data that is needed for MOD-031-3.

In lieu of creating yet another definition, we recommend using one of the existing definitions in Table D.1 of the SPIDERWG document: https://www.nerc.com/pa/Documents/DER_Quick%20Reference%20Guide.pdf, or potentially using the NERC Distributed Energy Task Force (ERTF) DER definition: Any resource on the distribution system that produces electricity and is not otherwise included in the formal NERC definition of the Bulk Electric System (BES).

Buckeye agrees with the comments prepared by ACES:

We have an ongoing concern regarding the level upon which this will require DPs to collect DER data interconnected to distribution systems. The proposed draft establishes a zero MVA threshold for the collection of all DER data "in non-isolated parallel operation with the Bulk Power System". Per the Technical Rationale, this includes each and every residential solar and commercial rooftop solar customer on the DP's systems. This is a major concern given the extent it may go to exhausting the resources of our Members for the collection of DER data which may or may not have a material impact to the reliability of the BES. Additionally, we have concerns regarding footnote 4 on the last page of the Attachment 1. This footnote states: "The TP/PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary for local practices and the TP/PC may need to coordinate with the DP/TO to determine appropriate assumptions for equivalent distribution system impedance."
This statement seems to allow some discretion for allowing "local practices" to then dictate what classifications of DER are to be modeled in aggregate versus otherwise. If that is the case, then it seems to conflict with the stated goal of the MOD-032-1 SAR to "…provide clarity and consistency for data collection across PCs and TPs when coordinating with the DP to gather aggregate load and aggregate DER data." We recommend that a non-zero MVA threshold be established below which DER data will be modeled in aggregate and above which DER data will be modeled explicitly. Allowing such "local practices" to dictate which DERs are to be modeled in aggregate or not seems contrary to having a standard for the industry to implement that is intended to provide clarity and consistency.
Thank you for the opportunity to comment.

Answer	
Document Name	2022-02_Unofficial Comment Form_ERCOT Comments.docx
Comment	

ERCOT generally supports DER-related data collection and recommends that it occur at an early stage (steady-state) of model development. ERCOT requests the following revisions and clarifications to the draft standard.

1. Dual Planning Authority (PA) / Planning Coordinator (PC) Designation

While there is justification to reference both the Planning Authority and Planning Coordinator in the Applicability section (section 4), since Appendix 5B: Statement of Compliance Registry Criteria of the NERC Rules of Procedure, dated January 19, 2021, still uses both terms, the explanatory paragraph in Part 4.1.4 refers to synchronization between registration criteria and the NERC functional model, which is not maintained, was never formally approved, and is only posted as a historical document. Therefore, ERCOT requests the explanatory paragraph be deleted from Part 4.1.4, which would then read as follows:

4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

2. Planning Coordinator (PC) Interface

ERCOT notes the importance of retaining the PC's flexibility with respect to determining the process used to acquire modeling data. While some PCs prefer to interface directly with the DP as noted in footnote 2 (*see* page 20 of 22 of the standard), other PCs prefer to interface with the Transmission Owner (TO) or Transmission Planner (TP). In the latter example, the TO or TP maintains the interface with the DP.

In support of this flexibility, ERCOT requests the SDT revise the table in Attachment 1 by removing the last sentence from footnote 2, adding a new footnote 3 to the first reference to DP in the steady-state column, and renumbering the remaining footnotes as needed, as proposed below:

2. Aggregate Demand*2* [DP*3*, TO (when a Demand is not associated with a registered DP)] a. real and reactive power* b. in-service status*

Footnote 2: For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources.

Footnote 3: Wherever DP is noted as the functional entity responsible for reporting data in Attachment 1, a Distribution Provider is responsible for providing this information, generally through coordination with the Transmission Owner or as specified in the joint PC/TP modeling data requirements and reporting procedures developed per R1.

3. Attachment 1, *steady state* column, item 9

a. Strike "feeder" to provide the TP/PC with flexibility in tracking the status of UVLS and UFLS (i.e. as aggregated values or as individual feeders).

b. Clarify the use of "and/or" with regards to UVLS and UFLS. Using "and/or" creates four possible combinations that must be tracked: UFLS only, UVLS only, both UFLS and UVLS, and neither UFLS nor UVLS. Is the intent of the SDT to track all these possible permutations?

ERCOT requests that the SDT modify item 9 to read as follows:

9.a. Location (bus from item 1) and if DER is subject to UFLS and/or UVLS

b. Real power capability (gross minimum and maximum)

c. Reactive power capability (gross minimum and maximum)

4. Attachment 1, existing footnote 4 - clarify the use of "/" by revising the footnote to read as follows:

4 The modeling data requirements and reporting procedures that the PC and TP jointly develop under R1 may require either aggregated or unaggregated data as necessary for local practices and the TP or PC may need to coordinate with the DP or TO to determine appropriate assumptions for equivalent distribution system impedance.

5. Clarify the intent of the short circuit column

The technical rationale states that "[d]rastically altering the structure of Attachment 1 or adding DER data to the 'short circuit' column was beyond the scope of the Project 2022- 02 SAR," which in turn states "note that the SPIDERWG does not see a need to modify the short circuit column of Attachment 1 because #1 already states 'all applicable elements' in the steady-state column should have necessary information related to positive, negative, and zero sequence data provided accordingly. If the TP/PC determines that aggregate DER is needed for these studies, then they have the capability to request such data. However, this is not a prevalent issue currently."

While the dynamics column was edited to include Distributed Energy Resource Data to match the format of the Dynamics column, the short circuit column was not updated per the reasoning given in the technical rationale and SAR. However, the short circuit column includes the bullet "[p]rovide for all applicable elements in column 'steady state' [GO, RP, TO]," which could be interpreted to compel the relevant entities to collect DER information in the short circuit models if it is deemed an applicable element. ERCOT requests that the SDT confirm that the TP/PC would determine if DER information is an applicable element for short circuit models.

6. Clarify the note regarding data that vary with system operating state and conditions

The steady-state column of Attachment 1 indicates that "[i]tems marked with an asterisk indicate data that vary with system operating state or conditions." ERCOT recommends that the SDT clarify or provide additional information regarding what types of system operating states or conditions are contemplated. For example, if a data element changes seasonally, should the element be marked with an asterisk, or are seasonal variations not considered "system operating state[s] or conditions" for purposes of Attachment 1?

Shannon Mickens - Southwest Power Pool, Inc. (RTO) - 2 - MRO,WECC, Group Name SPP RTO

Answer	
Document Name	

Comment

The SPP RTO recommends the drafting team revise the original Standard Authorization Request (SAR) to keep the project open and coordinate with other NERC drafting teams to address data collection efforts that are applicable to the Inverter-Based Resource (IBR) and Energy Storage Resource (ESR-Batteries). This coordination effort will create a level of proficiency and efficiency in the areas of creating accurate models that can be used by the appropriate entities in their study processes to generate quality results that address initial concerns applicable the reliability of the grid.

The drafting team should conduct a cost analysis to help industry understand the cost impacts of this project.

Additionally, the drafting team should consider a resource analysis to help industry understand the additional time required for their resources to participate in these efforts if the project is extended for a certain amount of time.

As for concerns, one of them focuses around NERC suggesting new responsibilities being applicable to the PC and TP in reference to modeling as well as studying process in reference to the reliability of the grid. For example, NERC suggests that there is a need to conduct an EMT study ever so often to help identify issues in a PC and TP footprint; however, the EMT standard has not been approved by the NERC Board of Trustees (BoT) nor FERC at this point. The RSTC has identified that the MOD-032 standard current doesn’t align with such data collection efforts to assist industry, specifically the PC and TP, in this type of process. These data collection gaps need to be resolved prior to giving the PC and TP related responsibilities.

Furthermore, there will be a need to align with the proposed MOD-026-2 standard in reference to the IBRs from a PC and TP perspective (PC and TP creating a process for GOs and TOs to access models).

Moreover, NERC has identified that PRC-024-3 doesn’t provide the information needed to address IBR ride-through with the occurrence of a system disturbance. From our perspective, there will be a need for data collection via MOD-032 to help ensure an appropriate performance standard can be developed to address NERC’s reliability concerns and needs.

Finally, our last concern pertains to the definition of the DER. There are several definitions currently used in industry, including the SPIDERWG's definition. We recommend that the drafting team coordinate with NERC legal to structure one definition (vetted via standard development process) for industry use. Without a common Glossary Term, there is a potential that the various definitions of DER will create confusing as well as reliability/compliance risks for the PC and TP..

Devon Tremont - Taunton Municipal Lighting Plant - 1

Answer	
Document Name	

Comment

Taunton Municipal Lighting Plant (TMLP) understands and respects the defined need for additional DER modeling data as these resources continue to grow behind-the-meter and beyond the visibility of PCs and BAs. Our concerns with the modifications to MOD-032 are simply to ensure that they require what we can reasonably expect to provide given current configurations. Adding all of the changes that the SDT proposed concerns us that we will continue to add costs to these projects and continue to prevent their viability. Below are additional comments on a few specific proposed revisions to MOD-032:

Proposed DER Definition: The project team is proposing to define a new term of DER to the NERC Glossary. We request additional clarity and background on the development on this definition. We have reviewed the Technical Rationale document that explains its development on Page 1, but it still remains unclear to us what could be considered to have "parallel operation" with the BES versus being a non-BES asset. TMLP requests that we consider a definition that better aligns with the BES definition and its inclusions/exclusions as this will be better understood by DPs.

Att. 1, Steady State Column, New Item 9: The request to provide real and reactive capability, as well as generator type, is within reason as it is readily available information.

Att. 1, Dynamics Column, New Item 10: TMLP requests additional clarity on the parenthetical that requires a distinction of an "*association*" between the DER and the DP, without which the TO is expected to be responsible. In either scenario, it will be unreasonable to expect the DP or TO to provide dynamic modeling information of the DERs. Currently, the DP is typically the host through a Power Purchase Agreement but are not requiring that DER developers provide dynamic modeling information, and the added cost to do so must be considered. At a minimum, the SDT should limit any TO/DP obligations to what is feasible and reasonable, and presently dynamic information for unregistered DERs is not available to us (as a DP) and other DP peers. Expecting a DP or TO to provide this information would require them to alter their interconnection agreements for future projects, as well as sending them on a "research mission" for their existing resources. Further on this point, TMLP agrees with APPA's comments which state "*While DPs may receive some or all of this information at the interconnection request stage, and can pass whatever data they have to their PC and TP, the draft standard must be revised to account for the fact that the DPs and TOs do not own or control these DERs, and thus cannot be held responsible for the completeness or accuracy of the data they themselves receive from the DER owners."*

tt. 1, Steady-State Column, Footnote 2 on "Aggregate Demand": This effectively provides the authority for the host PC/TP to request that DPs reconstitute their load readings prior to submitting, however, the DP's typically are not using revenue quality metering with their DERs and therefore cannot be relied upon for market reporting. If this is not the intended use of the data, then this needs to be clarified in this footnote. The Technical Rationale document states that current collection and modeling of net demand is not consistent with "a modeling framework that explicitly represents DER," and if this is true, then we need to understand what this framework is. We reside in ISO-NE and their market rules currently define the inputs to *Regional Network Load* to exclude "load served by behind-the-meter generation" (ISO-NE OATT, Section II.21.2).

Comment
In addition to PJM supporting the IRC SRC comments, PJM wants to ensure the coordination of Distribution Provider (DP) data is coordinated between the DP and Transmission Owner (TO). The coordination between the DP and TO is needed to properly model due to the DP interconnection with the TO. Thus, each Transmission Owner shall work with the Distribution Provider(s) within the Transmission Owner's area in collecting data for the PA and PC in order to properly model this information and how it interconnects with the Transmission Owner systems. PJM is requesting this information to be written directly in the Standard to ensure accurate and proper data collection. PJM wants to the thank the Standard Drafting Team for all their work and commitment to the Project!

Comment	

APPA has multiple concerns with the proposed definition of distributed energy resources (DER) and adding this scope to the MOD-032 Standard, as outlined below.

Scope Expansion and non-NERC Registered Entities

The proposed changes to include DERs in MOD-032 is expanding the scope of the Standard to include equipment not currently covered in the BES definition. The concept that non-BES or distribution equipment could impact the reliability and operation of the BES is not new to NERC Standards. For example, there is precedent in the PRC Standards to consider distribution equipment that supports UVLS programs or Protection System schemes. However, the proposed changes in this posting for MOD-032 are not sufficient to ensure the expansion of scope will be effective or reasonable.

The Technical Rationale states “the modifications place a compliance obligation on NERC registered DPs (or TOs) to provide basic information about DER that are connected to their systems so that DER can be properly represented in interconnection-wide cases.” The information includes “Location (bus from item 1) and if DER feeder is subject to UFLS and/or UVLS,” “Real power capability (minimum and maximum),” “Reactive power capability (minimum and maximum),” “Generator type (solar, battery, etc.),” and “In-service date or other information to be used to make assumptions about DER capabilities related to ride-through, voltage control and/or frequency control.” While DPs may receive some or all of this information at the interconnection request stage, and can pass whatever data they have to their PC and TP, the draft standard must be revised to account for the fact that the DPs and TOs do not own or control these DERs, and thus cannot be held responsible for the completeness or accuracy of the data they themselves receive from the DER owners. For example, a DER owner might inadvertently change its nameplate capacity by replacing a damaged inverter with a different capacity from the original due to supply chain issues, and might not think to inform its DP of the change. More fundamentally, some solar installations, whether commercial, industrial, or homeowners installing on rooftops, do so without taking advantage of net metering or otherwise complying with their distribution utility’s interconnection requirements—in other words, DPs may not have complete information about the *location* of DERs on their systems, let alone the capacity, type, and in-service date. Where customers *do* take advantage of net metering, the metering devices are generally not production meters, which highlights a concern regarding the SDT’s proposal to revise the existing requirement for “aggregate demand” data to state that “For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources.” Indeed, it is the nature of “net metering” that the data produced and collected is demand offset by DER output, not separate gross demand and generation values.

A registered entity cannot provide data that the registered entity itself does not have. In particular, it would be unrealistic to expect a TO or DP to have information about unregistered DERs at the same level of detail and accuracy that the unregistered DER owners can provide about their own facilities, nor would it be reasonable to hold a TO or DP responsible for gaps or inaccuracies in the data provided by an unregistered DER owner.

Accordingly, the SDT should, at minimum, revise the proposed standard to indicate that (a) DPs’ and TOs’ responsibility with respect to DER data is limited to passing along any responsive data they have received from DER owners, without vouching for the data’s completeness or accuracy; and (b) the requirement to provide “aggregate demand” can be satisfied by net demand data, at least with respect to net-metered DERs.

Implementation Plan

APPA does not agree with the proposed implementation plan for the DER definition. This definition will eventually be used in several future NERC Standard revisions. Some of these revisions may have a shorter implementation timeframe than Project 2022-02. The effective date of the DER definition needs to be coordinated with the other planned Standard revisions to ensure the timing supports implementation of the other Standard revisions.

Coordination with Other Standard Changes

APPA is concerned about how the DER definition will be used for other future NERC Standard changes, as outlined in the October 2022 "NERC System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG) White Paper." The proposal's impact on other Standards must be clear prior to putting the DER definition in place to avoid unintended consequences. For example, excluding various types of demand response from the DER definition may not be appropriate for PRC-006 and TPL-001. These two Standards may need to consider demand response for proper modeling of the BES. If NERC intends to add DERs to EMT Modeling Requirements in MOD-026, then this would be a significant cost and pose technical challenges for registered entities, which could impact the DER definition scope.

When reviewing the DER definition, entities need to understand how this definition will be used in all of the impacted Standards. APPA recommends creating a standalone Standards Project that addresses the DER definition development for all future Standard changes, similar to Standard Project 2016-02 and Standard Project 2015-09.

Response

Bobbi Welch - Midcontinent ISO, Inc. - 2, Group Name ISO/RTO Council Standards Review Committee (IRC SRC) 2022-02 Modifications to MOD-032 Draft 1

Answer	
Document Name	2022-02_Unofficial Comment Form_SRC_07-14-23_Final (as filed).docx

Comment

To achieve this project's objective [1] in an effective and efficient manner, the SRC recommends NERC do the following:

1. **Retain the need to define Distributed Energy Resources (DERs) as part of the scope of this project (as opposed to initiating another project).** This would be beneficial because:

a. The SDT for this project already includes many SPIDERWG members. Therefore, the existing team already has the "right" representation and expertise to perform this task.

b. The existing SDT has discussed and examined a broad range of DER definitions, so a substantial portion of the work needed to develop a DER definition has already been done, thereby giving the existing SDT a leg up on this effort.

c. It would eliminate the need for NERC to initiate another project and for industry to provide representatives to staff another team that would be starting this work from scratch (i.e., a loss of efficiency) and which may not be able to attract a commensurate level of expertise, e.g., SPIDERWG members (i.e., a loss of effectiveness).

2. **Revise the DP registration criteria found in the Rules Of Procedure (ROP), Appendix 5B, Section III** and in the corresponding **ERO Enterprise Registration Practice Guide Distribution Provider "directly connected" Determinations.pdf (nerc.com)** to more closely align with the criteria proposed in its Work Plan to register Inverter-Based Resources (IBRs) under FERC Docket RD22-4-000.

When the DP criteria (RoP, Appendix 5b, Section III.a.1) in the **ERO Enterprise Registration Practice Guide Distribution Provider "directly connected" Determinations.pdf (nerc.com)** was updated in July 2018, two key aspects were modified that are now in direct opposition to the approach NERC is taking with respect to registering IBRs:

a. **The amount of peak load served by the DP system was increased from 25 MW to 75 MW.** This is in direct contrast to NERC's Work Plan for the registration of IBRs whereby NERC is seeking to decrease the registration threshold from 75 MVA to 20 MVA.

b. **The connection point for peak load was changed from "directly connected to the "Bulk Power System (BPS)" to "directly connected to the BES."** Again, this is in direct contrast to NERC's Work Plan for the registration of IBRs whereby NERC is seeking to register IBRs that are directly connected to the BPS.

As the penetration of Distributed Energy Resources (DERs) increases, there will be a reliability need to register a broader range of Distribution Providers as was acknowledged with IBRs. The SRC requests NERC address this issue as part of this project, perhaps as a separate phase.

3. Dual Planning Authority (PA) / Planning Coordinator (PC) Designation

While there is justification to reference both the Planning Authority and Planning Coordinator in the Applicability section (section 4) since NERC Appendix 5B: Statement of Compliance Registry Criteria, dated January 19, 2021, still uses both terms, the explanatory paragraph in Part 4.1.4 refers to synchronization between registration criteria and the NERC functional model, which is not maintained, was never formally approved, and is only posted as a historical document. Therefore, the SRC requests the explanatory paragraph be deleted from Part 4.1.4 as illustrated below and in the attached file:

4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

Planning Coordinator (PC) Interface

The SRC notes the importance of retaining the PC's flexibility with respect to determining the process used to acquire modeling data. While some PCs prefer to interface directly with the DP as noted in footnote 2 (*see* page 20 of 22 of the standard), other PCs prefer to interface with the Transmission Owner (TO) or Transmission Planner (TP). In the latter example, the TO or TP maintains the interface with the DP.

Footnote 2: *For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. A Distribution Provider is responsible for providing this information, generally through coordination with the Transmission Owner.*

The SRC requests the SDT clarify the required interfaces under the standard are "as directed by the PC" so information flows to the appropriate entities as part of the data collection process. Leave flexibility to the PC for determining how this data is collected as proposed below:

2. Aggregate Demand2 [DP3, TO (when a Demand is not associated with a registered DP)] a. real and reactive power* b. in-service status*

Footnote 2: For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources.

Footnote 3: Wherever DP is noted as the functional entity responsible for reporting data in the table, a Distribution Provider is responsible for providing this information, generally through coordination with the Transmission Owner.

Footnote 4: Including synchronous condensers and pumped storage.

Other Clarifications

1. Attachment 1, "steady state" column, item 9

a. Strike "feeder" to provide the TP/PC with flexibility in tracking the status of UVLS and UFLS (i.e. as aggregated values or as individual feeders).

b. Clarify the use of "and/or" with regards to UVLS and UFLS. Using "and/or" creates four possible combinations that must be tracked: UFLS only, UVLS only, Both UFLS and UVLS, and neither UFLS nor UVLS. Is the intent of the SDT to track all these possible permutations?

The SRC requests the SDT modify item 9 to add the following details:

9.a. Location (bus from item 1) and if DER is subject to UFLS and/or UVLS

b. Real power capability (gross minimum and maximum)

c. Reactive power capability (gross minimum and maximum)

2. **Attachment 1, footnote 4 -** clarify the use of "/" as illustrated below:

4 The TP or PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary for local practices and the TP or PC may need to coordinate with the DP or TO to determine appropriate assumptions for equivalent distribution system impedance.

[1] From pages 1-2 of the SAR: "*Update MOD-032-1 to: (1) include "data requirements and reporting procedures" for DER that are necessary to support the development of accurate interconnection-wide models, (2) replace Load-Serving Entity (LSE) with Distribution Provider (DP) because of the removal of LSEs from the NERC registry criteria, (3) enable the SDT to review any additional gaps in DER data collection with the de-registration of LSE.*"

Comment

EEI supports SDT efforts to address DER impacts, however, the modifications to MOD-032-2 is inappropriately running ahead of NERC IBR organizational registration efforts. Presently, TOs and DPs have no ability to compel DER owners to supply the data identified in the proposed Reliability Standard and until these issues are settled through changes to DER registration, efforts to gather DER data beyond those resources DPs own will likely yield little useful data. Additionally, subjecting DPs and TOs to the compliance obligations through MOD-032-2, before the registration issues have been solved, represent untenable regulatory obligations they cannot fulfil. To address this concern, we ask that all efforts by the Project 2022-02 SDT to compel TOs and DPs to supply DER data, beyond the resources they own and operation, be removed.

We also do not support the development of a DER definition within this NERC Reliability Standards project. The impact of this definition will have far reaching impacts that go beyond this project. To address this issue, we suggest that a separate NERC Reliability Standards project be developed to address this definition.

EEI is additionally concerned that the number of separate DER projects currently under development and otherwise being considered is growing very quickly and it is unclear if there is adequate coordination between all of these projects. While addressing these issues is important, speed should not take precedent over ensuring these efforts are adequately coordinated and Requirements are not being duplicated or conflict.

In addition to the above concerns, we offer the following comments and concerns for consideration:

Applicability Section

There is insufficient clarity related to the extent of DER resources that must be reported under MOD-032. To address this concern, a Facilities section should be added to this Reliability Standard.

Attachment 1

General comment: As stated in EEI's response to Question 1, we support the replacement of LSEs with DP, however, Attachment 1 goes beyond the replacement of LSEs with DP and includes TOs as an additional replacement where there are no registered DPs. This change should be stricken from the proposed draft of MOD-032-2. Registration problems cannot be solved through compliance obligations placed on registered entities who do not participate in the approval of DER interconnections or have any ability to compel the sharing of DER data contained on networks outside their purview.

Steady-State Column - Item 2 (Aggregate Demand) & Dynamic Column – Item 5

EEI does not support the addition of "TO (when a Demand is not associated with a registered DP)" to Steady-State Column - Item 2 (Aggregate Demand) & Dynamic Column – Item 5 (Demand) because TOs have no part in interconnections on Distribution Provider systems and would therefore only have this data if it were supplied to them by the responsible DP. Furthermore, it is impractical to expect that TOs could compel unregistered DPs to supply this data. We further note that even registered DPs only have detailed data on DERs they own. Compelling DPs to similarly supply data beyond those resources they own should be removed. For these reasons, changes to MOD-032-2 should be placed on hold until registration issues surrounding DER owners can be resolved through the NERC organizational registration reforms that are intended to address IBRs that impact the BPS.

Footnote 2 – Additional clarity is needed regarding the intent of Footnote 2. Footnote 2 appears to require DPs (or TOs) to supply Aggregate Demand data that has been manipulated to exclude all DER offsets. While this would be desirable, most small DERs are not metered except through billing meters. Billing meters are not synchronized with SCADA data, diminishing the value of any data supplied by the reporting entities. Additionally, the work hours required to account for these DER offsets could be substantial, adding excessive costs while providing questionable value or improved reliability through this change. As an alternative, EEI suggests that DPs might be able provide estimated DER offset values to address the immediate needs of planners in the development of their planning models, but even this should be studied to ensure such efforts are even possible or practical to implement.

Steady-state Column (Item 9) and Dynamic Column 10

See EEI comments for Items 2 and 5 above.

Footnote 4: Footnote 4 does not align with the SAR. In the SAR, data requests for DERs appear to be limited to aggregated DER data, however, in footnote 4 it states "TP/PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary". This appears to go beyond the approved limits of this SAR and should therefore be removed.

Suggest making the following conforming changes to section 4.1.4 as per standards MOD-031-3 and MOD-033-2 in the NERC project 2017-17 - Standards Alignment with Registration project: Replace “Planning Authority and Planning Coordinator (hereafter collectively referred to as “Planning Coordinator”)” with “Planning Coordinator”. Delete the 2nd paragraph in section 4.1.4 R3 indicates “…each notified BA, GO, DP, RP, TO, or TSP shall respond to the notifying PC or TP as follows …”. The R3 VSL indicates these entities failed to provide a written response to their PC or TP. Suggesting either adding “written” to R3 or removing it from the R3 VSL. R1 Severe VSL: Correct “The Planning and Transmission Planner(s) Coordinator …” for “The Planning Coordinator and Transmission Planner(s)…” R2 Severe VSL: Missing the TO entity after the last “OR”. R3 VSL: incorrect references to R4 instead of R3 in all VSL levels. R3 Severe VSL: should read “or within a longer period of 45 days agreed upon by the notifying Planning Coordinator or Transmission Planner” instead of “or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner” TO’s and DP’s cannot be required to provide data for DER (or any generation resources) that the TO and DP do not own. TO and DP have no authority to collect this data and DER’s are not obligated to provide the data. In Attachment 1, under Dynamics, the following change should be made: Distributed Energy Resource (DER) data [DP, TO (when DER is owned by the TO or DP) In Attachment 1, under Steady-State, the following change should be made: Distributed Energy Resource (DER) data [DP, TO (when DER is owned by the TO or DP)

a. Location (bus from item 1) and if DER feeder is subject to UFLS and/or UVLS

b. Real power capability (minimum and maximum)

c. Reactive power capability (minimum and maximum)

d. Generator type (solar, battery, etc.)

e. In-service date or other information to be used to make assumptions about DER capabilities related to ride-through, voltage control, and/or frequency control.

Eversource recommends the drafting team consider the category of “Transients” (specifically EMT Models) as an inclusion in required data submittals in Attachment 1 to reach the SDT’s goal to “address gaps in data collection for the purposes of modeling aggregate levels of DERs in planning assessments” per the MOD-032 SAR.

While interconnection-wide models are built using dynamic and short circuit studies and not transient studies, there are still situations where border areas are studied between differing TPs or PCs, and the need for these EMT models to be available is necessary to better model aggregate levels of DERs.

Attachment 1 Data Reporting table (Steady State Column items 2, and 9, and Dynamics Column items 5, and 10) has added language indicating that the Transmission Owner (TO) is the responsible entity for submitting modeling data when a demand is not associated with a registered Distribution Provider. AZPS requests clarification regarding the type of entity that would have load, but not be a registered distribution provider. AZPS is concerned that the Transmission Owner may not have the ability to produce or acquire certain load information from an unregistered entity unless there is some other type of contractual relationship in place.

DER Definition:

Southern Indiana Gas & Electric Co. (SIGE) believes the potential impact of the DER definition exceeds the current scope of Project 2022-02 and suggestions expanding the scope of the current project and/or initiating a separate NERC Reliability Standards project to address the DER definition.

Applicability:

SIGE believes there is insufficient clarity related to the extent of DER resources that must be reported under MOD-032. Further clarity on the DER definition is needed.

Attachment 1:

SIGE agrees with EEI's comments that changes to MOD-032-2 should be put on hold until registration issues surrounding DER owners can be resolved through the NERC organizational registration reforms intended to address Inverter Based Resources (IBRs) that impact the Bulk Power System (BPS) .

SIGE is supporting EEI's **Footnote 2**.

SIGE recommends replacing the '\' in **Footnote 4** with "**or**". "The TP/ or PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary for local practices and the TP or PC may need to coordinate with the DP or TO to determine appropriate assumptions for equivalent distribution system impedance."

Attachment 1 - Under Steady State (2, 9) Recommend changing language to [DP (when a Demand connected to the DP is not associated with a registered DP), TO (when a Demand connected to the TO is not associated with a registered DP)]. Under dynamics (5, 10) Recommend changing language to [DP (when a Demand connected to the DP is not associated with a registered DP), TO (when a Demand connected to the TO is not associated with a registered DP)]. An entity that has an unregistered DP connected to them will have both the knowledge that the entity exists and contacts for them to obtain the required information. If a TO is required to provide information for an unregistered DP that receives its service through a registered DP, they may not know the entity exists or have the required contacts to obtain the required information. As written, the SDT is setting the TO up to fail and be non-compliant. Attachment 1 steady state, modify (9e) to DER capabilities related to ride-through, voltage control and/or frequency control, if available, or In-service date or other information to be used to make assumptions about them if this information is not available. Recommend trying to get the actual information if it is available rather than always making assumptions for this.

Comment
CEHE finds the proposed revisions to MOD-032-2, Attachment 1 too detailed and prescriptive. The NERC Standard should be written to give Planning Coordinators (PC), Transmission Planners (TP) and Transmission Service Providers (TSP) the flexibility to coordinate and determine the specific data requirements that are needed for the planning models under MOD-032-2, Attachment 1. CEHE recommends that data reporting requirements listed in Attachment 1 be determined by the PC, in coordination with TP. In the ERCOT region, processes are already in place to define these data requirements through the coordination of the Planning Coordinator and Transmission Planners as part of various regional working groups. CEHE also supports the comments as submitted by the Edison Electric Institute (EEI) regarding the development of a DER definition separate from the NERC Reliability Standards Project 2020-02. CEHE agrees with EEI comments on how presently, Transmission Owners (TOs) and Distribution Providers (DPs) have no ability to compel DER owners to supply the data identified in the proposed Reliability Standard and until these issues are settled through changes to DER registration, efforts to gather DER data beyond those resources DPs own will yield little useful data. Subjecting DPs and TOs to the compliance obligations through MOD-032-2, before the registration issues have been solved, represents untenable regulatory obligations they cannot fulfil. To address this concern, CEHE suggests that all efforts by the Project 2022-02 SDT to compel TOs and DPs to supply DER data, beyond the resources they own and operate, be removed. CEHE agrees with EEI comments relative to TOs. These entities may have no insights on DERs of unregistered DP systems and therefore should not be held accountable for supplying this type of information. CEHE supports the additional comments submitted by EEI regarding footnote 4 of the SAR.

RE: Definition of Distributed Energy Resource (DER): Please consider that the definition of Distributed Energy Resource (DER) should be more generic, such as, “Real Power and Reactive Power resources connected on the distribution system, in non-isolated parallel operation. Please consider changing active power to Real Power since “active power” is not included in the NERC Glossary of Terms and is in literature a synonym to Real Power and should not be defined differently. In the NERC Glossary of Terms, Real Power is defined as, “The portion of electricity that supplies energy to load.” In the slides presented at the Project 2022-02 webinar (June 27), “Active power” was proposed to “indicate[s] that the scope is focused on only those facilities that may be exporting real power to the power system or offsetting real power load (e.g. residential or commercial rooftop solar, even if they only operate at unity power factor or don’t have any reactive power capability). This would exclude examples such as charging-only electric vehicle (EV) installations and controllable load options.” This proposal seems to indicate active power no longer being used as a synonym to Real Power, which could cause a potential risk of misinterpretations.

RE: Applicability – Functional Entities, Section 4.1.4: Please consider removing the “Planning Authority” function from section 4.1.4 since Planning Coordinator is the preferred function name. Please consider that Project 2017-07 Standards Alignment with Registration was previously removing “Planning Authority” from other standards such as MOD-031-2 and MOD-033-1, in-advance of the removal of “Planning Authority” from Rules of Procedure - Appendix 5B: Statement of Compliance Registry Criteria.

RE: Section C. Compliance: Please consider adding (CEA) as the abbreviation of “Compliance Enforcement Authority” to section 1.1. Please consider using the abbreviation CEA in section 1.2.

RE: Attachment 1: Data Reporting Requirements: Please consider limiting steady-state data for new item 9 to read as, “9. Distributed Energy Resource (DER) data4 [DP]” Please consider that sub-parts a., b., c., d., and e. are not necessary since DER data requirements can be agreed upon per requirement R1.

We appreciate the SDT's inclusion of a draft definition for a "Distributed Energy Resource (DER)" in Draft 1 of MOD-032-2. We suggest the words 'Generators and energy storage technologies…' in the definition be replaced with 'Sources of Electrical Energy…'. The NERC Glossary of Terms defines "Electrical Energy" as "The generation or use of electric power by a device over a period of time, expressed in kilowatthours (kWh), megawatthours (MWh), or gigawatthours (GWh)" and is technology neutral. While a DER definition is important, the definition in combination with adding DP applicability may not provide the clarity for applicability that the SDT concludes in the Technical Rationale. The SDT should consider whether utilizing a new Facilities applicability section (4.2) could provide further scope clarity.

We believe section 4.1.4 should be updated to simply "Planning Coordinator". This would be consistent with the direction taken in other NERC standards that previously contained similar language regarding PA/PC applicability (see changes made to MOD-031-3 and MOD-033-2 under Project 2017-07, Standards Alignment with Registration). The Project 2017-07 webpage contains the following statement about MOD-032-1:

"MOD-032-1 will not be revised at this time, but may come back into Project 2017-07. The work of the System Planning Impact from Distributed Energy Resource Working Group (SPIDERWG) is ongoing at the time of the final posting for Project 2017-07. In June 2018, the NERC Planning Committee (PC) formed the SPDERWG subcommittee to address Distributed Energy Resource (DER) impacts on the bulk power system (BPS). Currently, the subcommittee has proposed a Standard Authorization Request (SAR) for MOD-032-1 pertaining to DERs. The SAR has recently been reviewed by the PC. At this time, the Project 2017-07 drafting team will not take any action in reference to the MOD-032 standard until the SPIDERWG has completed their initial efforts."

While the Draft 1 Technical Rationale notes that the currently posted "Appendix 5B: Statement of Compliance Registry Criteria" still uses the Planning Authority term, a cursory review of all currently active standards reflects that a transition to "Planning Coordinator" in the applicability sections is almost complete, so making this change in MOD-032-2 would complement this transition. FAC-014-3, effective 4/1/2024, will incorporate the PA to PC change for that standard.

We noted in our comments on the SAR that a Distribution Provider may not always be the most practical source for the DER modeling data needed by the PC and TP. We recognize that the SDT has allowed for the flexibility of a Transmission Owner to also be a source for DER modeling data in Draft 1. However if the DP or TO is not directly affiliated with the DER owner, would their need to collect the DER model data from the entities that possess it not essentially mirror the PC and TP's need under R1? The DP and TO might need their own requirement(s) to develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures to obtain DER modeling data (potentially from unregistered entities that don't have an obligation to comply with NERC's Reliability Standards) that would subsequently be passed on to the PC and TP. A "DER data entity" could also be added to the applicability section (reference PRC-006-5 for precedent) with a broader range of registered entity options to fulfil that role (e.g., DP, UFLS-Only DP, TO, RP, GO).

We interpret the implementation plan to mean that the PC and each of their TPs will have 24 months to jointly update their modeling data requirements and reporting procedures to incorporate the changes in Attachment 1. The entities responsible for providing DER modeling data to the PC/TP will then have 12 months to comply. We believe the initial collection and submittal of DER data will be equally if not more time consuming than the PC/TPs efforts to update their modeling data requirements and reporting procedures. As noted above, after receiving the PC/TP's updated modeling data requirements and reporting procedures, the DER data collectors may need to perform outreach and communicate their own procedure/schedule for receiving the data from others. We suggest the implementation plan be revised to allow 24 months (rather than 12 months) after the effective date for the initial performance of R2, R3 and R4.

We suggest that further development of MOD-032-2 and its associated implementation plan be paused until it can be performed in closer conjunction with NERC's three year plan to register 'GO-IBRs', which is just beginning; and the "Modifications to FAC-001 and FAC-002" Standard Authorization Requests approved for posting at the NERC Standards Committee's May 17, 2023 meeting (no NERC project number assigned yet). Addressing these items (and perhaps other IBR related standards initiatives) in a piecemeal fashion will lead to less optimal results and confusion in the industry.

Devin Shines - PPL - Louisville Gas and Electric Co. - 1,3,5,6 - SERC,RF

Answer	
Document Name	

Comment

PPL NERC Registered Affiliates do not agree with the separate inclusion of DER data in Attachment 1. A lack of specific reference to DER data does not mean that the data does not exist or is not already attainable by PCs and TPs under the existing standard. There are already specific provisions in the Standard allowing for the collection of such data. We do not believe there are gaps or lack of clarity within the currently approved MOD-032-1. Directing how an entity should collect and model such data is overly prescriptive, will increase administrative burden, and limit innovation in modeling DERs. The industry is just now learning how DERs are going to affect the BES. It is counterproductive to circumscribe how entities should meet their compliance requirements.

Exelon concurs with the concerns expressed in the EEI comments.

Requirements for DPs and TOs to provide Aggregate Demand and DER data should be limited to the aggregate data currently available to the entity.

For Attachment 1, Steady-State 9e, we suggest removing the implied requirement for the “in-service dates”. Consider restating Attachment 1, Steady-State 9e as, “Information to be used to make assumptions about DER capabilities related to ride-through, voltage control and/or frequency control.” The Technical Rationale document can be modified to discuss how in-service dates may support the response to Attachment 1, Steady-State 9e.

The DP must be able to bound restrictions/limitations to TP request due to limited data availability, reasonableness, etc., when DER data requirements are made.

Also, when determining the size of each DER, a minimum size of 500 kVA should be required for inclusion. Anything less than 500kVA would require an onerous amount of effort to provide accurate data, which would result in data being outdated and/or obsolete, etc. There is limited data available (MOD-032-2 Attachment 1) for DP area small DER generation (e.g., residential solar, small commercial), therefore the accuracy of aggregated small DER generation for BES system impact modeling is limited.

1) Suggest making the following conforming changes to section 4.1.4 as per standards MOD-031-3 and MOD-033-2 in the NERC project 2017-17 - Standards Alignment with Registration project:

- Replace “Planning Authority and Planning Coordinator (hereafter collectively referred to as “Planning Coordinator”)” with “Planning Coordinator”.
- Delete the 2nd paragraph in section 4.1.4

2) R3 indicates “…each notified BA, GO, DP, RP, TO, or TSP shall respond to the notifying PC or TP as follows …”. The R3 VSL indicates these entities failed to provide a written response to its PC or TP. Suggesting either adding “written” to R3 or removing it form the R3 VSL.

3) R1 Severe VSL: Correct “The Planning and Transmission Planner(s) Coordinator …” for “The Planning Coordinator and Transmission Planner(s)…”

4) R2 Severe VSL: Missing the TO entity after the last “OR”.

5) R3 VSL: incorrect references to R4 instead of R3 (more specifically R3.2) in all VSL levels.

6) R3 Severe VSL: should read “[...Requirement R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response after 135 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner)” instead of “Requirement R4 within 135 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).”

7)TO’s and DP’s cannot be required to provide data for DER (or any generation resources) that the TO and DP do not own. TO and DP have no authority to collect this data and DER’s are not obligated to provide the data.

8) In Attachment 1, under Dynamics, the following change should be made:

- Distributed Energy Resource (DER) data [DP, TO (when DER is owned by the TO or DP)

- In Attachment 1, under Steady-State, the following change should be made: Distributed Energy Resource (DER) data [DP, TO (when DER is owned by the TO or DP)

a. Location (bus from item 1) and if DER feeder is subject to UFLS and/or UVLS

b. Real power capability (minimum and maximum)

c. Reactive power capability (minimum and maximum)

d. Generator type (solar, battery, etc.)

e. In-service date or other information to be used to make assumptions about DER capabilities related to ride through, voltage control and/or frequency control.

1. Will there be an aggregate DER threshold (either nameplate or net injection to the grid) above which the DP should submit modeling data to the TP and PC for inclusion in transmission planning models? MOD-025, MOD-026, and MOD-027 standards are being revised to limit applicability to resources included in either I2 or I4 of the BES definition (individual units > 20 MVA or an aggregate plant > 75 MVA). Should thresholds for MOD-032 DER modeling be consistent with the other NERC modeling standard applicability thresholds? 2. Will the NERC BES Reference document be revised to include DER generation (individual units and/or DER aggregations)? 3. Are these DER data reporting requirements limited to merchant DER installations in the future only? o It will be challenging to obtain steady-state and dynamic data for each individual installation that has taken place over the years in the past, especially for non-merchant applications (such as residential roof-top solar resources). Hoe are DPs expected to obtain this data and who will bear the cost associated with this process? o How will DPs be able to obtain and verify the in-service dates of each individual distribution connected resource that has occurred in the past? o Most of the residential and other non-merchant solar and battery installations fall below the installed capacity threshold at which such resources are required to go through the distribution interconnection detailed study process. How are DPs expected to collect steady-state and dynamic data on such resources, even if occurring in the future?

General comments on MOD-032-2:

a. In Section 4. Applicability, under 4.1.4, BC Hydro recommends that the wording “Planning Authority and Planning Coordinator (hereafter collectively referred to as “Planning Coordinator”)”, be changed to “Planning Coordinator”. Retaining the current wording may create confusion or result in misinterpretation, especially for those utilities that treat PA standards and PC standards differently. A PC-only approach has been used in other recently approved NERC standards and those that are being developed, such as FAC-002-4, MOD-033-2, and MOD-026-2.

b. BC Hydro recommends that in Attachment 1, the language used in the DER steady-state data section (Item 9) be generalized to account for distribution-connected hydroelectric generators. A suggested wording is provided below for consideration:

“…c. Reactive power capability (minimum and maximum)

d. Fuel type (solar, wind, hydraulic, battery, etc.)

e. Generator type (synchronous, inverter-based resource, etc.)

f. In-service date or other …”

Steven Rueckert - Western Electricity Coordinating Council - 10, Group Name WECC Entity Monitoring

Answer	
Document Name	

Comment

WECC believes there is value in including these Distributed Sources in system modeling, but is concerned that the proposed defintion may not satisfy that need.

The definition of DER does not seem adequate. First, it includes non BES generation type resources that are beyond BES dispersed generation identified under inclusion I4 of the BES Definition. And thus, appears to go beyond the scope of mandatory standards applicability. A second issue is that because the definition has the qualifier “…connected to the Distribution Provider’s system…” it would leave out any “DER” that did not have a registered Distribution Provider including any connected via some pathway directly to a Transmission System.

WECC believes that a focused effort on defining DER and addressing it within the BES Definition or in the NERC Glossary to be used consistently in all standards.

Comment
Per the Federal Power Act, NERC's jurisdiction is to establish and enforce Reliability Standards for the Bulk Power System. A NERC document, Understanding the Grid, published in March 2023, indicates that the generation and transmission components and their associated control systems make up the BPS, so requiring DP's to provide DER data that is connected to the Distribution system is outside of NERC's jurisdiction, unless the DER is connected to the transmission system such as non-BES generation. Furthermore, the NERC Glossary of Terms definition for Bulk Power System explicitly states that is does not include facilities used in the local distribution of electric energy, which aligns to the definition for bulk-power system in the Federal Power Act Section 215(a), definitions. DER on a DP's network is not that clear in the Technical Reference document. Please provide some examples similar to the BES reference document of what would not be in-scope DER and what would be in-scope DER on a DP's network. What happens if we are unable to obtain modeling data from OEMs for older DER inverters? What if we do not have the information to determine the collector system impedance values? What happens if residential, retail or commercial owners do not want to support this effort? What happens if an IBR OEM has gone out of business?

Andrea Jessup - Bonneville Power Administration - 1,3,5,6 - WECC	
Answer	
Document Name	

Comment
BPA believes that this definition would require adjustment of the BES inclusions and exclusions lists. For example, currently resources below 75 MVA are not required to submit the data that will be required of DER. This will result in entities not providing data for anything less than 75 MVA and citing exclusion (or lack of inclusion), even though the intent appears to require data submission from much smaller resources. BPA suggests excluding legacy equipment such as hydro, or perhaps the definition should only apply to inverter based resources (IBR.) It is also important to note that small generator owners are likely not financially able to test equipment (per MOD-025/026/027) in order to provide modeling data. This could result in shutting down such generators and associated loads costing local jobs in affected areas. BPA requests clarification and consistency regarding the use of Bulk Power System and Bulk Electric System. Both terms are being used.

FE supports EEI's comments which state:

EEI supports SDT efforts to address DER impacts, however, the modifications to MOD-032-2 is inappropriately running ahead of NERC IBR organizational registration efforts. Presently, TOs and DPs have no ability to compel DER owners to supply the data identified in the proposed Reliability Standard and until these issues are settled through changes to DER registration, efforts to gather DER data beyond those resources DPs own will likely yield little useful data. Additionally, subjecting DPs and TOs to the compliance obligations through MOD-032-2, before the registration issues have been solved, represent untenable regulatory obligations they cannot fulfil. To address this concern, we ask that all efforts by the Project 2022-02 SDT to compel TOs and DPs to supply DER data, beyond the resources they own and operation, be removed.

We also do not support the development of a DER definition within this NERC Reliability Standards project. The impact of this definition will have far reaching impacts that go beyond this project. To address this issue, we suggest that a separate NERC Reliability Standards project be developed to address this definition.

EEI is additionally concerned that the number of separate DER projects currently under development and otherwise being considered is growing very quickly and it is unclear if there is adequate coordination between all of these projects. While addressing these issues is important, speed should not take precedent over ensuring these efforts are adequately coordinated and Requirements are not being duplicated or conflict.

In addition to the above concerns, we offer the following comments and concerns for consideration:

Applicability Section

There is insufficient clarity related to the extent of DER resources that must be reported under MOD-032. To address this concern, a Facilities section should be added to this Reliability Standard.

Attachment 1

General comment: As stated in EEI's response to Question 1, we support the replacement of LSEs with DP, however, Attachment 1 goes beyond the replacement of LSEs with DP and includes TOs as an additional replacement where there are no registered DPs. This change should be stricken from the proposed draft of MOD-032-2. Registration problems cannot be solved through compliance obligations placed on registered entities who do not participate in the approval of DER interconnections or have any ability to compel the sharing of DER data contained on networks outside their purview.

Steady-State Column - Item 2 (Aggregate Demand) & Dynamic Column – Item 5

EEI does not support the addition of "TO (when a Demand is not associated with a registered DP)" to Steady-State Column - Item 2 (Aggregate Demand) & Dynamic Column – Item 5 (Demand) because TOs have no part in interconnections on Distribution Provider systems and would therefore only have this data if it were supplied to them by the responsible DP. Furthermore, it is impractical to expect that TOs could compel unregistered DPs to supply this data. We further note that even registered DPs only have detailed data on DERs they own. Compelling DPs to similarly supply data beyond those resources they own should be removed. For these reasons, changes to MOD-032-2 should be placed on hold until registration issues surrounding DER owners can be resolved through the NERC organizational registration reforms that are intended to address IBRs that impact the BPS.

Footnote 2 – Additional clarity is needed regarding the intent of Footnote 2. Footnote 2 appears to require DPs (or TOs) to supply Aggregate Demand data that has been manipulated to exclude all DER offsets. While this would be desirable, most small DERs are not metered except through billing meters. Billing meters are not synchronized with SCADA data, diminishing the value of any data supplied by the reporting entities. Additionally, the work hours required to account for these DER offsets could be substantial, adding excessive costs while providing questionable value or improved reliability through this change. As

an alternative, EEI suggests that DPs might be able provide estimated DER offset values to address the immediate needs of planners in the development of their planning models, but even this should be studied to ensure such efforts are even possible or practical to implement.

Steady-state Column (Item 9) and Dynamic Column 10

See EEI comments for Items 2 and 5 above.

Footnote 4: EEI is concerned that footnote 4 does not align with the SAR. In the SAR, data requests for DERs appear to be limited to aggregated DER data, however, in footnote 4 it states “TP/PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary”. This appears to go beyond the approved limits of this SAR and should therefore be removed.

Comment

Tacoma Power has multiple concerns with the proposed DER definition and adding this scope to the MOD-032 Standard, as outlined in the next few bullets.

Scope Expansion and non-NERC Registered Entities

The proposed changes to include DERs in MOD-032 is expanding the scope of the Standard to include equipment not currently covered in the BES definition. The concept that non-BES or distribution equipment could impact the reliability and operation of the BES is not new to NERC Standards. For example, there is precedent in the PRC Standards to consider distribution equipment that supports UVLS programs or Protection System schemes. However, the proposed changes in this posting for MOD-032 are not sufficient on their own to ensure the expansion of scope will be effective.

The Technical Rationale states “the modifications place a compliance obligation on NERC registered DPs (or TOs) to provide basic information about DER that are connected to their systems so that DER can be properly represented in interconnection-wide cases.” However, there are large distribution utilities that are not registered as DPs, but have aggregate DERs that should be accounted for under the proposed MOD-032 Attachment 1 scope. To ensure the appropriate entities are held responsible, either the (1) BES definition needs to change to include DERs, (2) a new “DP-DER” registration needs to be created, or (3) the DP registration criteria needs to change to ensure the appropriate entities are held responsible. Of these three options, Tacoma Power recommends revising the DP criteria in ROP Appendix 5B, Section III, to include a new criterion to ensure distribution utilities that must provide data to support MOD-032, Attachment 1, are subject to NERC jurisdiction. This approach aligns with the regulatory precedent set for UVLS programs, RAS schemes, and Protection System components under PRC-005 and PRC-006. Without a seperate effort to revise the DP registration, Tacoma Power cannot approve the draft MOD-032. The draft Standard cannot be fulfilled without these entities being held responsible for the data.

Below is an example mark-up of ROP Appendix 5B, Section III for NERC to consider in the ROP revision:

III.a.1 Distribution Provider system serving >75 MW of peak Load that is directly connected to the BES; or

III.a.2 Distribution Provider is the responsible entity that owns, controls, or operates Facilities that are part of any of the following Protection Systems or programs designed, installed, and operated for the protection of the BES:

- *a required Undervoltage Load Shedding (UVLS) program and/or*
- *a required Special Protection System or Remedial Action Scheme and/or*
- *a required transmission Protection System; or*

III.a.3 Distribution Provider that is responsible for providing services related to Nuclear Plant Interface Requirements (NPIRs) pursuant to an executed agreement; or

III.a.4 Distribution Provider with field switching personnel identified as performing unique tasks associated with the Transmission Operator’s restoration plan that are outside of their normal tasks; or

III.a.5 Distribution Provider is the responsible entity that serves, controls, owns, or operates Distributed Energy Resources (DERs) exceeding 0.01 MW.

DER Definition

Tacoma Power supports the essence of the DER definition, but is concerned that it is unclear whether the proposed definition includes devices that have transient export of real power such as closed transition transfer switches, regenerative elevators/cranes, and industrial motors with regenerative braking. The proposed definition should be clarified to exclude these devices, while still including devices installed for energy storage such as batteries, flywheels, and Synchronous condensers. Tacoma Power suggests adding "for at least 30 seconds" to the definition so that the definition reads "... *providing active power for at least 30 seconds in non-isolated parallel operation*... "

The IEEE definition of DER includes both the energy resource plus any necessary supplemental equipment. Tacoma Power would like to see similar guidance within the NERC DER definition. This ensures that reactive power control devices such as capacitor and STATCOMS are correctly included in the DER model submittals.

Implementation Plan

Tacoma Power does not agree with the proposed implementation plan for the DER definition. This definition will eventually be used in several future NERC Standard revisions. Some of these revisions may have a shorter implementation timeframe than Project 2022-02. The effective date of the DER definition needs to be coordinated with the other planned Standard revisions to ensure the timing supports implementation of these other Standard revisions.

Coordination with Other Standard Changes

Tacoma Power is concerned about how the DER definition will be used for other future NERC Standard changes, as outlined in the October 2022 "NERC System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG) White Paper." The proposal's impact on other Standards must be clear prior to putting the DER definition in place to avoid unintended consequences. For example, excluding various types of demand response from the DER definition may not be appropriate for PRC-006 and TPL-001. These two Standards may need to consider demand response for proper modeling of the BES. If NERC intends to add DERs to EMT Modeling Requirements in MOD-026, then this would be a significant cost and pose technical challenges for registered entities, which could impact the DER definition scope.

When reviewing the DER definition in this posting, entities need to understand how this definition will be used in other future Standard changes. Tacoma Power recommends one of the two following options to ensure impacts to other future Standard changes are considered in the definition development:

1. Provide a list of other Standards that will be impacted by this definition change in the "New or Modified Term(s) Used in NERC Reliability Standards" section of the MOD-032 redline, similar to the approach taken by Project 2019-04, Modifications to PRC-005, or
2. Create a standalone Standards Project that addresses the DER definition development for all future Standard changes.

SMEs responded "MOD-032-1 provides language for the Planning Coordinators (PC) and their Transmission Planner(s) (TP) to request any, and all, modeling data pertaining to the development of steady-state, short circuit, and dynamics models. The language in MOD-032-1 currently allows the PCs and TPs to request DER data from TOs, GOs, and LSEs (Distribution Providers). Therefore, any language specific to the addition of DERs to MOD-032-1 would be redundant."

EEI Draft Comments should be included or referenced: {C}· {C}To better clarify the extent of DER resources that must be reported under MOD-032, EEI suggests that a Facilities section be added to this Reliability Standard. {C}· {C}Footnote 2 – EEI asks that the SDT provide additional clarity regarding the intent of Footnote 2. Footnote 2 appears to require DPs (or TOs) to supply Aggregate Demand data that has been manipulated to exclude all DER offsets. While we understand why this would be desirable, most small DERs are not metered except for billing meters. Billing meters are not synchronized with SCADA data, diminishing the value of any data supplied by the reporting entities. We are further concerned that the manhours required to account for these DER offsets could be substantial adding excessive costs while providing questionable value to this change. As an alternative, EEI suggests that DPs and TOs could provide estimated DER offset values, which would require fewer manhours to develop and should provide sufficient value to the planning models. {C}· {C}Steady-state and Dynamic columns EEI is concerned that the data requests identified in Item 9 (Steady-state), and Item 10 (Dynamic) seek non-aggregated data, while the SAR specifies that aggregated DER data is to be supplied. To address this concern, we ask that both Items 9 and 10 be edited to make it clear that data requests to DPs and TOs are to be limited to aggregate DER data.	

Footnote 4: EEI is concerned that footnote 4 does not align with the SAR. In the SAR, data requests for DERs appear to be limited to aggregated DER data, however, in footnote 4 it states “TP/PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary”. This appears to go beyond the approved limits of this SAR and should therefore be removed.

Answer	
Document Name	2022-02 Tables.PNG

Comment

- The NSRF recommends the SDT remove the DER definition from the proposed MOD-032-2 standard.

- The NSRF recommends NERC create a standalone Standards Project that addresses the DER definition development for all future Standard changes. As part of this project, the NSRF recommends revising the DP criteria in the Rules Of Procedure (ROP), Appendix 5B, Section III.

- NERC needs a way to register a DER or “DER aggregator” type entity, to ensure the appropriate entities are held responsible for NERC Reliability Standards.

Further:

The proposed changes to include DERs in MOD-032 is expanding the scope of the Standard to include equipment not currently covered in the BES definition. The concept that non-BES or distribution equipment could impact the reliability and operation of the BES is not new to NERC Standards. For example, there is precedent in the PRC Standards to consider distribution equipment that supports UVLS programs or Protection System schemes. However, the proposed changes in this posting for MOD-032 are not sufficient to ensure the expansion of scope will be effective.

Currently there are seven definitions for DER. The SDT chose to create a new definition of DER separate from those.

The proposed definition:

Term(s): Distributed Energy Resource (DER) Generators and energy storage technologies connected to the Distribution Provider’s system that are capable of providing active power in non-isolated parallel operation with the Bulk Electric System.

The SPIDERWG Terms and definitions document has six definitions for DER. The draft MOD-032-2 definition is different than the definitions contained in the document. See Table D.1: Alternate Definitions for DER-Related Concepts.

Link to SPIDERWG Terms and definitions document

Link to DER reference document – contains DER definition.

Distributed Energy Resources Connection Modeling and Reliability Considerations February 2017

The NERC Distributed Energy Task Force (ERTF) DER definition:

“Any resource on the distribution system that produces electricity and is not otherwise included in the formal NERC definition of the Bulk Electric System (BES).”

The NSRF is concerned about how the DER definition will be used for other future NERC Standard changes, as outlined in the October 2022 “NERC System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG) White Paper.” The proposal's impact on other Standards must be clear prior to putting the DER definition in place to avoid unintended consequences.

For example, excluding various types of demand response from the DER definition may not be appropriate for PRC-006 and TPL-001. These two Standards may need to consider demand response for proper modeling of the BES. If NERC intends to add DERs to EMT Modeling Requirements in MOD-026, then this would be a significant cost and pose technical challenges for registered entities, which could impact the DER definition scope.

The Technical Rationale states “the modifications place a compliance obligation on NERC registered DPs (or TOs) to provide basic information about DER that are connected to their systems so that DER can be properly represented in interconnection-wide cases.” However, there are large distribution utilities that are not registered as DPs, but have aggregate DERs that should be accounted for under the proposed MOD-032 Attachment 1 scope. To ensure the appropriate entities are held responsible, either the:

1. BES definition needs to change to include DERs,

2. a new “DP-DER” registration needs to be created, or

3. the DP registration criteria needs to change to ensure the appropriate entities are held responsible.

Comment	
AEP appreciates the efforts of the standards drafting team and sees the value of the proposed revisions to Attachment One. Even so, AEP would be unable to vote affirmative on this revised standard unless and until every entity providing DER data is a registered Functional Entity who is formally obligated to provide it. As is the case in existing standards where Generator Owners are obligated to provide similar data, entities who possess the needed DER data noted in the Attachment One revisions should likewise be registered and explicitly obligated to provide this data as well. While we are unsure if the existing Functional Entities classes are themselves sufficient, or if instead, a new class of Functional Entities might need to be considered and developed, the need nonetheless exists. NERC may wish to also consider the potential that such obligations could potentially cross Federal and State jurisdictional lines of responsibility, further illustrating the complexity-of and challenges-in developing obligations to obtain the DER data in the revised Attachment One. In addition, while the SDT has not provided a question regarding the proposed Implementation Plan, AEP believes additional time will be needed to accommodate the work pertaining to assets newly brought into scope. Rather than being required to comply with the obligations 12 months after the definition has become effective, we instead suggest it be 24 months after the definition has become effective.

The Project 2022-02 SDT should review and coordinate with ERO efforts separately filed with FERC in the NERC proposed work plan to register GO-IBRs. Recognizing the current and expected state of DER and inverter-based resources in North America demands that any revisions proposed to the MOD-032-2 Reliability Standard respect functional registrations and corresponding cognizance of modeling data.

There were 77 sets of responses, including comments from approximately 200 different people from approximately 126 companies representing 10 of the Industry Segments as shown in the table on the following pages.

All comments submitted can be reviewed in their original format on the project page.

If you feel that your comment has been overlooked, let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, contact Vice President of Engineering and Standards, Soo Jin Kim (via email) or at (404) 446-9742.

Questions

1. **Do you agree with the modification to remove "Load Serving Entity" and replace with "Distribution Provider" in MOD-032-2?**

2. **Provide any additional comments for the standard drafting team to consider, if desired.**

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

1. Do you agree with the modification to remove "Load Serving Entity" and replace with "Distribution Provider" in MOD-032-2?

Answer	No
Document Name	
Comment	

To be clear, the Project 2022-02 SDT added both TO and DP to replace LSE in the proposed MOD-032-2 Attachment 1 revision. This proposed change is incomplete, misappropriates modeling data responsibilities for Aggregate Demand, Demand, and Distributed Energy Resource (DER) modeling data, as well as retains a significant reliability gap.

Transmission Owners who are not Distribution Providers likely have no knowledge or capability to provide data for planned demand or DER constituents served from the transmission system. Transmission Owner visibility for load demand is typically limited to historical telemetered MW and MVAR data. This finding, especially with regards to DERs, has already been well-documented. A key recommendation in the NERC Reliability and Security Technical Committee (RSTC) subcommittee approved the "Model Verification of Aggregate DER Models used in Planning Studies - Reliability Guideline" developed by the System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG) was:

"TPs, PCs, TOs, and other applicable entities that may need DER information should coordinate with DPs for facilities connected to distribution systems to determine the necessary measurement information that would be of use for DER modeling and model verification and jointly develop requirements or practices that will ensure this data is available. ***As the TPs, PCs, and TOs are dependent on the DP to have the data made available****, this will likely require actions from state regulatory bodies and DPs to establish requirements to gather this information" (page 7 of 61).*

The SDT should consider that Transmission Owners should not be held accountable for demand and DER data that they have no cognizance of. Additionally, the SDT should remember that most DER are smaller than the BES resource threshold or reside on a distribution system. The threshold for an entity to be registered as a Distribution Provider is 75 MW of load. This implies that the majority of DERs are and will be connected to systems outside the scope and visibility of Transmission Owners, as well as existing Distribution Providers. To emphasize this reality: as of 15 May 2023, there were 314 Distribution Providers registered with NERC (excluding UFLS-only DPs). Of those DPs, 96 were not otherwise registered as either a PC, TP, or TO. While it may be misunderstood that only 96 DPs may become newly

applicable and participatory in model data collection given the draft changes to MOD-032-2, this ignores that the latest EIA 861 data (collected in 2021; published in 2022) reflects about 1,190 distribution utilities reflecting almost 197,000 distribution circuits in the continental US. In other words, it may be reasonable to conclude that 74% of the distribution utilities in the US do not meet the NERC registration threshold. Furthermore, PCs, TPs, and TOs have no regulatory relationship with these unregistered entities and cannot be held responsible for DER data for which that are not aware.

In June 2022, NERC published its "Inverter-Based Resource Strategy" that recognized efforts necessary to analyze the breakdown of resource size, location, type, and applicability with the BES definition to make a determination of whether the current BES threshold should be updated to reflect the changing resource mix" (page 9 of 10). Subsequently, the NERC Member Representatives Committee (MRC) and Board of Trustees (BOT) technical session on inverter-based resources in February 2023 emphasized the need for a focus on functional registration noting: "industry is increasingly challenged with addressing reliability issues for unregistered inverter-based resources, and those resources are reaching critical mass in some parts of the country. The lack of requirements currently imposed on those resources creates local and regional reliability risks to the BPS in aggregate. This issue compounds in many areas with the growing presence of distributed energy resources (DERs) connected to the distribution system." In response to the FERC directive "Registration of Inverter-based Resources", NERC filed a proposal to modify its Rules of Procedure to "include a new function comprised of owners of IBRs interconnected to the BPS." The Generator Owner – Inverter-Based Resource (GO-IBR) registration would include "owners of IBRs which have aggregate nameplate capacity of less than or equal to 75 MVA and greater than or equal to 20 MVA interconnected at a voltage greater than or equal to 100 kV; or Owners of IBRs which have aggregate nameplate capacity of greater than or equal to 20 MVA interconnected at a voltage less than 100 kV."

Given the anticipated GO-IBR functional registration, the NERC Project 2022-02 SDT should modify MOD-032-2 Attachment 1 to specify **DP, GO-IBR** are responsible for Aggregate Demand, Demand, and Distributed Energy Resource (DER) data, as well as other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes.

Thank you for your comment.
The SDT views comments suggesting NERC registration of individual DER owners as unnecessary and impractical (similar to the impracticality of registering the load at every single house connected to the system) that would still require DPs and TOs to report what is connected to their systems unless NERC registration of every single rooftop solar installation is being proposed.

The SDT contends that TOs and DPs (registered or not) have a reliability interest in knowing what is (and projected to be) connected to their systems with respect to the DER data items proposed to be added in Attachment 1. MOD-032-2 may help TOs get a better knowledge of what is being connected to their systems (and this may require amended interconnection agreements, as acknowledged in the Technical Rationale) and will require better coordination between TOs and DPs (registered or not) which should improve situational awareness and BPS reliability. However, the SDT recognizes the compliance challenges with obligating TOs and DPs to collect data from unregistered entities and added footnote 5 to Attachment 1 that requires TOs and DPs to pass through available information.

GO-IBR
The SDT is unable to add a registration not currently defined in the NERC registration documents. Further the proposed GO-IBR registration would not cover many DER installations.

Steven Rueckert - Western Electricity Coordinating Council - 10, Group Name WECC Entity Monitoring	
Answer	No

Document Name	
Comment	

WECC supports the removal of Load Serving Entity as that registration no longer exists. However, WECC believes that adding Distribution Provider is not necessary as explained below.

Including the registered Distribtuion Provider in the applicability of the standard complicates compliance applicability and monitoring. It requires two processes and two monitoring mithods instead of one.

The technical rational for the standard states that for distribution facilities which have no Distribution Provider, or which do not connect to a Distribution Provider, the Transmission Owner is responsible for coordinating to obtain the necessary data. If the TO can perform this for distrbution facilities that do not have a registered DP, they can use the same process to obtain the data from a registered DP.

This removes the need of potentially complex determination of standard applicability and the research needed to determine applicability for each Transmission Owner based on the existence of registered Distribution Providers or any other non-BES load that has no registered DP. It also makes clear that the Planning Coordinator and Transmission Planner would be receiving bus level demand data from a single source (The Transmission Owner) rather than obtaining data from multiple DP's and TO's.

If there is a concern that without a standard requirement to support it, a registered DP would not provide the required data to a TO or TP then how could it be expected that a non-registered entity would provide this information. The TO has the authority to obtain this data for any entities connected to its system via FAC-002.

If it is decided to continue to include Distribution Providers in the applicability, please clarify the applicability and obligation of the "registered" (USLF)- Only DP. Would MOD-032 now be applicable to all USLF only Distribution Providers?

The definition of Distribution Providers is limited by the current definition of Distribution providers to the entity that operates the wires between the Transmission system and the end-user. This is a short-cut to getting the DERs included in the standard. I recommend editing the definition of Distribution Provider to include those entities that are responsible for the operation and balancing of DERs if this is how the SDT wants to address this issue.

Kacie Fischer - Kacie Fischer On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Kacie Fischer

Answer	No
Document Name	

Comment

Oncor does not agree with the Load Serving Entity ("LSE") to Distribution Provider ("DP") terminology modification. Even for Transmission Owners that are also DP (like Oncor), there are many instances in which we interconnect and deliver transmission-level service to another DP. In these cases, Oncor would not have access to the DER modeling parameters listed in Attachment 1 or visibility into the other DP's system other than the aggregated load provided.

We further disagree with the changes outlined in Attachment 1 in the Steady-State column of Table – #9, which are being proposed in conjunction with the change in terminology from LSE to DP. It will be more appropriate to specify general model requirements in MOD-032 and allow Planning Coordinators and Transmission Planners to determine model details that are appropriate for their established processes and methodologies. Also, it may be impossible to provide individual specifications for Retail Scale DER such as reactive capability and in-service date.

Also, Oncor would like further clarification on the following:

1. "a. Location (bus from item 1) and if DER feeder is subject to UFLS and/or UVLS"
    - Could the SDT elaborate on how knowing that a DER is on a UFLS feeder could impact the results of a Steady State analysis? We do not see the need for the UFLS data in the Steady State column.
2. "b. Real power capability (minimum and maximum)"
    - Is this referring to the nameplate or approved capacity?
    - Is the meaning of *minimum* equivalent to approved capacity? And is *maximum* equivalent to nameplate capacity?
3. "c. Reactive capability (minimum and maximum)"
    - Oncor does not typically track reactive power data for currently installed DER.
4. "d. Generator type (solar, battery, etc.)"
    - Oncor recommends modifying this statement to give instruction on how to report a single location with multiple types of DER.
5. "e. In-service date or other information to be used to make assumptions about DER capabilities related to ride-through, voltage control and/or frequency control."
    - Can you define the in-service date? In Oncor's experience, some DER projects will connect to our system, test, and then permission is granted to operate. For some of the DER projects, we give permission for them to operate; but the project is not energized until the DER facility is ready on their end. Typically, the registered resources that participate in ancillary services go in-service before they are permitted to operate for testing purposes.
    - This is not practical for DERs that are modeled in an aggregated manner.

Thank you for your comment. A NERC Glossary definition for DER was proposed.	

DER MW thresholds NERC has recommended a zero MVA threshold for gathering DER information: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf It is expected that PC/TP procedures may specify thresholds and technical justification for inclusion of DER models (or not) in any particular study – this issue is more aligned with the SAR for TPL-001 that will be addressed in the second phase of this project 2022-02.

Load Serving Entity is no longer an active NERC registration code. BPA agrees that replacement is appropriate. However, Attachment A adds a parenthetical that states the Transmission Owner (TO) is responsible when a Demand or DER is not associated with a registered DP. That would put the responsibility on BPA as the TO. What if the TO cannot get non-BES DER data from an	

unregistered customer? As long as BPA is held responsible for providing data as the TO (that we do not have the authority to require from an unregistered DP), our vote will be NO.

Agree with EEI comment: {C}· To better clarify the extent of DER resources that must be reported under MOD-032, EEI suggests that a Facilities section be added to this Reliability Standard. {C}· Footnote 2 – EEI asks that the SDT provide additional clarity regarding the intent of Footnote 2. Footnote 2 appears to require DPs (or TOs) to supply Aggregate Demand data that has been manipulated to exclude all DER offsets. While we understand why this would be desirable, most small DERs are not metered except for billing meters. Billing meters are not synchronized with SCADA data, diminishing the value of any data supplied by the reporting entities. We are further concerned that the manhours required to account for these DER offsets	

could be substantial adding excessive costs while providing questionable value to this change. As an alternative, EEI suggests that DPs and TOs could provide estimated DER offset values, which would require fewer manhours to develop and should provide sufficient value to the planning models.

{C}· Steady-state and Dynamic columns

EEI is concerned that the data requests identified in Item 9 (Steady-state), and Item 10 (Dynamic) seek non-aggregated data, while the SAR specifies that aggregated DER data is to be supplied. To address this concern, we ask that both Items 9 and 10 be edited to make it clear that data requests to DPs and TOs are to be limited to aggregate DER data.

{C}· Footnote 4: EEI is concerned that footnote 4 does not align with the SAR. In the SAR, data requests for DERs appear to be limited to aggregated DER data, however, in footnote 4 it states "TP/PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary". This appears to go beyond the approved limits of this SAR and should therefore be removed.

Response

Thank you for your comment.
The SDT determined that a Facilities section is not necessary. Modifications were made to clarify data obligation for TOs and DPs with respect to data related to DER, for which a definition is proposed.

The SDT contends that TOs and DPs (registered or not) have a reliability interest in knowing what is (and projected to be) connected to their systems with respect to the DER data items proposed to be added in Attachment 1. MOD-032-2 may help TOs get a better knowledge of what is being connected to their systems (and this may require amended interconnection agreements, as acknowledged in the Technical Rationale) and will require better coordination between TOs and DPs (registered or not) which should improve situational awareness and

BPS reliability. However, the SDT recognizes the compliance challenges with obligating TOs and DPs to collect data from unregistered entities and added footnote 5 to Attachment 1 that requires TOs and DPs to pass through available information. Modifications to footnotes 2 and 4 are intended to address the concern and emphasize PC/TP flexibility in developing modeling data requirements and reporting procedures per R1. The intent of Attachment 1 is to specify the minimum required data but not procedures and methods. Clarification made in the Technical Rationale.

This modification appears to meet the intent of the SAR by addressing the paralleled DERs that are presently not modelled within Distribution Provider's system models. While some argument could be made concerning the minimal impact on system planning studies caused by Distribution Customer's DER deployment, it is important to set a standard approach toward assessing potential impacts, and these requirements are not substantially burdensome.

Rachel Coyne - Texas Reliability Entity, Inc. - 10	
Answer	
Document Name	
Comment	

Texas RE supports the modification to remove Load Serving Entity (LSE) and replace with Distribution Provider (DP) as LSE is no longer a registered function. Texas RE has some concerns, however, regarding the actions required by the DP in gathering Distributed Energy Resource (DER) data. There seems to be a potential gap for getting the DER data for Power System Modeling and Analysis as written. DPs are not typically the owners of the DER data and there are no current NERC registration or requirements for the owners of the DER data to provide the data to DPs. As written, the compliance responsibility for providing the DER data falls on the DP who may not authority or a robust process to get the data from the current and future DER owners. Texas RE recommends a requirement that the registered entity managing DERs provide the data to the DPs. Additionally, that non-registered DERs should be captured effectively to ensure reliability operations.

Texas RE does agree that the DPs should be responsible for providing the equivalent system impedance data (distribution feeder, power transformer, etc.) for the DER connections.

The Standard does not specify a threshold limit for the DER facilities required to provide the data. Texas RE recommends the 'Term(s)' section include a distinction between utility scale DERs (commercial level DERs, utility scale solar facilities, etc.) and aggregated level DERs (residential rooftop solar, small generators, residential batteries, etc.).

Texas RE understands the intention of the modifications to MOD-032 is to provide visibility of DER in planning models and achieve consistency in representation of various types of DER. To avoid double-counting DERs in the models, Texas RE recommends identifying whether or not the DER outputs are embedded in the load forecasts used in the models and that this is aligned with the demand and energy data that is needed for MOD-031-3.

Response

Thank you for your comment.
The SDT contends that TOs and DPs (registered or not) have a reliability interest in knowing what is (and projected to be) connected to their systems with respect to the DER data items proposed to be added in Attachment 1. MOD-032-2 may help TOs get a better knowledge of what is being connected to their systems (and this may require amended interconnection agreements, as acknowledged in the Technical Rationale) and will require better coordination between TOs and DPs (registered or not) which should improve situational awareness and BPS reliability. However, the SDT recognizes the compliance challenges with obligating TOs and DPs to collect data from unregistered entities and added footnote 5 to Attachment 1 that requires TOs and DPs to pass through available information.

DER MW thresholds
NERC has recommended a zero MVA threshold for gathering DER information:
https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf
It is expected that PC/TP procedures may specify thresholds and technical justification for inclusion of DER models (or not) in any particular study – this issue is more aligned with the SAR for TPL-001 that will be addressed in the second phase of this project 2022-02.

2. Provide any additional comments for the standard drafting team to consider, if desired.	
Mike Gabriel - Greybeard Compliance Services, LLC - 5	
Answer	
Document Name	
Comment	
In lieu of creating yet another definition, we recommend using one of the existing definitions in Table D.1 of the SPIDERWG document: https://www.nerc.com/pa/Documents/DER_Quick%20Reference%20Guide.pdf, or potentially using the NERC Distributed Energy Task Force (ERTF) DER definition: Any resource on the distribution system that produces electricity and is not otherwise included in the formal NERC definition of the Bulk Electric System (BES).	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. The SDT did review available definitions of DER and found existing definitions were not adequate to cover BPS reliability concerns. The proposed definition is aligned with the SPIDERWG working definition for DER. Additional details were added to the Technical Rationale.	
Ryan Strom - Ryan Strom On Behalf of: Carl Spaetzel, Buckeye Power, Inc., 4, 3, 5; Jason Procuniar, Buckeye Power, Inc., 4, 3, 5; Kevin Zemanek, Buckeye Power, Inc., 4, 3, 5; - Ryan Strom	
Answer

Comment	
Buckeye agrees with the comments prepared by ACES:	

We have an ongoing concern regarding the level upon which this will require DPs to collect DER data interconnected to distribution systems. The proposed draft establishes a zero MVA threshold for the collection of all DER data "in non-isolated parallel operation with the Bulk Power System". Per the Technical Rationale, this includes each and every residential solar and commercial rooftop solar customer on the DP's systems. This is a major concern given the extent it may go to exhausting the resources of our Members for the collection of DER data which may or may not have a material impact to the reliability of the BES. Additionally, we have concerns regarding footnote 4 on the last page of the Attachment 1. This footnote states: "The TP/PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary for local practices and the TP/PC may need to coordinate with the DP/TO to determine appropriate assumptions for equivalent distribution system impedance." This statement seems to allow some discretion for allowing "local practices" to then dictate what classifications of DER are to be modeled in aggregate versus otherwise. If that is the case, then it seems to conflict with the stated goal of the MOD-032-1 SAR to "…provide clarity and consistency for data collection across PCs and TPs when coordinating with the DP to gather aggregate load and aggregate DER data." We recommend that a non-zero MVA threshold be established below which DER data will be modeled in aggregate and above which DER data will be modeled explicitly. Allowing such "local practices" to dictate which DERs are to be modeled in aggregate or not seems contrary to having a standard for the industry to implement that is intended to provide clarity and consistency. Thank you for the opportunity to comment.

It is expected that PC/TP procedures may specify thresholds and technical justification for inclusion of DER models (or not) in any particular study – this issue is more aligned with the SAR for TPL-001 that will be addressed in the second phase of this project 2022-02.

Footnote 4 modified to address the concern. The SDT intent is to maintain PC/TP flexibility for consistently collecting accurate data, but not be overly prescriptive on data collection processes.

Kennedy Meier - Electric Reliability Council of Texas, Inc. - 2

Answer	
Document Name	2022-02_Unofficial Comment Form_ERCOT Comments.docx
Comment	

ERCOT generally supports DER-related data collection and recommends that it occur at an early stage (steady-state) of model development. ERCOT requests the following revisions and clarifications to the draft standard.

1. Dual Planning Authority (PA) / Planning Coordinator (PC) Designation

While there is justification to reference both the Planning Authority and Planning Coordinator in the Applicability section (section 4), since Appendix 5B: Statement of Compliance Registry Criteria of the NERC Rules of Procedure, dated January 19, 2021, still uses both terms, the explanatory paragraph in Part 4.1.4 refers to synchronization between registration criteria and the NERC functional model, which is not maintained, was never formally approved, and is only posted as a historical document. Therefore, ERCOT requests the explanatory paragraph be deleted from Part 4.1.4, which would then read as follows:

4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

2. Planning Coordinator (PC) Interface

ERCOT notes the importance of retaining the PC's flexibility with respect to determining the process used to acquire modeling data. While some PCs prefer to interface directly with the DP as noted in footnote 2 (*see* page 20 of 22 of the standard), other PCs prefer to interface with the Transmission Owner (TO) or Transmission Planner (TP). In the latter example, the TO or TP maintains the interface with the DP.

In support of this flexibility, ERCOT requests the SDT revise the table in Attachment 1 by removing the last sentence from footnote 2, adding a new footnote 3 to the first reference to DP in the steady-state column, and renumbering the remaining footnotes as needed, as proposed below:

2. Aggregate Demand*2* [DP*3*, TO (when a Demand is not associated with a registered DP)] a. real and reactive power* b. in-service status*

Footnote 2: For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources.

Footnote 3: Wherever DP is noted as the functional entity responsible for reporting data in Attachment 1, a Distribution Provider is responsible for providing this information, generally through coordination with the Transmission Owner or as specified in the joint PC/TP modeling data requirements and reporting procedures developed per R1.

3. Attachment 1, *steady state* column, item 9

a. Strike "feeder" to provide the TP/PC with flexibility in tracking the status of UVLS and UFLS (i.e. as aggregated values or as individual feeders).

b. Clarify the use of "and/or" with regards to UVLS and UFLS. Using "and/or" creates four possible combinations that must be tracked: UFLS only, UVLS only, both UFLS and UVLS, and neither UFLS nor UVLS. Is the intent of the SDT to track all these possible permutations?

ERCOT requests that the SDT modify item 9 to read as follows:

9.a. Location (bus from item 1) and if DER is subject to UFLS and/or UVLS

b. Real power capability (gross minimum and maximum)

c. Reactive power capability (gross minimum and maximum)

4. Attachment 1, existing footnote 4 - clarify the use of "/" by revising the footnote to read as follows:

4 The modeling data requirements and reporting procedures that the PC and TP jointly develop under R1 may require either aggregated or unaggregated data as necessary for local practices and the TP or PC may need to coordinate with the DP or TO to determine appropriate assumptions for equivalent distribution system impedance.

5. Clarify the intent of the short circuit column

The technical rationale states that "[d]rastically altering the structure of Attachment 1 or adding DER data to the 'short circuit' column was beyond the scope of the Project 2022- 02 SAR," which in turn states "note that the SPIDERWG does not see a need to modify the short circuit column of Attachment 1 because #1 already states 'all applicable elements' in the steady-state column should have necessary information

related to positive, negative, and zero sequence data provided accordingly. If the TP/PC determines that aggregate DER is needed for these studies, then they have the capability to request such data. However, this is not a prevalent issue currently."

While the dynamics column was edited to include Distributed Energy Resource Data to match the format of the Dynamics column, the short circuit column was not updated per the reasoning given in the technical rationale and SAR. However, the short circuit column includes the bullet "[p]rovide for all applicable elements in column 'steady state' [GO, RP, TO]," which could be interpreted to compel the relevant entities to collect DER information in the short circuit models if it is deemed an applicable element. ERCOT requests that the SDT confirm that the TP/PC would determine if DER information is an applicable element for short circuit models.

6. Clarify the note regarding data that vary with system operating state and conditions

The steady-state column of Attachment 1 indicates that "[i]tems marked with an asterisk indicate data that vary with system operating state or conditions." ERCOT recommends that the SDT clarify or provide additional information regarding what types of system operating states or conditions are contemplated. For example, if a data element changes seasonally, should the element be marked with an asterisk, or are seasonal variations not considered "system operating state[s] or conditions" for purposes of Attachment 1?

Response

Thank you for your comment.
Change made to address PC/PA applicability.

Modifications to footnotes 2 and 4 are intended to emphasize PC/TP flexibility in developing modeling data requirements and reporting procedures per R1. The intent of Attachment 1 is to specify the minimum required data but not procedures and methods. Clarification made in the Technical Rationale.

The intent of the SDT is to track all of the identified permutations of UFLS and UVLS.

Changes made to item 9 to address the concern and provide PC/TP flexibility.

Technical Rationale modified to address concern about short circuit column. Regarding asterisks – this is outside the scope of the SAR. The SDT does not believe asterisks would apply to any of the new items added.

We have an ongoing concern regarding the level upon which this will require DPs to collect DER data interconnected to distribution systems. The proposed draft establishes a zero MVA threshold for the collection of all DER data "in non-isolated parallel operation with the Bulk Power System". Per the Technical Rationale, this includes each and every residential solar and commercial rooftop solar customer on the DP's systems. This is a major concern given the extent it may go to exhausting the resources of our Members for the collection of DER data which may or may not have a material impact to the reliability of the BES. Additionally, we have concerns regarding footnote 4 on the last page of the Attachment 1. This footnote states: "The TP/PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary for local practices and the TP/PC may need to coordinate with the DP/TO to determine appropriate assumptions for equivalent distribution system impedance." This statement seems to allow some discretion for allowing "local practices" to then dictate what classifications of DER are to be modeled in aggregate versus otherwise. If that is the case, then it seems to conflict with the stated goal of the MOD-032-1 SAR to "…provide clarity and consistency for data collection across PCs and TPs when coordinating with the DP to gather aggregate load and aggregate DER data." We recommend that a non-zero MVA threshold be established below which DER data will be modeled in aggregate and above which DER data will be modeled explicitly. Allowing such "local practices" to dictate which DERs are to be modeled in aggregate or not seems contrary to having a standard for the industry to implement that is intended to provide clarity and consistency. Thank you for the opportunity to comment.

Response
Thank you for your comment. NERC has recommended a zero MVA threshold for gathering DER information: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf It is expected that PC/TP procedures may specify thresholds and technical justification for inclusion of DER models (or not) in any particular study – this issue is more aligned with the SAR for TPL-001 that will be addressed in the second phase of this project 2022-02. Footnote 4 modified to address the concern. The SDT's intent is to maintain PC/TP flexibility for consistently collecting accurate data, but not be overly prescriptive on data collection processes.

Shannon Mickens - Southwest Power Pool, Inc. (RTO) - 2 - MRO,WECC, Group Name SPP RTO	
Answer

Comment	

The SPP RTO recommends the drafting team revise the original Standard Authorization Request (SAR) to keep the project open and coordinate with other NERC drafting teams to address data collection efforts that are applicable to the Inverter-Based Resource (IBR) and Energy Storage Resource (ESR-Batteries). This coordination effort will create a level of proficiency and efficiency in the areas of creating accurate models that can be used by the appropriate entities in their study processes to generate quality results that address initial concerns applicable the reliability of the grid.

The drafting team should conduct a cost analysis to help industry understand the cost impacts of this project.

Additionally, the drafting team should consider a resource analysis to help industry understand the additional time required for their resources to participate in these efforts if the project is extended for a certain amount of time.

As for concerns, one of them focuses around NERC suggesting new responsibilities being applicable to the PC and TP in reference to modeling as well as studying process in reference to the reliability of the grid. For example, NERC suggests that there is a need to conduct an EMT study ever so often to help identify issues in a PC and TP footprint; however, the EMT standard has not been approved by the NERC Board of Trustees (BoT) nor FERC at this point. The RSTC has identified that the MOD-032 standard current doesn't align with such data collection

efforts to assist industry, specifically the PC and TP, in this type of process. These data collection gaps need to be resolved prior to giving the PC and TP related responsibilities.

Furthermore, there will be a need to align with the proposed MOD-026-2 standard in reference to the IBRs from a PC and TP perspective (PC and TP creating a process for GOs and TOs to access models).

Moreover, NERC has identified that PRC-024-3 doesn't provide the information needed to address IBR ride-through with the occurrence of a system disturbance. From our perspective, there will be a need for data collection via MOD-032 to help ensure an appropriate performance standard can be developed to address NERC's reliability concerns and needs.

Finally, our last concern pertains to the definition of the DER. There are several definitions currently used in industry, including the SPIDERWG's definition. We recommend that the drafting team coordinate with NERC legal to structure one definition (vetted via standard development process) for industry use. Without a common Glossary Term, there is a potential that the various definitions of DER will create confusing as well as reliability/compliance risks for the PC and TP..

Response

Thank you for your comment.
Establishing EMT modeling and data requirements for DER is beyond the scope of Project 2022-02.

MOD-026 is currently only applicable to BES facilities. There would need to be a separate project to add DER applicability to MOD-026.

PRC-024 - The SDT feels the language in Attachment 1 is appropriate to address the concern.

DER definition
The SDT did review available definitions of DER and found existing definitions were not adequate to cover BPS reliability concerns. The proposed definition is aligned with the SPIDERWG working definition for DER. Additional details were added to the Technical Rationale.

Devon Tremont - Taunton Municipal Lighting Plant - 1

Answer	

Document Name	
Comment	

Taunton Municipal Lighting Plant (TMLP) understands and respects the defined need for additional DER modeling data as these resources continue to grow behind-the-meter and beyond the visibility of PCs and BAs. Our concerns with the modifications to MOD-032 are simply to ensure that they require what we can reasonably expect to provide given current configurations. Adding all of the changes that the SDT proposed concerns us that we will continue to add costs to these projects and continue to prevent their viability. Below are additional comments on a few specific proposed revisions to MOD-032:

Proposed DER Definition: The project team is proposing to define a new term of DER to the NERC Glossary. We request additional clarity and background on the development on this definition. We have reviewed the Technical Rationale document that explains its development on Page 1, but it still remains unclear to us what could be considered to have "parallel operation" with the BES versus being a non-BES asset. TMLP requests that we consider a definition that better aligns with the BES definition and its inclusions/exclusions as this will be better understood by DPs.

Att. 1, Steady State Column, New Item 9: The request to provide real and reactive capability, as well as generator type, is within reason as it is readily available information.

Att. 1, Dynamics Column, New Item 10: TMLP requests additional clarity on the parenthetical that requires a distinction of an "*association*" between the DER and the DP, without which the TO is expected to be responsible. In either scenario, it will be unreasonable to expect the DP or TO to provide dynamic modeling information of the DERs. Currently, the DP is typically the host through a Power Purchase Agreement but are not requiring that DER developers provide dynamic modeling information, and the added cost to do so must be considered. At a minimum, the SDT should limit any TO/DP obligations to what is feasible and reasonable, and presently dynamic information for unregistered DERs is not available to us (as a DP) and other DP peers. Expecting a DP or TO to provide this information would require them to alter their interconnection agreements for future projects, as well as sending them on a "research mission" for their existing resources. Further on this point, TMLP agrees with APPA's comments which state "*While DPs may receive some or all of this information at the interconnection request stage, and can pass whatever data they have to their PC and TP, the draft standard must be revised to account for the fact that the DPs and TOs do not own or control these DERs, and thus cannot be held responsible for the completeness or accuracy of the data they themselves receive from the DER owners.*"

tt. 1, Steady-State Column, Footnote 2 on "Aggregate Demand": This effectively provides the authority for the host PC/TP to request that DPs reconstitute their load readings prior to submitting, however, the DP's typically are not using revenue quality metering with their DERs

and therefore cannot be relied upon for market reporting. If this is not the intended use of the data, then this needs to be clarified in this footnote. The Technical Rationale document states that current collection and modeling of net demand is not consistent with "a modeling framework that explicitly represents DER," and if this is true, then we need to understand what this framework is. We reside in ISO-NE and their market rules currently define the inputs to *Regional Network Load* to exclude "load served by behind-the-meter generation" (ISO-NE OATT, Section II.21.2).

Thank you for your comment. The SDT did review available definitions of DER and found existing definitions were not adequate to cover BPS reliability concerns. The proposed definition is aligned with the SPIDERWG working definition for DER. Additional details were added to the Technical Rationale. Improper DP/TO applicability The SDT contends that TOs and DPs (registered or not) have a reliability interest in knowing what is (and projected to be) connected to their systems with respect to the DER data items proposed to be added in Attachment 1. MOD-032-2 may help TOs get a better knowledge of what is being connected to their systems (and this may require amended interconnection agreements, as acknowledged in the Technical Rationale) and will require better coordination between TOs and DPs (registered or not) which should improve situational awareness and BPS reliability. However, the SDT recognizes the compliance challenges with obligating TOs and DPs to collect data from unregistered entities and added footnote 5 to Attachment 1 that requires TOs and DPs to pass through available information. Aggregate Demand The intent of Attachment 1 is to specify the minimum required data but not procedures and methods. Clarification made in the Technical Rationale.

Comment	

In addition to PJM supporting the IRC SRC comments, PJM wants to ensure the coordination of Distribution Provider (DP) data is coordinated between the DP and Transmission Owner (TO). The coordination between the DP and TO is needed to properly model due to the DP interconnection with the TO. Thus, each Transmission Owner shall work with the Distribution Provider(s) within the Transmission Owner's area in collecting data for the PA and PC in order to properly model this information and how it interconnects with the Transmission Owner systems. PJM is requesting this information to be written directly in the Standard to ensure accurate and proper data collection. PJM wants to the thank the Standard Drafting Team for all their work and commitment to the Project!

Comment	
APPA has multiple concerns with the proposed definition of distributed energy resources (DER) and adding this scope to the MOD-032 Standard, as outlined below. **Scope Expansion and non-NERC Registered Entities** The proposed changes to include DERs in MOD-032 is expanding the scope of the Standard to include equipment not currently covered in the BES definition. The concept that non-BES or distribution equipment could impact the reliability and operation of the BES is not new to NERC Standards. For example, there is precedent in the PRC Standards to consider distribution equipment that supports UVLS programs or	

Protection System schemes. However, the proposed changes in this posting for MOD-032 are not sufficient to ensure the expansion of scope will be effective or reasonable.

The Technical Rationale states "the modifications place a compliance obligation on NERC registered DPs (or TOs) to provide basic information about DER that are connected to their systems so that DER can be properly represented in interconnection-wide cases." The information includes "Location (bus from item 1) and if DER feeder is subject to UFLS and/or UVLS," "Real power capability (minimum and maximum)," "Reactive power capability (minimum and maximum)," "Generator type (solar, battery, etc.)," and "In-service date or other information to be used to make assumptions about DER capabilities related to ride-through, voltage control and/or frequency control." While DPs may receive some or all of this information at the interconnection request stage, and can pass whatever data they have to their PC and TP, the draft standard must be revised to account for the fact that the DPs and TOs do not own or control these DERs, and thus cannot be held responsible for the completeness or accuracy of the data they themselves receive from the DER owners. For example, a DER owner might inadvertently change its nameplate capacity by replacing a damaged inverter with a different capacity from the original due to supply chain issues, and might not think to inform its DP of the change. More fundamentally, some solar installations, whether commercial, industrial, or homeowners installing on rooftops, do so without taking advantage of net metering or otherwise complying with their distribution utility's interconnection requirements—in other words, DPs may not have complete information about the *location* of DERs on their systems, let alone the capacity, type, and in-service date. Where customers *do* take advantage of net metering, the metering devices are generally not production meters, which highlights a concern regarding the SDT's proposal to revise the existing requirement for "aggregate demand" data to state that "For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources." Indeed, it is the nature of "net metering" that the data produced and collected is demand offset by DER output, not separate gross demand and generation values.

A registered entity cannot provide data that the registered entity itself does not have. In particular, it would be unrealistic to expect a TO or DP to have information about unregistered DERs at the same level of detail and accuracy that the unregistered DER owners can provide about their own facilities, nor would it be reasonable to hold a TO or DP responsible for gaps or inaccuracies in the data provided by an unregistered DER owner.

Accordingly, the SDT should, at minimum, revise the proposed standard to indicate that (a) DPs' and TOs' responsibility with respect to DER data is limited to passing along any responsive data they have received from DER owners, without vouching for the data's completeness or accuracy; and (b) the requirement to provide "aggregate demand" can be satisfied by net demand data, at least with respect to net-metered DERs.

Implementation Plan

APPA does not agree with the proposed implementation plan for the DER definition. This definition will eventually be used in several future NERC Standard revisions. Some of these revisions may have a shorter implementation timeframe than Project 2022-02. The effective date of the DER definition needs to be coordinated with the other planned Standard revisions to ensure the timing supports implementation of the other Standard revisions.

Coordination with Other Standard Changes

APPA is concerned about how the DER definition will be used for other future NERC Standard changes, as outlined in the October 2022 "NERC System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG) White Paper." The proposal's impact on other Standards must be clear prior to putting the DER definition in place to avoid unintended consequences. For example, excluding various types of demand response from the DER definition may not be appropriate for PRC-006 and TPL-001. These two Standards may need to consider demand response for proper modeling of the BES. If NERC intends to add DERs to EMT Modeling Requirements in MOD-026, then this would be a significant cost and pose technical challenges for registered entities, which could impact the DER definition scope.

When reviewing the DER definition, entities need to understand how this definition will be used in all of the impacted Standards. APPA recommends creating a standalone Standards Project that addresses the DER definition development for all future Standard changes, similar to Standard Project 2016-02 and Standard Project 2015-09.

Response

Thank you for your comment.
BES expansion
Inclusion of DER as a BES facility is not being considered as part of this project.

Improper DP/TO applicability
The SDT contends that TOs and DPs (registered or not) have a reliability interest in knowing what is (and projected to be) connected to their systems with respect to the DER data items proposed to be added in Attachment 1. MOD-032-2 may help TOs get a better knowledge of what is being connected to their systems (and this may require amended interconnection agreements, as acknowledged in the Technical Rationale)

and will require better coordination between TOs and DPs (registered or not) which should improve situational awareness and BPS reliability. However, the SDT recognizes the compliance challenges with obligating TOs and DPs to collect data from unregistered entities and added footnote 5 to Attachment 1 that requires TOs and DPs to pass through available information.

DER definition
The SDT did review available definitions of DER and found existing definitions were not adequate to cover BPS reliability concerns. The proposed definition is aligned with the SPIDERWG working definition for DER. Additional details were added to the Technical Rationale.

The RSTC approved a White Paper produced by SPIDERWG identifying standards that may require revision due to DER: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/Whitepaper_SPIDERWG_Standards_Review.pdf
Other projects could propose to accelerate the DER definition timeline if necessary.

MOD-026 is currently only applicable to BES facilities. There would need to be a separate project to add DER applicability to MOD-026.

Bobbi Welch - Midcontinent ISO, Inc. - 2, Group Name ISO/RTO Council Standards Review Committee (IRC SRC) 2022-02 Modifications to MOD-032 Draft 1

Answer	
Document Name	2022-02_Unofficial Comment Form_SRC_07-14-23_Final (as filed).docx

Comment

To achieve this project's objective [1] in an effective and efficient manner, the SRC recommends NERC do the following:

1. **Retain the need to define Distributed Energy Resources (DERs) as part of the scope of this project (as opposed to initiating another project).** This would be beneficial because:

a. The SDT for this project already includes many SPIDERWG members. Therefore, the existing team already has the "right" representation and expertise to perform this task.

b. The existing SDT has discussed and examined a broad range of DER definitions, so a substantial portion of the work needed to develop a DER definition has already been done, thereby giving the existing SDT a leg up on this effort.

c. It would eliminate the need for NERC to initiate another project and for industry to provide representatives to staff another team that would be starting this work from scratch (i.e., a loss of efficiency) and which may not be able to attract a commensurate level of expertise, e.g., SPIDERWG members (i.e., a loss of effectiveness).

2. **Revise the DP registration criteria found in the Rules Of Procedure (ROP), Appendix 5B, Section III** and in the corresponding **ERO Enterprise Registration Practice Guide Distribution Provider "directly connected" Determinations.pdf (nerc.com)** to more closely align with the criteria proposed in its Work Plan to register Inverter-Based Resources (IBRs) under FERC Docket RD22-4-000.

When the DP criteria (RoP, Appendix 5b, Section III.a.1) in the **ERO Enterprise Registration Practice Guide Distribution Provider "directly connected" Determinations.pdf (nerc.com)** was updated in July 2018, two key aspects were modified that are now in direct opposition to the approach NERC is taking with respect to registering IBRs:

a. **The amount of peak load served by the DP system was increased from 25 MW to 75 MW.** This is in direct contrast to NERC's Work Plan for the registration of IBRs whereby NERC is seeking to decrease the registration threshold from 75 MVA to 20 MVA.

b. **The connection point for peak load was changed from "directly connected to the "Bulk Power System (BPS)" to "directly connected to the BES."** Again, this is in direct contrast to NERC's Work Plan for the registration of IBRs whereby NERC is seeking to register IBRs that are directly connected to the BPS.

As the penetration of Distributed Energy Resources (DERs) increases, there will be a reliability need to register a broader range of Distribution Providers as was acknowledged with IBRs. The SRC requests NERC address this issue as part of this project, perhaps as a separate phase.

3. Dual Planning Authority (PA) / Planning Coordinator (PC) Designation

While there is justification to reference both the Planning Authority and Planning Coordinator in the Applicability section (section 4) since NERC Appendix 5B: Statement of Compliance Registry Criteria, dated January 19, 2021, still uses both terms, the explanatory paragraph in Part 4.1.4 refers to synchronization between registration criteria and the NERC functional model, which is not maintained, was never formally approved, and is only posted as a historical document. Therefore, the SRC requests the explanatory paragraph be deleted from Part 4.1.4 as illustrated below and in the attached file:

4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

Planning Coordinator (PC) Interface

The SRC notes the importance of retaining the PC's flexibility with respect to determining the process used to acquire modeling data. While some PCs prefer to interface directly with the DP as noted in footnote 2 (*see* page 20 of 22 of the standard), other PCs prefer to interface with the Transmission Owner (TO) or Transmission Planner (TP). In the latter example, the TO or TP maintains the interface with the DP.

Footnote 2: *For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. A Distribution Provider is responsible for providing this information, generally through coordination with the Transmission Owner.*

The SRC requests the SDT clarify the required interfaces under the standard are "as directed by the PC" so information flows to the appropriate entities as part of the data collection process. Leave flexibility to the PC for determining how this data is collected as proposed below:

2. Aggregate Demand2 [DP3, TO (when a Demand is not associated with a registered DP)] a. real and reactive power* b. in-service status*

Footnote 2: For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources.

Footnote 3: Wherever DP is noted as the functional entity responsible for reporting data in the table, a Distribution Provider is responsible for providing this information, generally through coordination with the Transmission Owner.

Footnote 4: Including synchronous condensers and pumped storage.

Other Clarifications

1. Attachment 1, "steady state" column, item 9

a. Strike "feeder" to provide the TP/PC with flexibility in tracking the status of UVLS and UFLS (i.e. as aggregated values or as individual feeders).

b. Clarify the use of "and/or" with regards to UVLS and UFLS. Using "and/or" creates four possible combinations that must be tracked: UFLS only, UVLS only, Both UFLS and UVLS, and neither UFLS nor UVLS. Is the intent of the SDT to track all these possible permutations?

The SRC requests the SDT modify item 9 to add the following details:

9.a. Location (bus from item 1) and if DER is subject to UFLS and/or UVLS

b. Real power capability (gross minimum and maximum)

c. Reactive power capability (gross minimum and maximum)

2. **Attachment 1, footnote 4 -** clarify the use of "/" as illustrated below:

4 The TP or PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary for local practices and the TP or PC may need to coordinate with the DP or TO to determine appropriate assumptions for equivalent distribution system impedance.

[1] From pages 1-2 of the SAR: "*Update MOD-032-1 to: (1) include "data requirements and reporting procedures" for DER that are necessary to support the development of accurate interconnection-wide models, (2) replace Load-Serving Entity (LSE) with Distribution Provider (DP) because of the removal of LSEs from the NERC registry criteria, (3) enable the SDT to review any additional gaps in DER data collection with the de-registration of LSE.*"

Response

Thank you for your comment.
A NERC Glossary definition for DER was proposed.

Improper DP/TO applicability
The SDT contends that TOs and DPs (registered or not) have a reliability interest in knowing what is (and projected to be) connected to their systems with respect to the DER data items proposed to be added in Attachment 1. MOD-032-2 may help TOs get a better knowledge of what is being connected to their systems (and this may require amended interconnection agreements, as acknowledged in the Technical Rationale) and will require better coordination between TOs and DPs (registered or not) which should improve situational awareness and BPS reliability. However, the SDT recognizes the compliance challenges with obligating TOs and DPs to collect data from unregistered entities and added footnote 5 to Attachment 1 that requires TOs and DPs to pass through available information.

See Applicability section of Technical Rationale for SDT conclusion regarding modification of NERC registration criteria in ROP.

Change made to address PC/PA applicability.

Data flow processes
Modifications to footnotes 2 and 4 are intended to emphasize PC/TP flexibility in developing modeling data requirements and reporting procedures per R1. The intent of Attachment 1 is to specify the minimum required data but not procedures and methods. Clarification made in the Technical Rationale.

The intent of the SDT is to track all of the identified permutations of UFLS and UVLS.

Changes made to item 9 to address the concern and provide PC/TP flexibility.

Comment	

EEI supports SDT efforts to address DER impacts, however, the modifications to MOD-032-2 is inappropriately running ahead of NERC IBR organizational registration efforts. Presently, TOs and DPs have no ability to compel DER owners to supply the data identified in the proposed Reliability Standard and until these issues are settled through changes to DER registration, efforts to gather DER data beyond those resources DPs own will likely yield little useful data. Additionally, subjecting DPs and TOs to the compliance obligations through MOD-032-2, before the registration issues have been solved, represent untenable regulatory obligations they cannot fulfil. To address this concern, we ask that all efforts by the Project 2022-02 SDT to compel TOs and DPs to supply DER data, beyond the resources they own and operation, be removed.

We also do not support the development of a DER definition within this NERC Reliability Standards project. The impact of this definition will have far reaching impacts that go beyond this project. To address this issue, we suggest that a separate NERC Reliability Standards project be developed to address this definition.

EEI is additionally concerned that the number of separate DER projects currently under development and otherwise being considered is growing very quickly and it is unclear if there is adequate coordination between all of these projects. While addressing these issues is important, speed should not take precedent over ensuring these efforts are adequately coordinated and Requirements are not being duplicated or conflict.

In addition to the above concerns, we offer the following comments and concerns for consideration:

Applicability Section

There is insufficient clarity related to the extent of DER resources that must be reported under MOD-032. To address this concern, a Facilities section should be added to this Reliability Standard.

Attachment 1

General comment: As stated in EEI's response to Question 1, we support the replacement of LSEs with DP, however, Attachment 1 goes beyond the replacement of LSEs with DP and includes TOs as an additional replacement where there are no registered DPs. This change should be stricken from the proposed draft of MOD-032-2. Registration problems cannot be solved through compliance obligations placed on registered entities who do not participate in the approval of DER interconnections or have any ability to compel the sharing of DER data contained on networks outside their purview.

Steady-State Column - Item 2 (Aggregate Demand) & Dynamic Column – Item 5

EEI does not support the addition of "TO (when a Demand is not associated with a registered DP)" to Steady-State Column - Item 2 (Aggregate Demand) & Dynamic Column – Item 5 (Demand) because TOs have no part in interconnections on Distribution Provider systems and would therefore only have this data if it were supplied to them by the responsible DP. Furthermore, it is impractical to expect that TOs could compel unregistered DPs to supply this data. We further note that even registered DPs only have detailed data on DERs they own. Compelling DPs to similarly supply data beyond those resources they own should be removed. For these reasons, changes to MOD-032-2 should be placed on hold until registration issues surrounding DER owners can be resolved through the NERC organizational registration reforms that are intended to address IBRs that impact the BPS.

Footnote 2 – Additional clarity is needed regarding the intent of Footnote 2. Footnote 2 appears to require DPs (or TOs) to supply Aggregate Demand data that has been manipulated to exclude all DER offsets. While this would be desirable, most small DERs are not metered except through billing meters. Billing meters are not synchronized with SCADA data, diminishing the value of any data supplied by the reporting entities. Additionally, the work hours required to account for these DER offsets could be substantial, adding excessive costs while providing questionable value or improved reliability through this change. As an alternative, EEI suggests that DPs might be able provide estimated DER offset values to address the immediate needs of planners in the development of their planning models, but even this should be studied to ensure such efforts are even possible or practical to implement.

Steady-state Column (Item 9) and Dynamic Column 10

See EEI comments for Items 2 and 5 above.

Footnote 4: Footnote 4 does not align with the SAR. In the SAR, data requests for DERs appear to be limited to aggregated DER data, however, in footnote 4 it states "TP/PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary". This appears to go beyond the approved limits of this SAR and should therefore be removed.

Thank you for your comment.
Facilities Section
The SDT determined that a Facilities section is not necessary. Modifications were made to clarify data obligation for TOs and DPs with respect to data related to DER, for which a definition is proposed.

Improper DP/TO applicability

The SDT contends that TOs and DPs (registered or not) have a reliability interest in knowing what is (and projected to be) connected to their systems with respect to the DER data items proposed to be added in Attachment 1. MOD-032-2 may help TOs get a better knowledge of what is being connected to their systems (and this may require amended interconnection agreements, as acknowledged in the Technical Rationale) and will require better coordination between TOs and DPs (registered or not) which should improve situational awareness and BPS reliability. However, the SDT recognizes the compliance challenges with obligating TOs and DPs to collect data from unregistered entities and added footnote 5 to Attachment 1 that requires TOs and DPs to pass through available information. See Applicability section of Technical Rationale for SDT conclusion regarding modification of NERC registration criteria in ROP. Aggregate Demand The intent of Attachment 1 is to specify the minimum required data but not procedures and methods. Clarification made in the Technical Rationale. Adjustments made to Attachment 1 – many identified items would be specified in PC/TP procedures. Modifications to footnotes 2 and 4 are intended to emphasize PC/TP flexibility in developing modeling data requirements and reporting procedures per R1.

Suggest making the following conforming changes to section 4.1.4 as per standards MOD-031-3 and MOD-033-2 in the NERC project 2017-17 - Standards Alignment with Registration project:

Replace “Planning Authority and Planning Coordinator (hereafter collectively referred to as “Planning Coordinator”)” with “Planning Coordinator”.

Delete the 2nd paragraph in section 4.1.4

R3 indicates “…each notified BA, GO, DP, RP, TO, or TSP shall respond to the notifying PC or TP as follows …”. The R3 VSL indicates these entities failed to provide a written response to their PC or TP. Suggesting either adding “written” to R3 or removing it from the R3 VSL.

R1 Severe VSL: Correct “The Planning and Transmission Planner(s) Coordinator …” for “The Planning Coordinator and Transmission Planner(s)…”

R2 Severe VSL: Missing the TO entity after the last “OR”.

R3 VSL: incorrect references to R4 instead of R3 in all VSL levels.

R3 Severe VSL: should read “or within a longer period of 45 days agreed upon by the notifying Planning Coordinator or Transmission Planner” instead of “or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner”

TO's and DP's cannot be required to provide data for DER (or any generation resources) that the TO and DP do not own. TO and DP have no authority to collect this data and DER's are not obligated to provide the data.

In Attachment 1, under Dynamics, the following change should be made:

Distributed Energy Resource (DER) data [DP, TO (when DER is owned by the TO or DP)

In Attachment 1, under Steady-State, the following change should be made:

Distributed Energy Resource (DER) data [DP, TO (when DER is owned by the TO or DP)

a. Location (bus from item 1) and if DER feeder is subject to UFLS and/or UVLS

b. Real power capability (minimum and maximum)

c. Reactive power capability (minimum and maximum)

d. Generator type (solar, battery, etc.)

e. In-service date or other information to be used to make assumptions about DER capabilities related to ride-through, voltage control, and/or frequency control.

Eversource recommends the drafting team consider the category of “Transients” (specifically EMT Models) as an inclusion in required data submittals in Attachment 1 to reach the SDT’s goal to “address gaps in data collection for the purposes of modeling aggregate levels of DERs in planning assessments” per the MOD-032 SAR. While interconnection-wide models are built using dynamic and short circuit studies and not transient studies, there are still situations where border areas are studied between differing TPs or PCs, and the need for these EMT models to be available is necessary to better model aggregate levels of DERs.

DER Definition:

Southern Indiana Gas & Electric Co. (SIGE) believes the potential impact of the DER definition exceeds the current scope of Project 2022-02 and suggestions expanding the scope of the current project and/or initiating a separate NERC Reliability Standards project to address the DER definition.

Applicability:

SIGE believes there is insufficient clarity related to the extent of DER resources that must be reported under MOD-032. Further clarity on the DER definition is needed.

Attachment 1:

SIGE agrees with EEI's comments that changes to MOD-032-2 should be put on hold until registration issues surrounding DER owners can be resolved through the NERC organizational registration reforms intended to address Inverter Based Resources (IBRs) that impact the Bulk Power System (BPS) .

SIGE is supporting EEI's **Footnote 2**.

SIGE recommends replacing the '****' in **Footnote 4** with "**or**". "The TP/ or PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary for local practices and the TP or PC may need to coordinate with the DP or TO to determine appropriate assumptions for equivalent distribution system impedance."

Thank you for your comment.
The SDT did review available definitions of DER and found existing definitions were not adequate to cover BPS reliability concerns. The proposed definition is aligned with the SPIDERWG working definition for DER. Additional details were added to the Technical Rationale.

The RSTC approved a White Paper produced by SPIDERWG identifying standards that may require revision due to DER: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/Whitepaper_SPIDERWG_Standards_Review.pdf
The project scope for Project 2022-02 explicitly includes consideration of a DER definition.

Modifications were made to clarify data obligation for TOs and DPs with respect to data related to DER, for which a definition is proposed.

See Applicability section of Technical Rationale for SDT conclusion regarding modification of NERC registration criteria in ROP.

Adjustments made to Attachment 1, including footnote 4 – also, see response to EEI.

Attachment 1 - Under Steady State (2, 9) Recommend changing language to [DP (when a Demand connected to the DP is not associated with a registered DP), TO (when a Demand connected to the TO is not associated with a registered DP)]. Under dynamics (5, 10) Recommend changing language to [DP (when a Demand connected to the DP is not associated with a registered DP), TO (when a Demand connected to the TO is not associated with a registered DP)]. An entity that has an unregistered DP connected to them will have both the knowledge that the entity exists and contacts for them to obtain the required information. If a TO is required to provide information for an unregistered DP that receives its service through a registered DP, they may not know the entity exists or have the required contacts to obtain the required information. As written, the SDT is setting the TO up to fail and be non-compliant.

Attachment 1 steady state, modify (9e) to DER capabilities related to ride-through, voltage control and/or frequency control, if available, or In-service date or other information to be used to make assumptions about them if this information is not available. Recommend trying to get the actual information if it is available rather than always making assumptions for this.

Comment
CEHE finds the proposed revisions to MOD-032-2, Attachment 1 too detailed and prescriptive. The NERC Standard should be written to give Planning Coordinators (PC), Transmission Planners (TP) and Transmission Service Providers (TSP) the flexibility to coordinate and determine

the specific data requirements that are needed for the planning models under MOD-032-2, Attachment 1. CEHE recommends that data reporting requirements listed in Attachment 1 be determined by the PC, in coordination with TP. In the ERCOT region, processes are already in place to define these data requirements through the coordination of the Planning Coordinator and Transmission Planners as part of various regional working groups. CEHE also supports the comments as submitted by the Edison Electric Institute (EEI) regarding the development of a DER definition separate from the NERC Reliability Standards Project 2020-02. CEHE agrees with EEI comments on how presently, Transmission Owners (TOs) and Distribution Providers (DPs) have no ability to compel DER owners to supply the data identified in the proposed Reliability Standard and until these issues are settled through changes to DER registration, efforts to gather DER data beyond those resources DPs own will yield little useful data. Subjecting DPs and TOs to the compliance obligations through MOD-032-2, before the registration issues have been solved, represents untenable regulatory obligations they cannot fulfil. To address this concern, CEHE suggests that all efforts by the Project 2022-02 SDT to compel TOs and DPs to supply DER data, beyond the resources they own and operate, be removed. CEHE agrees with EEI comments relative to TOs. These entities may have no insights on DERs of unregistered DP systems and therefore should not be held accountable for supplying this type of information. CEHE supports the additional comments submitted by EEI regarding footnote 4 of the SAR.

Comment	

WEC Energy Group appreciates the opportunity to provide comment and suggests for consideration the inclusion of a specific MW threshold below which DER modeling is not required.

WEC Energy Group is also in support of the comments submitted by EEI which state:

"EEI supports SDT efforts to address DER impacts, however, the modifications to MOD-032-2 is inappropriately running ahead of NERC IBR organizational registration efforts. Presently, TOs and DPs have no ability to compel DER owners to supply the data identified in the proposed Reliability Standard and until these issues are settled through changes to DER registration, efforts to gather DER data beyond those resources DPs own will likely yield little useful data. Additionally, subjecting DPs and TOs to the compliance obligations through MOD-032-2, before the registration issues have been solved, represent untenable regulatory obligations they cannot fulfil. To address this concern, we ask that all efforts by the Project 2022-02 SDT to compel TOs and DPs to supply DER data, beyond the resources they own and operation, be removed.

We also do not support the development of a DER definition within this NERC Reliability Standards project. The impact of this definition will have far reaching impacts that go beyond this project. To address this issue, we suggest that a separate NERC Reliability Standards project be developed to address this definition.

EEI is additionally concerned that the number of separate DER projects currently under development and otherwise being considered is growing very quickly and it is unclear if there is adequate coordination between all of these projects. While addressing these issues is important, speed should not take precedent over ensuring these efforts are adequately coordinated and Requirements are not being duplicated or conflict.

In addition to the above concerns, we offer the following comments and concerns for consideration:

Applicability Section

There is insufficient clarity related to the extent of DER resources that must be reported under MOD-032. To address this concern, a Facilities section should be added to this Reliability Standard.

Attachment 1

Steady-State Column - Item 2 (Aggregate Demand) & Dynamic Column – Item 5

EEI does not support the addition of "TO (when a Demand is not associated with a registered DP)" to Steady-State Column - Item 2 (Aggregate Demand) & Dynamic Column – Item 5 (Demand) because TOs have no part in interconnections on Distribution Provider systems and would therefore only have this data if it were supplied to them by the responsible DP. Furthermore, it is impractical to expect that TOs could compel unregistered DPs to supply this data. We further note that even registered DPs only have detailed data on DERs they own. Compelling DPs to similarly supply data beyond those resources they own should be removed. For these reasons, changes to MOD-032-2 should be placed on hold until registration issues surrounding DER owners can be resolved through the NERC organizational registration reforms that are intended to address IBRs that impact the BPS.

Footnote 2 – Additional clarity is needed regarding the intent of Footnote 2. Footnote 2 appears to require DPs (or TOs) to supply Aggregate Demand data that has been manipulated to exclude all DER offsets. While this would be desirable, most small DERs are not metered except through billing meters. Billing meters are not synchronized with SCADA data, diminishing the value of any data supplied by the reporting entities. Additionally, the work hours required to account for these DER offsets could be substantial, adding excessive costs while providing questionable value or improved reliability through this change. As an alternative, EEI suggests that DPs might be able provide estimated DER offset values to address the immediate needs of planners in the development of their planning models, but even this should be studied to ensure such efforts are even possible or practical to implement.

Steady-state Column (Item 9) and Dynamic Column 10

See EEI comments for Items 2 and 5 above.

Footnote 4: Footnote 4 does not align with the SAR. In the SAR, data requests for DERs appear to be limited to aggregated DER data, however, in footnote 4 it states "TP/PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary". This appears to go beyond the approved limits of this SAR and should therefore be removed."

Response

Thank you for your comment.
The SDT determined that a Facilities section is not necessary. Modifications were made to clarify data obligation for TOs and DPs with respect to data related to DER, for which a definition is proposed.

Improper DP/TO applicability
The SDT contends that TOs and DPs (registered or not) have a reliability interest in knowing what is (and projected to be) connected to their systems with respect to the DER data items proposed to be added in Attachment 1. MOD-032-2 may help TOs get a better knowledge of what is being connected to their systems (and this may require amended interconnection agreements, as acknowledged in the Technical Rationale) and will require better coordination between TOs and DPs (registered or not) which should improve situational awareness and BPS reliability. However, the SDT recognizes the compliance challenges with obligating TOs and DPs to collect data from unregistered entities and added footnote 5 to Attachment 1 that requires TOs and DPs to pass through available information.

See Applicability section of Technical Rationale for SDT conclusion regarding modification of NERC registration criteria in ROP.

Aggregate Demand
The intent of Attachment 1 is to specify the minimum required data but not procedures and methods. Clarification made in the Technical Rationale.

Adjustments made to Attachment 1 – many identified items would be specified in PC/TP procedures. Modifications to footnotes 2 and 4 are intended to emphasize PC/TP flexibility in developing modeling data requirements and reporting procedures per R1.

RE: Definition of Distributed Energy Resource (DER): Please consider that the definition of Distributed Energy Resource (DER) should be more generic, such as, "Real Power and Reactive Power resources connected on the distribution system, in non-isolated parallel operation. Please consider changing active power to Real Power since "active power" is not included in the NERC Glossary of Terms and is in literature a synonym to Real Power and should not be defined differently. In the NERC Glossary of Terms, Real Power is defined as, "The portion of electricity that supplies energy to load." In the slides presented at the Project 2022-02 webinar (June 27), "Active power" was proposed to "indicate[s] that the scope is focused on only those facilities that may be exporting real power to the power system or offsetting real power load (e.g. residential or commercial rooftop solar, even if they only operate at unity power factor or don't have any reactive power capability). This would exclude examples such as charging-only electric vehicle (EV) installations and controllable load options." This proposal seems to indicate active power no longer being used as a synonym to Real Power, which could cause a potential risk of misinterpretations. RE: Applicability – Functional Entities, Section 4.1.4: Please consider removing the "Planning Authority" function from section 4.1.4 since Planning Coordinator is the preferred function name. Please consider that Project 2017-07 Standards Alignment with Registration was previously removing "Planning Authority" from other standards such as MOD-031-2 and MOD-033-1, in-advance of the removal of "Planning Authority" from Rules of Procedure - Appendix 5B: Statement of Compliance Registry Criteria. RE: Section C. Compliance: Please consider adding (CEA) as the abbreviation of "Compliance Enforcement Authority" to section 1.1. Please consider using the abbreviation CEA in section 1.2. RE: Attachment 1: Data Reporting Requirements: Please consider limiting steady-state data for new item 9 to read as, "9. Distributed Energy Resource (DER) data4 [DP]" Please consider that sub-parts a., b., c., d., and e. are not necessary since DER data requirements can be agreed upon per requirement R1.

Response
Thank you for your comment. Active power was replaced with Real Power in the proposed DER definition. DER definition

The SDT did review available definitions of DER and found existing definitions were not adequate to cover BPS reliability concerns. The proposed definition is aligned with the SPIDERWG working definition for DER. Additional details were added to the Technical Rationale. Use of CEA abbreviation was not a significant topic for industry comment – no change made. Adjustments made to Attachment 1. The SDT believes that the intent of the SAR was to establish some minimum level of DER data needed.

We appreciate the SDT's inclusion of a draft definition for a "Distributed Energy Resource (DER)" in Draft 1 of MOD-032-2. We suggest the words 'Generators and energy storage technologies…' in the definition be replaced with 'Sources of Electrical Energy…'. The NERC Glossary of Terms defines "Electrical Energy" as "The generation or use of electric power by a device over a period of time, expressed in kilowatthours (kWh), megawatthours (MWh), or gigawatthours (GWh)" and is technology neutral. While a DER definition is important, the definition in	

combination with adding DP applicability may not provide the clarity for applicability that the SDT concludes in the Technical Rationale. The SDT should consider whether utilizing a new Facilities applicability section (4.2) could provide further scope clarity.

We believe section 4.1.4 should be updated to simply "Planning Coordinator". This would be consistent with the direction taken in other NERC standards that previously contained similar language regarding PA/PC applicability (see changes made to MOD-031-3 and MOD-033-2 under Project 2017-07, Standards Alignment with Registration). The Project 2017-07 webpage contains the following statement about MOD-032-1:

"MOD-032-1 will not be revised at this time, but may come back into Project 2017-07. The work of the System Planning Impact from Distributed Energy Resource Working Group (SPIDERWG) is ongoing at the time of the final posting for Project 2017-07. In June 2018, the NERC Planning Committee (PC) formed the SPDERWG subcommittee to address Distributed Energy Resource (DER) impacts on the bulk power system (BPS). Currently, the subcommittee has proposed a Standard Authorization Request (SAR) for MOD-032-1 pertaining to DERs. The SAR has recently been reviewed by the PC. At this time, the Project 2017-07 drafting team will not take any action in reference to the MOD-032 standard until the SPIDERWG has completed their initial efforts."

While the Draft 1 Technical Rationale notes that the currently posted "Appendix 5B: Statement of Compliance Registry Criteria" still uses the Planning Authority term, a cursory review of all currently active standards reflects that a transition to "Planning Coordinator" in the applicability sections is almost complete, so making this change in MOD-032-2 would complement this transition. FAC-014-3, effective 4/1/2024, will incorporate the PA to PC change for that standard.

We noted in our comments on the SAR that a Distribution Provider may not always be the most practical source for the DER modeling data needed by the PC and TP. We recognize that the SDT has allowed for the flexibility of a Transmission Owner to also be a source for DER modeling data in Draft 1. However if the DP or TO is not directly affiliated with the DER owner, would their need to collect the DER model data from the entities that possess it not essentially mirror the PC and TP's need under R1? The DP and TO might need their own requirement(s) to develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures to obtain DER modeling data (potentially from unregistered entities that don't have an obligation to comply with NERC's Reliability Standards) that would subsequently be passed on to the PC and TP. A "DER data entity" could also be added to the applicability section (reference PRC-006-5 for precedent) with a broader range of registered entity options to fulfil that role (e.g., DP, UFLS-Only DP, TO, RP, GO).

We interpret the implementation plan to mean that the PC and each of their TPs will have 24 months to jointly update their modeling data requirements and reporting procedures to incorporate the changes in Attachment 1. The entities responsible for providing DER modeling data to the PC/TP will then have 12 months to comply. We believe the initial collection and submittal of DER data will be equally if not more

time consuming than the PC/TPs efforts to update their modeling data requirements and reporting procedures. As noted above, after receiving the PC/TP's updated modeling data requirements and reporting procedures, the DER data collectors may need to perform outreach and communicate their own procedure/schedule for receiving the data from others. We suggest the implementation plan be revised to allow 24 months (rather than 12 months) after the effective date for the initial performance of R2, R3 and R4.

We suggest that further development of MOD-032-2 and its associated implementation plan be paused until it can be performed in closer conjunction with NERC's three year plan to register 'GO-IBRs', which is just beginning; and the "Modifications to FAC-001 and FAC-002" Standard Authorization Requests approved for posting at the NERC Standards Committee's May 17, 2023 meeting (no NERC project number assigned yet). Addressing these items (and perhaps other IBR related standards initiatives) in a piecemeal fashion will lead to less optimal results and confusion in the industry.

Response

Thank you for your comment.
The proposed DER definition refers specifically to generators and storage technologies which would exclude transient sources of active power. Clarification added to Technical Rationale.

Facilities Section
The SDT determined that a Facilities section is not necessary. Modifications were made to clarify data obligation for TOs and DPs with respect to data related to DER, for which a definition is proposed.

Improper DP/TO applicability
The SDT contends that TOs and DPs (registered or not) have a reliability interest in knowing what is (and projected to be) connected to their systems with respect to the DER data items proposed to be added in Attachment 1. MOD-032-2 may help TOs get a better knowledge of what is being connected to their systems (and this may require amended interconnection agreements, as acknowledged in the Technical Rationale) and will require better coordination between TOs and DPs (registered or not) which should improve situational awareness and BPS reliability. However, the SDT recognizes the compliance challenges with obligating TOs and DPs to collect data from unregistered entities and added footnote 5 to Attachment 1 that requires TOs and DPs to pass through available information.

See Applicability section of Technical Rationale for SDT conclusion regarding modification of NERC registration criteria in ROP. Implementation Plan The expectation is that TOs and DPs would participate in PC/TP processes to change data reporting requirements related to DER developed during the 24 months prior to the effective date of R1. Thus, TOs and DPs should be able to start working on data collection processes and methods more than 12 months prior to the effective dates of R2, R3, and R4. GO-IBR registration would not cover many DER installations. The SDT views the GO-IBR registration as a separate effort that should not impact moving forward with MOD-032-2 as proposed.

Comment	
PPL NERC Registered Affiliates do not agree with the separate inclusion of DER data in Attachment 1. A lack of specific reference to DER data does not mean that the data does not exist or is not already attainable by PCs and TPs under the existing standard. There are already specific provisions in the Standard allowing for the collection of such data. We do not believe there are gaps or lack of clarity within the currently approved MOD-032-1. Directing how an entity should collect and model such data is overly prescriptive, will increase administrative burden, and limit innovation in modeling DERs. The industry is just now learning how DERs are going to affect the BES. It is counterproductive to circumscribe how entities should meet their compliance requirements.

Exelon concurs with the concerns expressed in the EEI comments. Requirements for DPs and TOs to provide Aggregate Demand and DER data should be limited to the aggregate data currently available to the entity. For Attachment 1, Steady-State 9e, we suggest removing the implied requirement for the “in-service dates”. Consider restating Attachment 1, Steady-State 9e as, “Information to be used to make assumptions about DER capabilities related to ride-through, voltage control and/or frequency control.” The Technical Rationale document can be modified to discuss how in-service dates may support the response to Attachment 1, Steady-State 9e.

The DP must be able to bound restrictions/limitations to TP request due to limited data availability, reasonableness, etc., when DER data requirements are made. Also, when determining the size of each DER, a minimum size of 500 kVA should be required for inclusion. Anything less than 500kVA would require an onerous amount of effort to provide accurate data, which would result in data being outdated and/or obsolete, etc. There is limited data available (MOD-032-2 Attachment 1) for DP area small DER generation (e.g., residential solar, small commercial), therefore the accuracy of aggregated small DER generation for BES system impact modeling is limited.

1) Suggest making the following conforming changes to section 4.1.4 as per standards MOD-031-3 and MOD-033-2 in the NERC project 2017-17 - Standards Alignment with Registration project:

- Replace “Planning Authority and Planning Coordinator (hereafter collectively referred to as “Planning Coordinator”)” with “Planning Coordinator”.
- Delete the 2nd paragraph in section 4.1.4

2) R3 indicates “…each notified BA, GO, DP, RP, TO, or TSP shall respond to the notifying PC or TP as follows …”. The R3 VSL indicates these entities failed to provide a written response to its PC or TP. Suggesting either adding “written” to R3 or removing it form the R3 VSL.

3) R1 Severe VSL: Correct “The Planning and Transmission Planner(s) Coordinator …” for “The Planning Coordinator and Transmission Planner(s)…”

4) R2 Severe VSL: Missing the TO entity after the last “OR”.

5) R3 VSL: incorrect references to R4 instead of R3 (more specifically R3.2) in all VSL levels.

6) R3 Severe VSL: should read "[...Requirement R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response after 135 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner)" instead of "Requirement R4 within 135 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner)."

7)TO's and DP's cannot be required to provide data for DER (or any generation resources) that the TO and DP do not own. TO and DP have no authority to collect this data and DER's are not obligated to provide the data.

8) In Attachment 1, under Dynamics, the following change should be made:

- Distributed Energy Resource (DER) data [DP, TO (when DER is owned by the TO or DP)
- In Attachment 1, under Steady-State, the following change should be made: Distributed Energy Resource (DER) data [DP, TO (when DER is owned by the TO or DP)

a. Location (bus from item 1) and if DER feeder is subject to UFLS and/or UVLS

b. Real power capability (minimum and maximum)

c. Reactive power capability (minimum and maximum)

d. Generator type (solar, battery, etc.)

e. In-service date or other information to be used to make assumptions about DER capabilities related to ride through, voltage control and/or frequency control.

Comment

PG&E provides the following:

The MRO New Standard Review Forum (NSRF) has provided additional comments that PG&E wishes to support related to the DER definition. PGAE supports the recommendation that the definition should be removed from this modification and addressed in a separate project since it would impact many Standards currently being worked on or planned for in the future. With seven (7) different DER definitions

currently being provided from such sources as the NERC SPIDERWG, NARUC, IEEE, and the California PUC, the Project 2022-02 effort will cause further confusion for the industry. For this reason, PG&E will be voting Negative for this proposed modification.

1. Will there be an aggregate DER threshold (either nameplate or net injection to the grid) above which the DP should submit modeling data to the TP and PC for inclusion in transmission planning models? MOD-025, MOD-026, and MOD-027 standards are being revised to limit applicability to resources included in either I2 or I4 of the BES definition (individual units > 20 MVA or an aggregate plant > 75 MVA). Should thresholds for MOD-032 DER modeling be consistent with the other NERC modeling standard applicability thresholds? 2. Will the NERC BES Reference document be revised to include DER generation (individual units and/or DER aggregations)? 3. Are these DER data reporting requirements limited to merchant DER installations in the future only? ○ It will be challenging to obtain steady-state and dynamic data for each individual installation that has taken place over the years in the past, especially for non-merchant applications (such as residential roof-top solar resources). Hoe are DPs expected to obtain this data and who will bear the cost associated with this process?	

○ How will DPs be able to obtain and verify the in-service dates of each individual distribution connected resource that has occurred in the past? ○ Most of the residential and other non-merchant solar and battery installations fall below the installed capacity threshold at which such resources are required to go through the distribution interconnection detailed study process. How are DPs expected to collect steady-state and dynamic data on such resources, even if occurring in the future?

General comments on MOD-032-2: a. In Section 4. Applicability, under 4.1.4, BC Hydro recommends that the wording “Planning Authority and Planning Coordinator (hereafter collectively referred to as “Planning Coordinator”)”, be changed to “Planning Coordinator”. Retaining the current wording may create confusion or result in misinterpretation, especially for those utilities that treat PA standards and PC standards differently. A PC-only approach has been used in other recently approved NERC standards and those that are being developed, such as FAC-002-4, MOD-033-2, and MOD-026-2. b. BC Hydro recommends that in Attachment 1, the language used in the DER steady-state data section (Item 9) be generalized to account for distribution-connected hydroelectric generators. A suggested wording is provided below for consideration:	

"…c. Reactive power capability (minimum and maximum) *d. Fuel type (solar, wind, hydraulic, battery, etc.)* *e. Generator type (synchronous, inverter-based resource, etc.)* *f. In-service date or other …"*

Thank you for your comment. Change made to address PC/PA applicability – please see Technical Rationale. The SDT intent is to maintain PC/TP flexibility for consistently collecting accurate data, but not be overly prescriptive on data collection processes with respect to developing modeling data requirements and reporting procedures per R1.

Steven Rueckert - Western Electricity Coordinating Council - 10, Group Name WECC Entity Monitoring	
Answer	
Document Name	

Comment
WECC believes there is value in including these Distributed Sources in system modeling, but is concerned that the proposed defintion may not satisfy that need. The definition of DER does not seem adequate. First, it includes non BES generation type resources that are beyond BES dispersed generation identified under inclusion I4 of the BES Definition. And thus, appears to go beyond the scope of mandatory standards applicability. A second issue is that because the definition has the qualifier "…connected to the Distribution Provider's system…" it would leave out any "DER" that did not have a registered Distribution Provider including any connected via some pathway directly to a Transmission System.

WECC believes that a focused effort on defining DER and addressing it within the BES Definition or in the NERC Glossary to be used consistently in all standards.	
Likes 0

Per the Federal Power Act, NERC's jurisdiction is to establish and enforce Reliability Standards for the Bulk Power System. A NERC document, Understanding the Grid, published in March 2023, indicates that the generation and transmission components and their associated control systems make up the BPS, so requiring DP's to provide DER data that is connected to the Distribution system is outside of NERC's jurisdiction, unless the DER is connected to the transmission system such as non-BES generation. Furthermore, the NERC Glossary of Terms definition for Bulk Power System explicitly states that is does not include facilities used in the local distribution of electric energy, which aligns to the definition for bulk-power system in the Federal Power Act Section 215(a), definitions. DER on a DP's network is not that clear in the Technical Reference document. Please provide some examples similar to the BES reference document of what would not be in-scope DER and what would be in-scope DER on a DP's network. What happens if we are unable to obtain modeling data from OEMs for older DER inverters?	

What if we do not have the information to determine the collector system impedance values? What happens if residential, retail or commercial owners do not want to support this effort? What happens if an IBR OEM has gone out of business?

BPA believes that this definition would require adjustment of the BES inclusions and exclusions lists. For example, currently resources below 75 MVA are not required to submit the data that will be required of DER. This will result in entities not providing data for anything less than 75 MVA and citing exclusion (or lack of inclusion), even though the intent appears to require data submission from much smaller	

resources. BPA suggests excluding legacy equipment such as hydro, or perhaps the definition should only apply to inverter based resources (IBR.) It is also important to note that small generator owners are likely not financially able to test equipment (per MOD-025/026/027) in order to provide modeling data. This could result in shutting down such generators and associated loads costing local jobs in affected areas. BPA requests clarification and consistency regarding the use of Bulk Power System and Bulk Electric System. Both terms are being used.

Comment
FE supports EEI's comments which state: EEI supports SDT efforts to address DER impacts, however, the modifications to MOD-032-2 is inappropriately running ahead of NERC IBR organizational registration efforts. Presently, TOs and DPs have no ability to compel DER owners to supply the data identified in the proposed Reliability Standard and until these issues are settled through changes to DER registration, efforts to gather DER data beyond those resources DPs own will likely yield little useful data. Additionally, subjecting DPs and TOs to the compliance obligations through MOD-032-2, before the registration issues have been solved, represent untenable regulatory obligations they cannot fulfil. To address this concern, we ask that all efforts by the Project 2022-02 SDT to compel TOs and DPs to supply DER data, beyond the resources they own and operation, be removed.

We also do not support the development of a DER definition within this NERC Reliability Standards project. The impact of this definition will have far reaching impacts that go beyond this project. To address this issue, we suggest that a separate NERC Reliability Standards project be developed to address this definition.

EEI is additionally concerned that the number of separate DER projects currently under development and otherwise being considered is growing very quickly and it is unclear if there is adequate coordination between all of these projects. While addressing these issues is important, speed should not take precedent over ensuring these efforts are adequately coordinated and Requirements are not being duplicated or conflict.

In addition to the above concerns, we offer the following comments and concerns for consideration:

Applicability Section

There is insufficient clarity related to the extent of DER resources that must be reported under MOD-032. To address this concern, a Facilities section should be added to this Reliability Standard.

Attachment 1

General comment: As stated in EEI's response to Question 1, we support the replacement of LSEs with DP, however, Attachment 1 goes beyond the replacement of LSEs with DP and includes TOs as an additional replacement where there are no registered DPs. This change should be stricken from the proposed draft of MOD-032-2. Registration problems cannot be solved through compliance obligations placed on registered entities who do not participate in the approval of DER interconnections or have any ability to compel the sharing of DER data contained on networks outside their purview.

Steady-State Column - Item 2 (Aggregate Demand) & Dynamic Column – Item 5

EEI does not support the addition of "TO (when a Demand is not associated with a registered DP)" to Steady-State Column - Item 2 (Aggregate Demand) & Dynamic Column – Item 5 (Demand) because TOs have no part in interconnections on Distribution Provider systems and would therefore only have this data if it were supplied to them by the responsible DP. Furthermore, it is impractical to expect that TOs could compel unregistered DPs to supply this data. We further note that even registered DPs only have detailed data on DERs they own. Compelling DPs to similarly supply data beyond those resources they own should be removed. For these reasons, changes to MOD-032-2 should be placed on

hold until registration issues surrounding DER owners can be resolved through the NERC organizational registration reforms that are intended to address IBRs that impact the BPS.

Footnote 2 – Additional clarity is needed regarding the intent of Footnote 2. Footnote 2 appears to require DPs (or TOs) to supply Aggregate Demand data that has been manipulated to exclude all DER offsets. While this would be desirable, most small DERs are not metered except through billing meters. Billing meters are not synchronized with SCADA data, diminishing the value of any data supplied by the reporting entities. Additionally, the work hours required to account for these DER offsets could be substantial, adding excessive costs while providing questionable value or improved reliability through this change. As an alternative, EEI suggests that DPs might be able provide estimated DER offset values to address the immediate needs of planners in the development of their planning models, but even this should be studied to ensure such efforts are even possible or practical to implement.

Steady-state Column (Item 9) and Dynamic Column 10

See EEI comments for Items 2 and 5 above.

Footnote 4: EEI is concerned that footnote 4 does not align with the SAR. In the SAR, data requests for DERs appear to be limited to aggregated DER data, however, in footnote 4 it states "TP/PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary". This appears to go beyond the approved limits of this SAR and should therefore be removed.

Response

Thank you for your comment.
The SDT determined that a Facilities section is not necessary. Modifications were made to clarify data obligation for TOs and DPs with respect to data related to DER, for which a definition is proposed.

The SDT contends that TOs and DPs (registered or not) have a reliability interest in knowing what is (and projected to be) connected to their systems with respect to the DER data items proposed to be added in Attachment 1. MOD-032-2 may help TOs get a better knowledge of what is being connected to their systems (and this may require amended interconnection agreements, as acknowledged in the Technical Rationale) and will require better coordination between TOs and DPs (registered or not) which should improve situational awareness and BPS reliability.

However, the SDT recognizes the compliance challenges with obligating TOs and DPs to collect data from unregistered entities and added footnote 5 to Attachment 1 that requires TOs and DPs to pass through available information. See Applicability section of Technical Rationale for SDT conclusion regarding modification of NERC registration criteria in ROP. The intent of Attachment 1 is to specify the minimum required data but not procedures and methods. Clarification made in the Technical Rationale. Adjustments made to Attachment 1 – many identified items would be specified in PC/TP procedures. Modifications to footnotes 2 and 4 are intended to emphasize PC/TP flexibility in developing modeling data requirements and reporting procedures per R1.

Project 2022-02 is more than the replacement of these registration identifiers as it also includes DER modeling data additions. The question above does not fully encompass the changes proposed for MOD-032-02. However, the changes for adding DER modeling data does seem appropriate and reflects the NERC Reliability Guideline: DER Data Collection for Modeling in Transmission Planning.

Tacoma Power has multiple concerns with the proposed DER definition and adding this scope to the MOD-032 Standard, as outlined in the next few bullets.

Scope Expansion and non-NERC Registered Entities

The proposed changes to include DERs in MOD-032 is expanding the scope of the Standard to include equipment not currently covered in the BES definition. The concept that non-BES or distribution equipment could impact the reliability and operation of the BES is not new to NERC Standards. For example, there is precedent in the PRC Standards to consider distribution equipment that supports UVLS programs or Protection System schemes. However, the proposed changes in this posting for MOD-032 are not sufficient on their own to ensure the expansion of scope will be effective.

The Technical Rationale states “the modifications place a compliance obligation on NERC registered DPs (or TOs) to provide basic information about DER that are connected to their systems so that DER can be properly represented in interconnection-wide cases.” However, there are large distribution utilities that are not registered as DPs, but have aggregate DERs that should be accounted for under the proposed MOD-032 Attachment 1 scope. To ensure the appropriate entities are held responsible, either the (1) BES definition needs to change to include DERs, (2) a new “DP-DER” registration needs to be created, or (3) the DP registration criteria needs to change to ensure the appropriate entities are held responsible. Of these three options, Tacoma Power recommends revising the DP criteria in ROP Appendix 5B, Section III, to include a new criterion to ensure distribution utilities that must provide data to support MOD-032, Attachment 1, are subject to NERC jurisdiction. This

approach aligns with the regulatory precedent set for UVLS programs, RAS schemes, and Protection System components under PRC-005 and PRC-006. Without a seperate effort to revise the DP registration, Tacoma Power cannot approve the draft MOD-032. The draft Standard cannot be fulfilled without these entities being held responsible for the data.

Below is an example mark-up of ROP Appendix 5B, Section III for NERC to consider in the ROP revision:

III.a.1 Distribution Provider system serving >75 MW of peak Load that is directly connected to the BES; or

III.a.2 Distribution Provider is the responsible entity that owns, controls, or operates Facilities that are part of any of the following Protection Systems or programs designed, installed, and operated for the protection of the BES:

- *a required Undervoltage Load Shedding (UVLS) program and/or*
- *a required Special Protection System or Remedial Action Scheme and/or*
- *a required transmission Protection System; or*

III.a.3 Distribution Provider that is responsible for providing services related to Nuclear Plant Interface Requirements (NPIRs) pursuant to an executed agreement; or

III.a.4 Distribution Provider with field switching personnel identified as performing unique tasks associated with the Transmission Operator's restoration plan that are outside of their normal tasks; or

III.a.5 Distribution Provider is the responsible entity that serves, controls, owns, or operates Distributed Energy Resources (DERs) exceeding 0.01 MW.

DER Definition

Tacoma Power supports the essence of the DER definition, but is concerned that it is unclear whether the proposed definition includes devices that have transient export of real power such as closed transition transfer switches, regenerative elevators/cranes, and industrial motors with regenerative braking. The proposed definition should be clarified to exclude these devices, while still including devices installed for energy storage such as batteries, flywheels, and Synchronous condensers. Tacoma Power suggests adding "for at least 30 seconds" to the definition so that the definition reads "... *providing active power for at least 30 seconds in non-isolated parallel operation*... "

The IEEE definition of DER includes both the energy resource plus any necessary supplemental equipment. Tacoma Power would like to see similar guidance within the NERC DER definition. This ensures that reactive power control devices such as capacitor and STATCOMS are correctly included in the DER model submittals.

Implementation Plan

Tacoma Power does not agree with the proposed implementation plan for the DER definition. This definition will eventually be used in several future NERC Standard revisions. Some of these revisions may have a shorter implementation timeframe than Project 2022-02. The effective date of the DER definition needs to be coordinated with the other planned Standard revisions to ensure the timing supports implementation of these other Standard revisions.

Coordination with Other Standard Changes

Tacoma Power is concerned about how the DER definition will be used for other future NERC Standard changes, as outlined in the October 2022 "NERC System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG) White Paper." The proposal's impact on other Standards must be clear prior to putting the DER definition in place to avoid unintended consequences. For example, excluding various types of demand response from the DER definition may not be appropriate for PRC-006 and TPL-001. These two Standards may need to consider demand response for proper modeling of the BES. If NERC intends to add DERs to EMT Modeling Requirements in MOD-026, then this would be a significant cost and pose technical challenges for registered entities, which could impact the DER definition scope.

When reviewing the DER definition in this posting, entities need to understand how this definition will be used in other future Standard changes. Tacoma Power recommends one of the two following options to ensure impacts to other future Standard changes are considered in the definition development:

1. Provide a list of other Standards that will be impacted by this definition change in the "New or Modified Term(s) Used in NERC Reliability Standards" section of the MOD-032 redline, similar to the approach taken by Project 2019-04, Modifications to PRC-005, or
2. Create a standalone Standards Project that addresses the DER definition development for all future Standard changes.

Response

Thank you for your comment.

Inclusion of DER as a BES facility is not being considered as part of this project.

Improper DP/TO applicability
The SDT contends that TOs and DPs (registered or not) have a reliability interest in knowing what is (and projected to be) connected to their systems with respect to the DER data items proposed to be added in Attachment 1. MOD-032-2 may help TOs get a better knowledge of what is being connected to their systems (and this may require amended interconnection agreements, as acknowledged in the Technical Rationale) and will require better coordination between TOs and DPs (registered or not) which should improve situational awareness and BPS reliability. However, the SDT recognizes the compliance challenges with obligating TOs and DPs to collect data from unregistered entities and added footnote 5 to Attachment 1 that requires TOs and DPs to pass through available information.

See Applicability section of Technical Rationale for SDT conclusion regarding modification of NERC registration criteria in ROP.

DER Definition
The proposed DER definition refers specifically to generators and storage technologies which would exclude transient source of active power. Clarification added to Technical Rationale.
The SDT feels that the DER definition is broad enough to include supplemental equipment, and in conjunction with item 9d in Attachment 1, adequately covers the concern. Clarification added to the Technical Rationale.
The SDT did review available definitions of DER and found existing definitions were not adequate to cover BPS reliability concerns. The proposed definition is aligned with the SPIDERWG working definition for DER. Additional details were added to the Technical Rationale.

The RSTC approved a White Paper produced by SPIDERWG identifying standards that may require revision due to DER: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/Whitepaper_SPIDERWG_Standards_Review.pdf

Comment	
EEI Draft Comments should be included or referenced:	

{C}· {C}To better clarify the extent of DER resources that must be reported under MOD-032, EEI suggests that a Facilities section be added to this Reliability Standard.

{C}· {C}Footnote 2 – EEI asks that the SDT provide additional clarity regarding the intent of Footnote 2. Footnote 2 appears to require DPs (or TOs) to supply Aggregate Demand data that has been manipulated to exclude all DER offsets. While we understand why this would be desirable, most small DERs are not metered except for billing meters. Billing meters are not synchronized with SCADA data, diminishing the value of any data supplied by the reporting entities. We are further concerned that the manhours required to account for these DER offsets could be substantial adding excessive costs while providing questionable value to this change. As an alternative, EEI suggests that DPs and TOs could provide estimated DER offset values, which would require fewer manhours to develop and should provide sufficient value to the planning models.

{C}· {C}Steady-state and Dynamic columns

EEI is concerned that the data requests identified in Item 9 (Steady-state), and Item 10 (Dynamic) seek non-aggregated data, while the SAR specifies that aggregated DER data is to be supplied. To address this concern, we ask that both Items 9 and 10 be edited to make it clear that data requests to DPs and TOs are to be limited to aggregate DER data.

Footnote 4: EEI is concerned that footnote 4 does not align with the SAR. In the SAR, data requests for DERs appear to be limited to aggregated DER data, however, in footnote 4 it states “TP/PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary”. This appears to go beyond the approved limits of this SAR and should therefore be removed.

Response

Thank you for your comment.

The SDT determined that a Facilities section is not necessary. Modifications were made to clarify data obligation for TOs and DPs with respect to data related to DER, for which a definition is proposed.

Improper DP/TO applicability
The SDT contends that TOs and DPs (registered or not) have a reliability interest in knowing what is (and projected to be) connected to their systems with respect to the DER data items proposed to be added in Attachment 1. MOD-032-2 may help TOs get a better knowledge of what is being connected to their systems (and this may require amended interconnection agreements, as acknowledged in the Technical Rationale) and will require better coordination between TOs and DPs (registered or not) which should improve situational awareness and BPS reliability. However, the SDT recognizes the compliance challenges with obligating TOs and DPs to collect data from unregistered entities and added footnote 5 to Attachment 1 that requires TOs and DPs to pass through available information.

Data flow processes
Modifications to footnotes 2 and 4 are intended to address the concern and emphasize PC/TP flexibility in developing modeling data requirements and reporting procedures per R1. The intent of Attachment 1 is to specify the minimum required data but not procedures and methods. Clarification made in the Technical Rationale.

Jou Yang - MRO - 1,2,3,4,5,6 - MRO, Group Name MRO NSRF

Answer	
Document Name	2022-02 Tables.PNG

Comment

- The NSRF recommends the SDT remove the DER definition from the proposed MOD-032-2 standard.

- The NSRF recommends NERC create a standalone Standards Project that addresses the DER definition development for all future Standard changes. As part of this project, the NSRF recommends revising the DP criteria in the Rules Of Procedure (ROP), Appendix 5B, Section III.

- NERC needs a way to register a DER or "DER aggregator" type entity, to ensure the appropriate entities are held responsible for NERC Reliability Standards.

Further:

The proposed changes to include DERs in MOD-032 is expanding the scope of the Standard to include equipment not currently covered in the BES definition. The concept that non-BES or distribution equipment could impact the reliability and operation of the BES is not new to NERC Standards. For example, there is precedent in the PRC Standards to consider distribution equipment that supports UVLS programs or Protection System schemes. However, the proposed changes in this posting for MOD-032 are not sufficient to ensure the expansion of scope will be effective.

Currently there are seven definitions for DER. The SDT chose to create a new definition of DER separate from those.

The proposed definition:

Term(s): Distributed Energy Resource (DER) Generators and energy storage technologies connected to the Distribution Provider's system that are capable of providing active power in non-isolated parallel operation with the Bulk Electric System.

The SPIDERWG Terms and definitions document has six definitions for DER. The draft MOD-032-2 definition is different than the definitions contained in the document. See Table D.1: Alternate Definitions for DER-Related Concepts.

Link to SPIDERWG Terms and definitions document

Link to DER reference document – contains DER definition.

Distributed Energy Resources Connection Modeling and Reliability Considerations February 2017

The NERC Distributed Energy Task Force (ERTF) DER definition:

“Any resource on the distribution system that produces electricity and is not otherwise included in the formal NERC definition of the Bulk Elec tric System (BES).”

The NSRF is concerned about how the DER definition will be used for other future NERC Standard changes, as outlined in the October 2022 “NERC System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG) White Paper.” The proposal's impact on other Standards must be clear prior to putting the DER definition in place to avoid unintended consequences.

For example, excluding various types of demand response from the DER definition may not be appropriate for PRC-006 and TPL-001. These two Standards may need to consider demand response for proper modeling of the BES. If NERC intends to add DERs to EMT Modeling Requirements in MOD-026, then this would be a significant cost and pose technical challenges for registered entities, which could impact the DER definition scope.

The Technical Rationale states “the modifications place a compliance obligation on NERC registered DPs (or TOs) to provide basic information about DER that are connected to their systems so that DER can be properly represented in interconnection-wide cases.” However, there are large distribution utilities that are not registered as DPs, but have aggregate DERs that should be accounted for under the proposed MOD-032 Attachment 1 scope. To ensure the appropriate entities are held responsible, either the:

1. BES definition needs to change to include DERs,

2. a new “DP-DER” registration needs to be created, or

3. the DP registration criteria needs to change to ensure the appropriate entities are held responsible.

Dislikes 0	

Response

Thank you for your comment.
New DER registration
The SDT views comments suggesting NERC registration of individual DER owners as unnecessary and impractical (similar to the impracticality of registering the load at every single house connected to the system) that would still require DPs and TOs to report what is connected to their systems unless NERC registration of every single rooftop solar installation is being proposed.

Improper DP/TO applicability
The SDT contends that TOs and DPs (registered or not) have a reliability interest in knowing what is (and projected to be) connected to their systems with respect to the DER data items proposed to be added in Attachment 1. MOD-032-2 may help TOs get a better knowledge of what is being connected to their systems (and this may require amended interconnection agreements, as acknowledged in the Technical Rationale) and will require better coordination between TOs and DPs (registered or not) which should improve situational awareness and BPS reliability. However, the SDT recognizes the compliance challenges with obligating TOs and DPs to collect data from unregistered entities and added footnote 5 to Attachment 1 that requires TOs and DPs to pass through available information.

See Applicability section of Technical Rationale for SDT conclusion regarding modification of NERC registration criteria in ROP.

Inclusion of DER as a BES facility is not being considered as part of this project.

DER definition
The SDT did review available definitions of DER and found existing definitions were not adequate to cover BPS reliability concerns. The proposed definition is aligned with the SPIDERWG working definition for DER. Additional details were added to the Technical Rationale.

Demand response was specifically excluded by SPIDERWG, so the cited example would impact intent related to other SPIDERWG recommendations and SARs.

Thomas Foltz - AEP - 5	
Answer	
Document Name	
Comment	
AEP appreciates the efforts of the standards drafting team and sees the value of the proposed revisions to Attachment One. Even so, AEP would be unable to vote affirmative on this revised standard unless and until every entity providing DER data is a registered Functional Entity who is formally obligated to provide it. As is the case in existing standards where Generator Owners are obligated to provide similar data, entities who possess the needed DER data noted in the Attachment One revisions should likewise be registered and explicitly obligated to provide this data as well. While we are unsure if the existing Functional Entities classes are themselves sufficient, or if instead, a new class of Functional Entities might need to be considered and developed, the need nonetheless exists. NERC may wish to also consider the potential that such obligations could potentially cross Federal and State jurisdictional lines of responsibility, further illustrating the complexity-of and challenges-in developing obligations to obtain the DER data in the revised Attachment One.	

In addition, while the SDT has not provided a question regarding the proposed Implementation Plan, AEP believes additional time will be needed to accommodate the work pertaining to assets newly brought into scope. Rather than being required to comply with the obligations 12 months after the definition has become effective, we instead suggest it be 24 months after the definition has become effective.

New DER registration
The SDT views comments suggesting NERC registration of individual DER owners as unnecessary and impractical (similar to the impracticality of registering the load at every single house connected to the system) that would still require DPs and TOs to report what is connected to their systems unless NERC registration of every single rooftop solar installation is being proposed.

Improper DP/TO applicability
The SDT contends that TOs and DPs (registered or not) have a reliability interest in knowing what is (and projected to be) connected to their systems with respect to the DER data items proposed to be added in Attachment 1. MOD-032-2 may help TOs get a better knowledge of what is being connected to their systems (and this may require amended interconnection agreements, as acknowledged in the Technical Rationale) and will require better coordination between TOs and DPs (registered or not) which should improve situational awareness and BPS reliability. However, the SDT recognizes the compliance challenges with obligating TOs and DPs to collect data from unregistered entities and added footnote 5 to Attachment 1 that requires TOs and DPs to pass through available information.

See Applicability section of Technical Rationale for SDT conclusion regarding modification of NERC registration criteria in ROP.

Implementation Plan
The expectation is that TOs and DPs would participate in PC/TP processes to change data reporting requirements related to DER developed during the 24 months prior to the effective date of R1. Thus, TOs and DPs should be able to start working on data collection processes and methods more than 12 months prior to the effective dates of R2, R3, and R4.

Standards Announcement
Project 2022-02 Modifications to TPL-001 and MOD-032

Initial Ballots and Non-binding Polls Open through July 14, 2023

Now Available

Initial ballots and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels are open through **8 p.m. Eastern Friday, July 14, 2023** for the following standard and implementation plan:

- MOD-032-2 – Data for Power System Modeling and Analysis
- Implementation Plan

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Balloting

Members of the ballot pools associated with this project can log in and submit their votes by accessing the Standards Balloting and Commenting System (SBS) here.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will review all responses received during the comment period and determine the next steps of the project.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer**,** Ben Wu (via email) or at 470-542-6882. A. Introduction

1. **Title: Data for Power System Modeling and Analysis**

2. **Number: MOD-032-1**

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Balancing Authority

   4.1.2 Generator Owner

   4.1.3 Load Serving Entity

   4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

   This proposed standard combines "Planning Authority" with "Planning Coordinator" in the list of applicable functional entities. The NERC Functional Model lists "Planning Coordinator" while the registration criteria list "Planning Authority," and they are not yet synchronized. Until that occurs, the proposed standard applies to both Planning Authority and Planning Coordinator.

   4.1.5 Resource Planner

   4.1.6 Transmission Owner

   4.1.7 Transmission Planner

   4.1.8 Transmission Service Provider

5. **Effective Date:**

   MOD-032-1, Requirement R1 shall become effective on the first day of the first calendar quarter that is 12 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, MOD-032-1, Requirement R1 shall become effective on the first day of the first calendar quarter that is 12 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

   MOD-032-1, Requirements R2, R3, and R4 shall become effective on the first day of the first calendar quarter that is 24 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority

is not required, MOD-032-1, Requirements R2, R3, and R4 shall become effective on the first day of the first calendar quarter that is 24 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

6. Background:

MOD-032-1 exists in conjunction with MOD-033-1, both of which are related to system-level modeling and validation. Reliability Standard MOD-032-1 is a consolidation and replacement of existing MOD-010-0, MOD-011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1, and it requires data submission by applicable data owners to their respective Transmission Planners and Planning Coordinators to support the Interconnection-wide case building process in their Interconnection. Reliability Standard MOD-033-1 is a new standard, and it requires each Planning Coordinator to implement a documented process to perform model validation within its planning area.

The transition and focus of responsibility upon the Planning Coordinator function in both standards are driven by several recommendations and FERC directives from FERC Order No. 693, which are discussed in greater detail in the rationale sections of the standards. One of the most recent and significant set of recommendations came from the NERC Planning Committee's System Analysis and Modeling Subcommittee (SAMS). SAMS proposed several improvements to the modeling data standards, to include consolidation of the standards (the SAMS whitepaper is available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here: http://www.nerc.com/comm/PC/Agendas%20Highlights%20and%20Minutes%20DL/2012/2012_Dec_PC%20Agenda.pdf).

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M2. Each registered entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data;

3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each registered entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

"Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance with Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Refer to the NERC Rules of Procedure for a list of compliance monitoring and assessment processes.

1.4. Additional Compliance Information

None

Table of Compliance Elements

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long-term Planning**	**Lower**	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include less than or equal to 25% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 25% but less than or equal to 50% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 50% but less than or equal to 75% of the required components specified in Requirement R1.	The Planning and Transmission Planner(s) Coordinator did not develop any steady-state, dynamics, and short circuit modeling data requirements and reporting procedures required by Requirement R1; OR The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 75% of the required components specified

						in Requirement R1.
R2	**Long-term Planning**	**Medium**	The Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide less than or equal to 25% of the required data specified in Attachment 1; OR The Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service Provider provided	The Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 25% but less than or equal to 50% of the required data specified in Attachment 1; OR The Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service	The Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 50% but less than or equal to 75% of the required data specified in Attachment 1; OR The Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service	The Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service Provider did not provide any steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s); OR The Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission

			steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but less than or equal to 25% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified	Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 25% but less than or equal to 50% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning	Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 50% but less than or equal to 75% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning	Planner(s) and Planning Coordinator(s), but failed to provide greater than 75% of the required data specified in Attachment 1; OR The Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 75% of the required data failed to meet data format, shareability, level of detail, or case type specifications;

			by the data requirements and reporting procedures but did provide the data in less than or equal to 15 calendar days after the specified date.	Coordinator(s) within the schedule specified by the data requirements and reporting procedures but did provide the data in greater than 15 but less than or equal to 30 calendar days after the specified date.	Coordinator(s) within the schedule specified by the data requirements and reporting procedures but did provide the data in greater than 30 but less than or equal to 45 calendar days after the specified date.	OR The Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures but did provide the data in greater than 45 calendar days after the specified date.
R3	**Long-term Planning**	**Lower**	The Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service	The Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service	The Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service	The Balancing Authority, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service

			Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R4 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response within 105 calendar days (or within 15 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R4 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response within greater than 105 calendar days but less than or equal to 120 calendar days (or within greater than 15 calendar days but less than or equal to 30 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R4 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response within greater than 120 calendar days but less than or equal to 135 calendar days (or within greater than 30 calendar days but less than or equal to 45 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R4 within 135 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).

R4	**Long-term Planning**	**Medium**	The Planning Coordinator made available the required data to the ERO or its designee but failed to provide less than or equal to 25% of the required data in the format specified by the ERO or its designee.	The Planning Coordinator made available the required data to the ERO or its designee but failed to provide greater than 25% but less than or equal to 50% of the required data in the format specified by the ERO or its designee.	The Planning Coordinator made available the required data to the ERO or its designee but failed to provide greater than 50% but less than or equal to 75% of the required data in the format specified by the ERO or its designee.	The Planning Coordinator made available the required data to the ERO or its designee but failed to provide greater than 75% of the required data in the format specified by the ERO or its designee.

None.

E. Interpretations

None.

F. Associated Documents

None.

MOD-032-01 – ATTACHMENT 1:

Data Reporting Requirements

The table, below, indicates the information that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in the Interconnection-wide cases. A Planning Coordinator may specify additional information that includes specific information required for each item in the table below. Each functional entity[1] responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The data reported shall be as identified by the bus number, name, and/or identifier that is assigned in conjunction with the PC, TO, or TP.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
1. Each bus [TO] a. nominal voltage b. area, zone and owner 2. Aggregate Demand[2] [LSE] a. real and reactive power* b. in-service status* 3. Generating Units[3] [GO, RP (for future planned resources only)] a. real power capabilities - gross maximum and minimum values b. reactive power capabilities - maximum and minimum values at	1. Generator [GO, RP (for future planned resources only)] 2. Excitation System [GO, RP(for future planned resources only)] 3. Governor [GO, RP(for future planned resources only)] 4. Power System Stabilizer [GO, RP(for future planned resources only)] 5. Demand [LSE]	1. Provide for all applicable elements in column "steady-state" [GO, RP, TO] a. Positive Sequence Data b. Negative Sequence Data c. Zero Sequence Data 2. Mutual Line Impedance Data [TO] 3. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling

[1] For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Generator Owner (GO), Load Serving Entity (LSE), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).

[2] For purposes of this item, aggregate Demand is the Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus. A Load Serving Entity is responsible for providing this information, generally through coordination with the Transmission Owner.

[3] Including synchronous condensers and pumped storage.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	dynamics *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	short circuit

a. reactive limits b. voltage set point* c. fixed/switched shunt, if applicable d. in-service status* 9. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, LSE, TO, TSP]		

Guidelines and Technical Basis

For purposes of jointly developing steady-state, dynamics, and short circuit modeling data requirements and reporting procedures under Requirement R1, if a Transmission Planner (TP) and Planning Coordinator (PC) mutually agree, a TP may collect and aggregate some or all data from providing entities, and the TP may then provide that data directly to the PC(s) on behalf of the providing entities. The submitting entities are responsible for getting the data to both the TP and the PC, but nothing precludes them from arriving at mutual agreements for them to provide it to the TP, who then provides it to the PC. Such agreement does not relieve the submitting entity from responsibility under the standard, nor does it make the consolidating entity liable for the submitting entities' compliance under the standard (in essence, nothing precludes parties from agreeing to consolidate or act as a conduit to pass the data, and it is in fact encouraged in certain circumstances, but the requirement is aimed at the act of submitting the data). Notably, there is no requirement for the TP to provide data to the PC. The intent, in part, is to address potential concerns from entities that they would otherwise be responsible for the quality, nature, and sufficiency of the data provided by other entities.

The requirement in Part 1.3 to include specifications for distribution or posting of the data requirements and reporting procedures could be accomplished in many ways, to include posting on a Web site, distributing directly, or through other methods that the Planning Coordinator and each of its Transmission Planners develop.

An entity submitting data per the requirements of this standard who needs to determine the PC for the area, as a starting point, should contact the local Transmission Owner (TO) for information on the TO's PC. Typically, the PC will be the same for both the local TO and those entities connected to the TO's system. If this is not the case, the local TO's PC can typically provide contact information on other PCs in the area. If the entity (e.g., a Generator Owner [GO]) is requesting connection of a new generator, the entity can determine who the PC is for that area at the time a generator connection request is submitted. Often the TO and PC are the same entity, or the TO can provide information on contacting the PC. The entity should specify as the reason for the request to the TO that the entity needs to provide data to the PC according to this standard. Nothing in the proposed requirement language of this standard is intended to preclude coordination between entities such that one entity, serving only as a conduit, provides the other entity's data to the PC. This can be accomplished if it is mutually agreeable by, for example, the GO (or other entity), TP, and the PC. This does not, however, relieve the original entity from its obligations under the standard to provide data, nor does it pass on the compliance obligation of the entity. The original entity is still accountable for making sure that the data has been provided to the PC according to the requirements of this standard.

The standard language recognizes that differences exist among the Interconnections. Presently, the Eastern/Quebec and Texas Interconnections build seasonal cases on an annual basis, while the Western Interconnection builds cases on a continuous basis throughout the year. The intent of the standard is not to change established processes and procedures in each of the Interconnections, but to create a framework to support both what is already in place or

what it may transition into in the future, and to provide further guidance in a common platform for the collection of data that is necessary for the building of the Interconnection-wide case(s).

The construct that these standards replace did not specifically list which Functional Entities were required to provide specific data. Attachment 1 specifically identifies the entities responsible for the data required for the building of the Interconnection-wide case(s).

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:

This requirement consolidates the concepts from the original data requirements from MOD-011-0, Requirement R1, and MOD-013-0, Requirement R1. The original requirements specified types of steady-state and dynamics data necessary to model and analyze the steady-state conditions and dynamic behavior or response within each Interconnection. The original requirements, however, did not account for the collection of short circuit data also required to perform short circuit studies. The addition of short circuit data also addresses the outstanding directive from FERC Order No. 890, paragraph 290.

In developing a performance-based standard that would address the data requirements and reporting procedures for model data, it was prohibitively difficult to account for all of the detailed technical concerns associated with the preparation and submittal of model data given that many of these concerns are dependent upon evolving industry modeling needs and software vendor terminology and product capabilities.

This requirement establishes the Planning Coordinator jointly with its Transmission Planners as the developers of technical model data requirements and reporting procedures to be followed by the data owners in the Planning Coordinator's planning area. FERC Order No. 693, paragraphs 1155 and 1162, also direct that the standard apply to Planning Coordinators. The inclusion of Transmission Planners in the applicability section is intended to ensure that the Transmission Planners are able to participate jointly in the development of the data requirements and reporting procedures.

This requirement is also consistent with the recommendations from the NERC System Analysis and Modeling Subcommittee (SAMS) White Paper titled "Proposed Improvements for NERC MOD Standards", available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here:

Aside from recommendations in support of strengthening and improving MOD-010 through MOD-015, the SAMS paper included the following suggested improvements:

1) reduce the quantity of MOD standards;
2) add short circuit data as a requirement to the MOD standards; and
3) supply data and models:

   a. add requirement identifying who provides and who receives data;
   b. identify acceptability;
   c. standard format;
   d. how to deal with new technologies (user written models if no standard model exists); and
   e. shareability.

4) These suggested improvements are addressed by combining the existing standards into two new standards, one standard for the submission and collection of data, and one for the validation of the planning models. Adding the requirement for the submittal of short circuit data is also an improvement from the existing standards, consistent with FERC Order No. 890, paragraph 290. In supplying data, the approach clearly identifies what data is required and which Functional Entity is required to provide the data.
5) The requirement uses an attachment approach to support data collection. The attachment specifically lists the entities that are required to provide each type of data and the steady-state, dynamics, and short circuit data that is required.
6) Finally, the decision to combine steady-state, dynamics, and short circuit data requirements into one requirement rather than three reflects that they all support the requirement of submission of data in general.

Rationale for R2:

This requirement satisfies the directive from FERC Order No. 693, paragraph 1155, which directs that "the planning authority should be included in this Reliability Standard because the planning authority is the entity responsible for the coordination and integration of transmission facilities and resource plans, as well as one of the entities responsible for the integrity and consistency of the data."

Rationale for R3:

In order to maintain a certain level of accuracy in the representation of a power system, the data that is submitted must be correct, periodically checked, and updated. Data used to perform steady-state, dynamics, and short circuit studies can change, for example, as a result of new planned transmission construction (in comparison to as-built information) or changes performed during the restoration of the transmission network due to weather-related events. One set of data that changes on a more frequent basis is load data, and updates to load data are needed when new improved forecasts are created.

This requirement provides a mechanism for the Planning Coordinator and Transmission Planner (that does not exist in the current standards) to collect corrected data from the entities that have the data. It provides a feedback loop to address technical concerns related to the data when the Planning Coordinator or Transmission Planner identifies technical concerns, such as concerns about the usability of data or simply that the data is not in the correct format and cannot be used. The requirement also establishes a time-frame for response to address timeliness.

Rationale for R4:

This requirement will replace MOD-014 and MOD-015.

This requirement recognizes the differences among Interconnections in model building processes, and it creates an obligation for Planning Coordinators to make available data for its planning area.

The requirement creates a clear expectation that Planning Coordinators will make available data that they collect under Requirement R2 in support of their respective Interconnection-wide case(s). While different entities in each Interconnection create the Interconnection-wide case(s), the requirement to submit the data to the "ERO or its designee" supports a framework whereby NERC, in collaboration and agreement with those other organizations, can designate the appropriate organizations in each Interconnection to build the specific Interconnection-wide case(s). It does not prescribe a specific group or process to build the larger Interconnection-wide case(s), but only requires the Planning Coordinators to make available data in support of their creation, consistent with the SAMS Proposed Improvements to NERC MOD Standards (at page 3) that, "industry best practices and existing processes should be considered in the development of requirements, *as many entities are successfully coordinating their efforts.*" (Emphasis added).

This requirement is about the Planning Coordinator's obligation to make information available for use in the Interconnection-wide case(s); it is not a requirement to build the Interconnection-wide case(s).

For example, under current practice, the Eastern Interconnection Reliability Assessment Group (ERAG) builds the Eastern Interconnection and Quebec Interconnection-wide cases, the Western Electricity Coordinating Council (WECC) builds the Western Interconnection-wide cases, and the Electric Reliability Council of Texas (ERCOT) builds the Texas Interconnection-wide cases. This requirement does not require a change to that construct, and, assuming continued agreement by those organizations, ERAG, WECC, and ERCOT could be the "designee" for each Interconnection contemplated by this requirement. Similarly, the requirement does not prohibit transition, and the requirement remains for the Planning Coordinators to make available the information to the ERO or to whomever the ERO has coordinated with and designated as the recipient of such information for purposes of creation of each of the Interconnection–wide cases.

Version History

Version	Date	Action	Change Tracking
1	February 6, 2014	Adopted by the NERC Board of Trustees.	Developed to consolidate and replace MOD-010-0, MOD -011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1
1	May 1, 2014	FERC Order issued approving	See Implementation Plan

		MOD-032-1.	posted on the Reliability Standards web page for details on enforcement dates for Requirements.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the first draft of the proposed standard for a formal 45-day comment period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	01/19/2022
SAR posted for comment	2/1/2022 – 3/02/2022
45-day formal or informal comment period with ballot	6/1/2023 – 7/17/2023

Anticipated Actions	Date
45-day formal or informal comment period with ballot	6/1/2023 – 7/17/2023
45-day formal or informal comment period with additional ballot	10/6/2023 – 11/20/2023
XX-day final ballot	
Board adoption	12/12/2023

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resource (DER)

Generators and energy storage technologies connected to the Distribution Provider's system that are capable of providing Real Power in non-isolated parallel operation with the Bulk Electric System.

- Distribution Provider refers to the NERC glossary definition, not the NERC registered entity.

A. Introduction

1. **Title: Data for Power System Modeling and Analysis**

2. **Number: MOD-032-2**

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Balancing Authority

   4.1.2 Generator Owner

   4.1.3 Distribution Provider

   4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

   4.1.5 Resource Planner

   4.1.6 Transmission Owner

   4.1.7 Transmission Planner

   4.1.8 Transmission Service Provider

5. **Effective Date: See Implementation Plan.**

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M2. Each registered entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data;

3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each registered entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance with Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

MOD-032-2 – ATTACHMENT 1:

Data Reporting Requirements

The table below, indicates the information that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in the Interconnection-wide cases. A Planning Coordinator may specify additional information that includes specific information required for each item in the table below. Each functional entity[1] responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The data reported shall be as identified by the bus number, name, and/or identifier that is assigned in conjunction with the PC, TO, or TP.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
1. Each bus [TO] a. nominal voltage b. area, zone and owner 2. Aggregate Demand[2] [DP] a. real and reactive power* b. in-service status* 3. Generating Units[3] [GO, RP (for future planned resources only)] a. real power capabilities - gross maximum and minimum values b. reactive power capabilities - maximum and minimum values at real power capabilities in 3a above	1. Generator [GO, RP (for future planned resources only)] 2. Excitation System [GO, RP (for future planned resources only)] 3. Governor [GO, RP (for future planned resources only)] 4. Power System Stabilizer [GO, RP (for future planned resources only)] 5. Demand [DP] 6. Wind Turbine Data [GO] 7. Photovoltaic systems [GO] 8. Static Var Systems and FACTS [GO, TO, DP]	1. Provide for all applicable elements in column "steady-state" [GO, RP, TO] a. Positive Sequence Data b. Negative Sequence Data

[1] For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Generator Owner (GO), Distribution Provider (DP), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).

[2] For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. A Distribution Provider is responsible for providing this information, generally through coordination with the Transmission Owner or as specified in the joint PC/TP modeling data requirements and reporting procedures developed per R1.

[3] Including synchronous condensers and pumped storage.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
c. station service auxiliary load for normal plant configuration (provide data in the same manner as that required for aggregate Demand under item 2, above). d. regulated bus* and voltage set point* (as typically provided by the TOP) e. machine MVA base f. generator step up transformer data (provide same data as that required for transformer under item 6, below) g. generator type (hydro, wind, fossil, solar, nuclear, etc.) h. in-service status* 4. AC Transmission Line or Circuit [TO] a. impedance parameters (positive sequence) b. susceptance (line charging) c. ratings (normal and emergency)* d. in-service status* 5. DC Transmission systems [TO] 6. Transformer (voltage and phase-shifting) [TO] a. nominal voltages of windings b. impedance(s) c. tap ratios (voltage or phase angle)* d. minimum and maximum tap position limits e. number of tap positions (for both the ULTC and NLTC) f. regulated bus (for voltage regulating transformers)* g. ratings (normal and emergency)* h. in-service status* 7. Reactive compensation (shunt capacitors and reactors) [TO] a. admittances (MVars) of each capacitor and reactor b. regulated voltage band limits* (if mode of operation not fixed) c. mode of operation (fixed, discrete, continuous, etc.) d. regulated bus* (if mode of operation not fixed) e. in-service status* 8. Static Var Systems [TO] a. reactive limits b. voltage set point* c. fixed/switched shunt, if applicable d. in-service status*	9. DC system models [TO] 10. Distributed Energy Resource (DER) data including whether DER is subject to tripping in conjunction with UFLS and/or UVLS [DP, TO where DER is directly connected to the TO system and not through a DP] 11. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]	c. Zero Sequence Data 2. Mutual Line Impedance Data [TO] 3. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
9. Distributed Energy Resource (DER) data[4] [DP, TO where DER is directly connected to the TO system and not through a DP][5] a. Location (bus from item 1) b. Real power capability c. Generator type (solar, battery, etc.) d. DER capabilities related to ride-through, voltage control and/or frequency control or information that can be used to infer those capabilities for modeling purposes. 10. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]		

[4] The joint PC/TP modeling data requirements and reporting procedures developed per R1 will specify data flow processes and the required level of aggregation. The PC or TP may need to coordinate with the DP or TO to determine appropriate equivalent distribution system impedance.

[5] Where DER is connected to an unregistered Distribution Provider, the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information. An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider. This footnote is also applicable to item 10 under the "dynamics" column.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the first draft of the proposed standard for a formal 45-day comment period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	01/19/2022
SAR posted for comment	2/1/2022 – 3/02/2022
45-day formal or informal comment period with ballot	6/1/2023 – 7/17/2023

Anticipated Actions	Date
~~45-day formal or informal comment period with ballot~~	~~6/1/2023 – 7/17/2023~~
45-day formal or informal comment period with additional ballot	10~~9~~/6~~1~~/2023 – ~~10~~11/~~15~~20/2023
XX-day final ballot	
Board adoption	12/12/2023

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resource (DER)

Generators and energy storage technologies connected to the Distribution Provider's system that are capable of providing ~~active power~~Real Power in non-isolated parallel operation with the Bulk Electric System.

- Distribution Provider refers to the NERC glossary definition, not the NERC registered entity.

A. Introduction

1. **Title: Data for Power System Modeling and Analysis**

2. **Number: MOD-032-2**

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Balancing Authority

   4.1.2 Generator Owner

   4.1.3 Distribution Provider

   4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

   ~~This standard combines "Planning Authority" with "Planning Coordinator" in the list of applicable functional entities. The NERC Functional Model lists "Planning Coordinator" while the registration criteria list "Planning Authority," and they are not yet synchronized. Until that occurs, the standard applies to both Planning Authority and Planning Coordinator.~~

   4.1.5 Resource Planner

   4.1.6 Transmission Owner

   4.1.7 Transmission Planner

   4.1.8 Transmission Service Provider

5. **Effective Date: See Implementation Plan.**

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M2. Each registered entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data;

3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each registered entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar

days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance with Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long-term Planning**	**Lower**	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include less than or equal to 25% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 25% but less than or equal to 50% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 50% but less than or equal to 75% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) ~~Coordinator~~ did not develop any steady-state, dynamics, and short circuit modeling data requirements and reporting procedures required by Requirement R1; OR The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 75% of the required

						components specified in Requirement R1.
R2	**Long-term Planning**	**Medium**	The Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide less than or equal to 25% of the required data specified in Attachment 1; OR The Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service	The Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 25% but less than or equal to 50% of the required data specified in Attachment 1; OR The Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, or	The Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 50% but less than or equal to 75% of the required data specified in Attachment 1; OR The Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, or	The Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service Provider did not provide any steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s); OR The Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data

			Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but less than or equal to 25% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within	Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 25% but less than or equal to 50% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and	Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 50% but less than or equal to 75% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and	to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 75% of the required data specified in Attachment 1; OR The Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 75% of the required data failed to meet data format, shareability,

NERC Reliability Standard MOD-032-2 Implementation Plan

NERC Reliability Standard MOD-032-2 Technical Rationale

Version History

Version	Date	Action	Change Tracking
1	February 6, 2014	Adopted by the NERC Board of Trustees.	Developed to consolidate and replace MOD-010-0, MOD -011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1
1	May 1, 2014	FERC Order issued approving MOD-032-1.	See Implementation Plan posted on the Reliability Standards web page for details on enforcement dates for Requirements.
2	TBD	TBD	Revised under Project 2022-02

MOD-032-2 – ATTACHMENT 1:

Data Reporting Requirements

The table~~,~~ below, indicates the information that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in the Interconnection-wide cases. A Planning Coordinator may specify additional information that includes specific information required for each item in the table below. Each functional entity[1] responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The data reported shall be as identified by the bus number, name, and/or identifier that is assigned in conjunction with the PC, TO, or TP.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
1. Each bus [TO] a. nominal voltage b. area, zone and owner 2. Aggregate Demand[2] [DP~~, TO (when a Demand is not associated with a registered DP)~~] a. real and reactive power* b. in-service status* 3. Generating Units[3] [GO, RP (for future planned resources only)] a. real power capabilities - gross maximum and minimum values	1. Generator [GO, RP (for future planned resources only)] 2. Excitation System [GO, RP (for future planned resources only)] 3. Governor [GO, RP (for future planned resources only)] 4. Power System Stabilizer [GO, RP (for future planned resources only)] 5. Demand [DP~~, TO (when a Demand is not associated with a registered DP)~~] 6. Wind Turbine Data [GO]	1. Provide for all applicable elements in column "steady-state" [GO, RP, TO] a. Positive Sequence Data b. Negative Sequence Data

[1] For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Generator Owner (GO), Distribution Provider (DP), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).

[2] For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. A Distribution Provider is responsible for providing this information, generally through coordination with the Transmission Owner or as specified in the joint PC/TP modeling data requirements and reporting procedures developed per R1.

[3] Including synchronous condensers and pumped storage.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
b. reactive power capabilities - maximum and minimum values at real power capabilities in 3a above c. station service auxiliary load for normal plant configuration (provide data in the same manner as that required for aggregate Demand under item 2, above). d. regulated bus* and voltage set point* (as typically provided by the TOP) e. machine MVA base f. generator step up transformer data (provide same data as that required for transformer under item 6, below) g. generator type (hydro, wind, fossil, solar, nuclear, etc.) h. in-service status* 4. AC Transmission Line or Circuit [TO] a. impedance parameters (positive sequence) b. susceptance (line charging) c. ratings (normal and emergency)* d. in-service status* 5. DC Transmission systems [TO] 6. Transformer (voltage and phase-shifting) [TO] a. nominal voltages of windings b. impedance(s) c. tap ratios (voltage or phase angle)* d. minimum and maximum tap position limits e. number of tap positions (for both the ULTC and NLTC) f. regulated bus (for voltage regulating transformers)* g. ratings (normal and emergency)* h. in-service status* 7. Reactive compensation (shunt capacitors and reactors) [TO] a. admittances (MVars) of each capacitor and reactor b. regulated voltage band limits* (if mode of operation not fixed) c. mode of operation (fixed, discrete, continuous, etc.) d. regulated bus* (if mode of operation not fixed) e. in-service status* 8. Static Var Systems [TO] a. reactive limits b. voltage set point*	7. Photovoltaic systems [GO] 8. Static Var Systems and FACTS [GO, TO, DP] 9. DC system models [TO] 10. Distributed Energy Resource (DER) data including whether DER is subject to tripping in conjunction with UFLS and/or UVLS [DP, TO where DER is directly connected to the TO system and not through a DP~~(when DER is not associated with a registered DP)~~] 11. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]	c. Zero Sequence Data 2. Mutual Line Impedance Data [TO] 3. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
c. fixed/switched shunt, if applicable d. in-service status* 9. Distributed Energy Resource (DER) data[4] [DP, TO where DER is directly connected to the TO system and not through a DP~~(when DER is not associated with a registered DP)~~][5] a. Location (bus from item 1) ~~and if DER feeder is subject to UFLS and/or UVLS~~ b. Real power capability ~~(minimum and maximum)~~ ~~c. Reactive power capability (minimum and maximum)~~ ~~d.~~c. Generator type (solar, battery, etc.) ~~e.~~d. ~~In-service date or other information to be used to make assumptions about~~ DER capabilities related to ride-through, voltage control and/or frequency control or information that can be used to infer those capabilities for modeling purposes. 10. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]		

[4] The joint PC/TP modeling data requirements and reporting procedures developed per R1 will specify data flow processes and the required level of aggregation. The PC or TP may need to coordinate with the DP or TO to determine appropriate equivalent distribution system impedance~~The TP/PC modeling data requirements and reporting procedures may require either aggregated or unaggregated data as necessary for local practices and the TP/PC may need to coordinate with the DP/TO to determine appropriate assumptions for equivalent distribution system impedance~~.

[5] Where DER is connected to an unregistered Distribution Provider, the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information. An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider. This footnote is also applicable to item 10 under the "dynamics" column.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resource (DER)

Generators and energy storage technologies connected to the Distribution Provider's system that are capable of providing Real Power in non-isolated parallel operation with the Bulk Electric System.

- Distribution Provider refers to the NERC glossary definition, not the NERC registered entity.

A. Introduction

1. **Title: Data for Power System Modeling and Analysis**

2. **Number: MOD-032-~~1~~2**

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Balancing Authority

   4.1.2 Generator Owner

   4.1.3 ~~Load Serving Entity~~Distribution Provider

   4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

   ~~This proposed standard combines "Planning Authority" with "Planning Coordinator" in the list of applicable functional entities. The NERC Functional Model lists "Planning Coordinator" while the registration criteria list "Planning Authority," and they are not yet synchronized. Until that occurs, the proposed standard applies to both Planning Authority and Planning Coordinator.~~

   4.1.5 Resource Planner

   4.1.6 Transmission Owner

   4.1.7 Transmission Planner

   4.1.8 Transmission Service Provider

5. **Effective Date: See Implementation Plan.**

   ~~MOD-032-2~~1, Requirement R1 ~~shall become effective on the first day of the first calendar quarter that is 12~~ 24 ~~months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, MOD-032-2~~1, Requirement R1 ~~shall become effective on the first day of the first calendar quarter that is 12~~ 24 ~~months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

   ~~MOD-032-2~~1, Requirements R2, R3, and R4 ~~shall become effective on the first day of the first calendar quarter that is 24~~ 36 ~~months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority~~

is not required, MOD-032-21, Requirements R2, R3, and R4 shall become effective on the first day of the first calendar quarter that is 24 36 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

6. Background:

MOD-032-1 exists in conjunction with MOD-033-1, both of which are related to system-level modeling and validation. Reliability Standard MOD-032-1 is a consolidation and replacement of existing MOD-010-0, MOD-011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1, and it requires data submission by applicable data owners to their respective Transmission Planners and Planning Coordinators to support the Interconnection-wide case building process in their Interconnection. Reliability Standard MOD-033-1 is a new standard, and it requires each Planning Coordinator to implement a documented process to perform model validation within its planning area.

The transition and focus of responsibility upon the Planning Coordinator function in both standards are driven by several recommendations and FERC directives from FERC Order No. 693, which are discussed in greater detail in the rationale sections of the standards. One of the most recent and significant set of recommendations came from the NERC Planning Committee's System Analysis and Modeling Subcommittee (SAMS). SAMS proposed several improvements to the modeling data standards, to include consolidation of the standards (the SAMS whitepaper is available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here: http://www.nerc.com/comm/PC/Agendas%20Highlights%20and%20Minutes%20DL/2012/2012_Dec_PC%20Agenda.pdf).

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Generator Owner, ~~Load Serving Entity~~Distribution Provider, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M2. Each registered entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Generator Owner, ~~Load Serving Entity~~Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data;

3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each registered entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

~~"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions. "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.~~

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance with Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and ~~Assessment~~ Enforcement Program~~Processes~~: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

~~Refer to the NERC Rules of Procedure for a list of compliance monitoring and assessment processes.~~

~~**1.4. Additional Compliance Information**~~

NERC Reliability Standard MOD-032-2 Implementation Plan

NERC Reliability Standard MOD-032-2 Technical Rationale

~~None.~~

Guidelines and Technical Basis

For purposes of jointly developing steady-state, dynamics, and short circuit modeling data requirements and reporting procedures under Requirement R1, if a Transmission Planner (TP) and Planning Coordinator (PC) mutually agree, a TP may collect and aggregate some or all data from providing entities, and the TP may then provide that data directly to the PC(s) on behalf of the providing entities. The submitting entities are responsible for getting the data to both the TP and the PC, but nothing precludes them from arriving at mutual agreements for them to provide it to the TP, who then provides it to the PC. Such agreement does not relieve the submitting entity from responsibility under the standard, nor does it make the consolidating entity liable for the submitting entities' compliance under the standard (in essence, nothing precludes parties from agreeing to consolidate or act as a conduit to pass the data, and it is in fact encouraged in certain circumstances, but the requirement is aimed at the act of submitting the data). Notably, there is no requirement for the TP to provide data to the PC. The intent, in part, is to address potential concerns from entities that they would otherwise be responsible for the quality, nature, and sufficiency of the data provided by other entities.

The requirement in Part 1.3 to include specifications for distribution or posting of the data requirements and reporting procedures could be accomplished in many ways, to include posting on a Web site, distributing directly, or through other methods that the Planning Coordinator and each of its Transmission Planners develop.

An entity submitting data per the requirements of this standard who needs to determine the PC for the area, as a starting point, should contact the local Transmission Owner (TO) for information on the TO's PC. Typically, the PC will be the same for both the local TO and those entities connected to the TO's system. If this is not the case, the local TO's PC can typically provide contact information on other PCs in the area. If the entity (e.g., a Generator Owner [GO]) is requesting connection of a new generator, the entity can determine who the PC is for that area at the time a generator connection request is submitted. Often the TO and PC are the same entity, or the TO can provide information on contacting the PC. The entity should specify as the reason for the request to the TO that the entity needs to provide data to the PC according to this standard. Nothing in the proposed requirement language of this standard is intended to preclude coordination between entities such that one entity, serving only as a conduit, provides the other entity's data to the PC. This can be accomplished if it is mutually agreeable by, for example, the GO (or other entity), TP, and the PC. This does not, however, relieve the original entity from its obligations under the standard to provide data, nor does it pass on the compliance obligation of the entity. The original entity is still accountable for making sure that the data has been provided to the PC according to the requirements of this standard.

The standard language recognizes that differences exist among the Interconnections. Presently, the Eastern/Quebec and Texas Interconnections build seasonal cases on an annual basis, while the Western Interconnection builds cases on a continuous basis throughout the year. The intent of the standard is not to change established processes and procedures in each of the Interconnections, but to create a framework to support both what is already in place or

what it may transition into in the future, and to provide further guidance in a common platform for the collection of data that is necessary for the building of the Interconnection-wide case(s).

The construct that these standards replace did not specifically list which Functional Entities were required to provide specific data. Attachment 1 specifically identifies the entities responsible for the data required for the building of the Interconnection-wide case(s).

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:

This requirement consolidates the concepts from the original data requirements from MOD-011-0, Requirement R1, and MOD-013-0, Requirement R1. The original requirements specified types of steady-state and dynamics data necessary to model and analyze the steady-state conditions and dynamic behavior or response within each Interconnection. The original requirements, however, did not account for the collection of short circuit data also required to perform short circuit studies. The addition of short circuit data also addresses the outstanding directive from FERC Order No. 890, paragraph 290.

In developing a performance-based standard that would address the data requirements and reporting procedures for model data, it was prohibitively difficult to account for all of the detailed technical concerns associated with the preparation and submittal of model data given that many of these concerns are dependent upon evolving industry modeling needs and software vendor terminology and product capabilities.

This requirement establishes the Planning Coordinator jointly with its Transmission Planners as the developers of technical model data requirements and reporting procedures to be followed by the data owners in the Planning Coordinator's planning area. FERC Order No. 693, paragraphs 1155 and 1162, also direct that the standard apply to Planning Coordinators. The inclusion of Transmission Planners in the applicability section is intended to ensure that the Transmission Planners are able to participate jointly in the development of the data requirements and reporting procedures.

This requirement is also consistent with the recommendations from the NERC System Analysis and Modeling Subcommittee (SAMS) White Paper titled "Proposed Improvements for NERC MOD Standards", available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here:

Aside from recommendations in support of strengthening and improving MOD-010 through MOD-015, the SAMS paper included the following suggested improvements:

reduce the quantity of MOD standards;

add short circuit data as a requirement to the MOD standards; and

supply data and models:

add requirement identifying who provides and who receives data;

identify acceptability;

standard format;

how to deal with new technologies (user written models if no standard model exists); and

a. shareability.

b. These suggested improvements are addressed by combining the existing standards into two new standards, one standard for the submission and collection of data, and one for the validation of the planning models. Adding the requirement for the submittal of short circuit data is also an improvement from the existing standards, consistent with FERC Order No. 890, paragraph 290. In supplying data, the approach clearly identifies what data is required and which Functional Entity is required to provide the data.

c. The requirement uses an attachment approach to support data collection. The attachment specifically lists the entities that are required to provide each type of data and the steady-state, dynamics, and short circuit data that is required.

d. Finally, the decision to combine steady-state, dynamics, and short circuit data requirements into one requirement rather than three reflects that they all support the requirement of submission of data in general.

e. Rationale for R2:

f. This requirement satisfies the directive from FERC Order No. 693, paragraph 1155, which directs that "the planning authority should be included in this Reliability Standard because the planning authority is the entity responsible for the coordination and integration of transmission facilities and resource plans, as well as one of the entities responsible for the integrity and consistency of the data."

g. **Rationale for R3:**

h. In order to maintain a certain level of accuracy in the representation of a power system, the data that is submitted must be correct, periodically checked, and updated. Data used to perform steady state, dynamics, and short circuit studies can change, for example, as a result of new planned transmission construction (in comparison to as-built information) or changes performed during the restoration of the transmission network due to weather related events. One set of data that changes on a more frequent basis is load data, and updates to load data are needed when new improved forecasts are created.

i. This requirement provides a mechanism for the Planning Coordinator and Transmission Planner (that does not exist in the current standards) to collect corrected data from the entities that have the data. It provides a feedback loop to address technical concerns related to the data when the Planning Coordinator or Transmission Planner identifies technical concerns, such as concerns about the usability of data or simply that the data is not in the correct format and

cannot be used. The requirement also establishes a time-frame for response to address timeliness.

Rationale for R4:

This requirement will replace MOD-014 and MOD-015.

This requirement recognizes the differences among Interconnections in model building processes, and it creates an obligation for Planning Coordinators to make available data for its planning area.

The requirement creates a clear expectation that Planning Coordinators will make available data that they collect under Requirement R2 in support of their respective Interconnection-wide case(s). While different entities in each Interconnection create the Interconnection-wide case(s), the requirement to submit the data to the "ERO or its designee" supports a framework whereby NERC, in collaboration and agreement with those other organizations, can designate the appropriate organizations in each Interconnection to build the specific Interconnection-wide case(s). It does not prescribe a specific group or process to build the larger Interconnection-wide case(s), but only requires the Planning Coordinators to make available data in support of their creation, consistent with the SAMS Proposed Improvements to NERC MOD Standards (at page 3) that, "industry best practices and existing processes should be considered in the development of requirements, *as many entities are successfully coordinating their efforts."* (Emphasis added).

This requirement is about the Planning Coordinator's obligation to make information available for use in the Interconnection-wide case(s); it is not a requirement to build the Interconnection-wide case(s).

For example, under current practice, the Eastern Interconnection Reliability Assessment Group (ERAG) builds the Eastern Interconnection and Quebec Interconnection-wide cases, the Western Electricity Coordinating Council (WECC) builds the Western Interconnection-wide cases, and the Electric Reliability Council of Texas (ERCOT) builds the Texas Interconnection-wide cases. This requirement does not require a change to that construct, and, assuming continued agreement by those organizations, ERAG, WECC, and ERCOT could be the "designee" for each Interconnection contemplated by this requirement. Similarly, the requirement does not prohibit transition, and the requirement remains for the Planning Coordinators to make available the information to the ERO or to whomever the ERO has coordinated with and designated as the recipient of such information for purposes of creation of each of the Interconnection-wide cases.

MOD-032-~~01~~ 2 – ATTACHMENT 1:

Data Reporting Requirements

The table~~,~~ below, indicates the information that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in the Interconnection-wide cases. A Planning Coordinator may specify additional information that includes specific information required for each item in the table below. Each functional entity[1] responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The data reported shall be as identified by the bus number, name, and/or identifier that is assigned in conjunction with the PC, TO, or TP.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
1. Each bus [TO] a. nominal voltage b. area, zone and owner 2. Aggregate Demand[2] [~~LSE~~DP] a. real and reactive power* b. in-service status* 3. Generating Units[3] [GO, RP (for future planned resources only)] a. real power capabilities - gross maximum and minimum values b. reactive power capabilities - maximum and minimum values at real power capabilities in 3a above	1. Generator [GO, RP (for future planned resources only)] 2. Excitation System [GO, RP (for future planned resources only)] 3. Governor [GO, RP (for future planned resources only)] 4. Power System Stabilizer [GO, RP (for future planned resources only)] 5. Demand [~~LSE~~DP] 6. Wind Turbine Data [GO] 7. Photovoltaic systems [GO]	1. Provide for all applicable elements in column "steady-state" [GO, RP, TO] a. Positive Sequence Data b. Negative Sequence Data

[1] For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Generator Owner (GO), ~~Load Serving Entity~~Distribution Provider (~~LSE~~DP), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).

[2] For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. A ~~Load Serving Entity~~Distribution Provider is responsible for providing this information, generally through coordination with the Transmission Owner or as specified in the joint PC/TP modeling data requirements and reporting procedures developed per R1.

[3] Including synchronous condensers and pumped storage.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**

NERC Glossary of Terms

This section includes a newly defined term used in the NERC Reliability Standard. The new definition listed below becomes approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Proposed New Definition(s):
Distributed Energy Resource (DER):

Generators and energy storage technologies connected to the Distribution Provider's system that are capable of providing Real Power in non-isolated parallel operation with the Bulk Power System.

- Distribution Provider refers to the NERC glossary definition, not the NERC registered entity.

Background

As the penetration of distributed energy resources (DERs) continues to increase across the many distribution systems connected both directly and indirectly to the North American Bulk Power System (BPS), it is necessary to account for the potential impacts of DERs on reliability in the planning, operation, and design of the Bulk Electric System. The NERC System Planning Impacts of Distributed Energy Resources Working Group (SPIDERWG) has identified the need for improved modeling of aggregate DER for planning studies (including both utility-scale and retail-scale DER) conducted by Transmission Planners (TPs) and Planning Coordinators (PCs), including updated modeling data requirements specific to DER.

Proposed Reliability Standard MOD-032-2 replaces the Load-Serving Entity as an applicable entity with the Distribution Provider and updates Attachment 1: Data Reporting Requirements with data specific to DERs.

General Considerations

In developing this implementation plan, the standard drafting team considered the time that would be necessary to develop data requirements and reporting procedures for data related to DERs, including identifying the proper reporting entity. The standard drafting team also considered that the standard would become applicable to the Distribution Provider for the first time.

Effective Date and Phased-In Compliance Dates

The effective date for the proposed Reliability Standard and NERC Glossary term Distributed Energy Resource is provided below. Where the standard drafting team identified the need for a longer implementation period for compliance with a particular section of a proposed Reliability Standard (i.e., an entire Requirement or a portion thereof), the additional time for compliance with that section is specified below. The phased-in compliance date for those particular sections represents the date that entities must begin to comply with that particular section of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

Reliability Standard MOD-032-2

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for Reliability Standard MOD-032-2 Requirements R2, R3, and R4
Entities shall not be required to comply with Requirements R2, R3, and R4 relating to revised Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under MOD-032-2 Requirement R1 and Attachment 1 until 12 months after the effective date of Reliability Standard MOD-032-2.

Definition – Distributed Energy Resource (DER)
Where approval by an applicable governmental authority is required, the definition of Distributed Energy Resource (DER) shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving Reliability Standard MOD-032-2, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the definition shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date that Reliability Standard MOD-032-2 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Retirement Date

Reliability Standard MOD-032-1
Reliability Standard MOD-032-1 shall be retired immediately prior to the effective date of Reliability Standard MOD-032-2 in the particular jurisdiction in which the revised standard is becoming effective.

Initial Performance Dates

Entities shall not be required to comply with Requirements R2, R3, and R4 relating to revised Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under MOD-032-2 Requirement R1 and Attachment 1 until 12 months after the effective date of Reliability Standard MOD-032-2.

Entities shall continue to comply with Requirements R2, R3, and R4 related to Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under MOD-032-1 Requirement R1 and Attachment 1 during the phased-in compliance period for MOD-032-2.

- Transmission Owner
- Transmission Planner
- Transmission Service Provider

NERC Glossary of Terms

This section includes a newly defined term used in the NERC Reliability Standard. The new definition listed below becomes approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

Proposed New Definition(s):
Distributed Energy Resource (DER):

Generators and energy storage technologies connected to the Distribution Provider's system that are capable of providing ~~active power~~Real Power in non-isolated parallel operation with the Bulk Power System.

- Distribution Provider refers to the NERC glossary definition, not the NERC registered entity.

Background

As the penetration of distributed energy resources (DERs) continues to increase across the many distribution systems connected both directly and indirectly to the North American Bulk Power System (BPS), it is necessary to account for the potential impacts of DERs on reliability in the planning, operation, and design of the Bulk Electric System. The NERC System Planning Impacts of Distributed Energy Resources Working Group (SPIDERWG) has identified the need for improved modeling of aggregate DER for planning studies (including both utility-scale and retail-scale DER) conducted by Transmission Planners (TPs) and Planning Coordinators (PCs), including updated modeling data requirements specific to DER.

Proposed Reliability Standard MOD-032-2 replaces the Load-Serving Entity as an applicable entity with the Distribution Provider and updates Attachment 1: Data Reporting Requirements with data specific to DERs.

General Considerations

In developing this implementation plan, the standard drafting team considered the time that would be necessary to develop data requirements and reporting procedures for data related to DERs, including identifying the proper reporting entity. The standard drafting team also considered that the standard would become applicable to the Distribution Provider for the first time.

Effective Date and Phased-In Compliance Dates

The effective date for the proposed Reliability Standard and NERC Glossary term Distributed Energy Resource is provided below. Where the standard drafting team identified the need for a longer implementation period for compliance with a particular section of a proposed Reliability Standard (i.e., an entire Requirement or a portion thereof), the additional time for compliance with that section is specified below. The phased-in compliance date for those particular sections represents the date that entities must begin to comply with that particular section of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

Reliability Standard MOD-032-2

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for Reliability Standard MOD-032-2 Requirements R2, R3, and R4
Entities shall not be required to comply with Requirements R2, R3, and R4 relating to revised Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under MOD-032-2 Requirement R1 and Attachment 1 until 12 months after the effective date of Reliability Standard MOD-032-2.

Definition – Distributed Energy Resource (DER)
Where approval by an applicable governmental authority is required, the definition of Distributed Energy Resource (DER) shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving Reliability Standard MOD-032-2, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the definition shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date that Reliability Standard MOD-032-2 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Retirement Date

Reliability Standard MOD-032-1
Reliability Standard MOD-032-1 shall be retired immediately prior to the effective date of Reliability Standard MOD-032-2 in the particular jurisdiction in which the revised standard is becoming effective.

Initial Performance Dates

Entities shall not be required to comply with Requirements R2, R3, and R4 relating to revised Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under MOD-032-2 Requirement R1 and Attachment 1 until 12 months after the effective date of Reliability Standard MOD-032-2.

Entities shall continue to comply with Requirements R2, R3, and R4 related to Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under MOD-032-1 Requirement R1 and Attachment 1 during the phased-in compliance period for MOD-032-2.

Project 2022-02 Modifications to TPL-001 and MOD-032

Do not use this form for submitting comments. Use the Standards Balloting and Commenting System (SBS) to submit comments on **Project 2022-02 Modifications to TPL-001 and MOD-032** by **8 p.m. Eastern, Monday, November 20, 2023.**

Additional information is available on the project page. If you have questions, contact Senior Standards Developer, Ben Wu (via email), or at 470-542-6882.

Background Information

Project 2022-02 addresses multiple Standard Authorization Requests (SARs) related to transmission planning and modeling data and analysis (MOD-032-1 Data for Power System Modeling and Analysis SAR from the NERC System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG); TPL-001-5.1 Transmission System Planning Performance Requirements SAR from NERC Inverter-Based Resource Performance Working Group (IRPWG); and TPL-001-5.1 Transmission System Planning Performance Requirements SAR from the SPIDERWG).

The Project 2022-02 Standard Drafting Team decided to break this project into two phases since there are two Reliability Standards involved and the project scopes are quite different. Phase one addresses MOD-032-1 in data collection and phase two will address TPL-001-5.1 in the accuracy of transmission system planning assessments. This posting affects phase one of this project only (MOD-032). TPL-001 will be addressed during phase two of this project.

Questions

1. Given the explanation in the Technical Rationale and response to industry comment, do you agree with the proposed definition for DER?

   ☐ Yes
   ☐ No

   Comments:

2. Are there any other clarifications needed in the Technical Rationale?

   ☐ Yes
   ☐ No

   Comments:

3. Do you agree the modifications made in MOD-032-2 will improve system modeling and reliability?

   ☐ Yes
   ☐ No

   Comments:

4. Do you agree the modifications made in MOD-032-2 are cost effective?

   ☐ Yes
   ☐ No

   Comments:

5. Do you agree with the Implementation Plan for revised MOD-032-2?

   ☐ Yes
   ☐ No

6. Provide any additional comments for the standard drafting team to consider, if desired.

Violation Risk Factor and Violation Severity Level Justifications

Project 2022-02 Modifications to MOD-032-2

This document provides the standard drafting team's (SDT's) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in MOD-032-2. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

MOD-032-2

VRF Justification for MOD-032-2, Requirement R1

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R1

The VSL did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VRF Justification for MOD-032-2, Requirement R2

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R2

"Load Serving Entity" was replaced with "Distribution Provider" from Requirement R2 in MOD-032-2.

VRF Justification for MOD-032-2, Requirement R3

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R3

"Load Serving Entity" was replaced with "Distribution Provider" from Requirement R2 in MOD-032-2.

VRF Justification for MOD-032-2, Requirement R4

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R4

The VSL did not change from the previously FERC approved MOD-032-1 Reliability Standard.

Technical Rationale for Reliability Standard MOD-032-2

October 2023

MOD-032-2 – Data for Power System Modeling and Analysis

Rationale for Applicability Section

For MOD-032-2, Load-Serving Entity (LSE) was replaced with Distribution Provider (DP) because of the removal of LSEs from the NERC registry criteria. Items in Attachment 1 that were previously required to be provided by the LSE are now required to be provided by the DP. It is recognized that some distribution facilities do not have an associated DP that meets the NERC registration criteria. It is expected that TOs (or registered DPs) will need to coordinate with the owners of distribution facilities that do not have an associated NERC-registered DP to ensure the availability of the necessary data, either through interconnection agreements or other binding contracts.

The Standard Drafting Team (SDT) has concerns that there may be challenges in collecting data for DER connected to unregistered entities. Draft 1 proposed to assign this data obligation on the TO/DP, but based on industry comments, this may place an unreasonable compliance risk on the TO/DP because any unregistered entities that connect DER to their systems have no compliance obligation to provide data to the TO/DP. As such, the SDT recommends that NERC consider a range of options that could include expanding DP registration criteria or registering DER-only DPs to reduce or eliminate this potential DER data collection gap. However, the process to modify NERC registry criteria and register new entities is beyond the scope of Project 2022-02 and would unnecessarily delay the implementation of DER data requirements. The SDT believes there is value in moving forward with MOD-032-2 as it does provide substantial improvement with respect to ensuring DER data is available for inclusion in PC and TP studies.

Additionally, the SDT reviewed the dual applicability to Planning Authority and Planning Coordinator and determined that it was most appropriate to reference both terms in the applicability section until NERC registration criteria is updated to use only a single term. The posted "Appendix 5B: Statement of Compliance Registry Criteria", dated January 19, 2021, still uses both terms and arguably, the Planning Authority term is used more prominently. However, the explanation included in MOD-032-1 refers to synchronization between registration criteria and the NERC functional model which is not maintained, was never formally approved, and is only posted as a historical document. Therefore, the SDT excluded the explanatory language from MOD-032-2 applicability section.

Rationale for Distributed Energy Resource (DER) Definition

The SDT considered various DER definitions utilized in the industry and discussed in the SPIDERWG Terms and Definitions Working Document, including the six other definitions described in Appendix D which were not adopted by SPIDERWG. Through this review, the SDT determined each of these seven definitions

required or would benefit from refinement to be most suitable for the application in MOD-032 and more broadly.

The SDT consensus is that the proposed definition aligns with the intent of the SPIDERWG working definition for DER (which explicitly excludes demand response) and clarifies what is in scope and out of scope with respect to where DER is connected rather than the technology type. Utilizing the existing NERC definition for DP and the associated area of responsibility aligns with the scope of DER data collection and modeling activities and provides clarity for the industry to aid in gathering this information. It should be clear that MOD-032-2 applicability and compliance obligations refer to NERC-registered DPs; the use of the DP term in the DER definition does not in itself imply any compliance obligation.

Below is a summary of the rationale for the SDT departing from each of the seven definitions when proposing a new DER definition.

SPIDERWG definition
After considering the SPIDERWG definition, the SDT determined it provided a useful foundation but needed refinement to be suitable for the intended use. Specifically, the SPIDERWG term 1) included transient types of DER power beyond generation and storage; 2) pointed to a SPIDERWG-specific defined term for "distribution systems"; and 3) included sources of back-up power that would have no potential grid impacts.

The SDT chose to refer to generator and storage technologies specifically, rather than use the SPIDERWG language of "source", to exclude devices or resources that only transiently inject real power (e.g., regenerative elevators, transition switches, etc.) Additionally, by specifying facilities that produce Real Power, the scope is focused on only those facilities that may be exporting Real Power to the power system or offsetting Real Power load (e.g., residential solar or commercial rooftop solar). This would exclude technologies such as charging-only electric vehicle (EV) installations and controllable load.

Further, the SDT term uses "connected to the Distribution Provider's system" to avoid ambiguities associated with a unique definition of "distribution system" as was required by the SPIDERWG term. The NERC glossary definition for DP[1] notes that the DP is defined by providing the distribution function (this includes entities that may not be NERC-registered DPs).

The SDT included the language "in non-isolated parallel operation with the Bulk Power System" to indicate that distributed energy resources with potential BES reliability impacts are those that have electrical connectivity to the BES. The SDT intentionally avoided the term "directly connected" to differentiate electrical connectivity from an electrical connection point. Resources that are only operated in islanded or isolated mode (e.g., back-up generation that only operates when a facility is disconnected from the grid), will not have an impact to the BES and therefore are not of interest from a BES-reliability

[1] NERC Glossary of Terms, Updated March 2023. DP is definition: "Provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage."

perspective. The SDT understands the concepts of non-isolated parallel operation versus isolated parallel operation to be commonly understood within the industry.

IEEE 1547-2018
The SDT reviewed the IEEE 1547-2018 definition and found that it contained elements that could supplement the SPIDERWG definition to address the three issues identified above. The SDT incorporated the explicit reference to "generation and storage" aspect of the IEEE definition. Further, the IEEE concept of "capable of exporting active power to an EPS" was used to inform the need for capturing non-isolated, long-term paralleling and the sourcing of Real Power (i.e., active power) within the SDT definition.

At the same time, the SDT did not view the IEEE definition as suitable for the SDT's intended use as written. The IEEE term qualifies the DER connection point as "not directly connected to a bulk power system" which the SDT viewed as potentially ambiguous. Instead, the SDT opted for the "connected to DP's system" language to point to a NERC defined term and concept. The SDT considered if it was necessary to define "supplemental DER devices" as part of the DER definition and determined this nuance is not needed for a DER definition for inclusion in the NERC Glossary of Terms.

Federal Energy Regulatory Commission (FERC) Energy Primer
The SDT identified the FERC Energy Primer definition as being inclusive of load resources (e.g., energy efficiency, demand response) which is not aligned with the SPIDERWG definition. Given the reliability planning use cases, the SDT and SPIDERWG definitions target sources of electric power, with the SDT narrowing this definition to be only sources "capable of providing Real Rower". After considering the FERC definition, the SDT determined it was not suitable for the intended use.

National Association of Regulatory Utility Commissions (NARUC)
NARUC's definition is also inclusive of load resources (e.g., energy efficiency, demand response) and therefore, the SDT concluded it is too broad. After considering the NARUC definition, the SDT determined it was not suitable for the intended use.

NERC DERTF
The NERC DERTF definition uses the language "resource on the distribution system that produces electricity" which appears to exclude distributed energy storage, a technology necessary for inclusion in the SDT definition. Further, the NERC DERTF definition defines DER as anything "not otherwise included in the formal NERC definition of the Bulk Electric system" which the SDT views as ambiguous and overly broad. After considering the NERC DERTF definition, the SDT determined it was not suitable for the intended application.

California Public Utilities Commission (CPUC)
The CPUC definition appears to be based on California legislation and includes energy efficiency, electric vehicles, and demand response, renewable generation resources, and energy storage. As is the case for FERC and NARUC definitions above, the inclusion of load resources is overly broad for the SDT's use. After considering the CPUC definition, the SDT determined it was not suitable for the intended application.

New York Independent System Operator (NYISO)
The NYISO definition only considers market-qualifying resources as DER. This definition to exclude a large portion of DER (i.e. retail participation) is too narrow for the reliability planning needs identified by the SPIDERWG DER Modeling Study. After considering the NYISO definition, the SDT determined it was not suitable for the intended application.

Rationale for Modifications to Attachment 1
MOD-032-2 Attachment 1: Data Reporting Requirements was updated with data specific to DERs. The intent is that all relevant DER data including both utility scale facilities (commonly referred to as U-DER) and smaller behind-the meter facilities (commonly referred to as R-DER) be available and represented in models of the interconnected transmission system consistent with the approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies. Specific data items listed for DER reflect the minimum amount of information expected to be needed to reasonably represent DER in transmission system models. It is expected that aggregate DER (rather than individual DER facilities) would be represented in most Planning Coordinator/Transmission Planner (PC/TP) study models. However, footnote 4 explicitly allows the PC/TP to specify the level of DER data aggregation. This provides flexibility for local practices wherein the PC/TP may elect to apply DER aggregation assumptions rather than depend on the DP/TO to apply aggregation assumptions.

The PC/TP may have access to sufficient data for modeling certain DER through alternative means (e.g., direct registration of DER in certain markets). In such cases, the DP (or TO) should not be obligated to provide duplicate DER modeling data. The PC/TP modeling data requirements and reporting procedures should clearly identify if there are certain classifications of DER that are excluded from the DP/TO obligation for providing DER modeling data. This in no way absolves a DP/TO from an obligation to provide DER data according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1.

The SDT intentionally maintained flexible language as to whether the underlying DER data originates from interconnection documentation, measured quantities, estimated quantities, or other sources. Data availability or sufficiency issues, among other factors, may lead to the DP/TO applying a combination of approaches to source the data. The PC/TP modeling data requirements and reporting procedures should identify acceptable methods and their application.

The SDT decided to maintain an approach similar to MOD-032-1 where more detailed sub-bullets associated with the required DER data are only presented in the “steady state” column (though arguably such data is also relevant to “dynamics” and/or “short circuit”). The SDT concluded that this was appropriate and consistent with other “dynamics” line items such as “Wind Turbine Data” and “Photovoltaic systems” that are listed without detailed sub-bullets. Drastically altering the structure of Attachment 1 or explicitly adding DER data to the “short circuit” column was beyond the scope of the Project 2022-02 SAR. However, the PC or TP is not restricted from requiring any needed short circuit data in their joint modeling data requirements and reporting procedures developed per R1.

It should be noted that the modifications do not make DER a BES facility subject to NERC reliability standards. Instead, the modifications place a compliance obligation on NERC registered DPs (or TOs) to

provide basic information about DER that are connected to their systems so that DER can be properly represented in interconnection-wide cases. There are already existing requirements for DPs (or TOs) to provide information about load connected to their systems. Similar to load, DER is not generally considered to be a BES facility. However, BES reliability assessments require an accurate representation of both aggregate load and aggregate DER behavior. The modifications proposed in MOD-032-2 are intended to ensure sufficient DER data is available to the PC/TP so that appropriate DER representations can be included in their BES reliability assessments.

- **Inferring DER Capabilities**

As suggested in the approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies, the in-service date for DER may be used as a proxy for the PC/TP to make reasonable assumptions about DER capabilities. For example, in a certain jurisdiction DER installed after a specified date may be required to have a certain ride-through characteristic. Thus, the appropriate ride-through characteristic representation for DER in that area could be inferred by the in-service date of the DER. However, the PC/TP modeling data requirements and reporting procedures may require the provision of alternative information to achieve the same purpose. PC/TP modeling data requirements and reporting procedures may also require more detail and/or additional information. In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, it is expected that the proportion of aggregate DER amount with in-service dates before and after certain threshold dates would be needed (and specified in the PC/TP requirements) to make inferences regarding the overall aggregate DER response characteristics.

- **Inclusion of Data Related to DER Subject to Trip by UFLS and/or UVLS**

There is a reliability need for the DP/TO to convey this information to the PC/TP. As described in the approved Reliability Guideline: Recommended Approaches for UFLS Program Design with Increasing Penetrations of DERs, accurately representing DER tripping as part of UFLS operation is vital for designing and evaluating UFLS programs. Similarly, accurately representing DER tripping as part of UVLS operation is vital for designing and evaluating UVLS programs as described in the approved White Paper: DER Impact to Under Voltage Load Shedding Program Design. In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, the proportion of aggregate DER subject to each UVLS/UFLS tripping stage should be identified.

- **Inclusion of Aggregate Demand Clarification**

Footnote 2 was modified to clarify that the gross demand is needed at each load serving bus. Collecting and modeling a net demand that incorporates offsets due to output from DER is not consistent with a modeling framework that explicitly represents DER. In situations where DER is not separately metered, a comparison to historical load levels can be used to approximate the addition of DER on the distribution feeder. A consistent reduction in load on the feeder may be indicative of DER interconnections.

- **Examples for Footnote 5**

Footnote 5 was added to Attachment 1, item 9, after the bracketed statement, indicating the functional entity responsible for data reporting requirements is the “DP, TO where DER is directly connected to the TO system and not through a DP”, to cover situations where the DER is not connected to a registered DP or directly to a registered TO. In these situations, DER is connecting to an “unregistered Distribution Provider”, that is responsible for DER interconnection processes and data management but does not have

NERC compliance obligations. The SDT viewed the collection of all DER data as the appropriate aim, but recognized practical constraints associated with unregistered entity compliance obligations. For that reason, the SDT added a footnote that in part states, "the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information" to request data that cannot be required.

The SDT offers two examples to illustrate the SDT's intended application of Footnote 5:

- If the DER is directly connecting to an unregistered Distribution Provider that is immediately electrically adjacent to a registered TO (i.e., "next closest electrically connected registered entity"), the TO is responsible for requesting data from the unregistered DP and incorporating it in the MOD-032 data to the Planning Coordinator.
- If the DER is directly connected to an unregistered Distribution Provider that is served by a registered DP (i.e., "next closest electrically connected registered entity"), then the registered DP is required to request data from the unregistered Distribution Provider and include this data in the MOD-032 data submission.

Technical Rationale for Reliability Standard MOD-032-2

~~May~~ October 2023

MOD-032-2 – Data for Power System Modeling and Analysis

Rationale for Applicability Section

For MOD-032-2, Load-Serving Entity (LSE) was replaced with Distribution Provider (DP) because of the removal of LSEs from the NERC registry criteria. Items in Attachment 1 that were previously required to be provided by the LSE are now required to be provided by the DP. It is recognized that some distribution facilities do not have an associated DP that meets the NERC registration criteria. ~~In such instances, the specified data is required to be provided by the Transmission Owner (TO) or registered DP to which those facilities are connected.~~ It is expected that TOs (or registered DPs) will ~~may~~ need to coordinate with the owners of distribution facilities that do not have an associated NERC-registered DP to ensure the availability of the necessary data, either through interconnection agreements or other binding contracts.

The Standard Drafting Team (SDT) has concerns that there may be challenges in collecting data for DER connected to unregistered entities. Draft 1 proposed to assign this data obligation on the TO/DP, but based on industry comments, this may place an unreasonable compliance risk on the TO/DP because any unregistered entities that connect DER to their systems have no compliance obligation to provide data to the TO/DP. As such, the SDT recommends that NERC consider a range of options that could include expanding DP registration criteria or registering DER-only DPs to reduce or eliminate this potential DER data collection gap. However, the process to modify NERC registry criteria and register new entities is beyond the scope of Project 2022-02 and would unnecessarily delay the implementation of DER data requirements. The SDT believes there is value in moving forward with MOD-032-2 as it does provide substantial improvement with respect to ensuring DER data is available for inclusion in PC and TP studies.

~~Additionally, the standard drafting team (SDT) reviewed the dual applicability to Planning Authority and Planning Coordinator and determined that that the explanation from MOD-032-1 is still correct and valid with minor edits as proposed. The posted "Appendix 5B: Statement of Compliance Registry Criteria", dated January 19, 2021, still uses the Planning Authority term.~~Additionally, the SDT reviewed the dual applicability to Planning Authority and Planning Coordinator and determined that it was most appropriate to reference both terms in the applicability section until NERC registration criteria is updated to use only a single term. The posted "Appendix 5B: Statement of Compliance Registry Criteria", dated January 19, 2021, still uses both terms and arguably, the Planning Authority term is used more prominently. However, the explanation included in MOD-032-1 refers to synchronization between registration criteria and the NERC functional model which is not maintained, was never formally approved, and is only posted as a historical document. Therefore, the SDT excluded the explanatory language from MOD-032-2 applicability section.

Rationale for Distributed Energy Resource (DER) Definition

The SDT considered various DER definitions utilized in the industry and discussed in the SPIDERWG Terms and Definitions Working Document, including the six other definitions described in Appendix D which were not adopted by SPIDERWG. Through this review, the SDT determined each of these seven definitions required or would benefit from refinement to be most suitable for the application in MOD-032 and more broadly.

The SDT consensus is that the proposed definition aligns with the intent of the SPIDERWG working definition for DER (which explicitly excludes demand response) and clarifies what is in scope and out of scope with respect to where DER is connected rather than the technology type. Utilizing the existing NERC definition for DP and the associated area of responsibility aligns with the scope of DER data collection and modeling activities and provides clarity for the industry to aid in gathering this information. It should be clear that MOD-032-2 applicability and compliance obligations refer to NERC-registered DPs; the use of the DP term in the DER definition does not in itself imply any compliance obligation.

Below is a summary of the rationale for the SDT departing from each of the seven definitions when proposing a new DER definition.

SPIDERWG definition

After considering the SPIDERWG definition, the SDT determined it provided a useful foundation but needed refinement to be suitable for the intended use. Specifically, the SPIDERWG term 1) included transient types of DER beyond power beyond generation and storage; 2) pointed to a SPIDERWG-specific defined term for "distribution systems"; and 3) included sources of back-up power that would have nowithout grid potential grid impacts.

The SDT chose to refer to generator and storage technologies specifically, rather than use the SPIDER-WG language of "source", to exclude devices or resources that only transiently inject real power (e.g., regenerative elevators, transition switches, etc.) Additionally, by specifying facilities that produce Real Power, the scope is focused on only those facilities that may be exporting Real Power to the power system or offsetting Real Power load (e.g., residential solar or commercial rooftop solar, even if they only operate at unity power factor or don't have any reactive power capability). This would exclude examplestechnologies such as charging-only electric vehicle (EV) installations and controllable load options.

Further, the SDT term uses used "connected to the Distribution P'sProvider's system" to avoid ambiguities associated with defining aa unique definition of "distribution system" as was required by the SPIDERWG defintiondefinitionterm.

The NERC glossary definition for DP[1] notes that the DP is defined by providing the distribution function (this includes entities that may not be NERC-registered DPs).

The SDT included the language "in non-isolated parallel operation with the Bulk Power System." to indicate that distributed energy resources with potential BES reliability impacts are those that ~~are actually electrically connected~~ have electrical connectivity to the BES. The SDT intentionally avoided the term "directly connected" to differentiate electrical connectivity from an electrical connection point. Resources that are only operated in ~~an~~ islanded or isolated mode (e.g., back-up generation that only operates when a facility is disconnected from the grid), will not have an impact to the BES and therefore are not of interest from a BES-reliability perspective. The SDT understands the concepts of non-isolated parallel operation versus isolated parallel operation to be commonly understood within the industry.

IEEE 1547-2018

The SDT reviewed the IEEE 1547-2018 definition and found that it contained elements that could supplement the SPIDERWG definition to address the three issues identified above. The SDT incorporated the explicit reference to "generation and storage" aspect of the IEEE definition. Further, the IEEE concept of "capable of exporting active power to an EPS" was used to inform the need for capturing non-isolated, long-term paralleling and the sourcing of R~~r~~eal ~~(i.e., active)~~ P~~p~~ower (i.e., active power) ~~-~~within the SDT definition.

At the same time, the SDT did not view the IEEE definition as suitable for the SDT's intended use as written. The IEEE term qualifies the DER connection point as "not directly connected to a bulk power system" which the SDT viewed as potentially ambiguous. Instead, the SDT opted for the "connected to DP's system" language to point to a NERC defined term and concept. The SDT considered if it was necessary to define "supplemental DER devices" as part of the DER definition and determined this nuance is not needed for a DER definition for inclusion in the NERC Glossary of Terms.

Federal Energy Regulatory Commission (FERC) Energy Primer

The SDT identified the FERC Energy Primer definition as being inclusive of load resources (e.g., energy efficiency, demand response)~~,~~ which is not aligned with the SPIDERWG definition. Given the reliability planning use cases, the SDT and SPIDERWG definitions target sources of electric power, with the SDT narrowing this definition to be only sources "capable of providing Real Rower". After considering the FERC definition, the SDT determined it was not suitable for the intended use.

National Association of Regulatory Utility Commissions (NARUC)

NARUC's definition is also inclusive of load resources (e.g., energy efficiency, demand response) and therefore, the SDT concluded it is too broad. After considering the NARUC definition, the SDT determined it was not suitable for the intended use.

[1] NERC Glossary of Terms, Updated March 2023. DP is definition: "Provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage."

NERC DERTF
The NERC DERTF definition uses the language "resource on the distribution system that produces electricity" which appears to exclude distributed energy storage, a technology necessary for inclusion in the SDT definition. Further, the NERC DERTF definition defines DER as anything "not otherwise included in the formal NERC definition of the Bulk Electric system" which the SDT views as ambiguous and overly broad. After considering the NERC DERTF definition, the SDT determined it was not suitable for the intended application.

California Public Utilities Commission (CPUC)
The CPUC definition appears to be~~is~~ based on California legislation and includes energy efficiency, electric vehicles, and demand response, renewable generation resources, and energy storage. As is the case for FERC and NARUC definitions above, the inclusion of load resources is overly broad for the SDT's use. After considering the CPUC definition, the SDT determined it was not suitable for the intended application.

New York Independent System Operator (NYISO)
The NYISO definition only considers market-qualifying resources as DER. This definition to exclude a large portion of DER (i.e. retail participation) is too narrow for the reliability planning needs identified by the SPIDERWG DER Modeling Study. After considering the NYISO definition, the SDT determined it was not suitable for the intended application.

Rationale for Modifications to Attachment 1
MOD-032-2 Attachment 1: Data Reporting Requirements was updated with data specific to DERs. The intent is that all relevant DER data including both utility scale facilities (commonly referred to as U-DER) and smaller behind-the meter facilities (commonly referred to as R-DER) be available and represented in models of the interconnected transmission system consistent with the approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies. Specific data items listed for DER reflect the minimum amount of information expected to be needed to reasonably represent DER in transmission system models. It is expected that aggregate DER (rather than individual DER facilities) would be represented in most Planning Coordinator/Transmission Planner (PC/TP) study models. However, footnote 4 explicitly allows the PC/TP to specify the level of~~require either aggregated or unaggregated~~ DER data aggregation. This provides flexibility for local practices wherein the PC/TP may elect to apply DER aggregation assumptions rather than depend on the DP/TO to apply aggregation assumptions.

The PC/TP may have access to sufficient data for modeling certain DER through alternative means (e.g., direct registration of DER in certain markets). In such cases, the DP (or TO) should not be obligated to provide duplicate DER modeling data. The PC/TP modeling data requirements and reporting procedures should clearly identify if there are certain classifications of DER that are excluded from the DP/TO obligation for providing DER modeling data. This in no way absolves a DP/TO from an obligation to provide DER data according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1.

The SDT intentionally maintained flexible language as to whether the underlying DER data originates from interconnection documentation, measured quantities, estimated quantities, or other sources. Data

availability or sufficiency issues, among other factors, may lead to the DP/TO applying a combination of approaches to source the data. The PC/TP modeling data requirements and reporting procedures should identify acceptable methods and their application.

The SDT decided to maintain an approach similar to MOD-032-1 where more detailed sub-bullets associated with the required DER data are only presented in the "steady state" column (though arguably such data is also relevant to "dynamics" and/or "short circuit"). ~~The addition to the "dynamics" column was limited to the "Distributed Energy Resource (DER) data" line item~~. The SDT concluded that this was appropriate and consistent with other "dynamics" line items such as "Wind Turbine Data" and "Photovoltaic systems" that are listed without detailed sub-bullets. Drastically altering the structure of Attachment 1 or explicitly adding DER data to the "short circuit" column was beyond the scope of the Project 2022-02 SAR. However, the PC or TP is not restricted from requiring any needed short circuit data in their joint modeling data requirements and reporting procedures developed per R1.

It should be noted that the modifications do not make DER a BES facility~~ies~~ subject to NERC reliability standards. Instead, the modifications place a compliance obligation on NERC registered DPs (or TOs) to provide basic information about DER that are connected to their systems so that DER can be properly represented in interconnection-wide cases. There are already existing requirements for DPs (or TOs) to provide information about load connected to their systems. Similar to load, DER is not generally considered to be a BES facility. However, BES reliability assessments require an accurate representation of both aggregate load and aggregate DER behavior. The modifications proposed in MOD-032-2 are intended to ensure sufficient DER data is available to the PC/TP so that appropriate DER representations can be included in their BES reliability assessments.

- **Inferring DER Capabilities~~nclusion of In-Service Date or Other Information~~**

As suggested in the approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies, the in-service date for DER may be used as a proxy for the PC/TP to make reasonable assumptions about DER capabilities. For example, in a certain jurisdiction DER installed after a specified date may be required to have a certain ride-through characteristic. Thus, the appropriate ride-through characteristic representation for DER in that area could be inferred by the in-service date of the DER. However, the PC/TP modeling data requirements and reporting procedures may require the provision of alternative information to achieve the same purpose. PC/TP modeling data requirements and reporting procedures may also require more detail and/or additional information. In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, it is expected that the proportion of aggregate DER amount with in-service dates before and after certain threshold dates would be needed (and specified in the PC/TP requirements) to make inferences regarding the overall aggregate DER response characteristics.

- **Inclusion of Data Related to DER ~~Feeders~~ Subject to Trip by UFLS and/or UVLS**

There is a reliability need for the DP/TO to convey this information to the PC/TP. As described in the approved Reliability Guideline: Recommended Approaches for UFLS Program Design with Increasing Penetrations of DERs, accurately representing DER tripping as part of UFLS operation is vital for designing and evaluating UFLS programs. Similarly, accurately representing DER tripping as part of UVLS operation is vital for designing and evaluating UVLS programs as described in the approved White Paper: DER Impact

to Under Voltage Load Shedding Program Design. In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, the proportion of aggregate DER subject to each UVLS/UFLS tripping stage should be identified.

- **Inclusion of Aggregate Demand Clarification**

Footnote 2 was modified to clarify that the gross demand is needed at each load serving bus. Collecting and modeling a net demand that incorporates offsets due to output from DER is not consistent with a modeling framework that explicitly represents DER. In situations where DER is not separately metered, a comparison to historical load levels can be used to approximate the addition of DER on the distribution feeder. A consistent reduction in load on the feeder may be indicative of DER interconnections.

- **Examples for Footnote 5**

Footnote 5 was added to Attachment 1, item 9, after the bracketed statement, indicating the functional entity responsible for data reporting requirements is the "DP, TO where DER is directly connected to the TO system and not through a DP", to cover situations where the DER is not connected to a registered DP or directly to a registered TO. In these situations, DER is connecting to an "unregistered Distribution Provider", that is responsible for DER interconnection processes and data management but does not have NERC compliance obligations. The SDT viewed the collection of all DER data as the appropriate aim, but recognized practical constraints associated with unregistered entity compliance obligations. For that reason, the SDT added a footnote that in part states, "the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information" to request data that cannot be required.~~n.~~"

The SDT offers two examples to illustrate the SDT's intended application of Footnote 5:

- ~~I~~if the DER is directly connecting to an unregistered Distribution Provider that is immediately electrically adjacent to a registered TO (i.e., "next closest electrically connected registered entity"), the TO is responsible for requesting data from the unregistered DP and incorporating it in the MOD-032 data to the Planning Coordinator.
- ~~I~~if the DER is directly connected to an unregistered Distribution Provider that is served by a registered DP (i.e., "next closest electrically connected registered entity"), then the registered DP is required to request data from the unregistered Distribution Provider and include this data in the MOD-032 data submission.

Standards Announcement

Project 2022-02 Modifications to TPL-001 and MOD-032

Formal Comment Period Open through November 20, 2023

Now Available

A formal comment period for **Project 2022-02 Modifications to TPL-001 and MOD-032** is open through **8 p.m. Eastern, Monday, November 20, 2023** for the following standard and implementation plan:

- MOD-032-2 – Data for Power System Modeling and Analysis
- Implementation Plan

The standard drafting team's considerations of the responses received from the previous comment period are reflected in this draft of the standard.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Additional ballots for the standard and implementation plan, as well as the non-binding poll of the

associated Violation Risk Factors and Violation Severity Levels will be conducted **November 10 – 20, 2023**.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer**,** Ben Wu (via email) or at 470-542-6882. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2022-02 Modifications to TPL-001 and MOD-032 observer list” in the Description Box.

Comment Period End Date:	11/20/2023
Associated Ballots:	2022-02 Modifications to TPL-001 and MOD-032 | Draft 1 Implementation Plan AB 2 OT 2022-02 Modifications to TPL-001 and MOD-032 | Draft 1 MOD-032-2 AB 2 ST 2022-02 Modifications to TPL-001 and MOD-032 | Non-Binding Poll MOD-032-2 AB 2 NB

There were 71 sets of responses, including comments from approximately 185 different people from approximately 114 companies representing 10 of the Industry Segments as shown in the table on the following pages.

Questions

1. Given the explanation in the Technical Rationale and response to industry comment, do you agree with the proposed definition for DER?

2. Are there any other clarifications needed in the Technical Rationale?

3. Do you agree the modifications made in MOD-032-2 will improve system modeling and reliability?

4. Do you agree the modifications made in MOD-032-2 are cost effective?

5. Do you agree with the Implementation Plan for revised MOD-032-2?

6. Provide any additional comments for the standard drafting team to consider, if desired.

1. Given the explanation in the Technical Rationale and response to industry comment, do you agree with the proposed definition for DER?

Mark Garza - FirstEnergy - FirstEnergy Corporation - 4, Group Name FE Voter

Answer	No
Document Name	

Comment

FirstEnergy supports EEI's comments which state:

we do not support the development of a DER definition within this NERC Reliability Standards project. The impact of this definition will have far reaching impacts that go beyond this project. To address this issue, we suggest that a separate NERC Reliability Standards project be developed to address this definition.

We additionally do not agree or support the notion that from a NERC Reliability Standard compliance standpoint, entities should be held accountable for DERs that fall outside of the NERC registration criteria.

We do not agree with the proposed definition for DER, nor do we agree that the definition for the term DER should be defined by the drafting team of single project working within the confines of that project as set forth by the Standard Drafting Process. We are concerned with the proliferation of NERC projects that are either directly, or indirectly, related to DERs and the potential consequences of the proposed DER definition. A definition that impacts multiple standards should be developed outside the scope of any individual standard and consider the impact to all of the affected NERC Reliability standards.

We have for example a GO/GOP-registered plant that feeds a DP-registered data center in behind-the-meter fashion, i.e. upstream of the POI to the TO. This 2.5 GW generation facility is clearly not a Distributed Energy Resource, yet it seems to be included under the currently proposed DER definition, depending on how one interprets the term, "parallel operation."

MRO NSRF does not agree with the proposed definition for DER; further, the MRO NSRF does not believe that the definition for the term DER should be defined solely by this Standard Drafting Team within the parameters of Project 2022-02. With the proliferation of NERC projects that are either directly, or indirectly, related to DERs, MRO NSRF contends that a definition, for a term such as DER, which is a broadly utilized term that impacts multiple standards, should be developed in a separate project. Additionally, MRO NSRF has concerns that the proposed definition for DER may fall outside the purview of NERC Reliability Standards as allowed for by Section 215(a)(1) of the Federal Power Act (“The term [bulk-power system] does not include facilities used in the local distribution of electric energy.”).

Comment

Buckeye Power, Inc. supports the comments of ACES:

We at ACES applaud the attempt made by the SDT to clearly define what is by nature a nebulous concept; however, we feel that the current definition is overly broad and will create an insurmountable compliance obstacle.

We have an ongoing concern regarding the level upon which this will require DPs to collect DER data interconnected to distribution systems. The proposed draft establishes a zero MVA threshold for the collection of all DER data "in non-isolated parallel operation with the Bulk Power System". Per the Technical Rationale, this includes each and every residential solar and commercial rooftop solar customer on the DP's systems. This is a major concern given the extent it may go to exhausting the resources of our Members for the collection of DER data which may not have a material impact to the reliability of the BES.

Additionally, there is a seemingly interchangeable use of the terms Distributed Energy Resource (DER) and Inverter Based Resource (IBR) to describe the same types of assets. It is our opinion that a singular definition should be developed to define these resource types. Given the currently proposed changes to the NERC Rules of Procedure (specifically Appendices 5A and 5B), we believe that the term IBR should be utilized in lieu of DER. Moreover, it is our opinion that the newly proposed GO-IBR and GOP-IBR registrations should be utilized when developing MOD-032-2. In short, we believe that the NERC registration criteria are well reasoned and were intentionally developed to only include those entities and/or resources that could have a material impact to the BES.

In conclusion, it is our recommendation that the proposed MOD-032-2 Reliability Standard be modified to include a non-zero MVA threshold. We believe that the DP should only be required to collect data from NERC registered entities.

Comment

AES Clean Energy appreciates the Standard Drafting Team's research into the various DER definitions adopted across the industry and regions. However, with the introduction of a new definition from NERC, this will create additional confusion for entities, especially those that operate in regions where the term DER is currently utilized. AES Clean Energy recommends that the Standard Drafting Team take an approach of proposing a broader definition of DER that is not specific to MOD-032 and will be applicable to other on-going DER related standard projects before moving forward with MOD-032 changes. This is similar to that of Project 2020-06 where definitions of IBRs were proposed for industry feedback.

Kacie Fischer - Kacie Fischer On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Kacie Fischer

Answer	No
Document Name	

Comment

- Oncor Electric Delivery Company LLC ("Oncor") considers the DER definition used in the Technical Rationale for Reliability Standard MOD-032-2 too vague because it does not contain a voltage class threshold for an energy resource to be considered a DER.
- Oncor's view of DER is consistent with ERCOT's definition of DER, which is: "An electrical generating facility consisting of one or more on-site distributed generation units connected at a voltage less than or equal to 60 kilovolts (kV), which may be connected in parallel operation to the utility system." This definition can be found here: https://www.ercot.com/files/docs/2017/03/24/DER_OnePager_FINAL.pdf
- From Oncor's experience, the total capacity of the installation's on-site distributed generation units may exceed ten megawatts (MW); however, no more than ten MW of the installation's capacity will be allowed to export into the grid at any point in time at the point of common coupling.
- Is there any MW size threshold for Generator and energy storage technologies to be taken into account when the end-use customer is served at transmission voltage? We would prefer a MW size threshold be specified in the definition.

*NYPA appreciates the standard drafting team’s effort to define ‘**DER**’ and aligning it with IEEE 1547, but we believe a more detailed definition is essential for better interpretations. The current proposed definition seems too narrow, given the use of the term DER across multiple NERC standards. NYPA suggest SDT to propose a more detailed **DER** definition with examples to avoid potential misinterpretations as DER which is not solely for renewables.*

ATC agrees that there is a need for a NERC DER definition, but ATC does not support the SDT's proposed definition for DER.

Defining DER within the confines of a single NERC project (i.e., NERC Project 2022-02) could limit the definition's use within other ongoing and future DER standard drafting efforts. With the number of NERC projects under modification and existing Standards that are either directly or indirectly related to DERs, ATC believes that a definition for a term such as DER, which is a broadly utilized term that impacts multiple standards, should be developed outside the scope of any individual standard, and should consider the impact to any affected NERC Reliability standards.

If the SDT does go forward with a NERC Glossary of Terms definition for DER, the NERC definition of DER should not involve itself in facilities that do not fall under the purview and regulation of NERC (e.g., local distribution facilities).

ATC believes that the text "Distribution Provider's system" should not be referenced in the DER definition as it refers to the NERC glossary definition of Distribution Provider, not the NERC registered entity and in some cases this is different.

If the term "Distribution Provider" is used, ATC also suggests that there should be a clearer distinction between Distribution Provider as a NERC glossary term and Distribution Provider as a NERC registered entity.

As an alternative, the SDT could replace "connected to the DP's system" with "not directly connected to a bulk power system."

Additionally, ATC requests that the standard explicitly allows the PC to determine thresholds (ex: MW or MVA) for both the collection of DER data and for the modeling of DERs. Alternatively, thresholds for DER data collection and for DER data modeling could be included in the standard. Thresholds for DER data collection and for DER data modeling could also be included in the DER definition but this may be less appropriate/ flexible for future use.

DER thresholds greater than zero MW are needed to manage the potentially large administrative burden on NERC Registered Entities such as the TOs, TPs, and DPs.

ATC encourages a new NERC Registered Entity for DER (ex: DP-DER or IBR-DER) to bring DER data reporting accountability to those unregistered DPs with DER.

The NAGF does not agree with the proposed definition for DER, nor do we agree that the definition for the term DER should be defined by the drafting team of single project working within the confines of that project as set forth by the Standard Drafting Process. The NAGF is concerned with the proliferation of NERC projects that are either directly, or indirectly, related to DERs and the potential consequences of the proposed DER definition. A definition that impacts multiple standards should be developed outside the scope of any individual standard and consider the impact to all of the affected NERC Reliability standards.

In addition, the NAGF is concerned with the inconsistency of DER term used across the industry as stated in the examples provided in the Technical Rationale. Regions or even states have their own definition of DERs which may impact a Generator Owner's ability to comply with both NERC and other state or regional requirements. It is recommended that NERC perform outreach to regions and/or states to try to ensure some consistency on how the term is going to be used.

The drafting team should consider defining “Transmission connected DERs” (100 kV and above) and “Distribution connected DERs” (below 100 kV). The proposed DER definition begins with “generators and energy storage technologies…”, implying that a Generator Owner is involved. The NERC Glossary of Terms defines a Generator Owner as the “Entity that owns and maintains generating Facility(ies)”. Would it be more practical to acquire DER data from the associated GO rather than the DP/TO; particularly in instances where the GO is a NERC registered entity?

Texas RE agrees with the definition of DER. Texas RE noticed a potential contradiction within the technical rationale and would like it clarified. On page 2 of the technical rationale, it states “It should be clear that MOD-032 2 applicability and compliance obligations refer to NERC registered DPs; the use of the DP term in the DER definition does not in itself imply any compliance.” This seems to be contradicted on page 3, where it states: “The NERC glossary definition for DP1 notes that the DP is defined by providing the distribution function (this includes entities that may not be NERC-registered DPs).”

While EEI finds the Technical Rationale to be clear, we have concerns with the following statements and positions contained in the Technical Rationale:

Page 1; Rationale for Applicability Section:

EEI does not agree that TOs (or registered DPs) should be required to coordinate with the owners of distribution facilities that do not have an associated NERC-registered DP to ensure the availability of necessary data, either through interconnection agreements or other binding contracts. TOs and DPs have no ability to control interconnection agreements on other entity's system or the ability to obtain data from non-registered entities or facilities used in the local distribution of electric energy.

EEI is also concerned that the SDT acknowledges that data collection for DERs connected to unregistered entities is a problem and suggests that NERC should expand DP registration criteria or develop a DER-only DP registration criteria to address this gap but still believes there is value in moving MOD-032-2 forward with requirements for TOs and DPs when those obligations are limited to assets owned by the TOs and DPs.

Page 4 – Rational for Modifications to Attachment 1

EEI does not support the scope of modifications to MOD-032, Attachment 1 which obligates TOs and DPs to collect DER data on all relevant DERs including utility scale facilities and smaller behind the meter facilities, which appears to include all residential DERs even though these resources are used for local distribution.

EEI does not agree with the SDT's position that the PC/TP should have the authority to specify DER data to whatever level it deems appropriate. (Ref. the explanation of Footnote 4 from Attachment 1 of MOD-032).

The following statement (in boldface) should be struck from the Technical Rationale because TOs and DPs should have no obligation to provide any data related to DERs participating within a DER Aggregation in the organized markets. While the SDT appears to believe that while the data should be provided by the DER Aggregator, they believe that TOs and DPs still have an obligation to provide this data if requested to do so by the PC/TP: **This in no way absolves a DP/TO from an obligation to provide DER data according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1.**

FirstEnergy has concerns with the following statements and positions contained in the Technical Rationale:

Page 1; Rationale for Applicability Section:

EEI does not agree that TOs (or registered DPs) should be required to coordinate with the owners of distribution facilities that do not have an associated NERC-registered DP to ensure the availability of necessary data, either through interconnection agreements or other binding contracts. Such a requirement makes no sense. TOs and DPs have no ability to control interconnection agreements on other entity's system or the ability to obtain data from non-registered entities.

EEI is also concerned that the SDT acknowledges that data collection for DERs connected to unregistered entities is a problem and suggests that NERC should expand DP registration criteria or develop a DER-only DP registration criteria to address this gap but still believes there is value in moving MOD-032-2 forward with regulator obligations on TOs and DPs when it is recognized their ability to collect certain data is not possible.

Page 4 – Rational for Modifications to Attachment 1

EEI does not support the scope of modifications to MOD-032, Attachment 1 which obligates TOs and DPs to collect DER data on all relevant DERs including utility scale facilities and smaller behind the meter facilities, which appears to include all residential DERs even though these resources are used for local distribution.

EEI does not agree with the SDT's position that the PC/TP should have the authority to specify DER data to whatever level it deems appropriate. (Ref. the explanation of Footnote 4 from Attachment 1 of MOD-032).

EEI believes that the following statement (underlined) should be struck from the Technical Rationale because TOs and DPs should have no obligation to provide any data related to DERs participating within a DER Aggregation in the organized markets. While the SDT appears to believe that while the data should be provided by the DER Aggregator, they believe that TOs and DPs still have an obligation to provide this data if requested to do so by the PC/TP: This in no way absolves a DP/TO from an obligation to provide DER data according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1.

We agree with some comments provided by ACES, EEI, MRO, NAGF, and Talen but are not going to restate each item specifically, as others have already restated them. Specifically, we disagree with the SDT stating in the standard footnote 5 on page 16, first sentence "Where DER is connected to an unregistered Distribution Provider". This makes it appear as though said entity should be registered. If they are not in the NERC registry then they are not a DP. Consequently, it should say "Where a DER is connected to a non-Distribution Provider". We also disagree with the SDT re: proposed standard footnote 5 on page 16, second sentence. "An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider". Our view is that this seems to imply that another DP or TO can determine, or has the responsibility of determining, if an entity should be registered as a DP. That is NERC's or the Regional Entities' responsibility; registration determination is not a DP's or a TO's responsibility.

The technical rationale doesn't provide guidance on determining which facilities connected to the DP's system would be classified as DERs and which ones would not. The current definition would classify any generation connected to a registered DP as a DER.

The SDT should give consideration to paragraph 105 of FERC Order No. 901 which states that if distribution providers are unable to gather adequate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation.

Bobbi Welch - Midcontinent ISO, Inc. - 2, Group Name ISO/RTO Council Standards Review Committee (IRC SRC) 2022-02 Modifications to MOD-032 Draft 2

Answer	Yes
Document Name	2022-02 Unofficial_Comment_Form_SRC_11-20-23_FINAL_as filed.docx
Comment	

The **ISO/RTO Council Standards Review Committee (SRC)[1]** recommends that the Technical Rationale include an explanation of why the term reactive power capability (*see* Draft #1 of MOD-032-2, Attachment 1, steady-state item 9c) has been removed in favor of the language added in Draft #2 of MOD-032-2, Attachment 1, steady-state item 9d. Our understanding is the change was made to focus on broadening the language to better describe the data needed to model operating characteristics (including ride-through capability, voltage support, frequency control, etc.) instead of focusing on mere operating capabilities.

[1] For purposes of these comments, the IRC SRC includes the following entities: CAISO, MISO, NYISO, PJM, SPP and ISO-NE (except for the response to question 6). ERCOT supports the response to question 2 only.

While we may disagree with some of the positions taken by the Standard Drafting Team, the NAGF appreciates the efforts the Standard Drafting Team put forth in developing the technical rationale. *In the Technical Rationale, the Standard Drafting Team acknowledges that there may be challenges in collecting data for DER connected to unregistered entities and that the obligations of this standard may place an unreasonable compliance risk on registered entities. However, despite the acknowledgement of this unreasonable risk, the Standard Drafting Team has put forth in draft 2 similar language, containing the same unreasonable risk for industry. The NAGF recommends that the Standard Drafting Team re-consider how to address the issues surrounding data collection from entities who have no obligation to comply.* *The NAGF recommends that the statement "Distribution Provider refers to the NERC glossary definition, not the NERC registered entity," be revised to be: "The term Distribution Provider in the DER definition includes all parties cited in the NERC Glossary definition of a Distribution Provider, some of whom may be registered as TOs and not as DPs. References to Distribution Providers in the requirements of MOD-032 pertain however only to entities registered as DPs."*

- Getting the gross demand of a registered/unregistered DP's DER will require tracking and retention of their DER data for TO/TP. Managing this additional DER data will put an undue burden on TPs. We request that the DER be responsible for submitting data to the PC/TPs directly.
- As requested by Oncor in the previous comment period, clarification is needed by SDT on how to represent a single location with multiple types of DER.

Regarding non registered DPs, as stated in the technical rationale *"the SDT recommends that NERC consider a range of options that could include expanding DP registration criteria or registering DER-only DPs to reduce or eliminate this potential DER data collection gap. However, the process to modify NERC registry criteria and register new entities is beyond the scope of Project 2022-02 and would unnecessarily delay the implementation of DER data requirements. The SDT believes there is value in moving forward with MOD-032-2 as it does provide substantial improvement with respect to ensuring DER data is available for inclusion in PC and TP studies."* We do not agree that this would unnecessarily delay the implementation. We believe it is necessary to delay the implementation because of this. Please explain the justification for moving forward with this known ambiguity which will cause significant compliance risk and may not ultimately be feasible until the process to modify NERC registry criteria is completed.

In the “Inclusion of Aggregate Demand Clarification” section, it is suggested a comparison to historical load levels can be used to approximate the addition of DER on the distribution feeder. In an era of energy efficiency and significant load transformation, it is extremely difficult to differentiate DER additions vs. other factors contributing to changing feeder loads. This suggestion should be removed as it could lead to false DER aggregation assumptions.

Foot Note 5 is an attempt by NERC to force requirements onto unregistered entities via registered entities. This requirement places compliance risk on TO’s and DP’s to request data where there is no enforcement support. The comments also don’t explain what would happen if the unregistered DP doesn’t provide the requested data.

The addition of the wording to support Footnote 2: “In situations where DER is not separately metered, a comparison to historical load levels can be used to approximate the addition of DER on the distribution feeder. A consistent reduction in load on the feeder may be indicative of DER interconnections. “

This may serve the purpose of determining approximate aggregate demand under item # 2 in Attachment-1, column-1 (steady-state), but won’t support item # 9 which requires generator type (solar, battery etc.) and DER capabilities.

The addition of footnote 5 seems to be confusing. This can be addressed in the joint PC/TP modeling data requirements and reporting procedures developed per R1 (after coordinating with applicable DPs/TOs).

Comment	
The standard as written places an untenable compliance burden on NERC registered entities. The technical rationale notes the challenges in collecting DER data from unregistered DPs. It does not note or address in any way the challenges in collecting DER data from the unregistered DER owners connected to DPs. These unregistered DER owners have no obligation or requirement under NERC standards to provide data for modeling. Requiring that DPs provide modeling data for equipment they do not own and have no means to acquire data on leaves them in a position where they fail to comply with the standard through no fault of their own and despite their best efforts.

While we may disagree with some of the positions taken by the Standard Drafting Team, the NAGF appreciates the efforts the Standard Drafting Team put forth in developing the technical rationale. In the Technical Rationale, the Standard Drafting Team acknowledges that there may be challenges in collecting data for DER connected to unregistered entities and that the obligations of this standard may place an unreasonable compliance risk on registered entities. However, despite the	

acknowledgement of this unreasonable risk, the Standard Drafting Team has put forth in draft 2 similar language, containing the same unreasonable risk for industry. We recommend that the Standard Drafting Team re-consider how to address the issues surrounding data collection from entities who have no obligation to comply.

We also recommend that the statement “Distribution Provider refers to the NERC glossary definition, not the NERC registered entity,” be revised to be, “The term Distribution Provider in the DER definition includes all parties cited in the NERC Glossary definition of a Distribution Provider, some of whom may be registered as TOs and not as DPs. References to Distribution Providers in the requirements of MOD-032 pertain however only to entities registered as DPs.”

3. Do you agree the modifications made in MOD-032-2 will improve system modeling and reliability?

Mark Garza - FirstEnergy - FirstEnergy Corporation - 4, Group Name FE Voter

Answer	No
Document Name	

Comment

FirstEnergy supports EEI's comments which state:

EEI does not support the proposed changes to MOD-032-2 because many of the changes would obligate TOs and DPs to provide data that exceeds their ability to obtain. EEI further notes that during the Fall 2023 NPCC Compliance and Reliability Conference a presentation titled "Inverter Based Resource Work Plan" was given and appears to use data from a Berkeley National Laboratory Report. The presentation goes on to indicate that BES IBRs (75MW at ≥100kV) account for 84% and non-BES (≥20MW & ≤75MW at ≥100kV plus ≥MW at <100kV) account for an additional 14%; for a total of 98% of the IBRs currently interconnected on the grid. This data additionally indicates that small IBRs (<20MW at any kV) only account for 2% of the connected IBRs and if correct, would mean these resources would have no meaningful impact on the Reliability of the BPS. Moreover, in FERC Order No. 901 (Reliability Standards to Address Inverter-Based Resources), the Commission made it clear that the focus of changes to NERC Reliability Standards, as it relates to modeling of DERs, is to be limited data to aggregate data not granular details on a non-aggregated basis. Given the NPCC data and FERC Order No. 901, it would indicate that many of the proposed changes to MOD-032 are unnecessary for reliability. This would include modifications to MOD-032 that propose to provide PCs/TPs with the authority to request data that is overly granular and unnecessary to model the impacts of DERs on the BPS. IBRs that have a meaningful impact on the BPS should be registered. Once this has been done, PCs and TPs could seek the data they need directly from the registered resource, not the TOs or DPs that are unlikely to have the needed data. While we recognize the need to gather and model the impacts of DER resources on the distribution system, modeling should be limited to load demand and aggregate DER impacts/offsets. However, we do support obligating DER Aggregators who are participating in the organized markets to provide data on their aggregated resources to the PCs/TPs upon request. We do not support obligating TOs and DPs to gather non aggregated data, upon request.

Comment	
SMUD and BANC agree with the comments submitted by BC Hydro, especially pertaining to Footnote 5. We feel that the language in Footnote 5, and the Technical Rationale, do not support passing the compliance obligations of an “unregistered Distribution Provider” onto “the next electrically connected registered entity (DP or TO)”. If models are required for all DERs in the BPS, there is an increased chance of Planning Coordinators and Transmission Planners receiving inaccurate models (especially from “unregistered Distribution Providers”) as many Distribution Providers may not have the experience to model their DERs correctly which could pollute the base cases and diminish their quality.

The MRO NSRF believes that the modifications made to MOD-032-2 will have very limited impact on improving system modeling and reliability. The fact remains that, TOs and DPs have no ability to compel DER owners to provide the data that would be necessary to significantly improve system modeling and reliability. This provides (in our opinion) a likely scenario under which a NERC-registered entity may be held to have a compliance gap for the non-performance/compliance of a non-NERC-registered entity.

The proposed draft establishes a zero MVA threshold for the collection of all DER data "in non-isolated parallel operation with the Bulk Power System". Per the Technical Rationale, this includes every residential solar and commercial rooftop solar customer on the DP's systems. This would likely impose an immense administrative burden on (NERC Registered) Distribution Providers and Transmission Owners, while not delivering significant reliability benefits.

Comment
Through various reports, NERC has displayed how IBR can have an impact on the BES, but it is unclear how the aggregation of smaller “R-DER” impacts the BES in a manor proportional to “U-DER”. Total aggregated R-DER penetration is far from equivalent to a few “U-DER” installations across a utility’s footprint. Much of the required information is not available to DP’s for smaller DER installations and the ability to require the information from interconnectors is authorized by RERRA entities. The assumptions required to try to model R-DER due to MOD-032-2 requirements could also lead to false confidence and support of the BES from R-DER sources. A threshold is needed, suggested at 1 MW, for DER installations to differentiate the discrete modeling of resources with steady state and dynamic information vs. aggregating DER below such threshold, providing gross nameplate values, and allowing the PC to determine approximated DER response to system events.

CEHE believes the proposed revisions to MOD-032-2 are problematic and contradicts the existing data requirements that have already been established by the local Planning Coordinators in coordination with Transmission Planners. For example, in the ERCOT region, ERCOT defines these data requirements through the coordination with Transmission Planners as part of various regional working groups. The already defined data requirements do not align with the proposed revisions of the Data Reporting Requirements in MOD-032-2 (ex. Attachment 1, item 2, footnote 2). The current MOD-032-1 addresses and includes the requirements around DER data.

CEHE is in support of EEI's comment that the modifications made to MOD-32-2 "continue to obligate TOs and DPs to provide data that exceeds their ability to obtain." CEHE agrees with EEI in that if this data is needed, the resource owners should be registered and obligated to supply the data, not the TOs or DPs.

Adrian Andreoiu - BC Hydro and Power Authority - 1, Group Name BC Hydro	
Answer	No
Document Name	
Comment	

BC Hydro appreciates the drafting team's efforts and the opportunity to comment, and offers the following.

1. While BC Hydro appreciates the intent of modifications made in MOD-032-2, BC Hydro is of the opinion that the intended improvement in system modeling and reliability cannot be realized, until the implementation of an effective and practical approach to collect accurate DER data in a timely manner and with a sufficient level of detail. This would be challenging due to the lack of any compliance obligations on unregistered DER owners. DP and TO may have some leverage, such as introducing obligations for DER owners to provide acceptable data for future DERs before they can be connected to the DP/TO systems. However, in the case of unregistered DER owners that are already connected to a TO/DP, the TO/DP will have an extremely limited ability to ensure a timely collection of such data, its accuracy, and sufficient level of detail.

2. The Footnote 5 of the Attachment 1 states that "Where DER is connected to an unregistered Distribution Provider, the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information". This appears to set a mandatory requirement, which – as outlined above – would impose regulatory compliance obligations the TO and/or DP registered entity may be unable to meet.

While SPP believes that the proposed modifications are a good step towards improving system modeling and reliability. However, we still have concerns around the appropriate data collection process pertaining to DERs.

We recommend that the UFLS-Only DP be added to the applicability section of the standard as these registered entities are just as likely to have DERs connected to their system. From our perspective, adding the UFLS-Only DP will eliminate the possibility of uncaptured DER load data if a DP does not have access to this data

ATC appreciates the intent of modifications contained in MOD-032-2. However, as Draft 2 of the Standard is written, TOs and DPs have no mechanism to compel the actual DER owners to provide the data that would be necessary to significantly improve system modeling and reliability.

Compliance-related questions:

Please clarify what the compliance implications are if a TO/ TP or DP requests the modeling data but does not receive it or if the data is inaccurate? Will showing that the TO/ TP attempted to request data be enough? Or that the TO/ TP utilized (or at least considered) the data received if no collection and modeling thresholds are set?

Please clarify how the TO/ TP or DP should be aware that DER are connected to an unregistered DP? The TO/ TP and DP would not have insight into those systems.

Please clarify the obligations of the TO/TP and DP in determining who is next closest electrically to each unregistered entity (DP or TO) as listed in Footnote 5? Does the TO/TP or DP need to reach out to the DER or to the unregistered DP for the information? Would the request for DER information be an annual process or triggered by something else?

Answer	No
Document Name	

Comment

The new requirements for DER data do not appear to directly correlate with the fields in existing modeling software such as the Composite Load Model (CMPLDWG). Tacoma would prefer for the Requirements to either align with existing modeling software, or for there to be a guidance document outlining what additional new software/model development needs to take place before the required DER can actually be utilized. The most significant concern is that there are often multiple installations of DERs connected to each substation, where each DER has unique ride-through and voltage control capabilities.

Comment

The revisions should also note that if the Planning Coordinator or Transmission Planner can obtain the information directly from the generator based on individual ISO Tariff or other local requirements that the TO or DP does not need to provide information listed in Attachment 1. Suggested revision is redlined below.

For steady-state:

9. Distributed Energy Resource (DER) data [DP, TO where DER is directly connected to the TO system and not through a DP unless the generator is required to provide the data directly to the PC or TP based on individual Tariff or local provisions]

a. Location (bus from item 1)

b. Real power capability

c. Generator type (solar, battery, etc.)

d. DER capabilities related to ride-through, voltage control and/or frequency control or information that can be used to infer those capabilities for modeling purposes.

For dynamics:

10. Distributed Energy Resource (DER) data including whether DER is subject to tripping in conjunction with UFLS and/or UVLS [DP, TO where DER is directly connected to the TO system and not through a DP, unless the generator is required to provide the data directly to the PC or TP based on individual Tariff or local provisions]

EEI does not support the proposed changes to MOD-032-2 because many of the changes would obligate TOs and DPs to provide data that exceeds their ability to obtain. EEI further notes that during the Fall 2023 NPCC Compliance and Reliability Conference a presentation titled “Inverter Based Resource Work Plan” was given and appears to use data from a Berkeley National Laboratory Report. The presentation goes on to indicate that BES IBRs (75MW at ≥100kV) account for 84% and non-BES (≥20MW & ≤75MW at ≥100kV plus ≥MW at <100kV) account for an additional 14%; for a total of 98% of the IBRs currently interconnected on the grid. This data additionally indicates that small IBRs (<20MW at any kV) only account for 2% of the connected IBRs and if correct, would mean these resources would have no meaningful impact on the Reliability of the BPS. Moreover, in FERC Order No. 901 (Reliability Standards to Address Inverter-Based Resources), the Commission made it clear that the focus of changes to NERC Reliability Standards, as it relates to modeling of DERs, is to be limited data to aggregate data not granular details on a non-aggregated basis. Given the NPCC data and FERC Order No. 901, it would indicate that many of the proposed changes to MOD-032 are unnecessary for reliability. This would include modifications to MOD-032 that propose to provide PCs/TPs with the authority to request data that is overly granular and unnecessary to model the impacts of DERs on the BPS. IBRs that have a meaningful impact on the BPS should be registered. Once this has been done, PCs and TPs could seek the data they need directly from the registered resource, not the TOs or DPs that are unlikely to have the needed data. While we recognize the

need to gather and model the impacts of DER resources on the distribution system, modeling should be limited to load demand and aggregate DER impacts/offsets. However, we do support obligating DER Aggregators who are participating in the organized markets to provide data on their aggregated resources to the PCs/TPs upon request. We do not support obligating TOs and DPs to gather non aggregated data, upon request.

Thomas Foltz - AEP - 5

Answer	Yes
Document Name	

Comment

AEP thanks the SDT for adding the text in footnote 5 which states "…Where DER is connected to an unregistered Distribution Provider, the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through ***available*** information" and request that clarity be provided on exactly what is meant by "available information?" AEP believes that information that is requested (and perhaps even exists) but is not provided by the data owner should be considered unavailable. In addition, this scenario should be added to the others listed in the Technical Rationale document.

Notwithstanding the SDT's response to our previous suggestion, AEP continues to believe that the best path forward for this proposed standard would be for those entities providing power at a minimum threshold to be registered as a Functional Entities and to provide DER data. We recommend that the SDT establish an aggregate minimum threshold, similar to what was recently proposed by NERC in regard to IBRs. As is the case in existing standards where Generator Owners are obligated to provide similar data, entities who possess the needed DER data noted in the Attachment One revisions should likewise be registered and explicitly obligated to provide this data as well. While we are unsure if the existing Functional Entities classes are themselves sufficient, or if instead, a new class of Functional Entities might need to be considered and developed, the need nonetheless exists. NERC may wish to also consider the potential that such obligations could potentially cross Federal and State jurisdictional lines of responsibility, further illustrating the complexity-of and challenges-in developing obligations to obtain the DER data in the revised Attachment One.

Duane Franke - Manitoba Hydro - 1,3,5,6 - MRO

Answer	Yes
Document Name	

Comment

In principle, getting more "reasonably accurate" DER models into the regional models should help to improve reliability. There could be some risk to reliability if DER dispatch in models is higher than expected as this could mask load serving reliability issues. MOD-032 regional model building groups need to provide guidelines on what level of DER should be included in each seasonal model. Studying appropriate sensitivity cases should be part of TPL-001 scope.

Comment
The latest draft of MOD-032 no longer requires reactive power information to be collected for DERs. While most smaller systems really only operate at unity, it is the belief of NCEMC having this information will allow planners to more accurately model Distributed Energy Resources, thereby improving grid reliability. Thus, NCEMC recommends that reactive power data collection for DERs be required by MOD-032.

Comment
The SRC believes there is an urgent need to move forward with collecting DER data now. Additional DER data collection activities will be needed as the penetration of DERs increases; however, these modifications are a step in the right direction and more can be done over time. The revisions should also note that if the Planning Coordinator or Transmission Planner will obtain the information directly from the generator based on individual ISO Tariff or other local requirements that the TO or DP may not need to provide information listed in Attachment 1. Suggested revision is redlined below.

For steady-state:

9. Distributed Energy Resource (DER) data [DP, TO where DER is directly connected to the TO system and not through a DP ***unless the generator will provide the data directly to the PC or TP based on individual Tariff or local provisions****]*

a. Location (bus from item 1)

b. Real power capability

c. Generator type (solar, battery, etc.)

d. DER capabilities related to ride-through, voltage control and/or frequency control or information that can be used to infer those capabilities for modeling purposes.

For dynamics:

10. Distributed Energy Resource (DER) data including whether DER is subject to tripping in conjunction with UFLS and/or UVLS [DP, TO where DER is directly connected to the TO system and not through a DP, ***unless the generator will provide the data directly to the PC or TP based on individual Tariff or local provisions****]*

Comment

While the acquisition and utilization of DER data by the PC/TP for the purposes of power system modeling should enhance the PC/TP's ability to study future scenarios and develop plans accordingly, we are concerned with the future compliance interpretation for Requirement R4. That is, how might the ERO (or its designee) modify its expectation for Interconnection-wide case(s) in regard to DER data?

We agree with some comments provided by ACES, EEI, MRO, NAGF, and Talen but are not going to restate each item specifically, as others have already restated them.

Additionally, the SDT has not stated a cost or benefit to said modifications. No standard should be allowed if a cost/benefit analysis is not provided by the SDT. SDT frequently asks this question but never provides a cost/benefit justification, simply someone says there is a reliability gap, or a risk, but does not provide estimated tangible reliability indices improvement numbers or a cost to fill the alleged gap or risk, is not good justification to create another costly administrative process.

The latest draft of MOD-032 no longer requires reactive power information to be collected for DERs. While most smaller systems really only operate at unity, it is the belief of NCEMC having this information will allow planners to more accurately model Distributed Energy Resources, thereby improving	

grid reliability and potentially allowing for solutions which reduce cost by taking DER reactive power capability into account. Thus, NCEMC recommends that reactive power data collection for DERs be required by MOD-032.

GO/GOPs will need more information to adequately assess the cost effectiveness of the proposed approach. *The NAGF requests that the SDT address the process under MOD-032 to require the TP/PC to request data each year rather than require the GO to go look for and follow TP/PC process. If reliability is really the goal, an active request for data is likely to receive a much higher response rate than expecting those that need to supply information to go looking for when, where and how they need to provide it. The NAGF believes that it is extremely costly for hundreds of entities to go looking for information to determine when they need to provide data than it is for a few entities to send out emails requesting the information.*

As previously stated, if DER penetration levels are high in a particular area, the changes in MOD-032-2 could have a positive impact on reliability. However, if DER penetrations are not high enough to impact the reliability of the BES, DPs and TOs will have added unnecessary administrative work and compliance burden for the purpose of checking a compliance box. Additionally, if the TO/DP is required to report data that the DER owner has no obligation to provide, the standard should address how the RE intends to handle situations where the unregistered Distribution Provider does not provide the requested data to the registered DP or TO. Otherwise, the TO/DP may be subject to fines and penalties for non-compliance related an issue that is beyond the control of the TO/DP.

Comment

Because so many issues around DERs, IBRs and ESRs remain unresolved and will be dependent upon final requirements for DERs, it is difficult to address the cost effectiveness of the MOD-32-2 modifications.

We do believe that software upgrades will be required to collect data on DERs, IBRs, and ESRs that have the potential to create cost increases for many in the industry.

Furthermore, we recommend the drafting team take into consideration evaluation the cost effectiveness from the FERC Order 2222 and IEEE Standards (1547 and 2800) perspectives.

The administrative burden to provide accurate modeling of aggregated R-DER does not outweigh marginal modeling benefits. It is recommended NERC focus on utility scale DER and assuming little to no support from residential DER during system events. A compromise may be to add a threshold for the steady state and dynamic modeling requirements in MOD-032-2 and allow all other DER to be aggregated gross nameplate values reported by DP/TO entities which the PC can determine modeling parameters for based on industry research.

If MOD-032-2 is approved as-is, utilities will need to increase resourcing to accommodate the additional modeling complexities and data collection. DP's, in particular, may not have staffing experience in dynamic modeling, which would lead to a need to establish contractors with the experience or hire/train internal staff. The ability to request the level of information to create dynamic models of DER also falls to the authority of RERRAs. Depending on the existing interconnection procedures, state or local government authorities may need to approve revisions to interconnection requirements. 12 months after the approval date is too soon to require compliance.

SPP recommends that the implementation of Requirements R2, R3 and R4 become effective 24 – 36 months after the implementation of Requirement R1. In order for industry to implement these changes we believe it will require a large transitional curve for requesting and providing the data. Newly impacted entities will need time to transition and ensure that the new process is efficient and reliable.

The timeline proposed in the Implementation Plan is not long enough for Requirements R2, R3, and R4. It The PCs and TPs are given 24 months to develop their data requirements, yet the entities required to submit said data are only given 12 months to collect and provide the data to the PC/TP. The Phased-In Compliance Dates for R2, R3 and R4 should be extended to at least 18 months (preferably 24 months) after the effective date of MOD-032-2.

As explained in our comments on Draft 1, we suggest the implementation plan be revised to allow 24 months (rather than 12 months) after the effective date for the initial performance of R2, R3 and R4. The drafting team's "expectation" that TOs and DPs would participate in PC/TP processes to change data reporting requirements related to DER developed during the 24 months prior to the effective date of R1, thereby allowing TOs and DPs to start working on data collection processes and methods more than 12 months prior to the effective dates of R2, R3, and R4 is not assured.

We agree with some comments provided by ACES, EEI, MRO, NAGF, and Talen but are not going to restate each item specifically, as others have already restated them.

Area coordinators are already responsible for submitting data for modelling, they should be getting data they feel they need; not what some other entity tells them they should get. If a PA needs data they should be responsible for getting said data.

Further, if said data is needed, then the BA and/or the TO or DP should modify and/or enforce their market and/or interconnection rules to require load and/or generation entities (Utilities interconnected to a BA's area) provide said data. It appears we are trying to draft new standards continent wide for local issues.

Additionally, each Utility is already required to complete an EIA-861 form annually. We suggest that the entity needing said data use data that is already on those spreadsheets and use a macro to populate each year's data (which EIA already has) with the bus numbers for each utility so it can be used with a composite load model for each bus.

The entity needing the data can call each utility or the TO that services them in order to get the appropriate bus number.

We feel there is more man-hours being spent talking about the issue and trying to develop a standard then it would take the entity that wants the data to call and find out the bus numbers to assign to data that already exists. Then the entity needing said data can get it annually from the public EIA website and run a macro to insert the bus numbers. Much simpler and less costly for everyone.

Comments on "Attachment 1":

Footnote 2 is concerning since the way we collect and forecast aggregate load data is metering that is unaware of any DER impacts. The suggestion in the technical rationale isn't possible to do cleanly. ("*In situations where DER is not separately metered, a comparison to historical load levels can be used to approximate the addition of DER on the distribution feeder. A consistent reduction in load on the feeder may be indicative of DER interconnections.")*

We would prefer the standard more explicitly allow for estimation by either reported DER nameplate capacity, or by estimated % of load (i.e., if no better information is available, perhaps use the data you do have to estimate DER as a % of peak load).

Dynamics reporting requirement # 10 reads:

"*Distributed Energy Resource (DER) data including whether DER is subject to tripping in conjunction with UFLS and/or UVLS [DP, TO where DER is directly connected to the TO system and not through a DP]*"

The added detail here is more burdensome, and is almost certainly not going to be available. The technical rationale says:

"*The SDT intentionally maintained flexible language as to whether the underlying DER data originates from interconnection documentation, measured quantities, estimated quantities, or other sources*."

However the addition of requirements for more specific data seems to go against the characterization that "estimated quantities" are acceptable.

Steady-state reporting requirement #9 has a footnote 4 that reads:

"*The joint PC/TP modeling data requirements and reporting procedures developed per R1 will specify data flow processes and the required level of aggregation. The PC or TP may need to coordinate with the DP or TO to determine appropriate equivalent distribution system impedance.*"

The implication here about determining the equivalent distribution system impedance to DER is perplexing. First because steady-state models do not model distribution impedance. In most cases, everything (including the main distribution transformers) is lumped into the aggregate load. This does apply to dynamic load models that consider equivalent distribution system impedances, but there is no practical way to vary that for every DER. And this is inconsistent with the approach used to model motor loads. For example, there is no requirement to report every individual motor and the equivalent impedance to that motor. And one could argue that the motor load has a vastly more important effect on the system than DER. TPL-001-5.1 stipulates the use of dynamic load models for Stability analysis but allows for the use of an aggregate System Load model. No further details or requirements. Studies are extremely sensitive to the load model that's used. If it is okay to develop those load models in estimated, aggregate form, why should there be anything more expected for DER?

Our general feeling is that the proposed modifications for DER data is getting too detailed and there needs to be very clear and explicit language that says estimating aggregate DER data is acceptable if more detailed data is not available.

Comment

The phrase "where DER is directly connected to the TO system and not through a DP" in steady state item 9 (and dynamics item 10) from Attachment 1 may not be consistent with footnote 5. ERCOT recommends simplifying the responsibility assignment in steady state item 9 (and dynamics item 10) to "[DP, TO]" and modifying footnote 5 to read as follows:

The registered entity (TO or DP) to which DER is connected is responsible for reporting DER data in accordance with PC/TP modeling data requirements and reporting procedures developed under Requirement R1. Where DER is connected to an unregistered Distribution Provider, the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information. An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider. This footnote is also applicable to item 10 under the "dynamics" column.

Comment

AEPC signed on to ACES comments:

We have a great deal of apprehension as it relates to proposed language in Footnote 5 of Attachment 1. Footnote 5 states (emphasis added):

"Where DER is connected to an unregistered Distribution Provider, the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information. An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider. This footnote is also applicable to item 10 under the "dynamics" column."

By what method should it be determined which registered entity is the "next closest electrically connected". Consider the case wherein a substation owned by an unregistered DP has a feeder from 2 different registered entities. Who is to make the determination as to which registered entity is the "next closest electrically connected" and how? In order to make this determination, a certain amount of knowledge about the other entity's infrastructure is required.

Of even greater concern is the continued inclusion of data from unregistered entities despite the open acknowledgment by the SDT of the challenges with collecting said data (see Technical Rationale, paragraph 2). We recommend that the SDT postpone further development of this Project until the GO-IBR and GOP-IBR registration criteria have been approved and can be included in the next draft of MOD-032-2.

Thank you for the opportunity to comment.

Comment

EEI notes that this project has been listed as a low priority project. While we understand this may have some immediate impacts on the work being conducted by this SDT, we suggest that a two phased approach for the revision of MOD-032 might address the immediate concerns surrounding efforts to align registration under Project 2017-02. Phase 1: Consider completing the work from project 2017-02 Standards Alignment with Registration: Replace Load-Serving Entity (LSE) with Distribution Provider (DP), remove the Planning Authority (PA) functional entity name and keep the Planning Coordinator (PC) functional entity name, and make the associated LSE / DP functional changes to the standard requirements. Phase 2: Please consider addressing additional DER data requirements, after further discussion regarding how GO-IBR and GOP-IBR standards are going to be addressed and what is needed from Distribution Providers regarding unregistered IBRs.

In addition to the comments responding to the questions above and our suggests related to project phasing, we are additionally concerned with Attachment 1, Footnote 5 and suggest it should be deleted because the next closest DP or TO to an unregistered distribution provider, should not be held responsible for providing DER data outside of their control or ability to collect.

We have a great deal of apprehension as it relates to proposed language in Footnote 5 of Attachment 1. Footnote 5 states (emphasis added):

“Where DER is connected to an unregistered Distribution Provider, the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information. An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider. This footnote is also applicable to item 10 under the “dynamics” column.”

By what method should it be determined which registered entity is the “next closest electrically connected”. Consider the case wherein a substation owned by an unregistered DP has a feeder from 2 different registered entities. Who is to make the determination as to which registered entity is the “next closest electrically connected” and how? In order to make this determination, a certain amount of knowledge about the other entity’s infrastructure is required.

Of even greater concern is the continued inclusion of data from unregistered entities despite the open acknowledgment by the SDT of the challenges with collecting said data (see Technical Rationale, paragraph 2). We recommend that the SDT postpone further development of this Project until the GO-IBR and GOP-IBR registration criteria have been approved and can be included in the next draft of MOD-032-2.

Additionally ACES collected the following comments for the consideration of the SDT:

1. "Once the GO-IBR standards are in place, the DP should not be part of this equation at all. This is especially true of non-registered members. Put the burden onto the GO-IBR not the DP."

2. "The latest draft of MOD-032 no longer requires reactive power information to be collected for DERs. While most smaller systems really only operate at unity, it is the belief of NCEMC having this information will allow planners to more accurately model Distributed Energy Resources, thereby improving grid reliability. Thus, NCEMC recommends that reactive power data collection for DERs be required by MOD-032."

Thank you for the opportunity to comment.

Comment

The SDT should give consideration to paragraph 105 of FERC Order No. 901 which states that if distribution providers are unable to gather adequate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation.

Southern supports the comments by EEI on potential implementation challenges.

Comment

Exelon concurs with the comments submitted by the EEI.

Exelon suggests the drafting team consider allowing TP/PCs to establish a threshold for aggregate DER reporting. Certain types of DERs such as non-exporting, or DERs connected behind the meter as load offsetting DERs may not be of concern to the TP/PC should be exempt from DP/TO data collection and reporting requirements. Data collection and reporting requirements should focus on "front of meter" connected DERs who primarily export energy, or DERs participating in wholesale markets.

Additionally, FERC Order 2222 will require some level of DER data reporting and modeling that may result in the proposed changes to MOD-032 becoming duplicative of, and in some cases in conflict with, obligations imposed by Order 2222.

Bobbi Welch - Midcontinent ISO, Inc. - 2, Group Name ISO/RTO Council Standards Review Committee (IRC SRC) 2022-02 Modifications to MOD-032 Draft 2

Answer	

Document Name	2022-02 Unofficial_Comment_Form_SRC_11-20-23_FINAL_as filed.docx

Comment

The SRC offers the following additional comments and recommendations:

Ensure consistency between Attachment 1, footnote 5 and steady-state item 9: The SRC is concerned that steady-state item 9 in Attachment 1 may not be consistent with footnote 5. Item 9 addresses instances in which DER is directly connected to a TO or DP, while footnote 5 addresses instances in which DER is not directly connected to a NERC-registered entity. Rather than addressing these topics in two separate locations, the SRC recommends that the drafting team ensure consistent language is used to describe each topic and consider addressing both topics in the same location, such as by moving relevant language from item 9 down to footnote 5.

The SRC recommends the SDT review and standardize its use of "DER" throughout the document. For example, MOD-032-2, Attachment 1, item 9 states:

Distributed Energy Resource (DER) data4 [DP, TO where DER is directly connected to the TO system and not through a DP (when DER is not associated with a registered DP)]5

However, this description of DER as "*DER is directly connected to the TO system and not through a DP*" appears to conflict with the DER definition (on page 2) which states: "*Generators and energy storage technologies connected to the Distribution Provider's system…*" To the extent a TO can also serve as a Distribution Provider and a DER is connected to the DP portion of a TO's system, there is no need to refer to that entity as a "TO" as the standard would apply to them as a DP.

Alternatively, if DERs can also be directly connected to a TO system, then the Distributed Energy Resource (DER) definition needs to be updated to reflect that as detailed below:

*Generators and energy storage technologies connected to **either a Transmission Owner's system or a** Distribution Provider's system that are capable of providing Real Power in non-isolated parallel operation with the Bulk Electric System.*

· Distribution Provider refers to the NERC glossary definition, not the NERC registered entity.

Stay within NERC's purview and require NERC-registered entities to provide DER information: To keep this project moving forward, the SRC recommends the SDT maintain its scope within NERC's regulatory purview. Requiring NERC registered entities to request information from non-registered entities as in Attachment 1, Footnote 5, moves the burden from entities that own and control the data to entities who do not own or control DER data. Entities are free to request information at any time without a standard. Using a mandatory standard to require an entity to request data is of little to no value. **The benefit of a mandatory standard lies in placing a requirement on the appropriate entity to provide the data**. Without a requirement on the providing entity, the data collected may be garbage and lead to poor modeling results; i.e. garbage in/garbage out.

As DERs proliferate, this increases the risk, administrative burden and cost on registered entities to expend time and energy on requesting and passing through DER data from unregistered entities that have no obligation to provide it ("pull" method). As non-registered entities have no obligation to provide the data or ensure its quality, this process may translate into a costly proposition that leads to poor modeling results. If the goal is to obtain quality data for modeling, NERC must ensure that it has the appropriate registration criteria and rules in place to require applicable NERC registered entities to provide it ("push" method) to modeling entities.

Footnote 5: *Where DER is connected to an unregistered Distribution Provider, the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information. An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider. This footnote is also applicable to item 10 under the "dynamics" column.*

Review the adequacy of Distribution Provider registration criteria. As noted in the **Technical Rationale for Reliability Standard MOD-032-2** and in Attachment 1, Footnote 5, the SRC observes that in some cases, the entity that owns and controls the DER information may not be a NERC-registered DP. In fact, in July 2018 NERC relaxed its Distribution Provider registration criteria which allowed certain entities to deregister as Distribution Providers,[1] thereby removing what would otherwise have been in place to compel a broader scope of entities to provide DER data.

To that end, NERC has the obligation to ensure all Distribution Providers with the ability to impact the reliability of the BES are registered. Therefore, NERC should verify whether its existing DP registration criteria is adequate to ensure reliable modeling. As with the registration of IBRs (where the approach proposed under Docket RD22-24-000 is expected to result in approximately 98% of BPS-connected IBR nameplate capacity being subject to applicable NERC Reliability Standards), existing DP registration requirements should likewise be made adequate to acquire needed DER information.

Although NERC may not be able to address this now, NERC should nonetheless commit to a plan to perform this validation as it would be helpful to know whether the existing registration criteria for a "Distribution Provider" is sufficient to capture a predominance of DERs. If not, NERC could develop and implement a plan to register DPs that would close the gap. In this way, this effort will not delay the SDT from moving forward with proposed modifications to MOD-032-2 now, as acquiring some DER information now will provide substantial improvement in PC and TP studies.

Standardize the required level of aggregation: The SRC is concerned if the standard does not specify or standardize "the required level of aggregation" among PC/TPs. The reason for this is to ensure future compliance audits will have an established aggregation level and removes any ambiguity of "the required level of aggregation" between the PC/TP being audited and the auditor.

Footnote 4 "*The joint PC/TP modeling data requirements and reporting procedures developed per R1 will specify data flow processes and **the required level of aggregation**. The PC or TP may need to coordinate with the DP or TO to determine appropriate equivalent distribution system impedance.*"

Ensure comprehensive reporting: The SRC is concerned with the proposed written language as it allows a gap as to knowing whether or not the registered DP or non-registered DP is providing all information and data – leaving an unknown compliance responsibility. This is especially true for non-jurisdictional entities, where the data may be unverifiable (un-auditable) and would lead to additional compliance concerns. One possible remedy is to aggregate small generators of the same type, along with an optional MW threshold for reporting.

Comment

In Attachment 1 please capitalize "interconnection-wide" in the following sentence: "Data must be shareable on an **interconnection-wide** basis to support use in the **Interconnection-wide** cases."

Did the SDT intend to have the TO(s) gather Item 1 in the "short circuit" column of the table in Attachment 1 for DERs (Item 9 in "steady-state" column)?

Has the SDT collaborated with Project 2022-04 EMT Modeling SAR team on any possible changes to MOD-032 that could be promoted now versus waiting to re-open MOD-032?

Attachment 1 Footnote 5- Determining the "next closest electrically connected entity" is very broad and subject to interpretation especially if deep within multiple jurisdictions (TO and DP or multiples of each). What mechanism is in place for registered DPs and TOs to ensure that data is collected appropriately for a non-registered DP? "Appropriately" may mean avoiding a couple of scenarios---Accounted for twice or more (once by a TO AND once or more by one or more registered DPs) or not accounted for at all by either the DP or TO. Is the SDT leaving the determination of "next closest electrically connected entities" to the TP or PC?

Additionally, would recommend a footnote 5 (or 6) be added to Item 10 in the “dynamics” column to provide clarity versus referring to item 10 within the footnote itself.

For Item 9 in “steady-state” column (i.e., DER data). WECC would suggest changing “Generator type (solar, battery, etc.)” to be more reflective of the proposed definition of DER which starts out as “Generators and energy storage technologies…”. Consider removing “Generator” from 9c and simply say “Type (solar, battery, etc.)”

The SDT should consider utilizing or correcting Glossary of Term usage within Table 1 to reflect “Real Power” and “Reactive Power” for all parts of the table to provide clarity.

Further comments for Question 1: The addition of the phrase “Distribution Provider refers to the NERC glossary definition, not the NERC registered entity” may cause confusion as the ROP definition of the registered entity (DP) is the same as the Glossary of Terms. SDT should further consider if a different term should be utilized to avoid some confusion. WECC appreciates the idea of trying to illustrate what the entity functions may be regardless of the determination for registration (and the ensuing obligation to NERC Reliability Standards construct if registered.)

ROP definition in Appendix 5b: “Provides and operates the “wires” between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage.”

ROP definition in Appendix 2:” “Distribution Provider” means the entity that provides and operates the “wires” between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage.**”

Glossary of Terms Definition: “Provides and operates the “wires” between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage."

Daniel Gacek - Exelon - 1

Answer	
Document Name	
Comment	

Exelon concurs with the comments submitted by the EEI.

Exelon suggests the drafting team consider allowing TP/PCs to establish a threshold for aggregate DER reporting. Certain types of DERs such as non-exporting, or DERs connected behind the meter as load offsetting DERs may not be of concern to the TP/PC should be exempt from DP/TO data collection and reporting requirements. Data collection and reporting requirements should focus on "front of meter" connected DERs who primarily export energy, or DERs participating in wholesale markets.

Additionally, FERC Order 2222 will require some level of DER data reporting and modeling that may result in the proposed changes to MOD-032 becoming duplicative of, and in some cases in conflict with, obligations imposed by Order 2222.

Transmission Owners who are not Distribution Providers likely have no knowledge or capability to provide data for planned demand or DER constituents served from the transmission system. Transmission Owner visibility for load demand is typically limited to historical telemetered MW and MVAR data. This finding, especially with regards to DERs, has already been well-documented. A key recommendation in the NERC Reliability and Security Technical Committee (RSTC) subcommittee approved the "Model Verification of Aggregate DER Models used in Planning Studies - Reliability Guideline" developed by the System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG) was:

"TPs, PCs, TOs, and other applicable entities that may need DER information should coordinate with DPs for facilities connected to distribution systems to determine the necessary measurement information that would be of use for DER modeling and model verification and jointly develop requirements or practices that will ensure this data is available. ***As the TPs, PCs, and TOs are dependent on the DP to have the data made available****, this will likely require actions from state regulatory bodies and DPs to establish requirements to gather this information" (page 7 of 61).*

The SDT should consider that Transmission Owners should not be held accountable for demand and DER data that they have no cognizance of. Additionally, the SDT should remember that most DER are smaller than the BES resource threshold or reside on a distribution system. The threshold for an entity to be registered as a Distribution Provider is 75 MW of load. This implies that the majority of DERs are and will be connected to systems outside the scope and visibility of Transmission Owners, as well as existing Distribution Providers. To emphasize this reality: as of 15 May 2023, there were 314 Distribution Providers registered with NERC (excluding UFLS-only DPs). Of those DPs, 96 were not otherwise registered as either a PC, TP, or TO. While it may be misunderstood that only 96 DPs may become newly applicable and participatory in model data collection given the draft changes to MOD-032-2, this ignores that the latest EIA 861 data (collected in 2021; published in 2022) reflects about 1,190 distribution utilities reflecting almost 197,000 distribution circuits in the continental US. In other words, it may be reasonable to conclude that 74% of the distribution utilities in the US do not meet the NERC registration threshold. Furthermore, PCs, TPs, and TOs have no regulatory relationship with these unregistered entities and cannot be held responsible for DER data for which that are not aware.

In June 2022, NERC published its "Inverter-Based Resource Strategy" that recognized efforts necessary to analyze the breakdown of resource size, location, type, and applicability with the BES definition to make a determination of whether the current BES threshold should be updated to reflect the changing resource mix" (page 9 of 10). Subsequently, the NERC Member Representatives Committee (MRC) and Board of Trustees (BOT) technical session on inverter-based resources in February 2023 emphasized the need for a focus on functional registration noting: "industry is increasingly challenged with addressing reliability issues for unregistered inverter-based resources, and those resources are reaching critical mass in some parts of the country. The lack of requirements currently imposed on those resources creates local and regional reliability risks to the BPS in aggregate. This issue compounds in many areas with the growing presence of distributed energy resources (DERs) connected to the distribution system." In response to the FERC directive "Registration of Inverter-based Resources", NERC filed a proposal to modify its Rules of Procedure to "include a new function comprised of owners of IBRs interconnected to the BPS." The Generator Owner – Inverter-Based Resource (GO-IBR) registration would include "owners of IBRs which have aggregate nameplate capacity of less than or equal to 75 MVA and greater than or equal to 20 MVA interconnected at a voltage greater than or equal to 100 kV; or Owners of IBRs which have aggregate nameplate capacity of greater than or equal to 20 MVA interconnected at a voltage less than 100 kV."

Attachment 1 Data Reporting table (Steady State Column items 2, and 9, and Dynamics Column items 5, and 10) has added language indicating that the Transmission Owner (TO) is the responsible entity for submitting modeling data when a demand is not associated with a registered Distribution Provider. AZPS requests clarification regarding the type of entity that would have load, but not be a registered distribution provider. AZPS is concerned that the Transmission Owner may not have the ability to produce or acquire certain load information from an unregistered entity unless there is some other type of contractual relationship in place.

Very little has changed from Draft 1 to Draft 2 of the proposed modifications to MOD-032-2. ATC supports the comments from the MRO-NSRF.

In the Technical Rationale, the Standard Drafting Team acknowledges that there may be challenges in collecting data for DER connected to unregistered entities and that the obligations of this standard may place an unreasonable compliance risk on registered entities. However, despite the acknowledgement of this unreasonable risk, the Standard Drafting Team has put forth in draft 2 similar language, containing the same unreasonable risk for industry consideration. A separate effort should be initiated to explore making DER entities above a specified threshold a NERC registered entity to ensure data will be correctly shared.

The SDT may also consider waiting until possible modifications have been suggested to MOD-032 in response to FERC Order 901 and IBR modeling.

While these modifications are necessary, approving them prior to the SDT's documented concerns over the changes to the DP registration creates a disconnect that has the potential for unintended future consequences. SRP recommend the SDT crate a SAR for adjusting the definition of DP to include the DER resources prior to moving forward with this effort.

Comment	

SPP recommends this drafting team coordinates with the Project 2023-08 drafting team to ensure the appropriate DER data is identified as well as listed to meet the needs of the two standards from an efficient and reliability prospective.

Furthermore, we recommend that the drafting team consider creating an independent registration for the TO with direct connection to DERs (R-DERs). From our perspective, the proposed Attachment 1 (footnotes) does not clearly define the role for this particular Transmission Owner (TO). Moreover, the independent document can be used to provide clarity on the expectation of the role for the TO with direct connection to DERs (R-DERs).

In support of the proposed solution, we recommend that the drafting team review the efforts made in the NERC Rules of Procedures (RoP) in reference to the GO (IBR) and GOP (IBR) pertaining to their definition and registration.

Additionally, we recommend that the drafting team takes into consideration the impact of creating a separate project to address the proposed definition in an independent process.

We have the concern that the creation of an independent project for the definition will only delay the efforts of addressing the needs for DER data collection. From our perspective, the definition effort needs to be finalized before pursuing other activities associate with data collection.

Finally, SPP recognizes that DPs and TOs have expressed concern with their ability to obtain granular DER data and because of this, the proposed data collection modifications to MOD-032-2 may not be accepted by industry. To help reach consensus, SPP suggests that the drafting team consider an alternative mechanism that would allow the DPs and TOs to forecast DER data based on their knowledge of DER penetration on their systems, especially when the data is not directly available through a NERC standard.

AES Clean Energy believes that the new requirements for DERs will help TPs and PCs to better understand the root cause of system instability. However, there is still concern about the ability of the TO and DP to obtain the data from unregistered entities that own the DERs. Currently, FAC-001 allows the TO to specify its interconnection requirements which may help TO to obtain the necessary data. However, there is no similar requirement for DP. AES Clean Energy recommends the Standard Drafting Team to look into this as well.

Comment

Buckeye Power, Inc. supports the comments of ACES:

We have a great deal of apprehension as it relates to proposed language in Footnote 5 of Attachment 1. Footnote 5 states (emphasis added):
"Where DER is connected to an unregistered Distribution Provider, the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information. An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider. This footnote is also applicable to item 10 under the "dynamics" column."
By what method should it be determined which registered entity is the "next closest electrically connected". Consider the case wherein a substation owned by an unregistered DP has a feeder from 2 different registered entities. Who is to make the determination as to which registered entity is the "next closest electrically connected" and how? In order to make this determination, a certain amount of knowledge about the other entity's infrastructure is required.
Of even greater concern is the continued inclusion of data from unregistered entities despite the open acknowledgment by the SDT of the challenges with collecting said data (see Technical Rationale, paragraph 2). We recommend that the SDT postpone further development of this Project until the GO-IBR and GOP-IBR registration criteria have been approved and can be included in the next draft of MOD-032-2.

Transmission Owner is not listed as a Functional Entity to which the proposed standard(s) should apply in the SAR. The SAR states that the Functional Entities to which the proposed standard(s) should apply are the Transmission Planner (TP), the Planning Coordinator (PC) and the Distribution Provider (DP). This section of the SAR is designed to, "assist the NERC Standards Committee in appointing a drafting team with the appropriate members." The proposed language in ATTACHMENT 1, affects and changes the obligations of the Transmission Owner (TO). Changes to the obligations of the Transmission Owner (TO) were not approved in the SAR and SDT members selected may not provide adequate representation of TOs.

In the Technical Rationale, the Standard Drafting Team acknowledges that there may be challenges in collecting data for DER connected to unregistered entities and that the obligations of this standard may place an unreasonable compliance risk on registered entities. However, despite the acknowledgement of this unreasonable risk, the Standard Drafting Team has put forth in draft 2 similar language, containing the same unreasonable risk for industry consideration. NV ENERGY recommends that the Standard Drafting Team consider utilizing the procedures allowed for by NERC Rules of Procedure to halt activity on this project until such time that issues surrounding data collection from entities who have no obligation to comply are addressed.

NV Energy has concerns with Footnote 5 of Attachment 1:

“Where DER is connected to an unregistered Distribution Provider, the **next closest electrically connected** registered entity (DP or TO) shall request DER data and pass through available information. An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider. This footnote is also applicable to item 10 under the “dynamics” column.”

Industry might be more open to language that mimics FERC Order 901, Paragraph 141, for Verification of IBR Plant Dynamic Model Performance. The requirements could be modified to allow the Transmission Owner and/or Distribution Providers, if unable to gather accurate DER data, or unable to gather DER data at all, to provide instead to the Bulk-Power System planners and operators in their areas, dynamic models of individual DERs and DERs in the aggregate using ***estimated data***. This would give the Planning Coordinators the latitude to use their best judgement and experience in developing the most accurate models for their areas if they cannot get the data from the DER owners or "unregistered Distribution Providers".

In Attachment 1, the steady state section 2 removed the TO due to the DP NERC glossary definition. I think the TO should also be removed from steady state section 9 and dynamics section 10 for the same reason.

Comment	
FirstEnergy believes Footnote 5 should be deleted. The next closest DP or TO to an unregistered distribution provider should not be held responsible for providing DER data outside of their control or ability to collect. Further, FirstEnergy supports EEI's comments which state: EEI notes that this project has been listed as a low priority project. While we understand this may have some immediate impacts on the work being conducted by this SDT, we suggest that a two phased approach for the revision of MOD-032 might address the immediate concerns surrounding efforts to align registration under Project 2017-02. Phase 1: Consider completing the work from project 2017-02 Standards Alignment with Registration: Replace Load-Serving Entity (LSE) with Distribution Provider (DP), remove the Planning Authority (PA) functional entity name and keep the Planning Coordinator (PC) functional entity name, and make the associated LSE / DP functional changes to the standard requirements. Phase 2: Please consider addressing additional DER data requirements, after further discussion regarding how GO-IBR and GOP-IBR standards are going to be addressed and what is needed from Distribution Providers regarding unregistered IBRs.

Consideration of Comments

Project Name:	2022-02 Modifications to TPL-001 and MOD-032 | Draft 2 - MOD-032-2
Comment Period Start Date:	10/6/2023
Comment Period End Date:	11/20/2023
Associated Ballot(s):	2022-02 Modifications to TPL-001 and MOD-032 | Draft 1 Implementation Plan AB 2 OT 2022-02 Modifications to TPL-001 and MOD-032 | Draft 1 MOD-032-2 AB 2 ST 2022-02 Modifications to TPL-001 and MOD-032 | Non-Binding Poll MOD-032-2 AB 2 NB

There were 71 sets of responses, including comments from approximately 185 different people from approximately 114 companies representing 10 of the Industry Segments as shown in the table on the following pages.

All comments submitted can be reviewed in their original format on the project page.

If you feel that your comment has been overlooked, let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, contact Vice President of Engineering and Standards, Soo Jin Kim (via email) or at (404) 446-9742.

Questions

1. **Given the explanation in the Technical Rationale and response to industry comment, do you agree with the proposed definition for DER?**

2. **Are there any other clarifications needed in the Technical Rationale?**

3. **Do you agree the modifications made in MOD-032-2 will improve system modeling and reliability?**

4. **Do you agree the modifications made in MOD-032-2 are cost effective?**

5. **Do you agree with the Implementation Plan for revised MOD-032-2?**

6. **Provide any additional comments for the standard drafting team to consider, if desired.**

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

1. Given the explanation in the Technical Rationale and response to industry comment, do you agree with the proposed definition for DER?	
Mark Garza - FirstEnergy - FirstEnergy Corporation - 4, Group Name FE Voter	
Answer	No
Document Name	
Comment	
FirstEnergy supports EEI's comments which state: we do not support the development of a DER definition within this NERC Reliability Standards project. The impact of this definition will have far reaching impacts that go beyond this project. To address this issue, we suggest that a separate NERC Reliability Standards project be developed to address this definition. We additionally do not agree or support the notion that from a NERC Reliability Standard compliance standpoint, entities should be held accountable for DERs that fall outside of the NERC registration criteria.

Response	
Thank you for your comments. 1A: DT should not define DER - separate project needed The SC approved the DT and the SAR which includes consideration of a DER definition in its scope. The DT considered a range of existing DER definitions with broad applicability across electric system planning and operations in proposing the current version; it is not intended to be specific to MOD-032. The DT recognizes the wide-reaching impacts of this. 2AG: Still maintains unreasonable compliance obligations + FN 5 - explain intent if no response from unregistered entity The DT recognized the need for clarity in Footnote 5. As such, Footnotes 4 and 5 were modified and combined to address unreasonable compliance obligations. The Technical Rationale was also updated to clarify the DT intent.

Comment	
We do not agree with the proposed definition for DER, nor do we agree that the definition for the term DER should be defined by the drafting team of single project working within the confines of that project as set forth by the Standard Drafting Process. We are concerned with the proliferation of NERC projects that are either directly, or indirectly, related to DERs and the potential consequences of the proposed DER definition. A definition that impacts multiple standards should be developed outside the scope of any individual standard and consider the impact to all of the affected NERC Reliability standards. We have for example a GO/GOP-registered plant that feeds a DP-registered data center in behind-the-meter fashion, i.e. upstream of the POI to the TO. This 2.5 GW generation facility is clearly not a Distributed Energy Resource, yet it seems to be included under the currently proposed DER definition, depending on how one interprets the term, “parallel operation.”

MRO NSRF does not agree with the proposed definition for DER; further, the MRO NSRF does not believe that the definition for the term DER should be defined solely by this Standard Drafting Team within the parameters of Project 2022-02. With the proliferation of NERC projects that are either directly, or indirectly, related to DERs, MRO NSRF contends that a definition, for a term such as DER, which is a broadly utilized term that impacts multiple standards, should be developed in a separate project.

Additionally, MRO NSRF has concerns that the proposed definition for DER may fall outside the purview of NERC Reliability Standards as allowed for by Section 215(a)(1) of the Federal Power Act ("The term [bulk-power system] does not include facilities used in the local distribution of electric energy.").

Comment	
- MH recommends using “Bulk Power System” instead of “Bulk Electric System" - It is essential to explicitly state both exporting Real Power to the BPS and offsetting Real Power load. Proposed Definition: Generators and energy storage technologies connected to the Distribution Provider’s system that are capable of exporting Real Power or offsetting Real Power load in non-isolated parallel operation with the Bulk Power System.	
Likes 0	

Dislikes 0	

Response

Thank you for your comments.
Facilities operating in non-isolated parallel operation with the BPS are generally also operating in non-isolated parallel operation with the BES and vice versa, so to a certain extent it does not really matter which term is used in the definition. The DT chose to use “Bulk Electric System” in the proposed definition to align with the concept that NERC reliability standards are generally intended to ensure the reliability of the BES.

The proposal to explicitly refer to both exporting Real Power and offsetting Real Power Load in the DER definition is addressed in the Technical Rationale. The DT consensus was that explicitly using the term “offsetting” in the definition could be interpreted in unintended ways.

Adrian Raducea - DTE Energy - Detroit Edison Company - 5, Group Name DTE Energy - DTE Electric

Answer	No
Document Name	

Comment

Having two different defintions for Distribution Provider makes the scope confusing. The definition is too broad and we believe that there needs to be threshold for what constitutes a DER.

Likes 0	
Dislikes 0	

Response

Thank you for your comments.
1C: Definition needs threshold/too broad/creates compliance obstacle
The DT consensus is that it is most appropriate to not include a threshold within the DER definition. NERC has recommended a zero MVA threshold for gathering DER information: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf
It is expected that PC/TP procedures may specify thresholds and technical justification for inclusion of DER models (or not) in any particular study – this issue is more aligned with the SAR for TPL-001 that will be addressed in the second phase of this project 2022-02. A single threshold is not likely universally applicable.

1G: Confusion between glossary DP and registered DP The DT found that the confusion related to the NERC glossary definition for Distribution Provider and the NERC registration criteria was pre-existing. The DT attempted to clarify that use of "Distribution Provider" in the proposed DER definition is not referring to NERC registration. The use of the "Distribution Provider" within the standard without further specific explanation refers to the NERC registered entity. The DT added language in the Technical Rationale and also modified the proposed definition to clarify.	
Kimberly Turco - Constellation - 6	
Answer	No
Document Name	
Comment	
There needs further clarification if the DER is going to include every DER or there will be a threshold as there are several small projects that would be extremely costly to have to abide by each NERC mandated modeling and testing requirement when their impact to the BES is marginal. Kimberly Turco on behalf of Constellation Segments 5 and 6

Response	
Thank you for your comments. Neither the proposed definition, nor MOD-032-2 mandate any testing related to DER. The DT proposals do not require detailed models for every individual DER. The DT contends that DPs should already have a record and basic understanding of DER that is connected to their system (e.g. rooftop solar, batteries, etc.) similar to how they have a record and basic understanding of houses, factories, and commercial spaces connected to their system. Such information should be sufficient for PCs and TPs to properly represent potential DER reliability impacts.	
Diana Aguas - CenterPoint Energy Houston Electric, LLC - 1 - Texas RE	

Answer	No

Comment	
Buckeye Power, Inc. supports the comments of ACES:	

We at ACES applaud the attempt made by the SDT to clearly define what is by nature a nebulous concept; however, we feel that the current definition is overly broad and will create an insurmountable compliance obstacle.

We have an ongoing concern regarding the level upon which this will require DPs to collect DER data interconnected to distribution systems. The proposed draft establishes a zero MVA threshold for the collection of all DER data "in non-isolated parallel operation with the Bulk Power System". Per the Technical Rationale, this includes each and every residential solar and commercial rooftop solar customer on the DP's systems. This is a major concern given the extent it may go to exhausting the resources of our Members for the collection of DER data which may not have a material impact to the reliability of the BES.

Additionally, there is a seemingly interchangeable use of the terms Distributed Energy Resource (DER) and Inverter Based Resource (IBR) to describe the same types of assets. It is our opinion that a singular definition should be developed to define these resource types. Given the currently proposed changes to the NERC Rules of Procedure (specifically Appendices 5A and 5B), we believe that the term IBR should be utilized in lieu of DER. Moreover, it is our opinion that the newly proposed GO-IBR and GOP-IBR registrations should be utilized when developing MOD-032-2. In short, we believe that the NERC registration criteria are well reasoned and were intentionally developed to only include those entities and/or resources that could have a material impact to the BES.

In conclusion, it is our recommendation that the proposed MOD-032-2 Reliability Standard be modified to include a non-zero MVA threshold. We believe that the DP should only be required to collect data from NERC registered entities.

1C: Definition needs threshold/too broad/creates compliance obstacle
The DT consensus is that it is most appropriate to not include a threshold within the DER definition. NERC has recommended a zero MVA threshold for gathering DER information: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf

It is expected that PC/TP procedures may specify thresholds and technical justification for inclusion of DER models (or not) in any particular study – this issue is more aligned with the SAR for TPL-001 that will be addressed in the second phase of this project 2022-02. A single threshold is not likely universally applicable. 1D: IBR/DER - single definition/GO-IBR The scope of the SAR was to address DER. Not all DER is IBR and not all IBR is DER. The proposed GO-IBR registration effort is primarily intended to capture the smaller transmission-connected resources that don't meet BES definition. Most individual DER will not meet proposed GO-IBR registration criteria (i.e. greater than 20 MVA) so that effort will provide little benefit with respect to making DER data available to PC/TPs. Yet, smaller individual DER installations connected to DP systems can, in aggregate, have a significant impact on BES reliability.	
Ruchi Shah - AES - AES Corporation - 5	
Answer	No
Document Name	
Comment	
AES Clean Energy appreciates the Standard Drafting Team's research into the various DER definitions adopted across the industry and regions. However, with the introduction of a new definition from NERC, this will create additional confusion for entities, especially those that operate in regions where the term DER is currently utilized. AES Clean Energy recommends that the Standard Drafting Team take an approach of proposing a broader definition of DER that is not specific to MOD-032 and will be applicable to other on-going DER related standard projects before moving forward with MOD-032 changes. This is similar to that of Project 2020-06 where definitions of IBRs were proposed for industry feedback.

Thank you for your comments. 1E: Need broader definition for DER not specific to MOD-032	

The DT considered a range of existing DER definitions with broad applicability across electric system planning and operations in proposing the current version; it is not intended to be specific to MOD-032.	
Kacie Fischer - Kacie Fischer On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Kacie Fischer	
Answer	No
Document Name	
Comment	

- Oncor Electric Delivery Company LLC ("Oncor") considers the DER definition used in the Technical Rationale for Reliability Standard MOD-032-2 too vague because it does not contain a voltage class threshold for an energy resource to be considered a DER.
- Oncor's view of DER is consistent with ERCOT's definition of DER, which is: "An electrical generating facility consisting of one or more on-site distributed generation units connected at a voltage less than or equal to 60 kilovolts (kV), which may be connected in parallel operation to the utility system." This definition can be found here: https://www.ercot.com/files/docs/2017/03/24/DER_OnePager_FINAL.pdf
- From Oncor's experience, the total capacity of the installation's on-site distributed generation units may exceed ten megawatts (MW); however, no more than ten MW of the installation's capacity will be allowed to export into the grid at any point in time at the point of common coupling.
- Is there any MW size threshold for Generator and energy storage technologies to be taken into account when the end-use customer is served at transmission voltage? We would prefer a MW size threshold be specified in the definition.

Response

Thank you for your comments.
1F: Include voltage class in definition
DT views that it is not appropriate to include voltage level in the DER definition given the different considerations of voltage level across the continent. As noted in the NERC glossary definition, the Distribution Provider "is not defined by a specific voltage, but rather as performing the distribution function at any voltage."

1C: Definition needs threshold/too broad/creates compliance obstacle

The DT consensus is that it is most appropriate to not include a threshold within the DER definition. NERC has recommended a zero MVA threshold for gathering DER information: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf. It is expected that PC/TP procedures may specify thresholds and technical justification for inclusion of DER models (or not) in any particular study – this issue is more aligned with the SAR for TPL-001 that will be addressed in the second phase of this project 2022-02. A single threshold is not likely universally applicable.

*NYPA appreciates the standard drafting team's effort to define '**DER**' and aligning it with IEEE 1547, but we believe a more detailed definition is essential for better interpretations. The current proposed definition seems too narrow, given the use of the term DER across multiple NERC standards. NYPA suggest SDT to propose a more detailed **DER** definition with examples to avoid potential misinterpretations as DER which is not solely for renewables.*

ATC agrees that there is a need for a NERC DER definition, but ATC does not support the SDT's proposed definition for DER. Defining DER within the confines of a single NERC project (i.e., NERC Project 2022-02) could limit the definition's use within other ongoing and future DER standard drafting efforts. With the number of NERC projects under modification and existing Standards that are either directly or indirectly related to DERs, ATC believes that a definition for a term such as DER, which is a broadly utilized term that impacts multiple standards, should be developed outside the scope of any individual standard, and should consider the impact to any affected NERC Reliability standards.	

If the SDT does go forward with a NERC Glossary of Terms definition for DER, the NERC definition of DER should not involve itself in facilities that do not fall under the purview and regulation of NERC (e.g., local distribution facilities).

ATC believes that the text “Distribution Provider’s system” should not be referenced in the DER definition as it refers to the NERC glossary definition of Distribution Provider, not the NERC registered entity and in some cases this is different.

If the term “Distribution Provider” is used, ATC also suggests that there should be a clearer distinction between Distribution Provider as a NERC glossary term and Distribution Provider as a NERC registered entity.

As an alternative, the SDT could replace “connected to the DP’s system” with “not directly connected to a bulk power system.”

Additionally, ATC requests that the standard explicitly allows the PC to determine thresholds (ex: MW or MVA) for both the collection of DER data and for the modeling of DERs. Alternatively, thresholds for DER data collection and for DER data modeling could be included in the standard. Thresholds for DER data collection and for DER data modeling could also be included in the DER definition but this may be less appropriate/ flexible for future use.

DER thresholds greater than zero MW are needed to manage the potentially large administrative burden on NERC Registered Entities such as the TOs, TPs, and DPs.

ATC encourages a new NERC Registered Entity for DER (ex: DP-DER or IBR-DER) to bring DER data reporting accountability to those unregistered DPs with DER.

1A: DT should not define DER - separate project needed
The SC approved the DT and the SAR which includes consideration of a DER definition in its scope. The DT considered a range of existing DER definitions with broad applicability across electric system planning and operations in proposing the current version; it is not intended to be specific to MOD-032. The DT recognizes the wide-reaching impacts of this.

1B: Definition falls outside NERC jurisdiction

Defining terms is not bound/restricted to NERC jurisdictional authority. The NERC glossary includes many examples of such defined terms including, but not limited to: Demand, Fault, Hourly Value, Interpersonal Communication, Load, and Vegetation.

1G: Confusion between glossary DP and registered DP
The DT found that the confusion related to the NERC glossary definition for Distribution Provider and the NERC registration criteria was pre-existing. The DT attempted to clarify that use of "Distribution Provider" in the proposed DER definition is not referring to NERC registration. The use of the "Distribution Provider" within the standard without further specific explanation refers to the NERC registered entity. The DT added language in the Technical Rationale and also modified the proposed definition to clarify.

1C: Definition needs threshold/too broad/creates compliance obstacle
The DT consensus is that it is most appropriate to not include a threshold within the DER definition. NERC has recommended a zero MVA threshold for gathering DER information: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf
It is expected that PC/TP procedures may specify thresholds and technical justification for inclusion of DER models (or not) in any particular study – this issue is more aligned with the SAR for TPL-001 that will be addressed in the second phase of this project 2022-02. A single threshold is not likely universally applicable.

As noted in the Technical Rationale, developing new registration criteria is beyond the scope of this project.

Thank you for your comments. Neither the proposed definition, nor MOD-032-2 mandate any testing related to DER. The DT proposals do not require detailed models for every individual DER. The DT contends that DPs should already have a record and basic understanding of DER that is connected to their system (e.g., rooftop solar, batteries, etc.) similar to how they have a record and basic understanding of houses, factories, and commercial spaces connected to their system. Such information should be sufficient for PCs and TPs to properly represent potential DER reliability impacts.	
Wayne Sipperly - North American Generator Forum - 5 - MRO,WECC,Texas RE,NPCC,SERC,RF	
Answer	No
Document Name	
Comment	
The NAGF does not agree with the proposed definition for DER, nor do we agree that the definition for the term DER should be defined by the drafting team of single project working within the confines of that project as set forth by the Standard Drafting Process. The NAGF is	

concerned with the proliferation of NERC projects that are either directly, or indirectly, related to DERs and the potential consequences of the proposed DER definition. A definition that impacts multiple standards should be developed outside the scope of any individual standard and consider the impact to all of the affected NERC Reliability standards. *In addition, the NAGF is concerned with the inconsistency of DER term used across the industry as stated in the examples provided in the Technical Rationale. Regions or even states have their own definition of DERs which may impact a Generator Owner's ability to comply with both NERC and other state or regional requirements. It is recommended that NERC perform outreach to regions and/or states to try to ensure some consistency on how the term is going to be used.*

The definition for the term DER should be defined solely by this Standard Drafting Team within the parameters of Project 2022-02. With the proliferation of NERC projects that are either directly, or indirectly, related to DERs. A definition, for a term such as DER, which is a broadly utilized term that impacts multiple standards, should be developed in a separate project. Additionally, the proposed definition for DER may fall outside the purview of NERC Reliability Standards as allowed for by Section 215(a)(1) of the Federal Power Act ("The term [bulk-power system] does not include facilities used in the local distribution of electric energy.").

As stated in our draft 1 comments, EEI does not support the development of a DER definition within this NERC Reliability Standards project. The impact of this definition will have far reaching impacts that go beyond this project. To address this issue, we suggest that a separate NERC Reliability Standards project be developed to address this definition. We additionally do not agree or support the notion that from a NERC Reliability Standard compliance standpoint, entities should be held accountable for DERs that fall outside of the NERC registration criteria.

We at ACES applaud the attempt made by the SDT to clearly define what is by nature a nebulous concept; however, we feel that the current definition is overly broad and will create an insurmountable compliance obstacle.

We have an ongoing concern regarding the level upon which this will require DPs to collect DER data interconnected to distribution systems. The proposed draft establishes a zero MVA threshold for the collection of all DER data "in non-isolated parallel operation with the Bulk Power System". Per the Technical Rationale, this includes each and every residential solar and commercial rooftop solar customer on the DP's systems. This is a major concern given the extent it may go to exhausting the resources of our Members for the collection of DER data which may not have a material impact to the reliability of the BES.

Additionally, there is a seemingly interchangeable use of the terms Distributed Energy Resource (DER) and Inverter Based Resource (IBR) to describe the same types of assets. It is our opinion that a singular definition should be developed to define these resource types. Given the currently proposed changes to the NERC Rules of Procedure (specifically Appendices 5A and 5B), we believe that the term IBR should be utilized in lieu of DER. Moreover, it is our opinion that the newly proposed GO-IBR and GOP-IBR registrations should be utilized when developing MOD-032-2. In short, we believe that the NERC registration criteria are well reasoned and were intentionally developed to only include those entities and/or resources that could have a material impact to the BES.

In conclusion, it is our recommendation that the proposed MOD-032-2 Reliability Standard be modified to include a non-zero MVA threshold. We believe that the DP should only be required to collect data from NERC registered entities.

1C: Definition needs threshold/too broad/creates compliance obstacle
The DT consensus is that it is most appropriate to not include a threshold within the DER definition. NERC has recommended a zero MVA threshold for gathering DER information: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf
It is expected that PC/TP procedures may specify thresholds and technical justification for inclusion of DER models (or not) in any particular study – this issue is more aligned with the SAR for TPL-001 that will be addressed in the second phase of this project 2022-02. A single threshold is not likely universally applicable.

1D: IBR/DER - single definition/GO-IBR

The scope of the SAR was to address DER. Not all DER is IBR and not all IBR is DER. The proposed GO-IBR registration effort is primarily intended to capture the smaller transmission-connected resources that don't meet BES definition. Most individual DER will not meet proposed GO-IBR registration criteria (i.e., greater than 20 MVA) so that effort will provide little benefit with respect to making DER data available to PC/TPs. Yet, smaller individual DER installations connected to DP systems can, in aggregate, have a significant impact on BES reliability. 2AG: Still maintains unreasonable compliance obligations + FN 5 - explain intent if no response from unregistered entity The DT recognized the need for clarity in Footnote 5. As such, Footnotes 4 and 5 were modified and combined to address unreasonable compliance obligations. The Technical Rationale was also updated to clarify the DT intent.

The drafting team should consider defining “Transmission connected DERs” (100 kV and above) and “Distribution connected DERs” (below 100 kV). The proposed DER definition begins with “generators and energy storage technologies…”, implying that a Generator Owner is involved. The NERC Glossary of Terms defines a Generator Owner as the “Entity that owns and maintains generating Facility(ies)”. Would it be more practical to acquire DER data from the associated GO rather than the DP/TO; particularly in instances where the GO is a NERC registered entity?

Response	
Thank you for your comments. 1F: Include voltage class in definition DT views that it is not appropriate to include voltage level in the DER definition given the different considerations of voltage level across the continent. As noted in the NERC glossary definition, the Distribution Provider “is not defined by a specific voltage, but rather as performing the distribution function at any voltage.” In most cases, the GO for DER is not a NERC-registered entity. It does not seem practical to create a NERC registration for DER GO because it would need to extend down to the level of residential solar (which in aggregate can significantly impact BPS reliability). Thus, it seems most appropriate for DPs, which would seem to have a need to know about and understand the capabilities of such DER installations to ensure reliable distribution system operations, to report DER data.

Texas RE agrees with the definition of DER. Texas RE noticed a potential contradiction within the technical rationale and would like it clarified. On page 2 of the technical rationale, it states “It should be clear that MOD-032 2 applicability and compliance obligations refer to	

NERC registered DPs; the use of the DP term in the DER definition does not in itself imply any compliance." This seems to be contradicted on page 3, where it states: "The NERC glossary definition for DP1 notes that the DP is defined by providing the distribution function (this includes entities that may not be NERC-registered DPs)."

RF recommends revising the proposed definition to explicitly include behind the meter resources: "Generators and energy storage technologies connected to the Distribution Provider's system*, either directly or behind the meter of an end use customer,* that are capable of providing Real Power in non-isolated parallel operation with the Bulk Electric System."	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. The DT has avoided the use of the term "directly connected" as described in the Technical Rationale. However, an explicit reference to behind the meter resources was added to the proposed DER definition.

1G: Confusion between glossary DP and registered DP Thank you for your comments. The DT found that the confusion related to the NERC glossary definition for Distribution Provider and the NERC registration criteria was pre-existing. The DT attempted to clarify that use of "Distribution Provider" in the proposed DER definition is not referring to NERC registration. The use of the "Distribution Provider" within the standard without further specific explanation refers to the NERC registered entity. The DT added language in the Technical Rationale and also modified the proposed definition to clarify.	

2. Are there any other clarifications needed in the Technical Rationale?

While EEI finds the Technical Rationale to be clear, we have concerns with the following statements and positions contained in the Technical Rationale:

Page 1; Rationale for Applicability Section:

EEI does not agree that TOs (or registered DPs) should be required to coordinate with the owners of distribution facilities that do not have an associated NERC-registered DP to ensure the availability of necessary data, either through interconnection agreements or other binding contracts. TOs and DPs have no ability to control interconnection agreements on other entity's system or the ability to obtain data from non-registered entities or facilities used in the local distribution of electric energy.

EEI is also concerned that the SDT acknowledges that data collection for DERs connected to unregistered entities is a problem and suggests that NERC should expand DP registration criteria or develop a DER-only DP registration criteria to address this gap but still believes there is value in moving MOD-032-2 forward with requirements for TOs and DPs when those obligations are limited to assets owned by the TOs and DPs.

Page 4 – Rational for Modifications to Attachment 1

EEI does not support the scope of modifications to MOD-032, Attachment 1 which obligates TOs and DPs to collect DER data on all relevant DERs including utility scale facilities and smaller behind the meter facilities, which appears to include all residential DERs even though these resources are used for local distribution.

EEI does not agree with the SDT's position that the PC/TP should have the authority to specify DER data to whatever level it deems appropriate. (Ref. the explanation of Footnote 4 from Attachment 1 of MOD-032).

The following statement (in boldface) should be struck from the Technical Rationale because TOs and DPs should have no obligation to provide any data related to DERs participating within a DER Aggregation in the organized markets. While the SDT appears to believe that while the data should be provided by the DER Aggregator, they believe that TOs and DPs still have an obligation to provide this data if requested to do so by the PC/TP: **This in no way absolves a DP/TO from an obligation to provide DER data according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1.**

We agree with some comments provided by ACES, EEI, MRO, NAGF, and Talen but are not going to restate each item specifically, as others have already restated them.

Specifically, we disagree with the SDT stating in the standard footnote 5 on page 16, first sentence "Where DER is connected to an unregistered Distribution Provider". This makes it appear as though said entity should be registered. If they are not in the NERC registry then they are not a DP.

Consequently, it should say "Where a DER is connected to a non-Distribution Provider".

We also disagree with the SDT re: proposed standard footnote 5 on page 16, second sentence. "An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider". Our view is that this seems to imply that another

DP or TO can determine, or has the responsibility of determining, if an entity should be registered as a DP. That is NERC's or the Regional Entities' responsibility; registration determination is not a DP's or a TO's responsibility.

Answer	Yes
Document Name	
Comment	
The technical rationale doesn’t provide guidance on determining which facilities connected to the DP’s system would be classified as DERs and which ones would not. The current definition would classify any generation connected to a registered DP as a DER.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. All generation connected to a DP’s system (whether the DP satisfies the NERC registration criteria or not) is considered DER. As noted in the Technical Rationale, the PC/TP may specify certain classifications of DER that do not need to be reported by the DP - such exclusions would be specified in the PC/TP data reporting procedures and requirements.

The SDT should give consideration to paragraph 105 of FERC Order No. 901 which states that if distribution providers are unable to gather adequate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation.

Response

Thank you for your comments. 6B: FERC 901 reference to allow estimated data
Consistent with what is described in FERC Order No. 901 and what already takes place with load demand, some level of estimation is anticipated as described in the Technical Rationale.

Bobbi Welch - Midcontinent ISO, Inc. - 2, Group Name ISO/RTO Council Standards Review Committee (IRC SRC) 2022-02 Modifications to MOD-032 Draft 2

Answer	Yes
Document Name	2022-02 Unofficial_Comment_Form_SRC_11-20-23_FINAL_as filed.docx

Comment

The **ISO/RTO Council Standards Review Committee (SRC)**[1] recommends that the Technical Rationale include an explanation of why the term reactive power capability (*see* Draft #1 of MOD-032-2, Attachment 1, steady-state item 9c) has been removed in favor of the language added in Draft #2 of MOD-032-2, Attachment 1, steady-state item 9d. Our understanding is the change was made to focus on broadening the language to better describe the data needed to model operating characteristics (including ride-through capability, voltage support, frequency control, etc.) instead of focusing on mere operating capabilities.

[1] For purposes of these comments, the IRC SRC includes the following entities: CAISO, MISO, NYISO, PJM, SPP and ISO-NE (except for the response to question 6). ERCOT supports the response to question 2 only.

Response

Thank you for your comments.
2C: elimination of reactive power
The DT removed the reactive power capability in response to previous industry comments. A DER's reactive power operating characteristics can depend on many factors aside from the maximum capability, including the mode of reactive power control. For instance, if the DER is in volt/var control mode, the distribution system loading, voltage regulation scheme, and impedance can all affect the DER's reactive power

output. The Attachment 1 information provides a minimum baseline for information. The PC/TP may request additional information to make assumptions about aggregate DER reactive power operating characteristics.

Comment	
Does the term "interconnection-wide" need to be capitalized.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. Interconnection is defined in the NERC glossary as: “A geographic area in which the operation of Bulk Power System components is synchronized such that the failure of one or more of such components may adversely affect the ability of the operators of other components within the system to maintain Reliable Operation of the Facilities within their control. When capitalized, any one of the four major electric system networks in North America: Eastern, Western, ERCOT and Quebec.” The DT believes that the use of non-capitalized “interconnection-wide” within MOD-032-1 may have been intentional; no change made.	
Carly Miller - Carly Miller On Behalf of: Micah Runner, Black Hills Corporation, 5, 6, 1, 3; - Carly Miller	
Answer	Yes
Document Name	
Comment	

Black Hills Corporation does not support the included language that the "next closest electrically connected registered entity (DP or TO)" is responsible for coordinating DER data with unregistered DPs. Black Hills Corporation agrees with EEI and NAGF comments that TO, or nearest registered DP do not have the ability or authority to gather or request data from unregistered DP entities.

Please provide the reasoning for elimination of reactive power (see Draft #1 of MOD-032-2, Attachment 1, item 9c) in favor of the added language in Draft #2 of MOD-032-2, Attachment 1, item 9d.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. 2C: elimination of reactive power The DT removed the reactive power capability in response to previous industry comments. A DER's reactive power operating characteristics can depend on many factors aside from the maximum capability, including the mode of reactive power control. For instance, if the DER is in volt/var control mode, the distribution system loading, voltage regulation scheme, and impedance can all affect the DER's reactive power output. The Attachment 1 information provides a minimum baseline for information. The PC/TP may request additional information to make assumptions about aggregate DER reactive power operating characteristics.

While we may disagree with some of the positions taken by the Standard Drafting Team, the NAGF appreciates the efforts the Standard Drafting Team put forth in developing the technical rationale.

In the Technical Rationale, the Standard Drafting Team acknowledges that there may be challenges in collecting data for DER connected to unregistered entities and that the obligations of this standard may place an unreasonable compliance risk on registered entities. However, despite the acknowledgement of this unreasonable risk, the Standard Drafting Team has put forth in draft 2 similar language, containing the same unreasonable risk for industry. The NAGF recommends that the Standard Drafting Team re-consider how to address the issues surrounding data collection from entities who have no obligation to comply.

The NAGF recommends that the statement "Distribution Provider refers to the NERC glossary definition, not the NERC registered entity," be revised to be: "The term Distribution Provider in the DER definition includes all parties cited in the NERC Glossary definition of a Distribution Provider, some of whom may be registered as TOs and not as DPs. References to Distribution Providers in the requirements of MOD-032 pertain however only to entities registered as DPs."

2AG: Still maintains unreasonable compliance obligations + FN 5 - explain intent if no response from unregistered entity
The DT recognized the need for clarity in Footnote 5. As such, Footnotes 4 and 5 were modified and combined to address unreasonable compliance obligations. The Technical Rationale was also updated to clarify the DT intent.

1G: Confusion between glossary DP and registered DP
The DT found that the confusion related to the NERC glossary definition for Distribution Provider and the NERC registration criteria was pre-existing. The DT attempted to clarify that use of "Distribution Provider" in the proposed DER definition is not referring to NERC registration. The use of the "Distribution Provider" within the standard without further specific explanation refers to the NERC registered entity. The DT added language in the Technical Rationale and also modified the proposed definition to clarify.

• Getting the gross demand of a registered/unregistered DP's DER will require tracking and retention of their DER data for TO/TP. Managing this additional DER data will put an undue burden on TPs. We request that the DER be responsible for submitting data to the PC/TPs directly.	

• As requested by Oncor in the previous comment period, clarification is needed by SDT on how to represent a single location with multiple types of DER.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. The DT contends that TOs and DPs have a reliability need to know what is being connected to their systems in terms of gross demand and DER and should have methods for managing this information. The intent of MOD-032 revisions is to ensure that DER data is available to PCs and TPs for inclusion in system studies. Details about how data is to be reported are specified by the PC/TP per Requirement R1. SPIDERWG has published numerous reliability guidelines and white papers related to representing DER: https://www.nerc.com/pa/Documents/DER_Quick%20Reference%20Guide.pdf. The DT contends that it is not appropriate to mandate a specific DER representation in MOD-032.

Regarding non registered DPs, as stated in the technical rationale *"the SDT recommends that NERC consider a range of options that could include expanding DP registration criteria or registering DER-only DPs to reduce or eliminate this potential DER data collection gap. However, the process to modify NERC registry criteria and register new entities is beyond the scope of Project 2022-02 and would unnecessarily delay the implementation of DER data requirements. The SDT believes there is value in moving forward with MOD-032-2 as it does provide substantial improvement with respect to ensuring DER data is available for inclusion in PC and TP studies."* We do not agree that this would unnecessarily delay the implementation. We believe it is necessary to delay the implementation because of this. Please explain the justification for moving forward with this known ambiguity which will cause significant compliance risk and may not ultimately be feasible until the process to modify NERC registry criteria is completed.

Comment	

In the “Inclusion of Aggregate Demand Clarification” section, it is suggested a comparison to historical load levels can be used to approximate the addition of DER on the distribution feeder. In an era of energy efficiency and significant load transformation, it is extremely difficult to differentiate DER additions vs. other factors contributing to changing feeder loads. This suggestion should be removed as it could lead to false DER aggregation assumptions.

Foot Note 5 is an attempt by NERC to force requirements onto unregistered entities via registered entities. This requirement places compliance risk on TO’s and DP’s to request data where there is no enforcement support. The comments also don’t explain what would happen if the unregistered DP doesn’t provide the requested data.

Comment	

The addition of the wording to support Footnote 2: "In situations where DER is not separately metered, a comparison to historical load levels can be used to approximate the addition of DER on the distribution feeder. A consistent reduction in load on the feeder may be indicative of DER interconnections. "

This may serve the purpose of determining approximate aggregate demand under item # 2 in Attachment-1, column-1 (steady-state), but won't support item # 9 which requires generator type (solar, battery etc.) and DER capabilities.

The addition of footnote 5 seems to be confusing. This can be addressed in the joint PC/TP modeling data requirements and reporting procedures developed per R1 (after coordinating with applicable DPs/TOs).

The standard as written places an untenable compliance burden on NERC registered entities. The technical rationale notes the challenges in collecting DER data from unregistered DPs. It does not note or address in any way the challenges in collecting DER data from the unregistered DER owners connected to DPs. These unregistered DER owners have no obligation or requirement under NERC standards to provide data for

modeling. Requiring that DPs provide modeling data for equipment they do not own and have no means to acquire data on leaves them in a position where they fail to comply with the standard through no fault of their own and despite their best efforts.

FirstEnergy supports EEI's comments which state:

EEI does not support the proposed changes to MOD-032-2 because many of the changes would obligate TOs and DPs to provide data that exceeds their ability to obtain. EEI further notes that during the Fall 2023 NPCC Compliance and Reliability Conference a presentation titled "Inverter Based Resource Work Plan" was given and appears to use data from a Berkeley National Laboratory Report. The presentation goes on to indicate that BES IBRs (75MW at ≥100kV) account for 84% and non-BES (≥20MW & ≤75MW at ≥100kV plus ≥MW at <100kV) account for an additional 14%; for a total of 98% of the IBRs currently interconnected on the grid. This data additionally indicates that small IBRs (<20MW at any kV) only account for 2% of the connected IBRs and if correct, would mean these resources would have no meaningful impact on the Reliability of the BPS. Moreover, in FERC Order No. 901 (Reliability Standards to Address Inverter-Based Resources), the Commission made it clear that the focus of changes to NERC Reliability Standards, as it relates to modeling of DERs, is to be limited data to aggregate data not granular details on a non-aggregated basis. Given the NPCC data and FERC Order No. 901, it would indicate that many of the proposed changes to MOD-032 are unnecessary for reliability. This would include modifications to MOD-032 that propose to provide PCs/TPs with the authority to request data that is overly granular and unnecessary to model the impacts of DERs on the BPS. IBRs that have a meaningful impact on the BPS should be registered. Once this has been done, PCs and TPs could seek the data they need directly from the registered resource, not the TOs or DPs that are unlikely to have the needed data. While we recognize the need to gather and model the impacts of DER resources on the distribution system, modeling should be limited to load demand and aggregate DER impacts/offsets. However, we do support obligating DER Aggregators who are participating in the organized markets to provide data on their aggregated resources to the PCs/TPs upon request. We do not support obligating TOs and DPs to gather non aggregated data, upon request.

SMUD and BANC agree with the comments submitted by BC Hydro, especially pertaining to Footnote 5. We feel that the language in Footnote 5, and the Technical Rationale, do not support passing the compliance obligations of an “unregistered Distribution Provider” onto “the next electrically connected registered entity (DP or TO)”. If models are required for all DERs in the BPS, there is an increased chance of Planning Coordinators and Transmission Planners receiving inaccurate models (especially from “unregistered Distribution Providers”) as many Distribution Providers may not have the experience to model their DERs correctly which could pollute the base cases and diminish their quality.

The MRO NSRF believes that the modifications made to MOD-032-2 will have very limited impact on improving system modeling and reliability. The fact remains that, TOs and DPs have no ability to compel DER owners to provide the data that would be necessary to significantly improve system modeling and reliability. This provides (in our opinion) a likely scenario under which a NERC-registered entity may be held to have a compliance gap for the non-performance/compliance of a non-NERC-registered entity. The proposed draft establishes a zero MVA threshold for the collection of all DER data "in non-isolated parallel operation with the Bulk Power System". Per the Technical Rationale, this includes every residential solar and commercial rooftop solar customer on the DP's systems. This would likely impose an immense administrative burden on (NERC Registered) Distribution Providers and Transmission Owners, while not delivering significant reliability benefits.

Through various reports, NERC has displayed how IBR can have an impact on the BES, but it is unclear how the aggregation of smaller “R-DER” impacts the BES in a manor proportional to “U-DER”. Total aggregated R-DER penetration is far from equivalent to a few “U-DER” installations across a utility’s footprint. Much of the required information is not available to DP’s for smaller DER installations and the ability to require the information from interconnectors is authorized by RERRA entities. The assumptions required to try to model R-DER due to MOD-032-2 requirements could also lead to false confidence and support of the BES from R-DER sources. A threshold is needed, suggested at 1 MW, for DER installations to differentiate the discrete modeling of resources with steady state and dynamic information vs. aggregating DER below such threshold, providing gross nameplate values, and allowing the PC to determine approximated DER response to system events.

Comment

CEHE believes the proposed revisions to MOD-032-2 are problematic and contradicts the existing data requirements that have already been established by the local Planning Coordinators in coordination with Transmission Planners. For example, in the ERCOT region, ERCOT defines these data requirements through the coordination with Transmission Planners as part of various regional working groups. The already defined data requirements do not align with the proposed revisions of the Data Reporting Requirements in MOD-032-2 (ex. Attachment 1, item 2, footnote 2). The current MOD-032-1 addresses and includes the requirements around DER data.

CEHE is in support of EEI's comment that the modifications made to MOD-32-2 "continue to obligate TOs and DPs to provide data that exceeds their ability to obtain." CEHE agrees with EEI in that if this data is needed, the resource owners should be registered and obligated to supply the data, not the TOs or DPs.

NV Energy believes that the modifications made to MOD-032-2 will have very limited impact on improving system modeling and reliability. The fact remains that, TOs and DPs have no ability to compel DER owners to provide the data that would be necessary to significantly improve system modeling and reliability. This provides (in our opinion) a likely scenario under which a NERC-registered entity may be held to have a compliance gap for the non-performance/compliance of a non-NERC-registered entity. The proposed draft establishes a zero MVA threshold for the collection of all DER data "in non-isolated parallel operation with the Bulk Power System". Per the Technical Rationale, this includes every residential solar and commercial rooftop solar customer on the DP's systems. This would likely impose an immense administrative burden on (NERC Registered) Distribution Providers and Transmission Owners, while not delivering significant reliability benefits.

2AG: Still maintains unreasonable compliance obligations + FN 5 - explain intent if no response from unregistered entity
The DT recognized the need for clarity in Footnote 5. As such, Footnotes 4 and 5 were modified and combined to address unreasonable compliance obligations. The Technical Rationale was also updated to clarify the DT intent.

3C: Minimum threshold
The DT consensus is that it is most appropriate to not include a threshold within the DER definition. NERC has recommended a zero MVA threshold for gathering DER information: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf

It is expected that PC/TP procedures may specify thresholds and technical justification for inclusion of DER models (or not) in any particular study – this issue is more aligned with the SAR for TPL-001 that will be addressed in the second phase of this project 2022-02. A single threshold is not likely universally applicable.

Comment	

BC Hydro appreciates the drafting team's efforts and the opportunity to comment, and offers the following.

1. While BC Hydro appreciates the intent of modifications made in MOD-032-2, BC Hydro is of the opinion that the intended improvement in system modeling and reliability cannot be realized, until the implementation of an effective and practical approach to collect accurate DER data in a timely manner and with a sufficient level of detail. This would be challenging due to the lack of any compliance obligations on unregistered DER owners. DP and TO may have some leverage, such as introducing obligations for DER owners to provide acceptable data for future DERs before they can be connected to the DP/TO systems. However, in the case of unregistered DER owners that are already connected to a TO/DP, the TO/DP will have an extremely limited ability to ensure a timely collection of such data, its accuracy, and sufficient level of detail.

2. The Footnote 5 of the Attachment 1 states that "Where DER is connected to an unregistered Distribution Provider, the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information". This appears to set a

mandatory requirement, which – as outlined above – would impose regulatory compliance obligations the TO and/or DP registered entity may be unable to meet.

Clarification is needed with the changes outlined in Attachment 1 in the Steady-State column of Table-#9: 1. "b. Real power capability" • Is this referring to the nameplate or approved capacity? 2. "c. Generator type (solar, battery, etc.)" • Oncor recommends modifying this statement to give instructions on how to report a single location with multiple types of DER. 3. "d. DER capabilities related to ride through, voltage control and/or frequency control or information that can be used to infer those capabilities for modeling purposes." • Could the SDT elaborate on how frequency control would impact the Steady State modeling?

Response	

Thank you for your comments. Details about how data is to be reported is specified by the PC/TP per Requirement R1. SPIDERWG has published numerous reliability guidelines and white papers related to representing DER https://www.nerc.com/pa/Documents/DER_Quick%20Reference%20Guide.pdf. The DT contends that it is not appropriate to mandate a specific DER representation in MOD-032. 6G: Move control capabilities to dynamics? As noted in the Technical Rationale, the DT maintained the approach from MOD-032-1 where detailed sub-bullets are only presented in the "steady state" column although such information may also be relevant to "dynamics" or "short circuit." In general, information about control and ride-through capabilities could be used to inform steady state behavior assumptions.

While SPP believes that the proposed modifications are a good step towards improving system modeling and reliability. However, we still have concerns around the appropriate data collection process pertaining to DERs.	

We recommend that the UFLS-Only DP be added to the applicability section of the standard as these registered entities are just as likely to have DERs connected to their system. From our perspective, adding the UFLS-Only DP will eliminate the possibility of uncaptured DER load data if a DP does not have access to this data

Response	
Thank you for your comments. 3F: Add UFLS-only DP to applicability The DT agrees that adding "UFLS-Only Distribution Provider" to MOD-032-2 applicability would reduce (but not necessarily completely eliminate) the potential gaps associated with DER connected to unregistered entities with no compliance obligation. However, consultation with NERC legal staff indicated that adding UFLS-Only Distribution Provider to the applicability would not be appropriate at this time.

ATC appreciates the intent of modifications contained in MOD-032-2. However, as Draft 2 of the Standard is written, TOs and DPs have no mechanism to compel the actual DER owners to provide the data that would be necessary to significantly improve system modeling and reliability. Compliance-related questions: Please clarify what the compliance implications are if a TO/ TP or DP requests the modeling data but does not receive it or if the data is inaccurate? Will showing that the TO/ TP attempted to request data be enough? Or that the TO/ TP utilized (or at least considered) the data received if no collection and modeling thresholds are set? Please clarify how the TO/ TP or DP should be aware that DER are connected to an unregistered DP? The TO/ TP and DP would not have insight into those systems. Please clarify the obligations of the TO/TP and DP in determining who is next closest electrically to each unregistered entity (DP or TO) as listed in Footnote 5? Does the TO/TP or DP need to reach out to the DER or to the unregistered DP for the information? Would the request for DER information be an annual process or triggered by something else?

The new requirements for DER data do not appear to directly correlate with the fields in existing modeling software such as the Composite Load Model (CMPLDWG). Tacoma would prefer for the Requirements to either align with existing modeling software, or for there to be a guidance document outlining what additional new software/model development needs to take place before the required DER can actually be utilized. The most significant concern is that there are often multiple installations of DERs connected to each substation, where each DER has unique ride-through and voltage control capabilities.

The revisions should also note that if the Planning Coordinator or Transmission Planner can obtain the information directly from the generator based on individual ISO Tariff or other local requirements that the TO or DP does not need to provide information listed in Attachment 1. Suggested revision is redlined below.	

For steady-state:

9. Distributed Energy Resource (DER) data [DP, TO where DER is directly connected to the TO system and not through a DP unless the generator is required to provide the data directly to the PC or TP based on individual Tariff or local provisions]

a. Location (bus from item 1)

b. Real power capability

c. Generator type (solar, battery, etc.)

d. DER capabilities related to ride-through, voltage control and/or frequency control or information that can be used to infer those capabilities for modeling purposes.

For dynamics:

10. Distributed Energy Resource (DER) data including whether DER is subject to tripping in conjunction with UFLS and/or UVLS [DP, TO where DER is directly connected to the TO system and not through a DP, unless the generator is required to provide the data directly to the PC or TP based on individual Tariff or local provisions]

EEI does not support the proposed changes to MOD-032-2 because many of the changes would obligate TOs and DPs to provide data that exceeds their ability to obtain. EEI further notes that during the Fall 2023 NPCC Compliance and Reliability Conference a presentation titled "Inverter Based Resource Work Plan" was given and appears to use data from a Berkeley National Laboratory Report. The presentation goes on to indicate that BES IBRs (75MW at ≥100kV) account for 84% and non-BES (≥20MW & ≤75MW at ≥100kV plus ≥MW at <100kV) account for an additional 14%; for a total of 98% of the IBRs currently interconnected on the grid. This data additionally indicates that small IBRs (<20MW at any kV) only account for 2% of the connected IBRs and if correct, would mean these resources would have no meaningful impact on the Reliability of the BPS. Moreover, in FERC Order No. 901 (Reliability Standards to Address Inverter-Based Resources), the Commission made it clear that the focus of changes to NERC Reliability Standards, as it relates to modeling of DERs, is to be limited data to aggregate data not granular details on a non-aggregated basis. Given the NPCC data and FERC Order No. 901, it would indicate that many of the proposed changes to MOD-032 are unnecessary for reliability. This would include modifications to MOD-032 that propose to provide PCs/TPs with the authority to request data that is overly granular and unnecessary to model the impacts of DERs on the BPS. IBRs that have a meaningful impact on the BPS should be registered. Once this has been done, PCs and TPs could seek the data they need directly from the registered resource, not the TOs or DPs that are unlikely to have the needed data. While we recognize the need to	

gather and model the impacts of DER resources on the distribution system, modeling should be limited to load demand and aggregate DER impacts/offsets. However, we do support obligating DER Aggregators who are participating in the organized markets to provide data on their aggregated resources to the PCs/TPs upon request. We do not support obligating TOs and DPs to gather non aggregated data, upon request.

Response	
Thank you for your comments. Response to similar comment related to modeling details + 4D & 6T themes: The DT contends that DPs should already have a record and basic understanding of DER that is connected to their system (e.g., rooftop solar, batteries, etc.) similar to how they have a record and basic understanding of houses, factories, and commercial spaces connected to their system. Consistent with what is described in FERC Order No. 901 and what already takes place with load demand, some level of estimation is anticipated as described in the Technical Rationale. The intent is not to require a detailed model for every single DER and the DT is not proposing any such requirement. However, DER data items proposed to be added to Attachment 1 are needed to assess the reliability impact of aggregate DER in system studies. Across the continent, there are variations of DER penetrations and preponderance of DER classes (some areas may have more residential rooftop solar, others may have more utility scale DER). Therefore, it is prudent to allow the PC/TP greater flexibility in determining the details regarding DER data requirements rather than being overly prescriptive in MOD-032. "Aggregate" was added to the DER data item in Attachment 1 to clarify the information that is expected to be included in the transmission model. The DT does not believe that the development of essential requirements related to ensuring appropriate DER data is available to PCs and TPs should be delayed to put the industry behind the curve as they are with IBR performance requirements. The DT believes this is aligned with the urgency conveyed in FERC Order No. 901. 2AG: Still maintains unreasonable compliance obligations + FN 5 - explain intent if no response from unregistered entity The DT recognized the need for clarity in Footnote 5. As such, Footnotes 4 and 5 were modified and combined to address unreasonable compliance obligations. The Technical Rationale was also updated to clarify the DT intent.

AEP thanks the SDT for adding the text in footnote 5 which states "…Where DER is connected to an unregistered Distribution Provider, the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through ***available*** information" and request that clarity be provided on exactly what is meant by "available information?" AEP believes that information that is requested (and perhaps even exists) but is not provided by the data owner should be considered unavailable. In addition, this scenario should be added to the others listed in the Technical Rationale document.

Notwithstanding the SDT's response to our previous suggestion, AEP continues to believe that the best path forward for this proposed standard would be for those entities providing power at a minimum threshold to be registered as a Functional Entities and to provide DER data. We recommend that the SDT establish an aggregate minimum threshold, similar to what was recently proposed by NERC in regard to IBRs. As is the case in existing standards where Generator Owners are obligated to provide similar data, entities who possess the needed DER data noted in the Attachment One revisions should likewise be registered and explicitly obligated to provide this data as well. While we are unsure if the existing Functional Entities classes are themselves sufficient, or if instead, a new class of Functional Entities might need to be considered and developed, the need nonetheless exists. NERC may wish to also consider the potential that such obligations could potentially cross Federal and State jurisdictional lines of responsibility, further illustrating the complexity-of and challenges-in developing obligations to obtain the DER data in the revised Attachment One.

2AG: Still maintains unreasonable compliance obligations + FN 5 - explain intent if no response from unregistered entity
The DT recognized the need for clarity in Footnote 5. As such, Footnotes 4 and 5 were modified and combined to address unreasonable compliance obligations. The Technical Rationale was also updated to clarify the DT intent.

3C: Minimum threshold
The DT consensus is that it is most appropriate to not include a threshold within the DER definition. NERC has recommended a zero MVA threshold for gathering DER information: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf. It is expected that PC/TP procedures may specify thresholds and technical justification for inclusion of DER models (or not) in any particular study – this issue is more aligned with the SAR for TPL-001 that will be addressed in the second phase of this project 2022-02. A single threshold is not likely universally applicable.

Duane Franke - Manitoba Hydro - 1,3,5,6 - MRO

Answer	Yes
Document Name	

Comment

In principle, getting more “reasonably accurate” DER models into the regional models should help to improve reliability. There could be some risk to reliability if DER dispatch in models is higher than expected as this could mask load serving reliability issues. MOD-032 regional model building groups need to provide guidelines on what level of DER should be included in each seasonal model. Studying appropriate sensitivity cases should be part of TPL-001 scope.

The latest draft of MOD-032 no longer requires reactive power information to be collected for DERs. While most smaller systems really only operate at unity, it is the belief of NCEMC having this information will allow planners to more accurately model Distributed Energy Resources, thereby improving grid reliability. Thus, NCEMC recommends that reactive power data collection for DERs be required by MOD-032.	
Likes 0

Response

Thank you for your comments.
2C: elimination of reactive power
The DT removed the reactive power capability in response to previous industry comments. A DER's reactive power operating characteristics can depend on many factors aside from the maximum capability, including the mode of reactive power control. For instance, if the DER is in volt/var control mode, the distribution system loading, voltage regulation scheme, and impedance can all affect the DER's reactive power output. The Attachment 1 information provides a minimum baseline for information. The PC/TP may request additional information to make assumptions about aggregate DER reactive power operating characteristics.

Bobbi Welch - Midcontinent ISO, Inc. - 2, Group Name ISO/RTO Council Standards Review Committee (IRC SRC) 2022-02 Modifications to MOD-032 Draft 2

Answer	Yes
Document Name	

Comment

The SRC believes there is an urgent need to move forward with collecting DER data now. Additional DER data collection activities will be needed as the penetration of DERs increases; however, these modifications are a step in the right direction and more can be done over time. The revisions should also note that if the Planning Coordinator or Transmission Planner will obtain the information directly from the generator based on individual ISO Tariff or other local requirements that the TO or DP may not need to provide information listed in Attachment 1. Suggested revision is redlined below.

For steady-state:

9. Distributed Energy Resource (DER) data [DP, TO where DER is directly connected to the TO system and not through a DP ***unless the generator will provide the data directly to the PC or TP based on individual Tariff or local provisions****]*

a. Location (bus from item 1)

b. Real power capability

c. Generator type (solar, battery, etc.)

d. DER capabilities related to ride-through, voltage control and/or frequency control or information that can be used to infer those capabilities for modeling purposes.

For dynamics:

10. Distributed Energy Resource (DER) data including whether DER is subject to tripping in conjunction with UFLS and/or UVLS [DP, TO where DER is directly connected to the TO system and not through a DP, ***unless the generator will provide the data directly to the PC or TP based on individual Tariff or local provisions****]*

Response

Thank you for your comments. 3H: Availability of data through alternative methods - move from TR to standard?
This concept is addressed in the Technical Rationale to provide flexibility to PC/TP in ensuring necessary data is available. Data collection requirements for DER in MOD-032 are focused on what is necessary for reliability and may differ from the data collected via an individual Tariff or local provisions.

Dennis Chastain - Tennessee Valley Authority - 1,3,5,6 - SERC

Answer	Yes
Document Name	

Comment

While the acquisition and utilization of DER data by the PC/TP for the purposes of power system modeling should enhance the PC/TP's ability to study future scenarios and develop plans accordingly, we are concerned with the future compliance interpretation for Requirement R4. That is, how might the ERO (or its designee) modify its expectation for Interconnection-wide case(s) in regard to DER data?

Likes 0	
Dislikes 0	

Response	
Thank you for your comments. Per R4, the PC "shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area." In other words, DER data provided to the PC shall be made available for inclusion in Interconnection-wide cases.

We agree with some comments provided by ACES, EEI, MRO, NAGF, and Talen but are not going to restate each item specifically, as others have already restated them.

Additionally, the SDT has not stated a cost or benefit to said modifications. No standard should be allowed if a cost/benefit analysis is not provided by the SDT. SDT frequently asks this question but never provides a cost/benefit justification, simply someone says there is a reliability gap, or a risk, but does not provide estimated tangible reliability indices improvement numbers or a cost to fill the alleged gap or risk, is not good justification to create another costly administrative process.

Response

Thank you for your comments. See responses to ACES, EEI, MRO, NAGF, and Talen.

The intent of the question is to solicit industry feedback on potentially more cost-effective ways to meet the reliability objective for DT consideration. The SC has already established the reliability need by approving the SAR and project. The work of the SPIDERWG provides technical references and industry best practices related to DER: https://www.nerc.com/pa/Documents/DER_Quick%20Reference%20Guide.pdf. Additionally, numerous disturbance reports where DER impact was significant have been published , including but not limited to:
https://nercstg.nerc.com/pa/rrm/ea/April_May_2018_Fault_Induced_Solar_PV_Resource_Int/April_May_2018_Solar_PV_Disturbance_Report.pdf

AEPC signed on to ACES comments:

It is our opinion that, as written, the proposed changes are not cost effective. It is our belief that requiring the DP to collect data for all DER/IBR resources, without regard to size and/or reliability impact, will create an unnecessary compliance burden and only provide a marginally increased reliability benefit.

Comment	
The latest draft of MOD-032 no longer requires reactive power information to be collected for DERs. While most smaller systems really only operate at unity, it is the belief of NCEMC having this information will allow planners to more accurately model Distributed Energy Resources, thereby improving grid reliability and potentially allowing for solutions which reduce cost by taking DER reactive power capability into account. Thus, NCEMC recommends that reactive power data collection for DERs be required by MOD-032.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. 2C: elimination of reactive power The DT removed the reactive power capability in response to previous industry comments. A DER's reactive power operating characteristics can depend on many factors aside from the maximum capability, including the mode of reactive power control. For instance, if the DER is in volt/var control mode, the distribution system loading, voltage regulation scheme, and impedance can all affect the DER's reactive power output. The Attachment 1 information provides a minimum baseline for information. The PC/TP may request additional information to make assumptions about aggregate DER reactive power operating characteristics.

GO/GOPs will need more information to adequately assess the cost effectiveness of the proposed approach. *The NAGF requests that the SDT address the process under MOD-032 to require the TP/PC to request data each year rather than require the GO to go look for and follow TP/PC process. If reliability is really the goal, an active request for data is likely to receive a much higher response rate than expecting those that need to supply information to go looking for when, where and how they need to provide it. The NAGF believes that it is extremely costly for hundreds of entities to go looking for information to determine when they need to provide data than it is for a few entities to send out emails requesting the information.*

Comment	
As previously stated, if DER penetration levels are high in a particular area, the changes in MOD-032-2 could have a positive impact on reliability. However, if DER penetrations are not high enough to impact the reliability of the BES, DPs and TOs will have added unnecessary administrative work and compliance burden for the purpose of checking a compliance box. Additionally, if the TO/DP is required to report data that the DER owner has no obligation to provide, the standard should address how the RE intends to handle situations where the	

unregistered Distribution Provider does not provide the requested data to the registered DP or TO. Otherwise, the TO/DP may be subject to fines and penalties for non-compliance related an issue that is beyond the control of the TO/DP.

Because so many issues around DERs, IBRs and ESRs remain unresolved and will be dependent upon final requirements for DERs, it is difficult to address the cost effectiveness of the MOD-32-2 modifications. We do believe that software upgrades will be required to collect data on DERs, IBRs, and ESRs that have the potential to create cost increases for many in the industry.	

Furthermore, we recommend the drafting team take into consideration evaluation the cost effectiveness from the FERC Order 2222 and IEEE Standards (1547 and 2800) perspectives.

Comment	

The administrative burden to provide accurate modeling of aggregated R-DER does not outweigh marginal modeling benefits. It is recommended NERC focus on utility scale DER and assuming little to no support from residential DER during system events. A compromise may be to add a threshold for the steady state and dynamic modeling requirements in MOD-032-2 and allow all other DER to be aggregated gross nameplate values reported by DP/TO entities which the PC can determine modeling parameters for based on industry research.

MRO NSRF does not agree that the modifications in MOD-032-2 are cost effective. As proposed MOD-032-2 would likely impose a immense administrative burden on (NERC Registered) Distribution Providers and Transmission Owners, while not delivering significant reliability benefits.

4B: Too much TO/DP (and GO?) burden - not enough reliability benefit	

Thank you for your comments. For the same reasons that MOD-032 and TPL-001 are being revised to account for DER data needs and potential impacts on the bulk power system, the DT understands that the TO/DP also has a reliability need for visibility into the types and amounts of DER connected to their electric systems. Burden will be reduced as a consequence of modification to Footnotes 4 and 5.

Response
Thank you for your comments. 5A: 12 months for data obligations is too short (18-36 months) As noted in the Project 2022-02 10/30/2023 Webinar, TOs and DPs would be expected to participate in PC/TP processes to change data reporting requirements related to DER developed during the 24 months prior to the effective date of Requirement R1 and should be able to start working on data collection processes and methods more than 12 months prior to the effective dates of Requirements R2, R3, and R4. In summary, this would give a full 36 months from FERC approval until data is required to be reported. Further, "Aggregate" was added to the DER data item in Attachment 1 to clarify the information that is expected to be included in the transmission model. Consistent with what is described in FERC Order No. 901 and what already takes place with load demand, some level of estimation is anticipated as described in the Technical Rationale. The DT believes that industry concerns related to the level of required DER modeling detail may be driving industry suggestions for longer implementation times and are addressed by these modifications.

If MOD-032-2 is approved as-is, utilities will need to increase resourcing to accommodate the additional modeling complexities and data collection. DP's, in particular, may not have staffing experience in dynamic modeling, which would lead to a need to establish contractors with the experience or hire/train internal staff. The ability to request the level of information to create dynamic models of DER also falls to the authority of RERRAs. Depending on the existing interconnection procedures, state or local government authorities may need to approve revisions to interconnection requirements. 12 months after the approval date is too soon to require compliance.

SPP recommends that the implementation of Requirements R2, R3 and R4 become effective 24 – 36 months after the implementation of Requirement R1. In order for industry to implement these changes we believe it will require a large transitional curve for requesting and providing the data. Newly impacted entities will need time to transition and ensure that the new process is efficient and reliable.

As explained in our comments on Draft 1, we suggest the implementation plan be revised to allow 24 months (rather than 12 months) after the effective date for the initial performance of R2, R3 and R4. The drafting team's "expectation" that TOs and DPs would participate in PC/TP processes to change data reporting requirements related to DER developed during the 24 months prior to the effective date of R1, thereby allowing TOs and DPs to start working on data collection processes and methods more than 12 months prior to the effective dates of R2, R3, and R4 is not assured.

Thank you for your comments. 5A: 12 months for data obligations is too short (18-36 months) As noted in the Project 2022-02 10/30/2023 Webinar, TOs and DPs would be expected to participate in PC/TP processes to change data reporting requirements related to DER developed during the 24 months prior to the effective date of Requirement R1 and should be able to	

start working on data collection processes and methods more than 12 months prior to the effective dates of Requirements R2, R3, and R4. In summary, this would give a full 36 months from FERC approval until data is required to be reported. Further, "Aggregate" was added to the DER data item in Attachment 1 to clarify the information that is expected to be included in the transmission model. Consistent with what is described in FERC Order No. 901 and what already takes place with load demand, some level of estimation is anticipated as described in the Technical Rationale. The DT believes that industry concerns related to the level of required DER modeling detail may be driving industry suggestions for longer implementation times and are addressed by these modifications.

We agree with some comments provided by ACES, EEI, MRO, NAGF, and Talen but are not going to restate each item specifically, as others have already restated them. Area coordinators are already responsible for submitting data for modelling, they should be getting data they feel they need; not what some other entity tells them they should get. If a PA needs data they should be responsible for getting said data. Further, if said data is needed, then the BA and/or the TO or DP should modify and/or enforce their market and/or interconnection rules to require load and/or generation entities (Utilities interconnected to a BA's area) provide said data. It appears we are trying to draft new standards continent wide for local issues.	

Additionally, each Utility is already required to complete an EIA-861 form annually. We suggest that the entity needing said data use data that is already on those spreadsheets and use a macro to populate each year's data (which EIA already has) with the bus numbers for each utility so it can be used with a composite load model for each bus. The entity needing the data can call each utility or the TO that services them in order to get the appropriate bus number. We feel there is more man-hours being spent talking about the issue and trying to develop a standard then it would take the entity that wants the data to call and find out the bus numbers to assign to data that already exists. Then the entity needing said data can get it annually from the public EIA website and run a macro to insert the bus numbers. Much simpler and less costly for everyone.

Comments on "Attachment 1":

Footnote 2 is concerning since the way we collect and forecast aggregate load data is metering that is unaware of any DER impacts. The suggestion in the technical rationale isn't possible to do cleanly. ("*In situations where DER is not separately metered, a comparison to historical load levels can be used to approximate the addition of DER on the distribution feeder. A consistent reduction in load on the feeder may be indicative of DER interconnections.")*

We would prefer the standard more explicitly allow for estimation by either reported DER nameplate capacity, or by estimated % of load (i.e., if no better information is available, perhaps use the data you do have to estimate DER as a % of peak load).

Dynamics reporting requirement # 10 reads:

"*Distributed Energy Resource (DER) data including whether DER is subject to tripping in conjunction with UFLS and/or UVLS [DP, TO where DER is directly connected to the TO system and not through a DP]*"

The added detail here is more burdensome, and is almost certainly not going to be available. The technical rationale says:

"*The SDT intentionally maintained flexible language as to whether the underlying DER data originates from interconnection documentation, measured quantities, estimated quantities, or other sources*."

However the addition of requirements for more specific data seems to go against the characterization that "estimated quantities" are acceptable.

Steady-state reporting requirement #9 has a footnote 4 that reads:

"*The joint PC/TP modeling data requirements and reporting procedures developed per R1 will specify data flow processes and the required level of aggregation. The PC or TP may need to coordinate with the DP or TO to determine appropriate equivalent distribution system impedance.*"

The implication here about determining the equivalent distribution system impedance to DER is perplexing. First because steady-state models do not model distribution impedance. In most cases, everything (including the main distribution transformers) is lumped into the aggregate load. This does apply to dynamic load models that consider equivalent distribution system impedances, but there is no practical way to vary that for every DER. And this is inconsistent with the approach used to model motor loads. For example, there is no requirement to report every individual motor and the equivalent impedance to that motor. And one could argue that the motor load has a vastly more important effect on the system than DER. TPL-001-5.1 stipulates the use of dynamic load models for Stability analysis but allows for the use of an aggregate System Load model. No further details or requirements. Studies are extremely sensitive to the load model that's used. If it is okay to develop those load models in estimated, aggregate form, why should there be anything more expected for DER?

Our general feeling is that the proposed modifications for DER data is getting too detailed and there needs to be very clear and explicit language that says estimating aggregate DER data is acceptable if more detailed data is not available.

Response

Thank you for your comments.
6U: more explicitly allow estimates related to FN2 (related to theme 6B)
Consistent with what is described in FERC Order No. 901 and what already takes place with load demand, some level of estimation is anticipated as described in the Technical Rationale.

6V: Estimated quantities related to UVLS/UFLS & DER

Knowledge of whether DER is subject to trip by UFLS/UVLS relays is necessary for proper development of UFLS/UVLS schemes as described in the SPIDERWG documents referenced in the Technical Rationale. 6S: FN 4 aggregation level - standardize/specify? Clarify modeling detail? The intent is not to require a detailed model for every single DER and the DT is not proposing any such requirement. However, DER data items proposed to be added to Attachment 1 are needed to assess the reliability impact of aggregate DER in system studies. Across the continent, there are variations of DER penetrations and preponderance of DER classes (some areas may have more residential rooftop solar, others may have more utility scale DER). Therefore, it is prudent to allow the PC/TP greater flexibility in determining the details regarding DER data requirements rather than being overly prescriptive in MOD-032. "Aggregate" was added to the DER data item in Attachment 1 to clarify the information that is expected to be included in the transmission model.

Comment	
The phrase “where DER is directly connected to the TO system and not through a DP” in steady state item 9 (and dynamics item 10) from Attachment 1 may not be consistent with footnote 5. ERCOT recommends simplifying the responsibility assignment in steady state item 9 (and dynamics item 10) to “[DP, TO]” and modifying footnote 5 to read as follows: **The registered entity (TO or DP) to which DER is connected is responsible for reporting DER data in accordance with PC/TP modeling data requirements and reporting procedures developed under Requirement R1.** Where DER is connected to an unregistered Distribution Provider, the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information. An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider. This footnote is also applicable to item 10 under the "dynamics" column.

Comment	

AEPC signed on to ACES comments:

We have a great deal of apprehension as it relates to proposed language in Footnote 5 of Attachment 1. Footnote 5 states (emphasis added):

"Where DER is connected to an unregistered Distribution Provider, the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information. An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider. This footnote is also applicable to item 10 under the "dynamics" column."

By what method should it be determined which registered entity is the "next closest electrically connected". Consider the case wherein a substation owned by an unregistered DP has a feeder from 2 different registered entities. Who is to make the determination as to which registered entity is the "next closest electrically connected" and how? In order to make this determination, a certain amount of knowledge about the other entity's infrastructure is required.

Of even greater concern is the continued inclusion of data from unregistered entities despite the open acknowledgment by the SDT of the challenges with collecting said data (see Technical Rationale, paragraph 2). We recommend that the SDT postpone further development of this Project until the GO-IBR and GOP-IBR registration criteria have been approved and can be included in the next draft of MOD-032-2.

Thank you for the opportunity to comment.

EEI notes that this project has been listed as a low priority project. While we understand this may have some immediate impacts on the work being conducted by this SDT, we suggest that a two phased approach for the revision of MOD-032 might address the immediate concerns surrounding efforts to align registration under Project 2017-02. Phase 1: Consider completing the work from project 2017-02 Standards	

Alignment with Registration: Replace Load-Serving Entity (LSE) with Distribution Provider (DP), remove the Planning Authority (PA) functional entity name and keep the Planning Coordinator (PC) functional entity name, and make the associated LSE / DP functional changes to the standard requirements. Phase 2: Please consider addressing additional DER data requirements, after further discussion regarding how GO-IBR and GOP-IBR standards are going to be addressed and what is needed from Distribution Providers regarding unregistered IBRs. In addition to the comments responding to the questions above and our suggests related to project phasing, we are additionally concerned with Attachment 1, Footnote 5 and suggest it should be deleted because the next closest DP or TO to an unregistered distribution provider, should not be held responsible for providing DER data outside of their control or ability to collect.

Response

Thank you for your comments.
6T: Prioritize administrative issues with MOD-032/Wait for 901
The DT does not believe that the development of essential requirements related to ensuring appropriate DER data is available to PCs and TPs should be delayed to put the industry behind the curve as they are with IBR performance requirements. The DT believes this is aligned with the urgency conveyed in FERC Order No. 901.

6E: GO-IBR to the rescue (related to theme 1D)
The proposed GO-IBR registration effort is primarily intended to capture the smaller transmission-connected resources that don't meet BES definition. Most individual DER will not meet proposed GO-IBR registration criteria (i.e., greater than 20 MVA) so that effort will provide little benefit with respect to making DER data available to PC/TPs. Yet, smaller individual DER installations connected to DP systems can, in aggregate, have a significant impact on BES reliability.

6D: issues with "next electrically closest" - need clarification
Footnotes 4 and 5 were combined and modified to eliminate the “next closest electrically connected” language and add clarity. A more detailed description of the DT intent was added to the Technical Rationale.

2AG: Still maintains unreasonable compliance obligations + FN 5 - explain intent if no response from unregistered entity The DT recognized the need for clarity in Footnote 5. As such, Footnotes 4 and 5 were modified and combined to address unreasonable compliance obligations. The Technical Rationale was also updated to clarify the DT intent.

We have a great deal of apprehension as it relates to proposed language in Footnote 5 of Attachment 1. Footnote 5 states (emphasis added):

"Where DER is connected to an unregistered Distribution Provider, the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information. An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider. This footnote is also applicable to item 10 under the "dynamics" column."

By what method should it be determined which registered entity is the "next closest electrically connected". Consider the case wherein a substation owned by an unregistered DP has a feeder from 2 different registered entities. Who is to make the determination as to which registered entity is the "next closest electrically connected" and how? In order to make this determination, a certain amount of knowledge about the other entity's infrastructure is required.

Of even greater concern is the continued inclusion of data from unregistered entities despite the open acknowledgment by the SDT of the challenges with collecting said data (see Technical Rationale, paragraph 2). We recommend that the SDT postpone further development of this Project until the GO-IBR and GOP-IBR registration criteria have been approved and can be included in the next draft of MOD-032-2.

Additionally ACES collected the following comments for the consideration of the SDT:

1. "Once the GO-IBR standards are in place, the DP should not be part of this equation at all. This is especially true of non-registered members. Put the burden onto the GO-IBR not the DP."

2. "The latest draft of MOD-032 no longer requires reactive power information to be collected for DERs. While most smaller systems really only operate at unity, it is the belief of NCEMC having this information will allow planners to more accurately model Distributed Energy Resources, thereby improving grid reliability. Thus, NCEMC recommends that reactive power data collection for DERs be required by MOD-032."

Thank you for the opportunity to comment.

Thank you for your comments.
6D: issues with "next electrically closest" - need clarification
Footnotes 4 and 5 were combined and modified to eliminate the “next closest electrically connected” language and add clarity. A more detailed description of the DT intent was added to the Technical Rationale.

6E: GO-IBR to the rescue (related to theme 1D)
The proposed GO-IBR registration effort is primarily intended to capture the smaller transmission-connected resources that don't meet BES definition. Most individual DER will not meet proposed GO-IBR registration criteria (i.e., greater than 20 MVA) so that effort will provide little benefit with respect to making DER data available to PC/TPs. Yet, smaller individual DER installations connected to DP systems can, in aggregate, have a significant impact on BES reliability.

2AG: Still maintains unreasonable compliance obligations + FN 5 - explain intent if no response from unregistered entity
The DT recognized the need for clarity in Footnote 5. As such, Footnotes 4 and 5 were modified and combined to address unreasonable compliance obligations. The Technical Rationale was also updated to clarify the DT intent.

2C: elimination of reactive power
The DT removed the reactive power capability in response to previous industry comments. A DER's reactive power operating characteristics can depend on many factors aside from the maximum capability, including the mode of reactive power control. For instance, if the DER is in

volt/var control mode, the distribution system loading, voltage regulation scheme, and impedance can all affect the DER's reactive power output. The Attachment 1 information provides a minimum baseline for information. The PC/TP may request additional information to make assumptions about aggregate DER reactive power operating characteristics.

The SDT should give consideration to paragraph 105 of FERC Order No. 901 which states that if distribution providers are unable to gather adequate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation. Southern supports the comments by EEI on potential implementation challenges.

Thank you for your comments. See response to EEI. 6B: FERC 901 reference to allow estimated data Consistent with what is described in FERC Order No. 901 and what already takes place with load demand, some level of estimation is anticipated as described in the Technical Rationale.	
Kinte Whitehead - Exelon - 3	
Answer	
Document Name	

Comment
Exelon concurs with the comments submitted by the EEI. Exelon suggests the drafting team consider allowing TP/PCs to establish a threshold for aggregate DER reporting. Certain types of DERs such as non-exporting, or DERs connected behind the meter as load offsetting DERs may not be of concern to the TP/PC should be exempt from DP/TO data collection and reporting requirements. Data collection and reporting requirements should focus on "front of meter" connected DERs who primarily export energy, or DERs participating in wholesale markets. Additionally, FERC Order 2222 will require some level of DER data reporting and modeling that may result in the proposed changes to MOD-032 becoming duplicative of, and in some cases in conflict with, obligations imposed by Order 2222.

Dislikes 0	

Response
Thank you for your comments. See response to EEI. 6N: Threshold needed - PC/TP discretion? (related to themes 1C, 2D and 3C) The DT consensus is that it is most appropriate to not include a threshold within the DER definition. NERC has recommended a zero MVA threshold for gathering DER information: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf It is expected that PC/TP procedures may specify thresholds and technical justification for inclusion of DER models (or not) in any particular study – this issue is more aligned with the SAR for TPL-001 that will be addressed in the second phase of this project 2022-02. A single threshold is not likely universally applicable. 6O: FERC 2222 coordination FERC 2222 may provide a different avenue for PC/TP obtaining needed data - care will be needed to not double count if that avenue is used (and PC/TP may need to adjust their data reporting requirements), but it's not clear how MOD-032-2 would conflict. The Technical Rationale already includes statements acknowledging these types of scenarios.

Answer	
Document Name	2022-02 Unofficial_Comment_Form_SRC_11-20-23_FINAL_as filed.docx

Comment

The SRC offers the following additional comments and recommendations:

Ensure consistency between Attachment 1, footnote 5 and steady-state item 9: The SRC is concerned that steady-state item 9 in Attachment 1 may not be consistent with footnote 5. Item 9 addresses instances in which DER is directly connected to a TO or DP, while footnote 5 addresses instances in which DER is not directly connected to a NERC-registered entity. Rather than addressing these topics in two separate locations, the SRC recommends that the drafting team ensure consistent language is used to describe each topic and consider addressing both topics in the same location, such as by moving relevant language from item 9 down to footnote 5.

The SRC recommends the SDT review and standardize its use of "DER" throughout the document. For example, MOD-032-2, Attachment 1, item 9 states:

Distributed Energy Resource (DER) data4 [DP, TO where DER is directly connected to the TO system and not through a DP (when DER is not associated with a registered DP)]5

However, this description of DER as "*DER is directly connected to the TO system and not through a DP*" appears to conflict with the DER definition (on page 2) which states: "*Generators and energy storage technologies connected to the Distribution Provider's system…*" To the extent a TO can also serve as a Distribution Provider and a DER is connected to the DP portion of a TO's system, there is no need to refer to that entity as a "TO" as the standard would apply to them as a DP.

Alternatively, if DERs can also be directly connected to a TO system, then the Distributed Energy Resource (DER) definition needs to be updated to reflect that as detailed below:

Generators and energy storage technologies connected to ***either a Transmission Owner's system or a*** *Distribution Provider's system that are capable of providing Real Power in non-isolated parallel operation with the Bulk Electric System.*

· Distribution Provider refers to the NERC glossary definition, not the NERC registered entity.

Stay within NERC's purview and require NERC-registered entities to provide DER information: To keep this project moving forward, the SRC recommends the SDT maintain its scope within NERC's regulatory purview. Requiring NERC registered entities to request information from non-registered entities as in Attachment 1, Footnote 5, moves the burden from entities that own and control the data to entities who do not own or control DER data. Entities are free to request information at any time without a standard. Using a mandatory standard to require an entity to request data is of little to no value. **The benefit of a mandatory standard lies in placing a requirement on the appropriate entity to provide the data**. Without a requirement on the providing entity, the data collected may be garbage and lead to poor modeling results; i.e. garbage in/garbage out.

As DERs proliferate, this increases the risk, administrative burden and cost on registered entities to expend time and energy on requesting and passing through DER data from unregistered entities that have no obligation to provide it ("pull" method). As non-registered entities have no obligation to provide the data or ensure its quality, this process may translate into a costly proposition that leads to poor modeling results. If the goal is to obtain quality data for modeling, NERC must ensure that it has the appropriate registration criteria and rules in place to require applicable NERC registered entities to provide it ("push" method) to modeling entities.

Footnote 5: *Where DER is connected to an unregistered Distribution Provider, the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information. An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider. This footnote is also applicable to item 10 under the "dynamics" column.*

Review the adequacy of Distribution Provider registration criteria. As noted in the **Technical Rationale for Reliability Standard MOD-032-2** and in Attachment 1, Footnote 5, the SRC observes that in some cases, the entity that owns and controls the DER information may not be a NERC-registered DP. In fact, in July 2018 NERC relaxed its Distribution Provider registration criteria which allowed certain entities to deregister as Distribution Providers,[1] thereby removing what would otherwise have been in place to compel a broader scope of entities to provide DER data.

To that end, NERC has the obligation to ensure all Distribution Providers with the ability to impact the reliability of the BES are registered. Therefore, NERC should verify whether its existing DP registration criteria is adequate to ensure reliable modeling. As with the registration of IBRs (where the approach proposed under Docket RD22-24-000 is expected to result in approximately 98% of BPS-connected IBR nameplate capacity being subject to applicable NERC Reliability Standards), existing DP registration requirements should likewise be made adequate to acquire needed DER information.

Although NERC may not be able to address this now, NERC should nonetheless commit to a plan to perform this validation as it would be helpful to know whether the existing registration criteria for a "Distribution Provider" is sufficient to capture a predominance of DERs. If not,

NERC could develop and implement a plan to register DPs that would close the gap. In this way, this effort will not delay the SDT from moving forward with proposed modifications to MOD-032-2 now, as acquiring some DER information now will provide substantial improvement in PC and TP studies.

Standardize the required level of aggregation: The SRC is concerned if the standard does not specify or standardize "the required level of aggregation" among PC/TPs. The reason for this is to ensure future compliance audits will have an established aggregation level and removes any ambiguity of "the required level of aggregation" between the PC/TP being audited and the auditor.

Footnote 4 "*The joint PC/TP modeling data requirements and reporting procedures developed per R1 will specify data flow processes and* ***the required level of aggregation****. The PC or TP may need to coordinate with the DP or TO to determine appropriate equivalent distribution system impedance.*"

Ensure comprehensive reporting: The SRC is concerned with the proposed written language as it allows a gap as to knowing whether or not the registered DP or non-registered DP is providing all information and data – leaving an unknown compliance responsibility. This is especially true for non-jurisdictional entities, where the data may be unverifiable (un-auditable) and would lead to additional compliance concerns. One possible remedy is to aggregate small generators of the same type, along with an optional MW threshold for reporting.

6I: Separate registration for TO with DER?/clarify TO obligation & FN5
Footnotes 4 and 5 were combined and modified to add clarity and a more detailed description of the DT intent was added to the Technical Rationale.

3B: Data accuracy
It is understood that modeling aggregate DER (based on collected data) will involve some assumptions (similar to modeling aggregate load response). The work of the SPIDERWG provides technical references and industry best practices: https://www.nerc.com/pa/Documents/DER_Quick%20Reference%20Guide.pdf.

2AG: Still maintains unreasonable compliance obligations + FN 5 - explain intent if no response from unregistered entity
The DT recognized the need for clarity in Footnote 5. As such, Footnotes 4 and 5 were modified and combined to address unreasonable compliance obligations. The Technical Rationale was also updated to clarify the DT intent.

The DP registration suggestion is aligned with DT statement in the Technical Rationale.

Related to 6S: standardized aggregation
The intent is not to require a detailed model for every single DER and the DT is not proposing any such requirement. However, DER data items proposed to be added to Attachment 1 are needed to assess the reliability impact of aggregate DER in system studies. Across the continent, there are variations of DER penetrations and preponderance of DER classes (some areas may have more residential rooftop solar, others may have more utility scale DER). Therefore, it is prudent to allow the PC/TP greater flexibility in determining the details regarding DER data requirements rather than being overly prescriptive in MOD-032. "Aggregate" was added to the DER data item in Attachment 1 to clarify the information that is expected to be included in the transmission model.

In Attachment 1 please capitalize “interconnection-wide” in the following sentence: “Data must be shareable on an **interconnection-wide** basis to support use in the **Interconnection-wide** cases.”

Did the SDT intend to have the TO(s) gather Item 1 in the “short circuit” column of the table in Attachment 1 for DERs (Item 9 in “steady-state” column)?

Has the SDT collaborated with Project 2022-04 EMT Modeling SAR team on any possible changes to MOD-032 that could be promoted now versus waiting to re-open MOD-032?

Attachment 1 Footnote 5- Determining the “next closest electrically connected entity” is very broad and subject to interpretation especially if deep within multiple jurisdictions (TO and DP or multiples of each). What mechanism is in place for registered DPs and TOs to ensure that

data is collected appropriately for a non-registered DP? "Appropriately" may mean avoiding a couple of scenarios---Accounted for twice or more (once by a TO AND once or more by one or more registered DPs) or not accounted for at all by either the DP or TO. Is the SDT leaving the determination of "next closest electrically connected entities" to the TP or PC?

Additionally, would recommend a footnote 5 (or 6) be added to Item 10 in the "dynamics" column to provide clarity versus referring to item 10 within the footnote itself.

For Item 9 in "steady-state" column (i.e., DER data). WECC would suggest changing "Generator type (solar, battery, etc.)" to be more reflective of the proposed definition of DER which starts out as "Generators and energy storage technologies…". Consider removing "Generator" from 9c and simply say "Type (solar, battery, etc.)"

The SDT should consider utilizing or correcting Glossary of Term usage within Table 1 to reflect "Real Power" and "Reactive Power" for all parts of the table to provide clarity.

Further comments for Question 1: The addition of the phrase "Distribution Provider refers to the NERC glossary definition, not the NERC registered entity" may cause confusion as the ROP definition of the registered entity (DP) is the same as the Glossary of Terms. SDT should further consider if a different term should be utilized to avoid some confusion. WECC appreciates the idea of trying to illustrate what the entity functions may be regardless of the determination for registration (and the ensuing obligation to NERC Reliability Standards construct if registered.)

ROP definition in Appendix 5b: "Provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage."

ROP definition in Appendix 2:" "Distribution Provider" means the entity that provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage.**"

Glossary of Terms Definition: "Provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage."

Thank you for your comments.
Interconnection is defined in the NERC glossary as:
“A geographic area in which the operation of Bulk Power System components is synchronized such that the failure of one or more of such components may adversely affect the ability of the operators of other components within the system to maintain Reliable Operation of the Facilities within their control. When capitalized, any one of the four major electric system networks in North America: Eastern, Western, ERCOT and Quebec.”

The DT believes that the use of non-capitalized “interconnection-wide” within MOD-032-1 may have been intentional; no change made.

Explicitly adding DER data to the "short circuit" column was outside the scope of this SAR. As noted in the Technical Rationale, the PC or TP is not restricted from requiring any needed short circuit data in their joint modeling data requirements and reporting procedures developed per R1.

The DT is aware of Project 2022-04. EMT model requirements are beyond the scope of this SAR. Ultimately, the Project 2022-04 team may propose EMT model data collection requirements. At this time, it is not clear that MOD-032 is an appropriate location for such requirements.

6D: issues with "next electrically closest" - need clarification
Footnotes 4 and 5 were combined and modified to eliminate the “next closest electrically connected” language and add clarity. A more detailed description of the DT intent was added to the Technical Rationale.

6P & 6Q: dynamics 10/steady state 9
DT addressed the issue with referring to Item 10 for dynamics within the footnote for item 9 in steady state.
Steady state Item 9 was modified to address the concern.

6R: Modify to Real/Reactive defined terms throughout?
Addressing the use of defined terms for Real Power and Reactive Power throughout MOD-032 is beyond the scope of this SAR. The DT believes that the usage of capitalized or non-capitalized terms may have been intentional.

1G: Confusion between glossary DP and registered DP The DT found that the confusion related to the NERC glossary definition for Distribution Provider and the NERC registration criteria was pre-existing. The DT attempted to clarify that use of "Distribution Provider" in the proposed DER definition is not referring to NERC registration. The use of the "Distribution Provider" within the standard without further specific explanation refers to the NERC registered entity. The DT added language in the Technical Rationale and also modified the proposed definition to clarify.

Black Hills Corporation agrees with other entities that Footnote 5 should be deleted. The "next closest electrically connected registered entity" DP, TO, or PC to an unregistered distribution provider, should not be held responsible for providing DER data outside of their control or ability to collect.

Comment	

Exelon concurs with the comments submitted by the EEI.

Exelon suggests the drafting team consider allowing TP/PCs to establish a threshold for aggregate DER reporting. Certain types of DERs such as non-exporting, or DERs connected behind the meter as load offsetting DERs may not be of concern to the TP/PC should be exempt from DP/TO data collection and reporting requirements. Data collection and reporting requirements should focus on "front of meter" connected DERs who primarily export energy, or DERs participating in wholesale markets.

Additionally, FERC Order 2222 will require some level of DER data reporting and modeling that may result in the proposed changes to MOD-032 becoming duplicative of, and in some cases in conflict with, obligations imposed by Order 2222.

6N: Threshold needed - PC/TP discretion? (related to themes 1C, 2D and 3C)
The DT consensus is that it is most appropriate to not include a threshold within the DER definition. NERC has recommended a zero MVA threshold for gathering DER information: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf
It is expected that PC/TP procedures may specify thresholds and technical justification for inclusion of DER models (or not) in any particular study – this issue is more aligned with the SAR for TPL-001 that will be addressed in the second phase of this project 2022-02. A single threshold is not likely universally applicable.

6O: FERC 2222 coordination

FERC 2222 may provide a different avenue for PC/TP obtaining needed data - care will be needed to not double count if that avenue is used (and PC/TP may need to adjust their data reporting requirements), but it's not clear how MOD-032-2 would conflict. The Technical Rationale already includes statements acknowledging these types of scenarios.

Transmission Owners who are not Distribution Providers likely have no knowledge or capability to provide data for planned demand or DER constituents served from the transmission system. Transmission Owner visibility for load demand is typically limited to historical telemetered MW and MVAR data. This finding, especially with regards to DERs, has already been well-documented. A key recommendation in the NERC Reliability and Security Technical Committee (RSTC) subcommittee approved the "Model Verification of Aggregate DER Models used in Planning Studies - Reliability Guideline" developed by the System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG) was:
