2. **Compliance Monitoring and Enforcement Program:** Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

3. **Potential Noncompliance (PNC) Abeyance Period:**
For a period of two years following the compliance date of Reliability Standard MOD-032-2 Requirement R2 under the associated implementation plan, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C to the Rules of Procedure for a failure to comply with Reliability Standard MOD-032-2 Requirement R2, Part 2.1 with respect to the provision of estimated aggregate DER data or estimated data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes against any entity acting in good faith to comply with the standard in accordance with the relevant implementation plan. "Good faith" in this context refers

to a sincere intention to comply with Reliability Standard MOD-032-2 regarding the provision of aggregate DER data or data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes in accordance with the data requirements and reporting procedures for the Planning Coordinator's planning area developed under Requirement R1, subject to the estimation requirements of Requirement R2, Part 2.1, following a reasonable and serious assessment by the entity in determining how this Reliability Standard should be applied to its particular facts and circumstances. Entities shall participate in any compliance monitoring activities undertaken by the CEA during this potential noncompliance abeyance period and submit documentation as requested.

Violation Severity Levels

MOD-032-2 – ATTACHMENT 1
Data Reporting Requirements

The table below indicates the information[1] that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in Interconnection-wide cases. The joint Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1 will specify entity responsibility and data flow processes. The typical functional entity[2] responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The data reported shall be identified by the bus number, name, and/or identifier that is assigned in conjunction with the Planning Coordinator, Transmission Owner, or Transmission Planner.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics**	**short circuit**
1. Each bus [TO] a. Nominal voltage b. Area, zone and owner 2. Aggregate Demand[3] [DP] a. Real and reactive power* b. In-service status* 3. Generating and storage units[4] [GO, TO[5], RP (for future planned resources only)] a. Real power capabilities - gross maximum and minimum values b. Reactive power capabilities - maximum and minimum values at real power capabilities in 3a above c. Station service auxiliary load for normal plant configuration (provide data in the same manner as that required for aggregate Demand under item 2, above). d. Regulated bus* and voltage set point* (as typically provided by the TOP) e. Machine MVA base	1. Generator [GO, RP (for future planned resources only)] 2. Excitation System [GO, RP (for future planned resources only)] 3. Governor [GO, RP (for future planned resources only)] 4. Power System Stabilizer [GO, RP (for future planned resources only)] 5. Aggregate Demand[3] [DP] 6. Wind plant model (for plants with type 1 and type 2 wind turbines) [GO] 7. Inverter-Based Resource [GO, TO[5]] a. Parameters, settings, or capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control 8. Static Var Systems and FACTS [GO, TO, DP] 9. DC System Models [TO] 10. Aggregate Distributed Energy Resource (DER) data[7] [DP, TO][6]	1. Provide for all applicable elements in column "steady-state" [GO, RP, TO, DP] a. Positive sequence data b. Negative sequence data c. Zero sequence data 2. Mutual Line Impedance Data [TO] 3. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics**	**short circuit**
f. Generator step up transformer data (provide same data as that required for transformer under item 6, below) g. Generator type (hydro, wind, fossil, solar, nuclear, etc.) h. In-service status* 4. AC Transmission Line or Circuit [TO] a. Impedance parameters (positive sequence) b. Susceptance (line charging) c. Ratings (normal and emergency)* d. In-service status* 5. DC Transmission Systems [TO] 6. Transformer (voltage and phase-shifting) [TO] a. Nominal voltages of windings b. Impedance(s) c. Tap ratios (voltage or phase angle)* d. Minimum and maximum tap position limits e. Number of tap positions (for both the ULTC and NLTC) f. Regulated bus (for voltage regulating transformers)* g. Ratings (normal and emergency)* h. In-service status* 7. Reactive compensation (shunt capacitors and reactors) [TO] a. Admittances (MVars) of each capacitor and reactor b. Regulated voltage band limits* (if mode of operation not fixed) c. Mode of operation (fixed, discrete, continuous, etc.) d. Regulated bus* (if mode of operation not fixed) e. In-service status* 8. Static Var Systems [TO] a. Reactive limits b. Voltage set point* c. Fixed/switched shunt, if applicable d. In-service status* 9. Aggregate Distributed Energy Resource (DER) data[7] [DP, TO][6] a. Location (bus from item 1)	a. parameters, settings, or capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control or information that can be used to infer those items for modeling purposes. b. Indication whether DERs are subject to tripping in conjunction with UFLS or UVLS. 11. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]	

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics**	**short circuit**
b. Real power capability c. DER type (solar, battery, diesel generator, etc.) 10. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]		

Attachment 1 Data Reporting Requirements Footnotes

1. Data specified in the sub-bullets of each column that are required for both steady-state and dynamics are not duplicated in the table.
2. For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Distribution Provider (DP), Generator Owner (GO), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).
3. For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 under Steady State Column that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. A Distribution Provider is the typical responsible entity for providing this information, generally through coordination with the Transmission Owner.
4. Generating and storage units include IBRs and synchronous condensers.
5. The Transmission Owner is the typical entity responsible for collecting and providing data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.
6. The Distribution Provider is the typical responsible entity for collecting and providing data for DERs connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider's system. The Transmission Owner is the typical responsible entity for collecting and providing data for DERs where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner's system.
7. Aggregation thresholds for DERs may be specified in the joint Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1.

MOD-032 Supporting Document

Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO)

The Unacceptable Models List is maintained separately by NERC as the ERO. This attachment describes the process by which changes may be made to the Unacceptable Models List.

The following steps shall be taken to add a model to or remove a model from the Unacceptable Models List:

1. Any person or entity may submit a request to the ERO to add or remove a model from the Unacceptable Models List. This request shall include, at a minimum:
    a. The model name;
    b. Alternative model name(s), if any;
    c. Organization(s) the submitting entity represents;
    d. Description of the model's stated intent;
    e. Request to add model as an "unacceptable" model or remove "unacceptable" model designation;
    f. Technical supporting documentation describing the ability or inability of the model to appropriately represent small and large disturbance behavior;
    g. Identification of any Confidential Information as defined in Section 1500 of the NERC Rules of Procedure; and
    h. An explanation, if any of the above technical support items are unavailable to the submitting entity.
2. ERO staff shall review and evaluate the information in the Unacceptable Models List change request, along with any group or subcommittee of the NERC Reliability and Security Technical Committee, or its successor (RSTC), charged with assisting in such reviews. If no such group or subcommittee has been identified, ERO staff may work with other industry subject matter experts as needed to review and evaluate the request.
3. ERO staff shall provide public notice that identifies the model being considered for addition to or removal from the list, includes a non-confidential summary of the rationale offered, and provides at least 30 days to submit comments.
4. The results of the ERO review and the recommended action shall be presented to the NERC RSTC in a duly noticed public meeting.
5. The NERC RSTC may recommend the NERC Vice President of Engineering and Standards approve the change request, reject the change request, or remand the application back to the ERO to work with the submitting entity. If the NERC RSTC recommends approving

the change request, the NERC RSTC shall also recommend an effective date for the change.

6. The NERC Vice President of Engineering and Standards, considering the recommendation of the NERC RSTC, shall approve the change request, reject the change request, or remand the application back to ERO staff to work with the submitting entity. If approved, the NERC Vice President of Engineering and Standards shall also determine the effective date for the change.
7. The ERO shall provide public notice of a change to the Unacceptable Models List along with the effective date of the change. The revised Unacceptable Models List shall be posted to the NERC website and filed with the applicable governmental authorities for informational purposes.

Version History

Version	Date	Action	Change Tracking
1	February 6, 2014	Adopted by the NERC Board of Trustees.	Developed to consolidate and replace MOD-010-0, MOD -011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1
1	May 1, 2014	FERC Order issued approving MOD-032-1.	See Implementation Plan posted on the Reliability Standards web page for details on enforcement dates for Requirements.
2	TBD	Adopted by the NERC Board of Trustees.	FERC Order No. 901 Revisions by Project 2022-02.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

MOD-032-2 is posted for a 34-day formal comment period with ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
(The above was Posted under IRPTF SAR pre–Order No. 901)	
30-day formal comment period with initial ballot	April 17 – May 16, 2025

Anticipated Actions	Date
34-day formal comment period with ballot	August 8 –September 10, 2025
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resource~~s~~ (DER): A ~~G~~generator~~s and~~or energy storage technology~~ies~~ connected to a distribution system that ~~are~~is capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including ~~those~~one connected behind the meter of an end-use customer that is supplied from a distribution system.

A. Introduction

1. **Title:** **Data for Power System Modeling and Analysis**

2. **Number:** **MOD-032-2**

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   ~~1.1.~~4.1. **Functional Entities:**

   - ~~1.1.1~~4.1.1 Balancing Authority
   - ~~1.1.2~~4.1.2 Distribution Provider
   - ~~1.1.3~~4.1.3 Generator Owner
   - ~~1.1.4~~4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as “Planning Coordinator”)
   - ~~1.1.5~~4.1.5 Resource Planner
   - ~~1.1.6~~4.1.6 Transmission Owner
   - ~~1.1.7~~4.1.7 Transmission Planner
   - ~~1.1.8~~4.1.8 Transmission Service Provider

5. **Effective Date:** See Implementation Plan for Project 2022-02.

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1, including the entity responsible ~~entity~~ for each required item.

~~**1.2.** Requirements for model submissions in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization (ERO).~~

~~**1.3.**~~**1.2.** Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

~~**1.3.1.**~~**1.2.1.** Data format;

~~**1.3.2.**~~**1.2.2.** Level of detail to which equipment shall be modeled;

~~**1.3.3.**~~**1.2.3.** Case types or scenarios to be modeled; and

~~**1.3.4.**~~**1.2.4.** A schedule for submission of data at least once every 13 calendar months.

~~**1.4.**~~**1.3.** Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

1.4. Specifications of the following items for dynamic model submissions:

1.4.1. Required submission of:

- standard library models incorporated within the software(s) utilized to create the Interconnection-wide case(s);
- user-defined models; or
- both standard library models and user-defined models.

1.4.2. Where user-defined models are accepted, usability requirements for any submitted user-defined models including, at a minimum, requirements to provide model documentation and instructions for model set up and use.

1.4.2.1. Each Planning Coordinator and Transmission Planner shall provide their user-defined model requirements within 90 calendar days of receiving a written request for such data from other Planning Coordinators and Transmission Planners within the Interconnection.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. If ~~the responsible~~a functional entity~~, as identified in Requirement R1 Part 1.1,~~ is required to provide data for one or more of the following and is unable to gather ~~unregistered Inverter-based Resource (IBR)[1] data or aggregate Distributed~~such data ~~and parameters and include~~, the functional entity shall provide an ~~explanation of the limitations~~estimate of the ~~availability of~~ data, an explanation of the limitations of ~~any~~the estimated data ~~provided~~, and the method used for estimation.

- Aggregate DER data; or
- Data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.

2.2. If a functional entity is required to provide dynamic models, the functional entity shall provide the models accepted by the Transmission Planner under MOD-026, where such models are available.

2.3. If a functional entity provides a model that is included on the Unacceptable Models List maintained by the ERO in accordance with the process described in the MOD-032 Supporting Document, the functional entity shall also provide a technical rationale justifying the use of that model.

M2. Each ~~registered~~functional entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying

[1] ~~As used in this standard, the phrase "unregistered IBR" refers to a Bulk-Power System connected IBR that does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.~~

Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data~~;~~, that is responsive to the technical concern.

3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each ~~registered~~ functional entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. **Compliance Monitoring Process**

   1.1. **Compliance Enforcement Authority:** "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

   1.2. **Evidence Retention:** The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

   The applicable entity shall keep data or evidence to show compliance as identified below unless ~~directive~~directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

   - Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

   If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

   The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

2. **Compliance Monitoring and Enforcement Program:** Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

3. **Potential Noncompliance (PNC) Abeyance Period:**
   For a period of two years following the compliance date of Reliability Standard MOD-032-2 Requirement R2 under the associated implementation plan, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C to the Rules of Procedure for a failure to comply with Reliability Standard MOD-032-2 Requirement R2 Part 2.1 with respect to the provision of estimated aggregate DER data or estimated data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes against any entity acting in good faith to comply with the standard in

accordance with the relevant implementation plan. “Good faith” in this context refers to a sincere intention to comply with Reliability Standard MOD-032-2 regarding the provision of aggregate DER data or data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes in accordance with the data requirements and reporting procedures for the Planning Coordinator’s planning area developed under Requirement R1, subject to the estimation requirements of Requirement R2 Part 2.1, following a reasonable and serious assessment by the entity in determining how this Reliability Standard should be applied to its particular facts and circumstances. Entities shall participate in any compliance monitoring activities undertaken by the CEA during this potential noncompliance abeyance period and submit documentation as requested.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include less than or equal to 25% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 25%, but less than or equal to 50% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 50%, but less than or equal to 75% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) did not develop any steady-state, dynamics, and short circuit modeling data requirements and reporting procedures required by Requirement R1; OR The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 75% of the required components specified in Requirement R1.

MOD-032-2 – ATTACHMENT 1
Data Reporting Requirements

The table below indicates the information[1] that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in Interconnection-wide cases. ~~A Planning Coordinator may specify additional information that includes specific information required for each item in the table below.~~ The joint Planning Coordinator ~~may~~/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1 will specify ~~additional information that includes specific information required for each item in the table below. Each~~entity responsibility and data flow processes. The typical functional entity[2] ~~typically~~ responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. ~~The joint Planning Coordinator /Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1 will specify the functional entity responsibility and data flow processes.~~ The data reported shall be identified by the bus number, name, and/or identifier that is assigned in conjunction with the Planning Coordinator, Transmission Owner, or Transmission Planner.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics**	**short circuit**
1. Each bus [TO] a. ~~n~~Nominal voltage b. ~~a~~Area, zone and owner 2. Aggregate Demand[3] [DP] a. ~~r~~Real and reactive power* b. ~~i~~In-service status* 3. Generating and storage units[4] [GO, TO[5], RP (for future planned resources only)] a. ~~r~~Real power capabilities - gross maximum and minimum values b. ~~r~~Reactive power capabilities - maximum and minimum values at real power capabilities in 3a above c. ~~s~~Station service auxiliary load for normal plant configuration (provide data in the same manner as that required for aggregate Demand under item 2, above).	1. Generator [GO, RP (for future planned resources only)] 2. Excitation System [GO, RP (for future planned resources only)] 3. Governor [GO, RP (for future planned resources only)] 4. Power System Stabilizer [GO, RP (for future planned resources only)] 5. Aggregate Demand[3] [DP] 6. Wind plant model (for plants with type 1 and type 2 wind turbines) [GO] 7. Inverter-Based Resource [GO, TO[5]] a. ~~IBR~~Parameters, settings, or capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control	1. c. ~~f~~Fixed/switched shunt, if applicable d. ~~i~~In-service status* 9. Aggregate Distributed Energy Resource (DER) data[7] [DP, TO][6] a. Location (bus from item 1) b. Real power capability c. DER type (solar, battery, diesel generator, etc.) 10. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]		

Attachment 1 Data Reporting Requirements Footnotes

1. Data specified in the sub-bullets of each column that are required for both steady-state and dynamics are not duplicated in the table.
2. For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Distribution Provider (DP), Generator Owner (GO), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).
3. For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 under Steady State Column that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. A Distribution Provider is the typical responsible entity for providing this information, generally through coordination with the Transmission Owner.
4. ~~This includes IBR,~~ Generating and storage units include IBRs and synchronous condensers~~, and pumped storage~~.
5. The Transmission Owner is the typical entity responsible ~~entity~~ for collecting and providing data for ~~unregistered IBRs~~an IBR that ~~are~~is not ~~DERs~~a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.
6. The Distribution Provider is the typical responsible entity for collecting and providing data for DERs connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider's system. The Transmission Owner is the typical responsible entity for collecting and providing data for DERs where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner's system.
7. Aggregation thresholds for DERs may be specified in the joint Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1.

MOD-032 Supporting Document

Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO)

The Unacceptable Models List is maintained separately by NERC as the ERO. This attachment describes the process by which changes may be made to the Unacceptable Models List.

The following steps shall be taken to add a model to or remove a model from the Unacceptable Models List:

1. Any person or entity may submit a request to the ERO to add or remove a model from the Unacceptable Models List. This request shall include, at a minimum:
    a. The model name;
    b. Alternative model name(s), if any;
    c. Organization(s) the submitting entity represents;
    d. Description of the model's stated intent;
    e. Request to add model as an "unacceptable" model or remove "unacceptable" model designation;
    f. Technical supporting documentation describing the ability or inability of the model to appropriately represent small and large disturbance behavior;
    g. Identification of any Confidential Information as defined in Section 1500 of the NERC Rules of Procedure; and
    h. An explanation, if any of the above technical support items are unavailable to the submitting entity.
2. ERO staff shall review and evaluate the information in the Unacceptable Models List change request, along with any group or subcommittee of the NERC Reliability and Security Technical Committee, or its successor (RSTC), charged with assisting in such reviews. If no such group or subcommittee has been identified, ERO staff may work with other industry subject matter experts as needed to review and evaluate the request.
3. ERO staff shall provide public notice that identifies the model being considered for addition to or removal from the list, includes a non-confidential summary of the rationale offered, and provides at least 30 days to submit comments.
4. The results of the ERO review and the recommended action shall be presented to the NERC RSTC in a duly noticed public meeting.

5. The NERC RSTC may recommend the NERC Vice President of Engineering and Standards approve the change request, reject the change request, or remand the application back to the ERO to work with the submitting entity. If the NERC RSTC recommends approving the change request, the NERC RSTC shall also recommend an effective date for the change.
6. The NERC Vice President of Engineering and Standards, considering the recommendation of the NERC RSTC, shall approve the change request, reject the change request, or remand the application back to ERO staff to work with the submitting entity. If approved, the NERC Vice President of Engineering and Standards shall also determine the effective date for the change.
7. The ERO shall provide public notice of a change to the Unacceptable Models List along with the effective date of the change. The revised Unacceptable Models List shall be posted to the NERC website and filed with the applicable governmental authorities for informational purposes.

Version History

Version	Date	Action	Change Tracking
1	February 6, 2014	Adopted by the NERC Board of Trustees.	Developed to consolidate and replace MOD-010-0, MOD -011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1
1	May 1, 2014	FERC Order issued approving MOD-032-1.	See Implementation Plan posted on the Reliability Standards web page for details on enforcement dates for Requirements.
2	TBD	Adopted by the NERC Board of Trustees.	FERC Order No. 901 Revisions by Project 2022-02.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

MOD-032-2 is posted for a 34-day formal comment period with ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
30-day formal comment period with initial ballot	April 17 – May 16, 2025

Anticipated Actions	Date
34-day formal comment period with ballot	August 8 –September 10, 2025
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resource (DER): A generators or energy storage technology connected to a distribution system that is capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including one connected behind the meter of an end-use customer that is supplied from a distribution system.

A. Introduction

1. **Title:** **Data for Power System Modeling and Analysis**

2. **Number:** **MOD-032-~~1~~2**

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   ~~1.1.~~**4.1.** **Functional Entities:**

   ~~1.1.1~~**4.1.1** Balancing Authority

   4.1.2 Distribution Provider

   ~~1.1.2~~**4.1.3** Generator Owner

   ~~**1.1.3** Load Serving Entity~~

   ~~1.1.4~~**4.1.4** Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

   ~~This proposed standard combines "Planning Authority" with "Planning Coordinator" in the list of applicable functional entities. The NERC Functional Model lists "Planning Coordinator" while the registration criteria list "Planning Authority," and they are not yet synchronized. Until that occurs, the proposed standard applies to both Planning Authority and Planning Coordinator.~~

   ~~1.1.5~~**4.1.5** Resource Planner

   ~~1.1.6~~**4.1.6** Transmission Owner

   ~~1.1.7~~**4.1.7** Transmission Planner

   ~~1.1.8~~**4.1.8** Transmission Service Provider

5. **Effective Date:** See Implementation Plan for Project 2022-02.

   ~~MOD-032-1, Requirement R1 shall become effective on the first day of the first calendar quarter that is 12 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, MOD-032-1, Requirement R1 shall become effective on the first day of the first calendar quarter that is 12 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

   ~~MOD-032-1, Requirements R2, R3, and R4 shall become effective on the first day of the first calendar quarter that is 24 months after the date that the standard is~~

approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, MOD-032-1, Requirements R2, R3, and R4 shall become effective on the first day of the first calendar quarter that is 24 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Background:

MOD-032-1 exists in conjunction with MOD-033-1, both of which are related to system-level modeling and validation. Reliability Standard MOD-032-1 is a consolidation and replacement of existing MOD-010-0, MOD-011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1, and it requires data submission by applicable data owners to their respective Transmission Planners and Planning Coordinators to support the Interconnection-wide case building process in their Interconnection. Reliability Standard MOD-033-1 is a new standard, and it requires each Planning Coordinator to implement a documented process to perform model validation within its planning area.

The transition and focus of responsibility upon the Planning Coordinator function in both standards are driven by several recommendations and FERC directives from FERC Order No. 693, which are discussed in greater detail in the rationale sections of the standards. One of the most recent and significant set of recommendations came from the NERC Planning Committee's System Analysis and Modeling Subcommittee (SAMS). SAMS proposed several improvements to the modeling data standards, to include consolidation of the standards (the SAMS whitepaper is available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here: http://www.nerc.com/comm/PC/Agendas%20Highlights%20and%20Minutes%20DL/2012/2012_Dec_PC%20Agenda.pdf).

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1, including the entity responsible for each required item.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

1.4. Specifications of the following items for dynamic model submissions:

1.4.1. Required submission of:

- standard library models incorporated within the software(s) utilized to create the Interconnection-wide case(s);
- user-defined models; or
- both standard library models and user-defined models.

1.4.2. Where user-defined models are accepted, usability requirements for any submitted user-defined models including, at a minimum, requirements to provide model documentation and instructions for model set up and use.

1.4.2.1. Each Planning Coordinator and Transmission Planner shall provide their user-defined model requirements within 90 calendar days of receiving a written request for such data from other Planning Coordinators and Transmission Planners within the Interconnection.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. If a functional entity is required to provide data for one or more of the following and is unable to gather such data, the functional entity shall provide an estimate of the data, an explanation of the limitations of the estimated data, and the method used for estimation.

- Aggregate DER data; or
- Data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.

2.2. If a functional entity is required to provide dynamic models, the functional entity shall provide the models accepted by the Transmission Planner under MOD-026, where such models are available.

2.3. If a functional entity provides a model that is included on the Unacceptable Models List maintained by the ERO in accordance with the process described in the MOD-032 Supporting Document, the functional entity shall also provide a technical rationale justifying the use of that model.

M2. Each ~~registered~~functional entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

~~2.1.~~3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data~~;~~, that is responsive to the technical concern.

~~3.1.~~3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each ~~registered~~functional entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance ~~with~~ as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

2. Compliance Monitoring and ~~Assessment Processes~~ Enforcement Program:
Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for ~~a list of~~performing compliance monitoring and ~~assessment processes~~enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

~~**1.3. Additional Compliance Information**~~

~~None~~

3. Potential Noncompliance (PNC) Abeyance Period:
For a period of two years following the compliance date of Reliability Standard MOD-032-2 Requirement R2 under the associated implementation plan, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C to the Rules of Procedure for a failure to comply with Reliability Standard MOD-032-2 Requirement R2 Part 2.1 with respect to the provision of estimated aggregate DER data or estimated data for

an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes against any entity acting in good faith to comply with the standard in accordance with the relevant implementation plan. “Good faith” in this context refers to a sincere intention to comply with Reliability Standard MOD-032-2 regarding the provision of aggregate DER data or data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes in accordance with the data requirements and reporting procedures for the Planning Coordinator’s planning area developed under Requirement R1, subject to the estimation requirements of Requirement R2 Part 2.1, following a reasonable and serious assessment by the entity in determining how this Reliability Standard should be applied to its particular facts and circumstances. Entities shall participate in any compliance monitoring activities undertaken by the CEA during this potential noncompliance abeyance period and submit documentation as requested.

~~Table of Compliance Elements~~

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include less than or equal to 25% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 25%, but less than or equal to 50% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 50%, but less than or equal to 75% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) ~~Coordinator~~ did not develop any steady-state, dynamics, and short circuit modeling data requirements and reporting procedures required by Requirement R1; OR The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 75% of the required components specified in Requirement R1.

R2.	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide less than or equal to 25% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but less than or equal to 25% of	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 25%, but less than or equal to 50% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 50%, but less than or equal to 75% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider did not provide any steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s); OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 75% of the required data specified in Attachment 1;

	the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in less than or equal to 15 calendar days after the specified date.	greater than 25%, but less than or equal to 50% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 15, but less than or equal to 30 calendar days after the specified date.	greater than 50%, but less than or equal to 75% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 30, but less than or equal to 45 calendar days after the specified date.	OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 75% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner, ~~Load Serving Entity,~~ Resource Planner, Transmission Owner or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its

MOD-032-2 – ATTACHMENT 1~~:~~

Data Reporting Requirements

The table below indicates the information[1] that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in ~~*the*~~ Interconnection-wide cases. ~~*A*~~The joint Planning Coordinator ~~*may*~~/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1 will specify ~~*additional information that includes specific information required for each item in the table below. Each*~~entity responsibility and data flow processes. The typical functional *entity*~~[1]~~[2] responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The data reported shall be ~~*as*~~ identified by the bus number, name, and/or identifier that is assigned in conjunction with the ~~*PC, TO*~~Planning Coordinator, Transmission Owner, or ~~*TP.*~~ Transmission Planner.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** ~~*(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*~~	**short circuit**
1. Each bus [TO] a. ~~n~~Nominal voltage b. ~~a~~Area, zone and owner 2. Aggregate Demand~~[3]~~[2] [~~LSE~~DP] a. ~~r~~Real and reactive power* b. ~~i~~In-service status*	1. Generator [GO, RP (for future planned resources only)] 2. Excitation System [GO, RP (for future planned resources only)] 3. Governor [GO, RP (for future planned resources only)] 4. Power System ~~S~~stabilizer [GO, RP(for future planned resources only)]	1. Provide for all applicable elements in column "steady-state" [GO, RP, TO, DP] a. Positive Sequence Data b. Negative Sequence Data c. Zero Sequence Data 2. Mutual Line Impedance Data [TO]

~~[1] For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Generator Owner (GO), Load Serving Entity (LSE), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).~~

~~[2] For purposes of this item, aggregate Demand is the Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus. A Load Serving Entity is responsible for providing this information, generally through coordination with the Transmission Owner.~~

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	dynamics ~~*(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*~~	short circuit

~~Guidelines and Technical Basis~~

~~For purposes of jointly developing steady-state, dynamics, and short circuit modeling data requirements and reporting procedures under Requirement R1, if a Transmission Planner (TP) and Planning Coordinator (PC) mutually agree, a TP may collect and aggregate some or all data from providing entities, and the TP may then provide that data directly to the PC(s) on behalf of the providing entities. The submitting entities are responsible for getting the data to both the TP and the PC, but nothing precludes them from arriving at mutual agreements for them to provide it to the TP, who then provides it to the PC. Such agreement does not relieve the submitting entity from responsibility under the standard, nor does it make the consolidating entity liable for the submitting entities' compliance under the standard (in essence, nothing precludes parties from agreeing to consolidate or act as a conduit to pass the data, and it is in fact encouraged in certain circumstances, but the requirement is aimed at the act of submitting the data). Notably, there is no requirement for the TP to provide data to the PC. The intent, in part, is to address potential concerns from entities that they would otherwise be responsible for the quality, nature, and sufficiency of the data provided by other entities.~~

~~The requirement in Part 1.3 to include specifications for distribution or posting of the data requirements and reporting procedures could be accomplished in many ways, to include posting on a Web site, distributing directly, or through other methods that the Planning Coordinator and each of its Transmission Planners develop.~~

~~An entity submitting data per the requirements of this standard who needs to determine the PC for the area, as a starting point, should contact the local Transmission Owner (TO) for information on the TO's PC. Typically, the PC will be the same for both the local TO and those entities connected to the TO's system. If this is not the case, the local TO's PC can typically provide contact information on other PCs in the area. If the entity (e.g., a Generator Owner [GO]) is requesting connection of a new generator, the entity can determine who the PC is for that area at the time a generator connection request is submitted. Often the TO and PC are the same entity, or the TO can provide information on contacting the PC. The entity should specify as the reason for the request to the TO that the entity needs to provide data to the PC according to this standard. Nothing in the proposed requirement language of this standard is intended to preclude coordination between entities such that one entity, serving only as a conduit, provides the other entity's data to the PC. This can be accomplished if it is mutually agreeable by, for example, the GO (or other entity), TP, and the PC. This does not, however, relieve the original entity from its obligations under the standard to provide data, nor does it pass on the compliance obligation of the entity. The original entity is still accountable for making sure that the data has been provided to the PC according to the requirements of this standard.~~

~~The standard language recognizes that differences exist among the Interconnections. Presently, the Eastern/Quebec and Texas Interconnections build seasonal cases on an annual basis, while the Western Interconnection builds cases on a continuous basis throughout the year. The intent of the standard is not to change established processes and procedures in each of the Interconnections, but to create a framework to support both what is already in place or what it may transition into in the future, and~~

~~to provide further guidance in a common platform for the collection of data that is necessary for the building of the Interconnection-wide case(s).~~

~~The construct that these standards replace did not specifically list which Functional Entities were required to provide specific data. Attachment 1 specifically identifies the entities responsible for the data required for the building of the Interconnection-wide case(s).~~

~~Rationale:~~

~~During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.~~

~~Rationale for R1:~~

~~This requirement consolidates the concepts from the original data requirements from MOD-011-0, Requirement R1, and MOD-013-0, Requirement R1. The original requirements specified types of steady-state and dynamics data necessary to model and analyze the steady-state conditions and dynamic behavior or response within each Interconnection. The original requirements, however, did not account for the collection of short-circuit data also required to perform short-circuit studies. The addition of short-circuit data also addresses the outstanding directive from FERC Order No. 890, paragraph 290.~~

~~In developing a performance-based standard that would address the data requirements and reporting procedures for model data, it was prohibitively difficult to account for all of the detailed technical concerns associated with the preparation and submittal of model data given that many of these concerns are dependent upon evolving industry modeling needs and software vendor terminology and product capabilities.~~

~~This requirement establishes the Planning Coordinator jointly with its Transmission Planners as the developers of technical model data requirements and reporting procedures to be followed by the data owners in the Planning Coordinator's planning area. FERC Order No. 693, paragraphs 1155 and 1162, also direct that the standard apply to Planning Coordinators. The inclusion of Transmission Planners in the applicability section is intended to ensure that the Transmission Planners are able to participate jointly in the development of the data requirements and reporting procedures.~~

~~This requirement is also consistent with the recommendations from the NERC System Analysis and Modeling Subcommittee (SAMS) White Paper titled "Proposed Improvements for NERC MOD Standards", available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here:~~

~~Aside from recommendations in support of strengthening and improving MOD-010 through MOD-015, the SAMS paper included the following suggested improvements:~~

~~1) reduce the quantity of MOD standards;~~
~~2) add short circuit data as a requirement to the MOD standards; and~~
~~3) supply data and models:~~
~~a. add requirement identifying who provides and who receives data;~~
~~b. identify acceptability;~~
~~c. standard format;~~
~~d. how to deal with new technologies (user written models if no standard model exists); and~~
~~e. shareability.~~

~~4) These suggested improvements are addressed by combining the existing standards into two new standards, one standard for the submission and collection of data, and one for the validation of the planning models. Adding the requirement for the submittal of short circuit data is also an improvement from the existing standards, consistent with FERC Order No. 890, paragraph 290. In supplying data, the approach clearly identifies what data is required and which Functional Entity is required to provide the data.~~

~~5) The requirement uses an attachment approach to support data collection. The attachment specifically lists the entities that are required to provide each type of data and the steady-state, dynamics, and short circuit data that is required.~~

~~6) Finally, the decision to combine steady-state, dynamics, and short circuit data requirements into one requirement rather than three reflects that they all support the requirement of submission of data in general.~~

~~Rationale for R2:~~

~~This requirement satisfies the directive from FERC Order No. 693, paragraph 1155, which directs that "the planning authority should be included in this Reliability Standard because the planning authority is the entity responsible for the coordination and integration of transmission facilities and resource plans, as well as one of the entities responsible for the integrity and consistency of the data."~~

~~Rationale for R3:~~

~~In order to maintain a certain level of accuracy in the representation of a power system, the data that is submitted must be correct, periodically checked, and updated. Data used to perform steady-state, dynamics, and short circuit studies can change, for example, as a result of new planned transmission construction (in comparison to as-built information) or changes performed during the restoration of the transmission network due to weather-related events. One set of data that changes on a more frequent basis is load data, and updates to load data are needed when new improved forecasts are created.~~

~~This requirement provides a mechanism for the Planning Coordinator and Transmission Planner (that does not exist in the current standards) to collect corrected data from the entities that have the data. It provides a feedback loop to address technical concerns related to the data when the Planning Coordinator or Transmission Planner identifies technical concerns, such as concerns about the usability of data or simply that the data is not in the correct format and cannot be used. The requirement also establishes a time-frame for response to address timeliness.~~

~~Rationale for R4:~~

~~This requirement will replace MOD-014 and MOD-015.~~

~~This requirement recognizes the differences among Interconnections in model building processes, and it creates an obligation for Planning Coordinators to make available data for its planning area.~~

~~The requirement creates a clear expectation that Planning Coordinators will make available data that they collect under Requirement R2 in support of their respective Interconnection-wide case(s). While different entities in each Interconnection create the Interconnection-wide case(s), the requirement to submit the data to the "ERO or its designee" supports a framework whereby NERC, in collaboration and agreement with those other organizations, can designate the appropriate organizations in each Interconnection to build the specific Interconnection-wide case(s). It does not prescribe a specific group or process to build the larger Interconnection-wide case(s), but only requires the Planning Coordinators to make available data in support of their creation, consistent with the SAMS Proposed Improvements to NERC MOD Standards (at page 3) that, "industry best practices and existing processes should be considered in the development of requirements, *as many entities are successfully coordinating their efforts.*" (Emphasis added).~~

~~This requirement is about the Planning Coordinator's obligation to make information available for use in the Interconnection-wide case(s); it is not a requirement to build the Interconnection-wide case(s).~~

~~For example, under current practice, the Eastern Interconnection Reliability Assessment Group (ERAG) builds the Eastern Interconnection and Quebec Interconnection-wide cases, the Western Electricity Coordinating Council (WECC) builds the Western Interconnection-wide cases, and the Electric Reliability Council of Texas (ERCOT) builds the Texas Interconnection-wide cases. This requirement does not require a change to that construct, and, assuming continued agreement by those organizations, ERAG, WECC, and ERCOT could be the "designee" for each Interconnection contemplated by this requirement. Similarly, the requirement does not prohibit transition, and the requirement remains for the Planning Coordinators to make available the information to the ERO or to whomever the ERO has coordinated with and designated as the recipient of such information for purposes of creation of each of the Interconnection–wide cases.~~

Attachment 1 Data Reporting Requirements Footnotes

1. Data specified in the sub-bullets of each column that are required for both steady-state and dynamics are not duplicated in the table.
2. For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Distribution Provider (DP), Generator Owner (GO), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).
3. For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 under Steady State Column that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. A Distribution Provider is the typical responsible entity for providing this information, generally through coordination with the Transmission Owner.
4. Generating and storage units include IBRs, and synchronous condensers.
5. The Transmission Owner is the typical entity responsible for collecting and providing data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.
6. The Distribution Provider is the typical responsible entity for collecting and providing data for DERs connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider's system. The Transmission Owner is the typical responsible entity for collecting and providing data for DERs where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner's system.
7. Aggregation thresholds for DERs may be specified in the joint Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1.

MOD-032 Supporting Document

Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO)

The Unacceptable Models List is maintained separately by NERC as the ERO. This attachment describes the process by which changes may be made to the Unacceptable Models List.

The following steps shall be taken to add a model to or remove a model from the Unacceptable Models List:

1. Any person or entity may submit a request to the ERO to add or remove a model from the Unacceptable Models List. This request shall include, at a minimum:
    a. The model name;
    b. Alternative model name(s), if any;
    c. Organization(s) the submitting entity represents;
    d. Description of the model's stated intent;
    e. Request to add model as an "unacceptable" model or remove "unacceptable" model designation;
    f. Technical supporting documentation describing the ability or inability of the model to appropriately represent small and large disturbance behavior;
    g. Identification of any Confidential Information as defined in Section 1500 of the NERC Rules of Procedure; and
    h. An explanation, if any of the above technical support items are unavailable to the submitting entity.
2. ERO staff shall review and evaluate the information in the Unacceptable Models List change request, along with any group or subcommittee of the NERC Reliability and Security Technical Committee, or its successor (RSTC), charged with assisting in such reviews. If no such group or subcommittee has been identified, ERO staff may work with other industry subject matter experts as needed to review and evaluate the request.
3. ERO staff shall provide public notice that identifies the model being considered for addition to or removal from the list, includes a non-confidential summary of the rationale offered, and provides at least 30 days to submit comments.
4. The results of the ERO review and the recommended action shall be presented to the NERC RSTC in a duly noticed public meeting.

5. The NERC RSTC may recommend the NERC Vice President of Engineering and Standards approve the change request, reject the change request, or remand the application back to the ERO to work with the submitting entity. If the NERC RSTC recommends approving the change request, the NERC RSTC shall also recommend an effective date for the change.
6. The NERC Vice President of Engineering and Standards, considering the recommendation of the NERC RSTC, shall approve the change request, reject the change request, or remand the application back to ERO staff to work with the submitting entity. If approved, the NERC Vice President of Engineering and Standards shall also determine the effective date for the change.
7. The ERO shall provide public notice of a change to the Unacceptable Models List along with the effective date of the change. The revised Unacceptable Models List shall be posted to the NERC website and filed with the applicable governmental authorities for informational purposes.

Version History

Version	Date	Action	Change Tracking
1	February 6, 2014	Adopted by the NERC Board of Trustees.	Developed to consolidate and replace MOD-010-0, MOD -011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1
1	May 1, 2014	FERC Order issued approving MOD-032-1.	See Implementation Plan posted on the Reliability Standards web page for details on enforcement dates for Requirements.
2	TBD	Adopted by the NERC Board of Trustees.	FERC Order No. 901 Revisions by Project 2022-02.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the second draft of the proposed standard for a formal 34-day comment period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
30-day formal comment period with initial ballot	April 17 – May 16, 2025

Anticipated Actions	Date
25-day formal comment period with ballot	August 8 –September 10, 2025
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

A. Introduction

1. **Title:** Reliability Coordinator Data and information Specification and Collection
2. **Number:** IRO-010-6
3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact reliability, by ensuring each Reliability Coordinator has the data and information it needs to plan, monitor and assess the operation of its Reliability Coordinator Area.
4. **Applicability:**
   - **4.1.** Reliability Coordinator
   - **4.2.** Balancing Authority
   - **4.3.** Generator Owner
   - **4.4.** Generator Operator
   - **4.5.** Transmission Operator
   - **4.6.** Transmission Owner
   - **4.7.** Distribution Provider
5. **Effective Date:** See Implementation Plan for Project 2022-02.

B. Requirements

R1. The Reliability Coordinator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include, but not be limited to: *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification as deemed necessary by the Reliability Coordinator.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1 Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints.

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide data and information that includes, but is not limited to:

1.5.1 Specific deadlines or periodicity in which data and information is to be provided;

1.5.2 Performance criteria for the availability and accuracy of data and information, as applicable;

1.5.3 Requirements for model submissions to be consistent with the model submitted for planning purposes, as applicable;

1.5.4 Provisions to update or correct data and information, as applicable or necessary;

1.5.5 A mutually agreeable format; and

1.5.6 A mutually agreeable method(s) for securely transferring data and information.

M1. The Reliability Coordinator shall make available its dated, current, in force documented specification(s) for data and information.

R2. The Reliability Coordinator shall distribute its data and information specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

M2. The Reliability Coordinator shall make available evidence that it has distributed its specification(s) to entities that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. This evidence could include, but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or email records.

R3. Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall satisfy the obligations of the documented specifications. *(Violation Risk Factor: Medium) (Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations)*

M3. The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall make available evidence that it satisfied the obligations of the documented specification using the specified criteria. Such evidence could include, but is not limited to electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain its dated, current, in force documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R1, Measure M1 as well as any documents in force since the last compliance audit.
- The Reliability Coordinator shall keep evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R2 and Measure M2.
- Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R3 and Measurement M3.

1.3. Compliance Monitoring and Enforcement Program:
"Compliance Monitoring and Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower	Moderate	High	Severe
R1	The Reliability Coordinator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Reliability Coordinator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
For the Requirement R2 VSLs only, the intent of the drafting team is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				

R#	Violation Severity Levels			
	Lower	Moderate	High	Severe
R2	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, and Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to four or more entities, or more than 15% of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R3	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications, but failed to meet one of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications, but failed to meet two of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications, but failed to meet any of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 did not satisfy the obligations of the documented specifications.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the second draft of the proposed standard for a formal 34-day comment period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
30-day formal comment period with initial ballot	April 17 – May 16, 2025

Anticipated Actions	Date
25-day formal comment period with ballot	August 8 –September 10, 2025
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

A. Introduction

1. **Title:** Reliability Coordinator Data and information Specification and Collection
2. **Number:** IRO-010-6
3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact reliability, by ensuring each Reliability Coordinator has the data and information it needs to plan, monitor and assess the operation of its Reliability Coordinator Area.
4. **Applicability:**
   - **4.1.** Reliability Coordinator
   - **4.2.** Balancing Authority
   - **4.3.** Generator Owner
   - **4.4.** Generator Operator
   - **4.5.** Transmission Operator
   - **4.6.** Transmission Owner
   - **4.7.** Distribution Provider
5. **Effective Date:** See Implementation Plan for Project 2022-02

B. Requirements

R1. The Reliability Coordinator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include but not be limited to: *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification as deemed necessary by the Reliability Coordinator.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1 Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints.

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide data and information that includes, but is not limited to:

1.5.1 Specific deadlines or periodicity in which data and information is to be provided;

1.5.2 Performance criteria for the availability and accuracy of data and information, as applicable;

1.5.3 Requirements for model submissions to be consistent with the model submitted for planning purposes~~in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization~~, as applicable;

1.5.4 Provisions to update or correct data and information, as applicable or necessary;

1.5.5 A mutually agreeable format; and

1.5.6 A mutually agreeable method(s) for securely transferring data and information.

M1. The Reliability Coordinator shall make available its dated, current, in force documented specification(s) for data and information.

R2. The Reliability Coordinator shall distribute its data and information specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

M2. The Reliability Coordinator shall make available evidence that it has distributed its specification(s) to entities that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. This evidence could include, but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or email records.

R3. Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall satisfy the obligations of the documented specifications. *(Violation Risk Factor: Medium) (Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations)*

M3. The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, ~~Reliability Coordinator,~~ Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall make available evidence that it satisfied the obligations of the documented specification using the specified criteria. Such evidence could include, but is not limited to electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain its dated, current, in force documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R1, Measure M1 as well as any documents in force since the last compliance audit.
- The Reliability Coordinator shall keep evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R2~~,~~ and Measure M2.
- Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R3 and Measurement M3.

1.3. Compliance Monitoring and Enforcement Program:
"Compliance Monitoring and Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower	Moderate	High	Severe
R1	The Reliability Coordinator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Reliability Coordinator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
For the Requirement R2 VSLs only, the intent of the DT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				

R#	Violation Severity Levels			
	Lower	Moderate	High	Severe
R2	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, and Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to four or more entities, or more than 15% of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R3	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet one of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet two of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet any of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 did not satisfy the obligations of the documented specifications.

45-day formal comment period with additional ballot	August 27 – October 10, 2024
30-day formal comment period with initial ballot	April 17 – May 16, 2025

Anticipated Actions	Date
25-day formal comment period with ballot	August 8 –September 10, 2025
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

A. Introduction

1. **Title:** Reliability Coordinator Data and information Specification and Collection

2. **Number:** IRO-010-~~5~~6

3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact reliability, by ensuring each Reliability Coordinator has the data and information it needs to plan, monitor and assess the operation of its Reliability Coordinator Area.

4. **Applicability:**

   4.1. Reliability Coordinator

   4.2. Balancing Authority

   4.3. Generator Owner

   4.4. Generator Operator

   4.5. Transmission Operator

   4.6. Transmission Owner

   4.7. Distribution Provider

5. **Effective Date:** See Implementation Plan for Project ~~2021-06.~~2022-02.

B. Requirements

R1. The Reliability Coordinator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include but not be limited to: *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification as deemed necessary by the Reliability Coordinator.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1 Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints.

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide data and information that includes, but is not limited to~~.~~:

1.5.1 Specific deadlines or periodicity in which data and information is to be provided;

1.5.2 Performance criteria for the availability and accuracy of data and information, as applicable;

1.5.3 Requirements for model submissions to be consistent with the model submitted for planning purposes, as applicable;

~~**1.5.3**~~**1.5.4** Provisions to update or correct data and information, as applicable or necessary~~.~~;

~~**1.5.4**~~**1.5.5** A mutually agreeable format~~.~~; and

~~1.5.5~~1.5.6 A mutually agreeable method(s) for securely transferring data and information.

M1. The Reliability Coordinator shall make available its dated, current, in force documented specification(s) for data and information.

R2. The Reliability Coordinator shall distribute its data and information specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

M2. The Reliability Coordinator shall make available evidence that it has distributed its specification(s) to entities that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. This evidence could include, but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or ~~e-mail~~email records.

R3. Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall satisfy the obligations of the documented specifications. *(Violation Risk Factor: Medium) (Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations)*

M3. The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, ~~Reliability Coordinator,~~ Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall make available evidence that it satisfied the obligations of the documented specification using the specified criteria. Such evidence could include, but is not limited to electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" ~~(CEA)~~ means NERC or the Regional Entity~~, or any entity as otherwise designated by an Applicable Governmental Authority,~~ in their respective roles of monitoring and~~/or~~ enforcing compliance with the ~~mandatory and enforceable~~NERC Reliability Standards ~~in their respective jurisdictions~~.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the ~~CEA~~Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain its dated, current, in force documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R1, Measure M1 as well as any documents in force since the last compliance audit.
- The Reliability Coordinator shall keep evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R2~~,~~ and Measure M2.
- Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R3 and Measurement M3.

1.3. Compliance Monitoring and Enforcement Program:
~~As defined in the NERC Rules of Procedure,~~ "Compliance Monitoring and Enforcement Program" ~~refers~~or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the ~~identification~~NERC Rules of Procedure) or the Commission-approved program of ~~the processes~~a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that ~~will be used to evaluate data or~~

~~information~~is responsible for ~~the purpose of assessing performance or outcomes~~performing compliance monitoring and enforcement activities with ~~the associated reliability standard~~respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower	Moderate	High	Severe
R1.	The Reliability Coordinator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Reliability Coordinator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
For the Requirement R2 VSLs only, the intent of the ~~SDT~~DT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				

R#	Violation Severity Levels			
	Lower	Moderate	High	Severe
R2.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, and Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to four or more entities, or more than 15% of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R3.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet one of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet two of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet any of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 did not satisfy the obligations of the documented specification.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the second draft of the proposed standard for a formal 34-day comment period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
30-day formal comment period with initial ballot	April 17 – May 16, 2025

Anticipated Actions	Date
34-day formal comment period with ballot	August 8 –September 10, 2025
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

A. Introduction

1. **Title:** Transmission Operator and Balancing Authority Data and Information Specification and Collection

2. **Number:** TOP-003-8

3. **Purpose:** To ensure that each Transmission Operator and Balancing Authority has the data and information it needs to plan, monitor, and assess the operation of its Transmission Operator Area or Balancing Authority Area.

4. **Applicability:**

   4.1 Functional Entities:

   4.1.1 Transmission Operator

   4.1.2 Balancing Authority

   4.1.3 Generator Owner

   4.1.4 Generator Operator

   4.1.5 Transmission Owner

   4.1.6 Distribution Provider

5. **Effective Date:** See Implementation Plan for Project 2022-02.

B. Requirements and Measures

R1. Each Transmission Operator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification as deemed necessary by the Transmission Operator.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1. Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide the data and information that includes, at a minimum, the following:

1.5.1. Specified deadlines or periodicity in which data and information is to be provided;

1.5.2. Performance criteria for the availability and accuracy of data and information as applicable;

1.5.3. Requirements for model submissions to be consistent with the model submitted for planning purposes, as applicable;

1.5.4. Provisions to update or correct data and information, as applicable or necessary;

1.5.5. A mutually agreeable format;

1.5.6. Mutually agreeable method(s) for securely transferring data and information.

M1. Each Transmission Operator shall make available its dated, current, in force documented specification(s) for data and information.

R2. Each Balancing Authority shall maintain documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. The data specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

2.1. A list of data and information needed by the Balancing Authority to support its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments, including non-Bulk Electric System data and information, IBR-specific data and parameters, and external network data and information, as deemed necessary by the Balancing Authority, and identification of the entity responsible for responding to the specification.

2.2. Provisions for notification of current Protection System and Remedial Action Scheme status or degradation that impacts System reliability.

2.3. Provisions for notification of BES generating unit(s) status during local forecasted cold weather to include:

2.3.1. Operating limitations based on:

2.3.1.1. capability and availability;

2.3.1.2. fuel supply and inventory concerns;

2.3.1.3. fuel switching capabilities; and

2.3.1.4. environmental constraints.

2.3.2. Generating unit(s) minimum:

2.3.2.1. design temperature; or

2.3.2.2. historical operating temperature; or

2.3.2.3. current cold weather performance temperature determined by an engineering analysis.

2.4. Identification of a mutually agreeable process in resolving conflicts;

2.5. Methods for the entity identified in Part 2.1 to provide data and information that includes at a minimum the following:

2.5.1. Specific deadlines or periodicity in which data and information is to be provided;

2.5.2. Performance criteria for the availability and accuracy of data and

information, as applicable;

2.5.3. Requirements for model submissions to be consistent with the model submitted for planning purposes, as applicable;

2.5.4. Provisions to update or correct data and information, as applicable or necessary.

2.5.5. A mutually agreeable format.

2.5.6. A mutually agreeable method(s) for securely transferring data and information.

M2. Each Balancing Authority shall make available its dated, current, in force documented specification(s) for data and information.

R3. Each Transmission Operator shall distribute its data and information specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M3. Each Transmission Operator shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or email records.

R4. Each Balancing Authority shall distribute its data and information specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. Each Balancing Authority shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, or email records.

R5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a data and information specification(s) in Requirement R3 or R4 shall satisfy the obligations of the documented specifications. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall make available evidence that it has satisfied the obligations

of the documented specification. Such evidence could include, but is not limited to, electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority (CEA) may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Transmission Operator shall retain its dated, current, in force, documented specification for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R1 and Measurement M1 as well as any documents in force since the last compliance audit.
- Each Balancing Authority shall retain its dated, current, in force, documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R2 and Measurement M2, as well as any documents in force since the last compliance audit.
- Each Transmission Operator shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R3 and Measurement M3.
- Each Balancing Authority shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R4 and Measurement M4.
- Each Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of

the documented specifications in accordance with Requirement R5 and Measurement M5.

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Transmission Operator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Transmission Operator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R2	The Balancing Authority did not include two or fewer of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include three of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include four of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include any of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. OR, The Balancing Authority did not have a documented specification(s) for the data and information necessary for it to perform its analysis functions,

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				Real-time monitoring, and Near-Term Energy Reliability Assessments.
For the Requirement R3 and R4 VSLs only, the intent of the drafting team is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				
R3	The Transmission Operator did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R4	The Balancing Authority did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term	The Balancing Authority did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time	The Balancing Authority did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability	The Balancing Authority did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
	Energy Reliability Assessments.	monitoring, and Near-Term Energy Reliability Assessments.	Assessments.	
R5	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet one of the parts in Requirement R1, Part1.5 or Requirement R2, Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet two of the parts in Requirement R1, Part 1.5 or Requirement R2, Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet three or more of the parts in Requirement R1, Part 1.5 or Requirement R2, Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 did not satisfy the obligations of the documented specifications.

Board adoption	October 14, 2025

A. Introduction

1. **Title:** Transmission Operator and Balancing Authority Data and Information Specification and Collection

2. **Number:** TOP-003-8

3. **Purpose:** To ensure that each Transmission Operator and Balancing Authority has the data and information it needs to plan, monitor, and assess the operation of its Transmission Operator Area or Balancing Authority Area.

4. **Applicability:**

   4.1 Functional Entities:

   4.1.1 Transmission Operator

   4.1.2 Balancing Authority

   4.1.3 Generator Owner

   4.1.4 Generator Operator

   4.1.5 Transmission Owner

   4.1.6 Distribution Provider

5. **Effective Date:** See Implementation Plan for Project 2022-02.

B. Requirements and Measures

R1. Each Transmission Operator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification as deemed necessary by the Transmission Operator.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1. Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide the data and information that includes, at a minimum, the following:

1.5.1. Specified deadlines or periodicity in which data and information is to be provided;

1.5.2. Performance criteria for the availability and accuracy of data and information as applicable;

1.5.3. Requirements for model submissions ~~in accordance~~to be consistent with the ~~Criteria~~model submitted for ~~Acceptable Models maintained by the Electric Reliability Organization~~ planning purposes, as applicable;

1.5.4. Provisions to update or correct data and information, as applicable or necessary;

1.5.5. A mutually agreeable format;

1.5.6. Mutually agreeable method(s) for securely transferring data and information.

M1. Each Transmission Operator shall make available its dated, current, in force documented specification(s) for data and information.

R2. Each Balancing Authority shall maintain documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. The data specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

2.1. A list of data and information needed by the Balancing Authority to support its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments, including non-Bulk Electric System data and information, IBR-specific data and parameters, and external network data and information, as deemed necessary by the Balancing Authority, and identification of the entity responsible for responding to the specification.

2.2. Provisions for notification of current Protection System and Remedial Action Scheme status or degradation that impacts System reliability.

2.3. Provisions for notification of BES generating unit(s) status during local forecasted cold weather to include:

2.3.1. Operating limitations based on:

2.3.1.1. capability and availability;

2.3.1.2. fuel supply and inventory concerns;

2.3.1.3. fuel switching capabilities; and

2.3.1.4. environmental constraints.

2.3.2. Generating unit(s) minimum:

2.3.2.1. design temperature; or

2.3.2.2. historical operating temperature; or

2.3.2.3. current cold weather performance temperature determined by an engineering analysis.

2.4. Identification of a mutually agreeable process in resolving conflicts;

2.5. Methods for the entity identified in Part 2.1 to provide data and information that includes at a minimum the following:

2.5.1. Specific deadlines or periodicity in which data and information is to be provided;

2.5.2. Performance criteria for the availability and accuracy of data and information, as applicable;

2.5.3. Requirements for model submissions ~~in accordance~~to be consistent with the ~~Criteria~~model submitted for ~~Acceptable Models maintained by the ERO~~planning purposes, as applicable;

2.5.4. Provisions to update or correct data and information, as applicable or necessary.

2.5.5. A mutually agreeable format.

2.5.6. A mutually agreeable method(s) for securely transferring data and information.

M2. Each Balancing Authority shall make available its dated, current, in force documented specification(s) for data and information.

R3. Each Transmission Operator shall distribute its data and information specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M3. Each Transmission Operator shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or email records.

R4. Each Balancing Authority shall distribute its data and information specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. Each Balancing Authority shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, or email records.

R5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a data and information specification(s) in Requirement R3 or R4 shall satisfy the obligations of the documented specifications. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall make available evidence that it has satisfied the obligations of the documented specification. Such evidence could include, but is not limited to,

electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority (CEA) may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Transmission Operator shall retain its dated, current, in force, documented specification for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R1 and Measurement M1 as well as any documents in force since the last compliance audit.
- Each Balancing Authority shall retain its dated, current, in force, documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R2 and Measurement M2, as well as any documents in force since the last compliance audit.
- Each Transmission Operator shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R3 and Measurement M3.
- Each Balancing Authority shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R4 and Measurement M4.
- Each Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of

the documented specifications in accordance with Requirement R5 and Measurement M5.

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Transmission Operator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Transmission Operator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R2	The Balancing Authority did not include two or fewer of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include three of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include four of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include any of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. OR, The Balancing Authority did not have a documented specification(s) for the data and information necessary for it to perform its analysis functions,

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				Real-time monitoring, and Near-Term Energy Reliability Assessments.
For the Requirement R3 and R4 VSLs only, the intent of the ~~Drafting Team (DT)~~ drafting team is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				
R3	The Transmission Operator did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R4	The Balancing Authority did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term	The Balancing Authority did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time	The Balancing Authority did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability	The Balancing Authority did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
	Energy Reliability Assessments.	monitoring, and Near-Term Energy Reliability Assessments.	Assessments.	
R5	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet one of the parts in Requirement R1, Part1.5 or Requirement R2, Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet two of the parts in Requirement R1, Part 1.5 or Requirement R2, Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet three or more of the parts in Requirement R1, Part 1.5 or Requirement R2, Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 did not satisfy the obligations of the documented specifications.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the second draft of the proposed standard for a formal 34-day comment period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
30-day formal comment period with initial ballot	April 17 – May 16, 2025

Anticipated Actions	Date
34-day formal comment period with ballot	August 8 –September 10, 2025
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

A. Introduction

1. **Title:** Transmission Operator and Balancing Authority Data and Information Specification and Collection

2. **Number:** TOP-003-~~7~~8

3. **Purpose:** To ensure that each Transmission Operator and Balancing Authority has the data and information it needs to plan, monitor, and assess the operation of its Transmission Operator Area or Balancing Authority Area.

4. **Applicability:**

   4.1 Functional Entities:

   4.1.1 Transmission Operator

   4.1.2 Balancing Authority

   4.1.3 Generator Owner

   4.1.4 Generator Operator

   4.1.5 Transmission Owner

   4.1.6 Distribution Provider

5. **Effective Date:** See Implementation Plan for Project 2022-~~03~~02.

B. Requirements and Measures

R1. Each Transmission Operator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification as deemed necessary by the Transmission Operator.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1. Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide the data and information that includes, at a minimum, the following~~.~~:

1.5.1. Specified deadlines or periodicity in which data and information is to be provided;

1.5.2. Performance criteria for the availability and accuracy of data and information as applicable;

1.5.3. Requirements for model submissions to be consistent with the model submitted for planning purposes, as applicable;

~~**1.5.3.**~~**1.5.4.** Provisions to update or correct data and information, as applicable or necessary;

~~**1.5.4.**~~**1.5.5.** A mutually agreeable format;

~~1.5.5.~~1.5.6. Mutually agreeable method(s) for securely transferring data and information.

M1. Each Transmission Operator shall make available its dated, current, in force documented specification(s) for data and information.

R2. Each Balancing Authority shall maintain documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. The data specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

2.1. A list of data and information needed by the Balancing Authority to support its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments, including non-Bulk Electric System data and information, IBR-specific data and parameters, and external network data and information, as deemed necessary by the Balancing Authority, and identification of the entity responsible for responding to the specification.

2.2. Provisions for notification of current Protection System and Remedial Action Scheme status or degradation that impacts System reliability.

2.3. Provisions for notification of BES generating unit(s) status during local forecasted cold weather to include:

2.3.1. Operating limitations based on:

2.3.1.1. capability and availability;

2.3.1.2. fuel supply and inventory concerns;

2.3.1.3. fuel switching capabilities; and

2.3.1.4. environmental constraints.

2.3.2. Generating unit(s) minimum:

2.3.2.1. design temperature; or

2.3.2.2. historical operating temperature; or

2.3.2.3. current cold weather performance temperature determined by an engineering analysis.

2.4. Identification of a mutually agreeable process in resolving conflicts;

2.5. Methods for the entity identified in Part 2.1 to provide data and information that includes at a minimum the following~~.~~:

2.5.1. Specific deadlines or periodicity in which data and information is to be provided;

2.5.2. Performance criteria for the availability and accuracy of data and information, as applicable;

2.5.3. Requirements for model submissions to be consistent with the model

submitted for planning purposes, as applicable;

~~2.5.3.~~2.5.4. Provisions to update or correct data and information, as applicable or necessary.

~~2.5.4.~~2.5.5. A mutually agreeable format.

~~2.5.5.~~2.5.6. A mutually agreeable method(s) for securely transferring data and information.

M2. Each Balancing Authority shall make available its dated, current, in force documented specification(s) for data and information.

R3. Each Transmission Operator shall distribute its data and information specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M3. Each Transmission Operator shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or ~~e-mail~~email records.

R4. Each Balancing Authority shall distribute its data and information specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. Each Balancing Authority shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, or ~~e-mail~~email records.

R5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a data and information specification(s) in Requirement R3 or R4 shall satisfy the obligations of the documented specifications. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall make available evidence that it has satisfied the obligations of the documented specification. Such evidence could include, but is not limited to, electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority (CEA) may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

~~Each responsible~~The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its ~~CEA~~Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Transmission Operator shall retain its dated, current, in force, documented specification for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R1 and Measurement M1 as well as any documents in force since the last compliance audit.
- Each Balancing Authority shall retain its dated, current, in force, documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R2 and Measurement M2, as well as any documents in force since the last compliance audit.
- Each Transmission Operator shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R3 and Measurement M3.
- Each Balancing Authority shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R4 and Measurement M4.
- Each Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall retain evidence

for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R5 and Measurement M5.

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Transmission Operator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Transmission Operator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R2	The Balancing Authority did not include two or fewer of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include three of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include four of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include any of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. OR, The Balancing Authority did not have a documented specification(s) for the data and information necessary for it to perform its analysis functions,

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				Real-time monitoring, and Near-Term Energy Reliability Assessments.
For the Requirement R3 and R4 VSLs only, the intent of the ~~Standard~~ Drafting Team (~~SDT~~DT) is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				
R3	The Transmission Operator did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R4	The Balancing Authority did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term	The Balancing Authority did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time	The Balancing Authority did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability	The Balancing Authority did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
	Energy Reliability Assessments.	monitoring, and Near-Term Energy Reliability Assessments.	Assessments.	
R5	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet one of the parts in Requirement R1 Part1.5 or Requirement R2 Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet two of the parts in Requirement R1 Part 1.5 or Requirement R2 Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet three or more of the parts in Requirement R1 Part 1.5 or Requirement R2 Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 did not satisfy the obligations of the documented specifications.

Project 2022-02 Uniform Modeling Framework for IBR

Applicable Standard(s)

- Reliability Standard MOD-032-2 Data for Power System Modeling and Analysis
- Reliability Standard IRO-010-6 Reliability Coordinator Data and information Specification and Collection
- Reliability Standard TOP-003-8 Transmission Operator and Balancing Authority Data and Information Specification and Collection

Requested Retirement(s)

- Reliability Standard MOD-032-1 Data for Power System Modeling and Analysis
- Reliability Standard IRO-010-5 Reliability Coordinator Data and information Specification and Collection
- Reliability Standard TOP-003-7 Transmission Operator and Balancing Authority Data and Information Specification and Collection

Prerequisite Standard(s)

These standard(s) or definitions must be approved before the Applicable Standard becomes effective:

- None

Applicable Entities

- See subject standards

Glossary of Terms used in NERC Reliability Standards

This section includes a newly defined term used in the NERC Reliability Standards. The new definition listed below becomes approved when the proposed standard is approved. When the standard becomes effective, the defined term will be removed from the individual standard and added to the NERC Glossary.

Proposed New Definition:

Distributed Energy Resource (DER):

A generator or energy storage technology connected to a distribution system that is capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including one connected behind the meter of an end-use customer that is supplied from a distribution system.

Background

As the penetration of DERs continues to increase across the many distribution systems connected both directly and indirectly to the North American Bulk-Power System (BPS), it is necessary to account for the potential impacts of DERs on reliability in the planning, operation, and design of the BPS. The NERC System Planning Impacts of Distributed Energy Resources Working Group (SPIDERWG) has identified the need for improved modeling of aggregate DERs for planning studies (including both utility-scale and retail-scale DERs) conducted by Transmission Planners (TPs) and Planning Coordinators (PCs), including updated modeling data requirements specific to DERs.

Further, in Order No. 901,[1] the U.S. Federal Energy Regulatory Commission ("FERC") found that it is imperative for NERC to develop new or modified Reliability Standards to address reliability concerns "related to IBRs at all stages of interconnection, planning, and operations."[2]. Among other things, FERC directed NERC to develop requirements addressing the provision of IBR and DER data to the entities responsible for the planning and operation of the BPS. Detailed information on the specific FERC Order No. 901 directives addressed through this project is available in Project 2022-02 Consideration of Order No. 901 Directives.

Proposed Reliability Standard MOD-032-2 replaces Load-Serving Entity with Distribution Provider as an applicable entity. Data items specific to IBRs and DERs were added to Attachment 1: Data Reporting Requirements, consistent with addressing the FERC Order No. 901 directives. Proposed Reliability Standard MOD-032-2 also adds a new Part 1.4 in Requirement R1, which would require the Planning Coordinator and Transmission Planner to specify submission of standard library dynamic models, user-defined models or both. Allowing the specification of standard library models incorporated within modeling software is responsive to FERC concerns about usability and allows PCs to maintain current requirements for generic models that may be necessary for the creation of large Interconnection-wide base cases. Allowing the specification of user-defined models is responsive to industry feedback expressed during the NERC Industry Engagement workshops. New Requirement R1, Part 1.4.2 is responsive to FERC concerns about model usability and non-convergence by requiring PCs and TPs that accept user-defined models to specify usability requirements and require appropriate model documentation and instructions. New Requirement R2, Part 2.1 addresses estimation of unregistered IBR or DER data where actual data is not available, consistent with the directives in Order No. 901. New Requirement R2, Part 2.2 addresses the provision of dynamic models accepted under the MOD-026 standard, and new Requirement R2, Part 2.3 requires any entity submitting a model included on the Unacceptable Model List maintained by the ERO to include a technical rationale with its submission supporting the use of the model. Altogether, these modifications establish a uniform modeling framework that incorporates both IBR and DER data and facilitates model accuracy in alignment with FERC Order No. 901.

[1] Reliability Standards to Address Inverter-Based Resources, Order No. 901, 185 FERC ¶ 61,042 (2023).
[2] Id. at P 25

Revisions in the Reliability Standards TOP-003-8 and IRO-010-6 data specification standards specify that entities responsible for developing and distributing data specifications shall include requirements for model submissions consistent with the model submitted for planning purposes, as applicable.

General Considerations

In developing this implementation plan, the drafting team (DT) considered the time that would be necessary to update modeling data requirements and reporting procedures for MOD-032-2, including identifying the proper reporting entity for modeling data related to IBRs (including IBRs that are not DERs and do not meet the criteria that would require the owner(s) to register with NERC for mandatory Reliability Standards compliance purposes) and aggregate DERs. The DT also considered that the standard would become applicable to the Distribution Provider (DP) for the first time. During the 24 months prior to the effective date of Requirement R1, the applicable entities would be expected to participate in PC/TP processes to change the modeling data reporting requirements related to IBRs and aggregate DERs and should be able to start working on data collection processes and methods. The applicable entities in Requirement R2 would then have an additional 12 months to complete and implement data collection prior to the compliance dates of Requirements R2, R3, and R4. This timeline also allows for the development of new data estimation processes developed under MOD-032-2 Requirement R2, Part 2.1 and for the development of technical rationale to support the use of models included on the Unacceptable Model List maintained by the ERO, where applicable. Requirements adjusted in Reliability Standards IRO-010-6 and TOP-003-8 may not be practical to implement prior to full implementation of MOD-032-2, and therefore were set to the same implementation timeline. One additional limitation the DT considered is the requirement for all FERC Order No. 901 directives to be fully implemented by January 1, 2030, including those to be addressed by future standard revisions that may be dependent upon the implementation of these standard revisions.

In summary, this implementation plan would provide a full 36 months for MOD-032 Requirements R2, R3, R4, IRO-010, and TOP-003 from FERC approval until data is required to be reported under the revised requirements. During the phased-in compliance period for Requirements R2-R4, entities shall continue to provide data and perform other required actions in accordance with specifications developed under Reliability Standard MOD-032-1, unless entities are able to comply with the revised requirements sooner.

Effective Date and Phased-In Compliance Dates

The effective date for the proposed Reliability Standard and NERC Glossary term Distributed Energy Resource is provided below. Where the DT identified the need for a longer implementation period for compliance with a particular section of a proposed Reliability Standard (i.e., an entire Requirement or a portion thereof), the additional time for compliance with that section is specified below. The phased-in compliance date for those particular sections represents the date that entities must begin to comply with that particular section of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

Reliability Standard MOD-032-2

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for Reliability Standard MOD-032-2 Requirements R2, R3, and R4

Entities shall not be required to comply with Requirements R2, R3, and R4 relating to revised Planning Coordinator and Transmission Planner data requirements and reporting procedures developed under MOD-032-2 Requirement R1 and Attachment 1 until 12 months after the effective date of Reliability Standard MOD-032-2.

During the phased-in compliance period, entities shall continue to comply with Requirements R2, R3, and R4 related to Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under MOD-032-1 Requirement R1 and Attachment 1 unless they are compliant with revised Planning Coordinator/Transmission Planner data requirements and reporting procedures under Reliability Standard MOD-032-2 Requirement R1.

Definition – Distributed Energy Resource (DER)

Where approval by an applicable governmental authority is required, the definition of Distributed Energy Resource (DER) shall become effective on the first day of the first calendar quarter that is after the effective date of the applicable governmental authority's order approving Reliability Standard MOD-032-2, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the definition shall become effective on the first day of the first calendar quarter that is after the date that Reliability Standard MOD-032-2 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Reliability Standard IRO-010-6

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Reliability Standard TOP-003-8

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Retirement Date

Reliability Standard MOD-032-1

Reliability Standard MOD-032-1 shall be retired immediately prior to the effective date of Reliability Standard MOD-032-2 in the particular jurisdiction in which the revised standard is becoming effective.

Reliability Standard IRO-010-5

Reliability Standard IRO-010-5 shall be retired immediately prior to the effective date of Reliability Standard IRO-010-6 in the particular jurisdiction in which the revised standard is becoming effective.

Reliability Standard TOP-003-7

Reliability Standard TOP-003-7 shall be retired immediately prior to the effective date of Reliability Standard TOP-003-8 in the particular jurisdiction in which the revised standard is becoming effective.

Glossary of Terms used in NERC Reliability Standards

This section includes a newly defined term used in the NERC Reliability Standards. The new definition listed below becomes approved when the proposed standard is approved. When the standard becomes effective, the defined term will be removed from the individual standard and added to the NERC Glossary ~~of Terms~~.

Proposed New Definition:
Distributed Energy Resource (DER):
A ~~G~~generators ~~and~~ or energy storage technology~~ies~~ connected to a distribution system that ~~are~~is capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including ~~those~~one connected behind the meter of an end-use customer that is supplied from a distribution system.

Background

As the penetration of DERs continues to increase across the many distribution systems connected both directly and indirectly to the North American Bulk-Power System (BPS), it is necessary to account for the potential impacts of DERs on reliability in the planning, operation, and design of the ~~Bulk Electric System.~~BPS. The NERC System Planning Impacts of Distributed Energy Resources Working Group (SPIDERWG) has identified the need for improved modeling of aggregate DERs for planning studies (including both utility-scale and retail-scale DERs) conducted by Transmission Planners (TPs) and Planning Coordinators (PCs), including updated modeling data requirements specific to DERs.

Further, in Order No. 901,[1] the U.S. Federal Energy Regulatory Commission ("FERC") found that it is imperative for NERC to develop new or modified Reliability Standards ~~MOD-032, IRO-010, and TOP-003~~ to address reliability concerns "related to IBRs at all stages of interconnection, planning, and operations."[2]. Among other things, FERC directed NERC to develop requirements addressing the provision of IBR and DER data to the entities responsible for the planning and operation of the BPS. Detailed information on the specific FERC Order No. 901 directives addressed through this project is available in Project 2022-02 Consideration of Order No. 901 Directives.

Proposed Reliability Standard MOD-032-2 replaces ~~the~~ Load-Serving Entity ~~as an applicable entity~~ with ~~the~~ Distribution Provider ~~and updates~~as an applicable entity. Data items specific to IBRs and DERs were added to Attachment 1: Data Reporting Requirements ~~with data specific to DERs and IBRs~~, consistent with addressing the FERC Order No. 901 directives. Proposed Reliability Standard MOD-032-2 also adds a new Part 1.~~2~~4 in Requirement R1, which would require the Planning Coordinator and Transmission Planner to ~~include in their data requirements~~specify submission of standard library dynamic models, user-defined models or both. Allowing the specification of standard library models incorporated within modeling software is responsive to FERC concerns about usability and

[1] Reliability Standards to Address Inverter-Based Resources, Order No. 901, 185 FERC ¶ 61,042 (2023).
[2] Id. at P 25

~~procedures~~allows PCs to maintain current requirements for generic models that may be necessary for the creation of large Interconnection-wide base cases. Allowing the specification of user-defined models is responsive to industry feedback expressed during the NERC Industry Engagement workshops. New Requirement R1, Part 1.4.2 is responsive to FERC concerns about model ~~submissions in accordance with the Criteria for Acceptable Models maintained~~usability and non-convergence by ~~the Electric Reliability Organization (ERO).~~requiring PCs and TPs that accept user-defined models to specify usability requirements and require appropriate model documentation and instructions. New Requirement R2, Part 2.1 addresses estimation of unregistered IBR or DER data where actual data is not available, consistent with the directives in Order No. 901. New Requirement R2, Part 2.2 addresses the provision of dynamic models accepted under the MOD-026 standard, and new Requirement R2, Part 2.3 requires any entity submitting a model included on the Unacceptable Model List maintained by the ERO to include a technical rationale with its submission supporting the use of the model. Altogether, these modifications establish a uniform modeling framework that incorporates both IBR and DER data and facilitates model accuracy in alignment with FERC Order No. 901.

Revisions in the Reliability Standards TOP-003-8 and IRO-010-6 data specification standards specify that entities responsible for developing and distributing data specifications shall include requirements for model submissions ~~in accordance~~consistent with the ~~Criteria~~model submitted for ~~Acceptable Models List maintained by the ERO~~planning purposes, as applicable.

General Considerations

In developing this implementation plan, the drafting team (DT) considered the time ~~in MOD-032-2~~ that would be necessary to ~~develop~~update modeling data requirements and reporting procedures for MOD-032-2, including identifying the proper reporting entity~~,~~ for modeling data related to IBRs~~,~~ (including ~~unregistered~~ IBRs that are not DERs and do not meet the criteria that would require the owner(s) to register with NERC for mandatory Reliability Standards compliance purposes) and aggregate DERs. The DT also considered that the standard would become applicable to the Distribution Provider (DP) for the first time. ~~Transmission Owners (TOs) and DPs~~During the 24 months prior to the effective date of Requirement R1, the applicable entities would be expected to participate in PC/TP processes to change the modeling data reporting requirements related to ~~DER and IBR developed during the 24 months prior to the effective date of Requirement R1~~IBRs and aggregate DERs and should be able to start working on data collection processes and methods. The applicable entities in Requirement R2 would then have an additional 12 months to complete and implement data collection prior to the compliance dates of Requirements R2, R3, and R4. This timeline also allows for the development of new data estimation processes developed under MOD-032-2 Requirement R2, Part 2.1~~.~~ and for the development of technical rationale to support the use of models included on the Unacceptable Model List maintained by the ERO, where applicable. Requirements adjusted in Reliability Standards IRO-010-~~5~~6 and TOP-003-8 may not be practical to implement prior to full implementation of MOD-032-2, and therefore ~~was~~were set to the same implementation timeline. One additional limitation the DT ~~noted~~considered is the requirement for all FERC Order No. 901 directives to be fully implemented by January 1, 2030, including those ~~covered by~~to be addressed by

future standard revisions that may be dependent upon the implementation of these standard revisions.

In summary, this implementation plan would provide a full 36 months for MOD-032 Requirements R2, R3, R4, IRO-010, and TOP-003 from FERC approval until data is required to be reported~~.~~ under the revised requirements. During the phased-in compliance period for Requirements R2-R4, entities shall continue to provide data and perform other required actions in accordance with specifications developed under Reliability Standard MOD-032-1, unless entities are able to comply with the revised requirements sooner.

Effective Date and Phased-In Compliance Dates

The effective date for the proposed Reliability Standard and NERC Glossary term Distributed Energy Resource is provided below. Where the DT identified the need for a longer implementation period for compliance with a particular section of a proposed Reliability Standard (i.e., an entire Requirement or a portion thereof), the additional time for compliance with that section is specified below. The phased-in compliance date for those particular sections represents the date that entities must begin to comply with that particular section of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

~~Initial Performance Dates~~

~~Entities shall not be required to comply with Reliability Standard MOD-032-2 Requirements R2, R3, and R4 relating to revised Planning Coordinator/Transmission Planner data requirements and reporting procedures as developed under Requirement R1 and Attachment 1, until 12 months after the effective date of Reliability Standard MOD-032-2.~~

~~Entities shall continue to comply with Requirements R2, R3, and R4 related to Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under MOD-032-1 Requirement R1 and Attachment 1 during the phased-in compliance period for MOD-032-2 unless they are compliant with revised Planning Coordinator/Transmission Planner data requirements and reporting procedures under Reliability Standard MOD-032-2 Requirement R1.~~

Reliability Standard MOD-032-2

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for Reliability Standard MOD-032-2 Requirements R2, R3, and R4

Entities shall not be required to comply with Requirements R2, R3, and R4 relating to revised Planning Coordinator and Transmission Planner data requirements and reporting procedures developed under MOD-032-2 Requirement R1 and Attachment 1 until 12 months after the effective date of Reliability Standard MOD-032-2.

During the phased-in compliance period, entities shall continue to comply with Requirements R2, R3, and R4 related to Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under MOD-032-1 Requirement R1 and Attachment 1 unless they are compliant with revised Planning Coordinator/Transmission Planner data requirements and reporting procedures under Reliability Standard MOD-032-2 Requirement R1.

Definition – Distributed Energy Resource (DER)

Where approval by an applicable governmental authority is required, the definition of ~~DER~~Distributed Energy Resource (DER) shall become effective on the first day of the first calendar quarter that is after the effective date of the applicable governmental authority's order approving Reliability Standard MOD-032-2, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the definition shall become effective on the first day of the first calendar quarter that is after the date that Reliability Standard MOD-032-2 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Reliability Standard IRO-010-~~5~~6

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Reliability Standard TOP-003-8

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Retirement Date

Reliability Standard MOD-032-1

Reliability Standard MOD-032-1 shall be retired immediately prior to the effective date of Reliability Standard MOD-032-2 in the particular jurisdiction in which the revised standard is becoming effective.

Reliability Standard IRO-010-~~4~~5

Reliability Standard IRO-010-~~4~~5 shall be retired immediately prior to the effective date of Reliability Standard IRO-010-~~5~~6 in the particular jurisdiction in which the revised standard is becoming effective.

Reliability Standard TOP-003-7

Reliability Standard TOP-003-7 shall be retired immediately prior to the effective date of Reliability Standard TOP-003-8 in the particular jurisdiction in which the revised standard is becoming effective.

Background Information

As the penetration of distributed energy resources (DERs) continues to increase across the many distribution systems connected both directly and indirectly to the North American Bulk-Power System (BPS), it is necessary to account for the potential impacts of DERs on reliability in the planning, operation, and design of the Bulk Electric System (BES). The North American Electric Reliability Corporation (NERC) System Planning Impacts of Distributed Energy Resources Working Group (SPIDERWG) has identified the need for improved modeling of aggregate DER for planning studies (including both utility-scale and retail-scale DER) conducted by Transmission Planners (TPs) and Planning Coordinators (PCs), including updated modeling data requirements specific to DER.

Further, in Order No. 901 issued October 2023, The Federal Energy Regulatory Commission (FERC) directed the development of Reliability Standards to address concerns "related to Inverter-based Resources (IBRs) at all stages of Interconnection, planning, and operations." (Id. at P 25). Among other things, FERC directed NERC to develop requirements addressing the provision of IBR and DER data to the entities responsible for the planning and operation of the BPS. More information on the specific FERC Order No. 901 directives addressed through this project is available in the Project 2022-02 Consideration of Order No. 901 Directives.

Based on comments received from Draft 1 posting, the drafting team (DT) updated MOD-032-2 to incorporate requirement language from the ERO Acceptable Models List Criteria Document. The ERO Acceptable Model Lists Criteria Document has been renamed ERO Unacceptable Models List, and the process as to how documents are added or removed has been added to the MOD-032-2 Standard as a Supporting Document. The ERO Unacceptable Models List itself will be posted on the NERC website for entities to locate whenever needed. Requirement R1, Part 1.4 was added to draft 2 for the PC and TP to specify submission of standard library dynamic models, user-written models, or both. Allowing the specification of standard library models incorporated within modeling software is responsive to FERC concerns about usability and allows PCs to maintain current requirements for generic models that may be necessary for the creation of large interconnection-wide base cases. Allowing the specification of user-written models is responsive to industry feedback expressed during the NERC Industry Engagement workshops. The DT also explicitly ensured the PC and TP authority require submission of both model types, if deemed necessary. Requirement R1, Part 1.4.2 is responsive to FERC concerns about model

usability and non-convergence by requiring PCs and TPs that accept user-written models to specify usability requirements and require appropriate model documentation and instructions.

In addition, the DT worked on Requirement R2, Part 2.1 estimation language based on feedback received. Requirement R2 was modified to require estimation of modeling data if the Responsible entity (typically the Transmission Owner or Distribution Provider) is unable to gather required data. FERC Order 901 requires the provision of data related to unregistered-IBR and IBR-DER that in the aggregate have a material impact on the BPS.[1] If the data is estimated, Requirement R2, Part 2.1 also requires the entity to provide an explanation of the limitations of the estimated data and the method used for estimation in line with the Order 901 directives[2]. The requirement language intentionally uses the phrase "unable to gather" to mirror the FERC Order 901 language. Limitations of the estimated data is intended to capture both limitations of the availability of data (including instances where there are legal or contractual prohibitions on requesting certain data, no mechanism to enforce collection, or incomplete records of what is connected), and limitations of any data provided (including partially missing or suspect data). Further, the addition of compliance abeyance language for the estimation process provides entities the opportunity to hone their estimation process without risk of penalty (provided they proceed in good faith). The approach directed by FERC is flexible as to whether the underlying unregistered IBR and DER data originates from interconnection documentation, measured quantities, estimated quantities, or other sources. Data availability or sufficiency issues, among other factors, may lead to the Distribution Provider and Transmission Owner applying a combination of approaches to source the data. The PC and TP modeling data requirements and reporting procedures should identify acceptable methods and their application.

Lastly, revisions in the Reliability Standards TOP-003-8 and IRO-010-6 data specification standards specify that entities responsible for developing and distributing data specifications shall include requirements for model submissions consistent with the model submitted for planning purposes, as applicable.

[1] FERC Order 901 at P104 and P105

[2] FERC Order 901 P104: "if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation."

Questions

1. Do you agree with the proposed MOD-032-2 modifications? If you do not support the modifications made, please provide rationale and proposed language on how you would address the FERC Order 901 directives.

   ☐ Yes
   ☐ No

   Comments:

2. Do you agree with the proposed IRO-010-6 and TOP-003-8 modifications? If you do not support the modifications made, please provide rationale and proposed language on how you would address the FERC Order 901 directives.

   ☐ Yes
   ☐ No

   Comments:

3. Do you agree that the modifications for the proposed reliability standards (MOD-032-2, IRO-010-6, and TOP-003-8) address the scope of the standard authorization request (SAR) in a cost-effective manner? If you do not agree, please provide alternatives that would address the SAR scope in a more cost-effective manner.

   ☐ Yes
   ☐ No

   Comments:

4. Do you agree with the proposed ERO Unacceptable Models List? If you do not agree, please provide alternative language and explain the rationale that, if made, would result in your support.

   ☐ Yes
   ☐ No

   Comments:

5. Provide any additional comments for the drafting team to consider, if desired.

Violation Risk Factor and Violation Severity Level Justifications

Project 2022-02 Uniform Modeling Framework for IBR

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in Project 2022-02 Uniform Modeling Framework for Inverter-Based Resources (IBRs). Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in the Federal Energy Regulatory Commission (FERC)-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The drafting team applied the following North American Electric Reliability Corporation (NERC) criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on a Single Violation, not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

MOD-032-2

VRF Justification for MOD-032-2, Requirement R1

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard. The modifications made to Requirement R1 require model submission in accordance with the Criteria for Acceptable Models maintained by the ERO. This is similar to other sub-requirements in Requirements R1; therefore, the VRF remained a low.

VSL Justification for MOD-032-2, Requirement R1

Please refer to the VSL table below.

VRF Justification for MOD-032-2, Requirement R2

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard. “Load Serving Entity” was replaced with “Distribution Provider” from Requirement R2 in MOD-032-2. In addition, Requirement R2 added a sub-requirement requiring if entity is unable to gather unregistered IBR data or Distributed Energy Resource (DER) data to complete an estimate. These modifications align with the medium risk requirement and therefore, the VRF remained medium.

VSL Justification for MOD-032-2, Requirement R2

Please refer to the VSL table located below**.**

VRF Justification for MOD-032-2, Requirement R3

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard. The modifications made to Requirement R3 were administrative in nature; therefore, the VRF remained a low.

VSL Justification for MOD-032-2, Requirement R3

Please refer to the VSL table located below**.**

VRF Justification for MOD-032-2, Requirement R4

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R4

The VSL did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSLs for MOD-032-1, Requirement 1			
Lower	**Moderate**	**High**	**Severe**
The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include less than or equal to 25% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 25%, but less than or equal to 50% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 50%, but less than or equal to 75% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) did not develop any steady-state, dynamics, and short circuit modeling data requirements and reporting procedures required by Requirement R1; OR The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 75% of the required components specified in Requirement R1.

VSL Justifications for MOD-032-1, Requirement 1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement was modified by adding an additional sub-requirement to Requirement R1. The proposed VSL was modified to reflect the additional sub-requirement. It does not have an unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The updated sub-requirement requires the responsible entity to follow the Criteria for Acceptable Models document maintained by the Electric Reliability Organization. The VSLs are not binary and do not contain ambiguous language.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement; therefore, it is consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VSLs for MOD-032-1, Requirement 2			
Lower	**Moderate**	**High**	**Severe**
The Balancing Authority, Distribution Provider, Generator Owner Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide less than or equal to 25% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but less than or equal to 25% of the required data failed to meet data format, shareability, level	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 25%, but less than or equal to 50% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 25%, but less than or equal to 50% of the required data failed to meet data format,	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 50%, but less than or equal to 75% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 50%, but less than or equal to 75% of the required data failed to meet data format,	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider did not provide any steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s); OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 75% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner,

of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in less than or equal to 15 calendar days after the specified date.	shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 15, but less than or equal to 30 calendar days after the specified date.	shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 30, but less than or equal to 45 calendar days after the specified date.	Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 75% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 45 calendar days after the specified date.

VSL Justifications for MOD-032-1, Requirement 2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	"Load Serving Entity" was replaced with "Distribution Provider" from Requirement R2 and a sub-requirement was added requiring if entity is unable to gather unregistered IBR data or DER data to complete an estimate. The proposed VSL was modified to reflect the additional sub-requirement language. It does not have an unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The updated sub-requirement requires the entity if it is unable to gather unregistered IBR data or DER data to complete an estimate. The VSLs are not binary and do not contain ambiguous language.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement; therefore, it is consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VSLs for MOD-032-1, Requirement 3			
Lower	**Moderate**	**High**	**Severe**
The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response within 105 calendar days (or within 15 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response within greater than 105 calendar days, but less than or equal to 120 calendar days (or within greater than 15 calendar days, but less than or equal to 30 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response within greater than 120 calendar days, but less than or equal to 135 calendar days (or within greater than 30 calendar days, but less than or equal to 45 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R3 within 135 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).

VSL Justifications for MOD-032-1, Requirement 3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement was modified by replacing Load Serving Entity with Distribution provider. The proposed VSL was modified to reflect this modification. It does not have an unintended consequence of lowering the level of compliance.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Technical Rationale

NERC Project 2022-02 | MOD-032-2, TOP-003-8, and IRO-010-6
August 2025

MOD-032-2 – Data for Power System Modeling and Analysis

Rationale for Applicability Section

For MOD-032-2, Load-Serving Entity (LSE) was replaced with Distribution Provider (DP) because of the removal of LSEs from the NERC registry criteria. It should be noted that Generator Owner (GO) applicability includes both Category 1 GO and Category 2 GO consistent with proposed revisions to the definitions of those terms developed under Project 2024-01 Rules of Procedure Definitions Alignment.

Additionally, the drafting team (DT) reviewed the dual applicability to Planning Authority (PA) and Planning Coordinator and determined that it was most appropriate to reference both terms in the applicability section until NERC registration criteria are updated to use only a single term. The posted "Appendix 5B: Statement of Compliance Registry Criteria," dated June 27, 2024, still uses both terms and, arguably, the PA term is used more prominently. However, the explanation included in MOD-032-1 refers to synchronization between registration criteria and the NERC functional model which is not maintained, was never formally approved, and is only posted as a historical document. Therefore, the DT excluded the explanatory language from MOD-032-2 Applicability Section.

Rationale for Distributed Energy Resource (DER) Definition

The DT has proposed that a definition for DER be added to the *NERC Glossary of Terms used in Reliability Standards* (NERC Glossary of Terms). The approved standard authorization request (SAR) to revise MOD-032, submitted December 2021, noted that "it may be needed (based on the discretion of the DT) to add a definition for 'Distributed Energy Resource (DER)' to the NERC Glossary of Terms" in conjunction with adding DER data to Attachment 1, the main purpose of this SAR.[1] The DT found it necessary to draft a DER definition to clarify the usage of this term within the standard. Further, the DT recognized benefits of a NERC Glossary of Terms definition to bring alignment and consistency of term usage across Reliability Standards. Additionally, the term Inverter-Based Resource (IBR) was recently defined in the NERC Glossary of Terms under Project 2020-06 for a similar reason. Finally, the DT was comprised of team members with adequate experience to propose a definition, including members of the NERC SPIDERWG and IEEE 1547 working group.

The DT proposes to define Distributed Energy Resource (DER) as follows:

"A generator or energy storage technology connected to a distribution system that is capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including one connected behind the meter of an end-use customer that is supplied from a distribution system."

[1] SAR title "MOD-032-1 Data for Power System Modeling and Analysis", submitted 12/15/2021. Available at: https://www.nerc.com/pa/Stand/Project202202ModificationstoTPL00151andMOD0321DL/2022-02_MOD-032%20SAR%20SPIDERWG_020122.pdf

In developing this definition, the DT considered various DER definitions utilized in the industry and discussed in the NERC System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG) Terms and Definitions Working Document, including the six other definitions described in Appendix D that were not adopted by SPIDERWG. Through this review, the DT determined each of these seven definitions would benefit from refinement to be most suitable for application in MOD-032 and future reliability standards more broadly. It is expected that most reliability standard revision proposals related to DERs would originate from the SPIDERWG. Thus, the DT's intent was to propose a DER definition that aligned with the SPIDERWG working definition, which explicitly excludes demand response and clarifies what is in scope and out of scope with respect to where a DER is connected, rather than the technology type.

The DT considered adopting a voltage threshold to define distribution. However, industry generally differentiates transmission from distribution based on the functional use of the system rather than technical specifications (e.g., voltage, active power, etc.). Setting aside the Bulk Electric System, that has a NERC definition, defining electric facilities as either transmission or distribution is often based on State law or regulations, ISO/RTO tariff, and/or utility tariffs. There are no conflicts in how applicable entities define distribution and transmission facilities for a given region, even if those definitions vary from region to region. Additionally, the DT considered an active power threshold to define DER and concluded that DER technologies can vary in size, and a threshold might inappropriately exclude technologies that are DER[2]. At the same time, the DT understands that certain applications of DER data, for instance determining when or how a Transmission Planning (TP) or Planning Coordinator (PC) includes DERs into planning processes (e.g., TPL-001), may include active power or other TP or PC defined thresholds.

The DT considered defining DER based on the resource not being connected to the Bulk Power System (BPS), similar to the IEEE 1547-2018 definition that uses "not directly connected to the BPS" to describe DERs. However, the NERC Glossary of Terms definition of BPS does not provide specificity that would enhance a definition of DER beyond an undefined term that is generally used in industry. The phrase "distribution system" was selected to expressly describe the type of electric facilities that would cause a resource to be defined as a DER, if interconnected to those facilities.

The DT recognizes that "distribution system" is not defined in the NERC Glossary of Terms and that the SPIDERWG proposed a definition.[3] The DT reviewed the SPIDERWG definition and concluded that it would not clarify the term DER. The SPIDERWG use of the term "transmission-distribution" interface within a definition of "distribution system" could be considered a circular reference that causes ambiguity. The DT is not proposing a definition for distribution system given any proposed definition could be of limited benefit for clarifying the proposed definition for DER.

Below is a summary of the rationale for the DT departing from each of the seven definitions when proposing a new DER definition.

[2] NERC has published a study recommending that a zero MVA threshold be used when collecting DER information: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf

[3] SPIDERWG definition of "distribution system": The electrical facilities that are located behind a transmission-distribution transformer that serves multiple end-use customers. https://www.nerc.com/comm/RSTC/SPIDERWG/SPIDERWG%20Terms%20and%20Definitions%20Working%20Document.pdf

SPIDERWG definition

After considering the SPIDERWG definition, the DT determined it provided a useful foundation but needed refinement to be suitable for the intended use. Specifically, the SPIDERWG term included transient types of DER power beyond generation and storage, and it included sources of back-up power that would have no potential grid impacts.

The DT chose to refer to a generator or storage technology specifically, rather than use the SPIDERWG language of "source", to exclude devices or resources that only transiently inject real power (e.g., regenerative elevators, transition switches, etc.). A DER can use various technologies including synchronous machines, induction machines, and power inverters/converters (i.e., IBR). Different types of DERs can utilize a wide range of energy sources including, but not limited to, natural gas, diesel, hydro, storage, wind, and solar. Additionally, the DT intention was to ensure that the scope included facilities "connected behind the meter of an end use customer" that may export Real Power to the power system or offset Real Power load (e.g., residential solar or commercial rooftop solar). This would exclude technologies such as charging-only electric vehicle (EV) installations and controllable load. While not finalized, it is the drafting team's understanding that this determination is consistent with recent proceeding from the IEEE 1547 revision Working Group. To exclude transmission connected load customers that have onsite generation or storage resources, the DER definition clarifies that the behind-the-meter customer "is supplied from a distribution system".

The DT included the language "in non-isolated parallel operation with the Bulk-Power System" to indicate that a distributed energy resource with potential BPS reliability impacts is only one that has electrical connectivity to the BPS. A resource that is only operated in islanded or isolated mode (e.g., back-up generation that only operates when a facility is disconnected from the grid), will not have an impact to the BPS and, therefore, is not of interest from a BPS-reliability perspective. The DT understands the concepts of non-isolated parallel operation versus isolated parallel operation to be commonly understood within the industry. The DT intentionally avoided the term "directly connected" to differentiate electrical connectivity from an electrical connection point. The phrase "connected to the distribution system" speaks to electrical connectivity and the subsequent phrase "including one connected behind the meter of an end use customer" clarifies this connectivity includes a resource directly connected to a customer system (i.e., behind the meter).

IEEE 1547-2018

The DT reviewed the IEEE 1547-2018 definition and found that it contained elements that could supplement the SPIDERWG definition to address the issues identified above. The DT incorporated the explicit reference to generation and storage aspect of the IEEE definition. Further, the IEEE concept of "capable of exporting active power to an EPS" informed the need for capturing non-isolated, long-term paralleling and the sourcing of Real Power (i.e., active power) within the DT definition.

At the same time, the DT did not view the IEEE definition as suitable for the DT's intended use as written. The IEEE term qualifies the DER connection point as "not directly connected to a bulk power system" which the DT viewed as potentially ambiguous. Instead, the DT opted for the "connected to a distribution system" language to point to the electric system location, and how facilities at that location are classified, as a key

concept in differentiating DERs from other generators and energy storage technology. The DT considered if it was necessary to define "supplemental DER devices" as part of the DER definition and determined this nuance is not needed for a NERC Glossary of Terms DER definition.

Federal Energy Regulatory Commission (FERC) Energy Primer
The DT identified the FERC Energy Primer definition as being inclusive of load resources (e.g., energy efficiency, demand response) which is not aligned with the SPIDERWG definition. Given the reliability use cases, the DT and SPIDERWG definitions target sources of electric power, with the DT narrowing this definition to be only sources "capable of providing Real Rower." After considering the FERC definition, the DT determined it was not suitable for the intended use.

National Association of Regulatory Utility Commissions (NARUC)
NARUC's definition is also inclusive of load resources (e.g., energy efficiency, demand response) and therefore, the DT concluded it is too broad.

NERC DERTF
The NERC DERTF definition uses the language "resource on the distribution system that produces electricity" which appears to exclude distributed energy storage, a technology necessary for inclusion in the DT definition. Further, the NERC DERTF definition defines DER as anything "not otherwise included in the formal NERC definition of the Bulk Electric System" which the DT views as overly broad.

California Public Utilities Commission (CPUC)
The CPUC definition appears to be based on California legislation and includes energy efficiency, EVs, demand response, renewable generation resources, and energy storage. As is the case for FERC and NARUC definitions above, the inclusion of load resources is overly broad for the NERC Glossary of Terms.

New York Independent System Operator (NYISO)
The NYISO definition only considers market-qualifying resources as DER. This definition's exclusion of a large portion of DER (i.e., retail participation) is too narrow for the reliability planning needs identified by the SPIDERWG DER Modeling Study.

Figure 1 below provides a graphic illustration of the DER definition and the intended scope of facilities that would fall under the proposed definition. Figure 2 below shows that the proposed DER and IBR definitions are compatible, but distinct. Some resources may be classified as a DER, but not an IBR; some resources may be classified as an IBR, but not a DER; some resources may be classified as both a DER and an IBR. This relationship between the definitions and the existence of non-IBR storage solutions informed the phrasing of "generator and energy storage technology" to ensure all generators and all storage devices are included, even if they do not meet the definition of IBR. Note that in Figure 2, "distribution-connected" is shorthand for connected to the distribution system and "bulk system-connected" refers to resources connected to the transmission system.

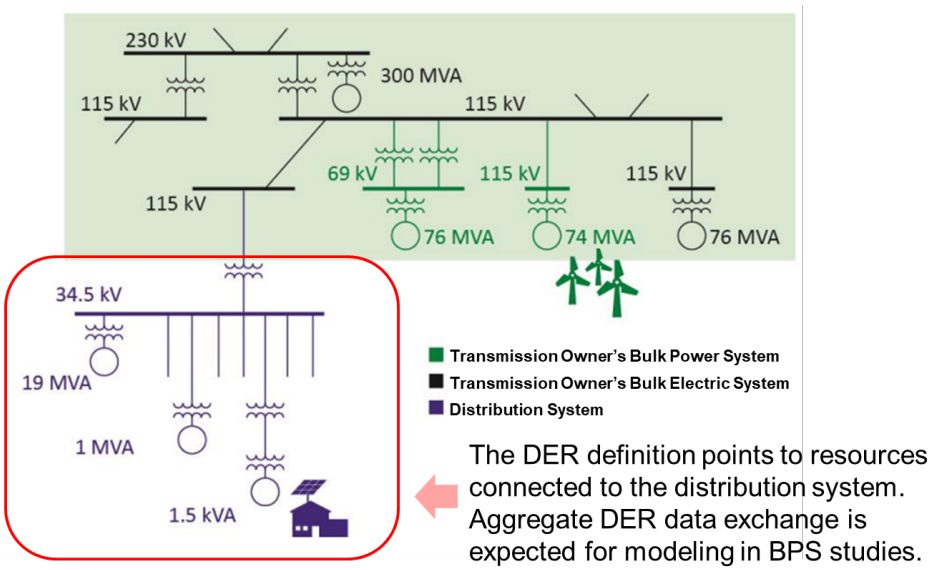

Figure 1: DER Definition Illustration

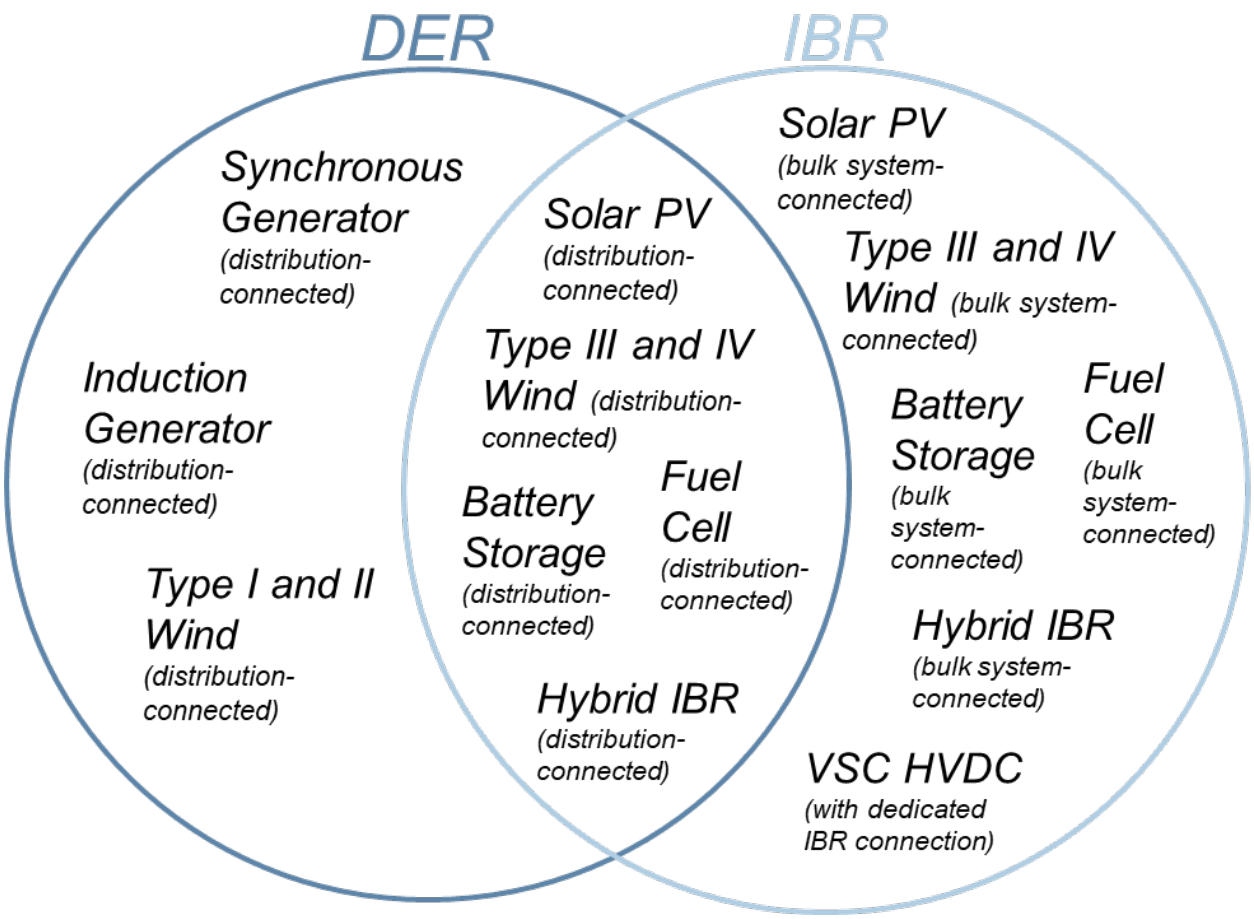

Figure 2: DER and IBR Definition Compatibility

Rationale for Modifications to Requirement R1

Requirement R1, Part 1.1 was modified to require that the PC and TP data requirements and reporting procedures include the responsible entity for data items listed in Attachment 1. To be clear, the "entity" to be identified would be the entity type or category (i.e., Transmission Owner), not specific companies for each data item. This modification aligns with changes made to the introductory paragraph in Attachment 1 clarifying that data obligations are established by the PC/TP modeling data requirements and reporting procedures rather than the listing of typical functional entities in Attachment 1. The intention of this addition is not to create an administrative requirement for the PC and TP to maintain separate lists identifying entity obligations, but to reinforce PC/TP authority to request data from appropriate entities, thereby creating obligations for those entities to provide the requested data. In most cases, it is expected that data requirements and reporting procedures would inherently identify the entities required to provide data. Further, this modification is intended to give the PC/TP flexibility to identify (and specify within their data requirements and reporting procedures) the best source for necessary data, even if that source is not a NERC functional entity. However, only NERC functional entities are subject to mandatory compliance with NERC Reliability Standards, so the PC/TP is unlikely to assign other entities without a local authority to create data obligations outside of NERC enforcement. Such flexibility could allow the TP or PC to directly estimate data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes and aggregated DERs connected to unregistered Distribution Providers based on any information received in accordance with their data requirements and reporting procedures. As an example, data received from DPs in the area that can be assumed to have similar DER adoption profiles. FERC Order 901 uses the phrase "unregistered IBR" but given this is an undefined term and the drafting team received opposition to explaining that term in a footnote, the phrase was replaced in the standard with "an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes." This is the intent of all further references to "unregistered IBR" in this technical rationale.

FERC Order 901 directs NERC to develop reliability standards that require "the use of approved industry generic library IBR models".[4] However, pre-defining a limited set of models (i.e., a library of models) that could be used to represent generation and system components is potentially at odds with objectives to also have accurate models, especially as technology rapidly progresses. To align with industry practices while addressing the directives of the FERC Order, the DT incorporated elements from the NERC Dynamic Modeling Recommendations into Requirement R1, Part 1.4, rather than defining an inclusive model library. The DT supports the approach and views it as aligned with the FERC Order directives while addressing the practical limitations raised by industry at the January 15-16 and June 3-5 NERC Industry Engagement Workshops.[5][6] For instance, Order 901 P125 requires "the sole use of nation-wide approved component generic library models" whereas workshop participants raised issues surrounding timelines for approving library models that reflect new IBR products, the accuracy of library models for certain products, timelines associated with updating library models, and referencing a document outside of the standard that could be changed by a process also outside the standard, among other issues.

[4] FERC Order 901 at Paragraph 122.
[5] NERC Industry Engagement Workshop–Reliable IBR Integration and Milestone 3 of FERC Order 901 Agenda
[6] Milestone 3 of FERC Order 901 NERC Industry Engagement Workshop June 3-4 PowerPoint

To address these concerns, Requirement R1, Part 1.4 includes requirements for the PC/TP to specify submission of standard library dynamic models, user-defined models, or both. The phrase user-defined models should be considered interchangeable with user-written models, equipment-specific models, and other such terms. The phrase "user-defined models" was used in MOD-032-2 based on language in FERC Order 901.[7] Allowing the specification of standard library models incorporated within modeling software is responsive to FERC concerns about usability and allows PCs to maintain current requirements for generic models that may be necessary for the creation of large Interconnection-wide base cases. Allowing the specification of user-defined models is responsive to industry feedback expressed during the NERC Industry Engagement workshops. The DT also explicitly ensured PC/TP authority to require submission of both model types, if deemed necessary. Requirement R1, Part 1.4.2 is responsive to FERC concerns about model usability and non-convergence by requiring PCs and TPs that accept user-defined models to specify usability requirements and require appropriate model documentation and instructions.

Rationale for Modifications to Requirement R2

Requirement R2 was modified to require estimation of modeling data if the Responsible entity (typically the Transmission Owner or Distribution Provider) is unable to gather required data. FERC Order 901 requires the provision of data related to unregistered-IBR and IBR-DER that in the aggregate have a material impact on the BPS.[8] If the data is estimated, Requirement R2 Part 2.1 also requires the entity to provide an explanation of the limitations of the estimated data and the method used for estimation in line with the Order 901 directives.[9] The requirement language intentionally uses the phrase "unable to gather" to mirror the FERC Order 901 language. Limitations of the estimated data is intended to capture both limitations of the availability of data (including instances where there are legal or contractual prohibitions on requesting certain data, no mechanism to enforce collection, or incomplete records of what is connected) and limitations of any data provided (including partially missing or suspect data).

The exact method used for estimation is intentionally left open given the varying levels of data available across the ERO footprint. A few possible examples include:

- A full list of DERs broken down by resource type with limited fields missing and assumed based on other characteristics.
- Real Power capability by resource type with approximate percentage of the resource compliance with various IEEE 1547 versions used for dynamic performance assumptions (known or assumed based on installation date).
- Count of resources by resource type with average size used to estimate Real Power capability.
- Derive values for unregistered DPs based on average of registered DPs in the area (scaled based on total system size).
- Solar capability estimated based on satellite imagery of rooftops.

[7] FERC Order 901 at P124
[8] FERC Order 901 at P104 and P105
[9] FERC Order 901 P104: "if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation."

- Assumptions of regional/national average IBR-DER penetration levels.

Additional guidance for DER estimation can be found in NERC SPIDERWG Reliability Guidelines on the topic.[10]

The DT views the introduction of this estimation provision as alleviating previously expressed compliance obligation concerns around challenges in collecting data for DERs connected to unregistered entities. Further, the addition of compliance abeyance language for the estimation process provides entities the opportunity to hone their estimation process without risk of penalty (provided they proceed in good faith). The approach directed by FERC is flexible as to whether the underlying unregistered IBR and DER data originates from interconnection documentation, measured quantities, estimated quantities, or other sources. Data availability or sufficiency issues, among other factors, may lead to the DP and TO applying a combination of approaches to source the data. The PC and TP modeling data requirements and reporting procedures should identify acceptable methods and their application.

While the FERC Order 901 directives only addressed IBR-DER, meaning that DER technologies based on induction generators or synchronous generators are not explicitly addressed, Project 2022-02 is also assigned a SAR that requires DERs to be addressed in MOD-032 more generally, and the inclusion of all DERs in this revision of the standard removes the need for a second modification under this project. The DT found it practical to have a consistent estimation framework applicable for all DER technologies when DER data cannot be gathered. Therefore, Requirement R2 was intentionally written to have requirements for estimating DER data regardless of the technology type, when an applicable entity is unable to gather the data. The approach FERC directed NERC to use forms the basis for this uniform approach.

Given the challenges with collecting complete and accurate DER data, the DT would still recommend that NERC consider a range of options that could include expanding DP registration criteria or registering DER-only DPs to reduce or eliminate this potential DER data collection gap. However, the process to modify NERC registry criteria and register new entities is beyond the scope of Project 2022-02 and would delay the project beyond the FERC Order 901 Milestone 3 timeline. The DT considered adding "UFLS-Only Distribution Provider" to MOD-032-2 applicability to reduce (but not necessarily eliminate) the potential gaps associated with DER connected to unregistered entities with no compliance obligation. However, the UFLS-Only Distribution Provider can only be obligated to provide data directly associated with UFLS programs (essentially the data identified in Attachment 1 Dynamics Column 10b). Provision of such data in the absence of the other DER data identified in Attachment 1 would not be particularly useful for planners.

Requirement R2, Part 2.2 was added to confirm the relationship and consistency between MOD-026 and MOD-032 indicated in FERC Order 901 Paragraph 143[11]. The DT believes that the intent of FERC Order 901

[10] Reliability Guidelines, Security Guidelines, Technical Reference Documents, and White Papers

[11] FERC Order 901 P143: ""Regarding EPRI's recommendation to require appropriately parameterized plant models, we agree that the model verification process of an IBR model should include steps to ensure that responsible entities provide both verified and appropriately parameterized models. Additionally, we agree with IRC's recommendation that the plant model verification process should include requirements for equipment to be represented as installed in the field. While we decline to include this level of detail in the directive to NERC, we nonetheless direct NERC to establish a standard uniform model verification process. A uniform model verification process will

is to ensure that accurate (validated and verified) models are collected under MOD-032. However, facility models submitted under MOD-032 are often submitted before physical validation can be completed (e.g., for planned facilities). Part 2.2 requires the model submitted by the functional entity be the model that was verified and validated (and accepted by the TP) in accordance with MOD-026, if available.

Requirement R2, Part 2.3 introduces a reference to the Unacceptable Models List (UML) maintained by the ERO. The DT concluded that it would be most appropriate for NERC to maintain the UML as a separate document that could be updated more quickly and frequently than the standard development process. However, any changes to the process for modifying the UML, that is incorporated into MOD-032-2 as a supporting document, would need to be approved through the standard development process.

It is also recognized that models on the UML may be the best available for some generators, particularly for some synchronous generators and for units manufactured by companies that are no longer in business. Part 2.3 allows for the submission of such a model if accompanied by a technical rationale justifying its use. The requirement does not intend any specific level of scrutiny for this rationale, but it also does not prevent the PC or TP from identifying technical concerns with the model or the rationale per Requirement R3. This rationale could include notation of prior usage for synchronous generation as well as models that have been recently added to the UML without time to procure an updated model prior to reporting. A MOD-032 supporting document defines the process for modifying the UML as a sufficient safeguard to prevent arbitrary or unvetted modifications being made to the UML.

Rationale for Modifications to Requirement R3

Requirement R3, Part 3.1 was modified to include the phrase “that is responsive to the technical concern”. The ultimate intent of R3 is to resolve technical concerns that are identified by the PC or TP. However, model providers may not always be able to know that their update or explanation will resolve the planner’s technical concern. The intent of this addition is to convey that the model provider’s obligation does not simply end with providing a response, but further information exchanges between the planner and model provider may be necessary to resolve the technical concern.

Rationale for Modifications to Attachment 1

Data items specific to IBRs and DERs were added to MOD-032-2 Attachment 1: Data Reporting Requirements.

The DT decided to maintain an approach similar to MOD-032-1 where more detailed sub-bullets associated with items are only presented in one column (i.e., some sub-bullets are only listed in the “steady state” column even though the data is also relevant to “dynamics” and/or “short circuit”). This long-standing approach was made explicit in footnote 1 of the MOD-032-2 Reliability Standard.

ensure that all entities use the same set of minimum requirements to verify that all generation resource (i.e., synchronous and non-synchronous) models are complete and that the models accurately represent the dynamic behavior of all generation resources at a sufficient level of fidelity for Bulk-Power System planners and operators to perform valid interconnection-wide, planning, and operational studies. Therefore, we direct NERC to define the model verification process and to require consistency among the model verification processes for existing Reliability Standards (e.g., FAC-002, MOD-026, and MOD-027) and any new or modified Reliability Standards.”

The format of Attachment 1 was modified to minimize replicating footnotes applicable to multiple items by adding a new footnotes section (Attachment 1 Data Reporting Requirements Footnotes) to the document. Along with the reformatting, language was added to the introductory paragraph to clarify that data obligations are established by the PC/TP modeling data requirements and reporting procedures rather than the listing of typical functional entities in Attachment 1.

Modifications for IBR

To incorporate IBR within Attachment 1, "and storage units" was added to generating units in the steady-state column under item 3. "Generating units" already incorporates IBR generators such as solar and wind. Storage is typically not classified as a generation resource because it has no primary energy source and consumes more energy than it injects when considering losses. Therefore, the DT found it necessary to include storage explicitly. Footnote 4, associated with "Generating units and storage", was also updated to explicitly identify IBR as an applicable technology for the item and remove pumped storage now that storage is explicitly identified.

The dynamics column was updated to replace "photovoltaic systems" (PV) with "Inverter-Based Resources" under item 7. IBR encompasses PV, resulting in PV technology still being included under this new item.

The three following sub-items were added to dynamics item 7 based on specific language from the FERC Order 901, Paragraph 141.[12]

- IBR capabilities related to momentary cessation,
- Tripping, and
- Ride-through

"Frequency control" was added as a sub-item because frequency response of IBR is important for studying system reliability. For instance, a 2024 NERC Lessons Learned report shows how IBR frequency response can affect system performance.[13] Frequency control encompasses primary frequency response, fast frequency response (e.g., IEEE 2800-2022, Subclause 6.2), and potentially other frequency responsive controls (e.g., "grid-forming" virtual synchronous machine controls).

"Voltage control" was added to encompass reactive power and voltage control that may affect the dynamic or steady state performance of the plant. NERC's Level 3 Alert on Inverter-Based Resource Performance and Modeling, issued May 2025, contains Essential Action #1 indicating the importance of voltage control performance for normal and post-disturbance operations.[14]

[12] FERC Order 901, P141 states that IBR and IBR-DER data must include "momentary cessation and/or tripping, and all ride through behavior."
[13] NERC, Lessons learned, Incorrect IBR Primary Frequency Response Logic Caused Negative ACE. Available at: https://www.nerc.com/pa/rrm/ea/Lessons%20Learned%20Document%20Library/LL20240501_Incorrect_IBR_Primary_Frequency_Response_Logic_Caused_Negative_ACE.pdf
[14] NERC, IBR Performance and Modeling, Level 3 Alert. May 2025. Available at: https://www.nerc.com/pa/rrm/bpsa/Alerts%20DL/Level%203%20Alert%20Essential%20Actions%20IBR%20Performance%20and%20Modeling.pdf

In order to clarify dynamics item 6, "wind plant model", to not overlap with the new IBR item 7, type 1 and type 2 wind turbines are specifically called out under item 6. These technologies are not IBR.

Footnote 5 indicates that the PC/TP data requirements and reporting procedures need to account for IBRs that are not DERs and do not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes. It also indicates that the TO is typically responsible for such data.

Modifications for DERs

Item 9, "Aggregate Distributed Energy Resource (DER) data" was added to the steady state column with location, real power capability, and DER type (solar, battery, diesel generator, etc.) specified as required subitems. The DT selected these subitems as the minimum information needed to use data and make assumptions for power system modeling and analysis; the PC/TP have the authority to request additional data items as deemed necessary.

The intent is that relevant DER data be available and represented in models of the interconnected transmission system consistent with the NERC approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies. Specific data items listed for DER reflect the minimum information needed to reasonably represent DER in transmission system models. "Aggregate DER" is specified in item 9 to indicate aggregate DER data, rather than individual DER facilities, would be represented in most PC/TP study models.[15] The word "aggregate" was specifically added to Attachment 1 to clarify this point based on industry comments and to align with FERC Order 901. However, Requirement R1 provides the PC and TP great flexibility in developing data requirements and reporting procedures that align with local practices and needs, in addition to the required items listed in the Requirement R1 Parts. Given industry comments on DER data availability, and FERC Order 901 directives, a process is needed for estimating DER data when an entity is unable to gather it. The process for estimating those values is referenced in Requirement R2, Part 2.1.

Footnote 3, associated with "aggregate demand", was modified to clarify that the gross demand is needed at each load serving bus. Collecting and modeling a net demand that incorporates offsets due to output from DERs is not consistent with a modeling framework that explicitly represents DERs.

Dynamics item 5, previously "demand", was updated to be "aggregate demand" to be consistent with the steady state column and general industry practices of modeling load dynamics for aggregate demand (e.g., composite load model).

Dynamics item 10 was updated to include "Aggregate Distributed Energy Resource (DER) data" along with the subitems: "parameters, settings, or capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control"; and "indication whether DERs are subject to tripping in conjunction with UFLS or UVLS".

[15] In certain circumstances (e.g., a very large DER), a TP or PC may decide to represent the individual DER. However, the DT anticipates most DER information will be aggregated based on PC and TP planning practices.

Momentary cessation, tripping, and ride-through of aggregate DERs is needed for dynamics studies. For instance, NERC's Lessons Learned, LL20220401 "Distributed Energy Resource Performance Characteristics during a Disturbance" provided information following the loss of 300 MW of DERs following a system fault. The report indicated that:

> "There is a need to understand how distribution system connected generation, and loads will behave and how they can accurately be modeled under expected system contingencies. Entities should know the behavioral characteristics of DER inverters on their system (both new and old) as well as their number, capabilities, and locations and then report that information to their Balancing Authorities and Reliability Coordinators so their models can be accurate".

Voltage control of DERs can alter the exchange of reactive power between distribution and transmission systems and may affect the results of reliability studies. Examples are described in the approved Reliability Guideline: Bulk Power System Planning under Increasing Penetration of Distributed Energy Resources.

Frequency control must be accounted for because DER interconnection under different standards (e.g., IEEE 1547-2003 versus IEEE 1547-2018) have different frequency response characteristics that may affect dynamics study results. Frequency control in this case typically refers to the frequency-droop characteristic outlined in IEEE 1547-2018, Subclause 6.5.2.7 and adopted in many jurisdictions. However, should other DER frequency controls become common in industry, those would also fall under this category.

As described in the approved Reliability Guideline: Recommended Approaches for UFLS Program Design with Increasing Penetrations of DERs, accurately representing DER tripping as part of UFLS operation is vital for designing and evaluating UFLS programs. Similarly, accurately representing DER tripping as part of UVLS operation is vital for designing and evaluating UVLS programs as described in the approved White Paper: DER Impact to Under Voltage Load Shedding Program Design. In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, the proportion of aggregate DERs subject to each UVLS/UFLS tripping stage should be identified.

In response to comments, the DT added Footnote 7, which explicitly confirms the PC/TPs discretion to specify aggregation thresholds below which they do not consider DER data necessary to collect. Based on the 0 MVA threshold recommendation noted previously, this threshold should only be established following consideration of that DER Modeling Study Report[16].

Inferring DER Capabilities

Item 10 in the dynamics column indicates that aggregate DER dynamics modeling data may need to be inferred due to data availability and practical limitations. As suggested in the approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies, the in-service date for DERs may be used as a proxy for the PC/TP to make reasonable assumptions about DER capabilities. For example, in a certain jurisdiction DERs installed after a specified date may be required to have a certain ride-through characteristic. Thus, the appropriate Ride-through characteristic representation for DERs in that area could be inferred by the in-service date of the DERs. However, the PC/TP modeling data requirements and

[16] https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf

reporting procedures may require the provision of alternative information to achieve the same purpose. PC/TP modeling data requirements and reporting procedures may also require more detail and/or additional information. In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, it is expected that the proportion of aggregate DER amount with in-service dates before and after certain threshold dates would be needed (and specified in the PC/TP requirements) to make inferences regarding the overall aggregate DER response characteristics.

Entity responsibilities and coordination

Footnote 6 indicates that the PC/TP data requirements and reporting procedures need to account for situations where DERs are connected to the system of an unregistered DP. When a DER is connected through a registered DP (directly connected to that DP, connected to an unregistered DP that is connected to that DP, or behind the meter of an end-use customer of either) that DP is the typical responsible entity for collecting and providing the DER data. Further, the TO would be the typical responsible entity if there is no system owned by a registered DP between the DER connection point and TO system. This clarification is necessary to reduce the possibility of DERs on the system being unaccounted for by any entity. The DT was responsible for the FERC Order 901 directive requiring an entity to be identified when DERs had no registered DP. It is possible that a company that is a registered Generator Owner may also own resources that do not meet the criteria for registration. That would not change the responsible entity identified per R1, though the owner is encouraged to provide all relevant data to that responsible entity. This point applies broadly, where nothing in the standard is intended to preclude coordination among entities to make sure the responsible entity has the best available information to provide.

The PC/TP may have access to sufficient data for modeling certain DERs through alternative means (e.g., direct registration of DERs or DER aggregators in certain markets). In such cases, the DP (or TO) should not be obligated to provide duplicate DER modeling data, but care will be needed to ensure DERs are not double counted. The PC/TP modeling data requirements and reporting procedures should clearly identify if there are certain classifications of DERs that are excluded from the DP/TO obligation for providing DER modeling data. This in no way absolves a DP/TO from an obligation to provide DER data according to the data requirements and reporting procedures developed by its PC and TP under Requirement R1.

It should be noted that the MOD-032-2 modifications do not change the classification of unregistered IBRs or DERs to become BES facilities subject to NERC reliability standards. Instead, the modifications place a compliance obligation on NERC registered entities (typically DPs or TOs if identified as the responsible entity by the PC/TP) to provide basic information about unregistered IBRs or DERs that are connected to their systems so they can be properly represented in Interconnection-wide cases. There are already existing requirements for such entities to provide information about load connected to their systems. Like load, unregistered IBRs and DERs are not generally considered to be BES facilities. However, BES reliability assessments require an accurate representation of aggregate load, unregistered IBR, and aggregate DER behavior. The modifications proposed in MOD-032-2 are intended to ensure sufficient data is available to the PC/TP so that appropriate unregistered IBR and DER representations can be included in their BES reliability assessments as required by FERC Order 901 and system planning needs.

IRO-010-6 – Reliability Coordinator Data Specification and Collection; and TOP-003-8 – Transmission Operator and Balancing Authority Data and Information Specification and Collection

The DT reviewed existing IRO-010 and TOP-003 versions and found that both standards had broad requirements language that encompassed generation and storage resources, including IBR. Nevertheless, to ensure no ambiguity that FERC Order 901 requirements are met, the DT included explicit references to IBR-specific data and parameters and pointed to the uniform framework through an alignment between planning and operations models.

Rationale for Modifications to add "IBR-specific data and parameters"

The phrase "IBR-specific data and parameters" was added to the following requirements:

- IRO-010-6 Requirement R1, Part 1.1
- TOP-003-8 Requirement R1, Part 1.1
- TOP-003-8 Requirement R2, Part 2.1

These modifications were made in response to FERC Order 901 directives related to the inclusion of IBRs in operations models.[17] The phrase "IBR-specific data and parameters" in the revised IRO-010-06 and TOP-003-8 is intended to reflect what FERC describes in the order as "IBR models that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions".

Rationale for Modifications to add reference to MOD-032

"Requirements for model submissions to be consistent with the model submitted for planning purposes, as applicable" was added to the following requirements:

- IRO-010-6 Requirement R1, Part 1.5.3
- TOP-003-8 Requirement R1, Part 1.5.3
- TOP-003-8 Requirement R2, Part 2.5.3

These modifications were made in response to FERC Order 901 directives related to usage of a uniform framework in the development of planning and operations models. Planning model submissions in accordance with MOD-032-2 will reflect this uniform framework. Thus, requiring that operations model submissions be consistent with planning model submissions ensures that they also reflect the uniform framework as directed by FERC in Order 901. Models submitted for planning purposes are typically in accordance with MOD-032, though additional standards or regional requirements may apply. Simulation time constraints in an online operations environment may warrant a reduced model structure complexity; such models may differ from, but should still be consistent with, more complex modeling that is submitted under MOD-032. The inclusion of "as applicable" allows for variation as necessary for application in the operations horizon. For example, consistent models would not be appropriate if an update was made to a planning model for known pending changes, which should not be reflected in the operations models prior to implementation.

[17] FERC Order 901 Paragraph 122 and Paragraph 161

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of FERC Order No. 901 Directives

Milestone 3: Project 2022-02 Uniform Modeling Framework for IBR
August 2025

On October 23, 2023, FERC issued a Final Rule, Order No. 901, directing the North American Electric Reliability Corporation (NERC) to develop new or modified Reliability Standards that address aggregation of data, parameters, and estimation methods to provide the Transmission Planner (TP) and Transmission Operator (TOP) with the estimate values, explanation for limitations on data availability, and the method used for all estimations. This project has a FERC regulatory deadline of November 4, 2025. Below provides the directives from FERC Order 901 along with the drafting team's (DT's) consideration of the directives.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
P7. "… Second, by November 4, 2025, NERC must submit new or modified Reliability Standards addressing the interrelated directives concerning: (1) data sharing for registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate…"	IRO-010 MOD-032 TOP-003	A timeline has been drafted to meet the regulatory deadline of November 4, 2025. Completed tasks listed below. • An industry workshop completed January 14-17, 2025. (outreach) • Many virtual DT meetings completed weekly from January – March 2025. (publicly posted) • In-person DT completed February 11-13, 2025. (publicly posted) • Industry Webinar March 6, 2025. (publicly posted) • DT outreach with trade groups and entities March 3-14, 2025 • Industry comment and ballot period April 17-May 16, 2025. (publicly posted)

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		• A second industry workshop completed June 3-5, 2025. (publicly posted) • Many virtual meetings were completed weekly from May 19-July 23, 2025. • Industry outreach with trade groups and entities July 3-23, 2025. • Industry comment and ballot period August 8-September 10, 2025.
P76. "Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require registered IBR generator owners and operators to provide IBR-specific modeling data and parameters (e.g., steady-state, dynamic, and short circuit modeling information, and control settings for momentary cessation and ramp rates) that accurately represent the registered IBRs to their planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities that are responsible for planning and operating the Bulk-Power System. As several commenters indicate, ensuring the sharing of appropriate IBR modeling data is critical to create and maintain the models used in reliability studies, and in turn to ensure that Bulk-Power System transmission planners or operators are able to plan for, operate, and reliably integrate IBRs onto the Bulk-Power System."	IRO-010 MOD-032 TOP-003	**Theme:** Inverter-Based Resource (IBR) /Generator Owner to provide specific modeling data. IRO-010 and TOP-003: • While TOP-003 and IRO-010 allow any data to be requested, the DT felt it was important to add "IBR-specific data and parameters" specifically to IRO-010-6 Requirements R1, subpart 1.1 and TOP-003-8 Requirement R1, subpart 1.1 and Requirement R2, subpart 2.1 to ensure it is clear what data may be specifically requested to address FERC Order No. 901. In addition, IBR encompasses IBR-DER, and this information could be requested. • The DT considered adding a new subpart at the end of Requirement R1 (e.g., Part 1.6), but after reviewing requirement language, the DT determined the data and information lists within the existing subparts were the appropriate place to capture IBR-specific modeling data and parameters.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		MOD-032: • Generator Owner and Generator Operator – The DT decided to maintain applicability for just the Generator Owner and did not add Generator Operator as a functional entity to the applicability section. If data is needed from the Generator Operator, then the Generator Owner can reach out to the Generator Operator for necessary data via contractual obligations, etc. The DT does not find it necessary to require two applicable entities when one oversees the other. • The DT modified Attachment 1 to include generation and storage units, removed photovoltaic system (covered within IBR) and added Inverter-Based Resources. The wind turbine was updated for clarity that it is for Type 1 and Type 2, which is not included in the IBR definition.
P77. "With regard to AEU and ACP/SEIA's comments that the Commission direct NERC to specify data sharing requirements from transmission owners to generator owners and operators, we believe that this request may already be addressed through each transmission planner's existing processes. For example, the New York Independent System Operator (NYISO) and CAISO both have processes for obtaining such data after demonstrating a need for the specific information requested and that the required information protection and non-disclosure agreements are signed. Nevertheless, to support accurate modeling and performance, we direct NERC to consider during its standards development process AEU and ACP/SEIA's	MOD-032	**Theme:** Information going from Transmission Owner to Generator Owner/Generator Operator (consider): MOD-032 • There is no specific requirement within MOD-032 that requires Transmission Owners to share data with the Generator Owners and Generator Operators (and such a requirement would not be aligned with the purpose of MOD-032). However, Transmission Planners and Planning coordinators have a framework where requests for data can be sent for inclusion for the Interconnection-wide models. At this time, the DT does not see a need for a requirement to be drafted requiring Transmission Owners to provide data to Generator Owners and Generator Operators. The DT believes this is most appropriately addressed

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
suggested data sharing requirements when developing the framework, criteria, and necessary data exchange requirements to meet the registered IBR data sharing directive." **P74.** "AEU and ACP/SEIA ask that, in addition to data provision requirements for generator owners and operators, the Commission direct NERC to specify data sharing requirements from transmission owners to generator owners. For example, AEU explains that generator owners and operators also require data from transmission owners to support accurate modeling and performance, e.g., short circuit data, grid data for offshore wind, information on other power electronic devices around the IBR plant, and voltage harmonics. AEU adds that putting requirements on transmission owners would be consistent with revisions being developed for NERC's Modeling, Data, and Analysis (MOD) Reliability Standards."		through processes that exist outside of the MOD-032 Reliability Standard and concurs with the suggestion in P77 that these processes are already in place.
P78. "Commenters raised general concerns that mandating specific modeling and data submissions would reduce the flexibility and discretion of transmission planners and operators to identify the information they need. We find that, given the need for IBRs to operate in a predictable and reliable manner to ensure the reliable operation of the Bulk-Power System, it is necessary to establish uniform, minimum categories or types of data that must be provided so that Bulk-Power System planners and operators can predict the behavior of all IBRs. As discussed in more	MOD-032 TOP-003 IRO-010	**Theme:** Individual use of approved IBR models. (Uniform modeling framework) **Applicability:** Transmission Planner and Transmission Operator • Modifications made to MOD-032, including incorporation of an ERO Unacceptable Models list, establish an improved uniform modeling framework. IBR has been included in Attachment 1 of MOD-032 under steady state (item 3), dynamics (item 7), and short circuit specifying the minimum types of IBR data and capabilities that need to be collected as required per FERC Order No. 901.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
detail in section IV.C of this final rule, we are also directing NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models that accurately reflect the behavior of all IBRs during steady state, short-circuit, and dynamic conditions."		• Explicit reference to IBR data was added to the TOP-003 and IRO-010 standards along with provisions to ensure that models submitted under these standards are consistent with the models submitted under the framework established in MOD-032.
P86. "As a general matter, we agree with ACP/SEIA regarding the need to balance the burden to generator owners of collecting and providing data collected by disturbance monitoring equipment with the benefit of that data to reliability. Thus, in developing the directed data collection requirements, we direct NERC to consider the burdens of generators collecting and providing data, while assuring that Bulk-Power System operators and planners have the data they need for accurate disturbance monitoring and analysis. Likewise, regarding CAISO's request that the Commission direct NERC to consider requiring registered IBRs to provide additional data, we agree that such data collections may be warranted, and direct **NERC to consider through its standards development process whether additional IBR data points (e.g., telemetry collections or other automated platform integrations) are needed to further enhance real-time visibility of Bulk-Power System operations."**	TOP-003 IRO-010	**Theme:** Disturbance and monitoring (Consider) (real-time operations) **Applicability:** Generator Owner TOP-003/IRO-010 • TOP-003 and IRO-010 Reliability Standards are already structured in an open way so that any type of data needed can be requested at any time. In addition, transmission of information from the plant level is generally dealt with via interconnection agreements and does not rise to the level of a requirement being needed at this time. Lastly, PRC-028 PMU devices must be installed for every IBR installation. These additional monitoring devices will allow additional data requests related to those devices, if the applicable entities find that useful. Because of the two items above (the open method for data requests and the PRC-028 PMU devices), the standard balances the needs for the Transmission Operator to gather the data deemed necessary for reliability without uniform burden on all generating facilities.
P102. "Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal, with modification. Specifically, as proposed in the NOPR, we direct NERC to submit to the Commission for approval one or more new or modified Reliability Standards that require: (1)	MOD-032 IRO-010 TOP-003	**Theme:** 1) Transmission Owner directed to provide data for unregistered IBR and 2) Distribution Provider directed to provide data for IBR-DER **Applicability:** Transmission Owner and Distribution Provider

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
transmission owners to provide to Bulk-Power System planners and operators modeling data and parameters for unregistered IBRs in their transmission owner areas that, individually or in the aggregate, materially affect the reliable operation of the Bulk-Power System and (2) distribution providers to provide to Bulk-Power System planners and operators modeling data and parameters for IBR-DERs in the aggregate in their distribution provider areas where the IBR-DERs in the aggregate materially affect the reliable operation of the Bulk-Power System."		• The DT focused on the MOD-032 standard to address this directive from FERC. The DT added IBRs (including unregistered-IBRs) and DER (including IBR-DER) to Attachment 1 of the MOD-032 standard. In response to comments seeking more precision, the MOD-032 standard uses the phrase "an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes" to refer to the IBR resources encompassed by the term "unregistered IBR" in Order No. 901. • While the DT agrees that the Transmission Owner would be the typical entity for providing unregistered IBR data and the Distribution Provider would be the typical entity to provide DER data (as noted in Attachment 1 of MOD-032), the DT modified the Requirement language in response to comments to allow the Planning Coordinator and each of its Transmission Planners to identify the most appropriate entity to provide the data listed in Attachment 1 of MOD-032-2. Determination if an unregistered IBR or aggregate IBR-DER would "materially affect" the Bulk-Power System, requires engineering judgment and is not something that would be appropriate to precisely specify in a reliability standard. Thus, Attachment 1 footnote 7 was added to explicitly allow Transmission Planners and Planning Coordinators to specify DER thresholds that may be appropriate when considering impact to their local areas. • The DT made changes to the IRO-010 and TOP-003 standards to include IBRs specifically (see R1 of each standard), and to add references back to the MOD-032 standard. The DT determined that the IRO-010 and TOP-003 standards already included language in place to address IBR impacts.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
P104. "Recognizing that there may be instances in which transmission owners are unable to gather adequate unregistered IBR modeling data and parameters to create and maintain unregistered IBR models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation. We believe that this directive appropriately balances commenters' concerns about data accessibility and burden with the established need for transmission owners to provide unregistered IBR modeling data and parameters to Bulk-Power System planners and operators in their transmission owner area. We recognize that estimated modeling data and parameters are approximations of actual modeling data and parameters. We further acknowledge that there is some degree of error in estimated modeling data and parameters. However, on balance we believe that requiring such estimates with explanation of any limitations is an improvement from not having any data at all; and that even estimates will increase the overall adequacy of models and improve	MOD-032 IRO-010 TOP-003	**Theme 1:** 1) Estimation, if not able to get data from unregistered IBRs, 2) an explanation of the limitations of the availability of data, 3) explanation of the limitations of any data provided by unregistered IBRs, and 4) method for estimation. (directive) **Theme 2:** Implement a process or mechanism by which Transmission Owners would receive modeling data and parameters. (consider) **Applicability:** TO • The DT added Requirement R2, Part 2.1 allowing the functional entity to use the method of estimation should it find itself in a place unable to gather unregistered IBR data or DER data. However, it must include an explanation of the limitations of the data provided for unregistered IBRs or DERs (limitations on the availability and of the data provided) and the method used for estimation. • In addition, the DT added an explanation of the resources that are intended to be captured. In proposed MOD-032, "unregistered IBR" are described as IBRs that are not Distributed Energy Resources, as the DT proposes to define that term, and that would not meet the criteria in the NERC Rules of Procedure to register the owner of the IBR for the Generator Owner functional entity registration (as owning either category 1 or category 2 assets). As suggested by commenters, the DT has removed the phrase "Bulk-Power System" from this description to remove any potential for ambiguity in application. • While previous drafts of the MOD-032 standard used the shorthand phrase "unregistered IBR" to establish consistency with FERC Order No. 901, with the more fulsome description of

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
the reliability of the Bulk-Power System. To support this data collection, we further direct **NERC to consider commenters suggestions to implement a process or mechanism by which transmission owners would receive modeling data and parameters."**		those resources in the footnote, the DT moved this description to the requirement text (in lieu of the phrase "unregistered IBR") in response to comments. • It is important to note that Order No. 901 predated the changes NERC made to the Rules of Procedure to ensure that the owners and operators of such IBR resources would be registered with NERC for mandatory compliance purposes. NERC does not register IBRs as resources, but rather the owners of such resources based on the registry criteria for Generator Owner and Generator Operator. There are two categories of each: owners and operators of BES Facilities (category 1 GOs/GOPs); and owners and operators of non-BES inverter based generating resources that either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV (category 2 GOs/GOPs). In Order No. 901 parlance, ownership or operation of IBR resources meeting these criteria would require owner/operator registration and therefore would be considered "registered IBRs". In Order No. 901 parlance, ownership or operation of IBR resources that do not meet these criteria but are connected to a transmission system (i.e., are not Distributed Energy Resources) would not require owner/operator registration and therefore would be considered "unregistered IBR." • The DT discussed implementing a process or mechanism by which Transmission Owners would receive modeling data and parameters in depth. It was determined that if a TO is unable to gather data for unregistered IBRs and DERs, it is better to not

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		mandate a specific process for how Transmission Owners acquire or estimate data. Obtaining data for unregistered IBRs should not pose a significant challenge because such facilities are likely directly connected to a TO system and provision of necessary data should be specified in interconnection agreements or other contracts. Obtaining data for DERs would be more challenging as these facilities are connected to the TO system through a separate unregistered DP. In such cases, it is prudent to allow various estimation methods to be used. • The IRO-010 and TOP-003 Reliability Standards are drafted in a way that is open-ended and allows the respective applicable entities to request data needed. However, project 2022-02 DT added "Inverter-based Resource (IBR) specific data and parameters" to ensure it is clear that entities can request data when needed for operations assessments. To the extent modeling is needed, it should be consistent with modeling data provided under MOD-032 modeling framework. Therefore, the DT made changes to the IRO-010 and TOP-003 standards to require that model submissions for operations purposes under IRO-010 and TOP-003 are consistent with the model submissions for planning purposes under MOD-032, as applicable.
P105. "We also recognize that there may be instances where distribution providers are similarly unable to gather adequate modeling data and parameters from IBR-DERs. Accordingly, to account for instances in which distribution providers are unable to gather adequate modeling data and parameters of IBR-DERs to create and maintain IBR-DER models, we modify the NOPR proposal and direct NERC to develop new or	MOD-032 IRO-010 TOP-003	**Theme 1:** 1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation. (Directive) **Theme 2:** Consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters. (Consider)

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
modified Reliability Standards that require that each distribution provider, if unable to gather accurate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation. In support of above, we further direct NERC to consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters."		**Applicability:** Distribution Provider The DT added a new Requirement R2, Part 2.1 that if the responsible entity is unable to gather unregistered IBR data (*see description above*) or DER data and provide it to the Transmission Planner and Planning Coordinator, as specified in the data requirements and reporting procedures developed under Requirement R1, the responsible entity shall provide an estimate of the modeling data and parameters and include an explanation of the limitations of the data provided for unregistered IBRs or DERs (limitations on the availability and of the data provided) and the method used for estimation. The DT discussed the possible mechanism by which Distribution Providers would receive modeling data and parameters. The DT did not feel this rose to the level of a requirement as the Distribution Provider can ask for the modeling data and parameters from the respective entity.
P106. "Finally, as noted by commenters, we recognize that there may be instances where IBR-DERs are connected to an entity that does not meet the criteria for registration with NERC as a distribution provider. For those areas with IBR-DERs that in the aggregate materially affect the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we direct NERC to determine the appropriate registered entity responsible for providing data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, or, when unable to gather such accurate IBR-DERs data, to provide instead	MOD-032 IRO-010 TOP-003	**Theme:** Who is the responsible entity when no registered DP of IBR-DER (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation. • After much deliberation, the DT determined that if there is no registered Distribution Provider, then the next best entity would be a Transmission Owner. The DT created a footnote to Attachment 1 stating: "The Distribution Provider is the typical responsible entity for collecting and providing data for DERs

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation."		connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider's system. The Transmission Owner is the typical responsible entity for collecting and providing data for DERs where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner's system." • The DT asked industry the following question: "Do you agree that the Transmission Owner (TO) is typically the appropriate responsible entity for collecting and providing data for DER where there is no associated registered DP between the DER connection point and the TO's system?" Some commenters agreed that the TO is the correct entity who should gather data if there is no associated registered DP between the DER connection point and the TO system. However, many comments received stated that the TO has no authority to collect data, and the following entities would be better suited to gather the data needed: Registered DP, Balancing Authority, Planning Coordinator, LSE, Generator Owner, Transmission Operator, and Resource Planner. Based on this feedback, the DT modified the Requirement language to allow the Planning Coordinator and each of its Transmission Planners to identify the most appropriate entity to provide the data listed in Attachment 1 of MOD-032-2.
P108. "Regarding CAISO's concern regarding the potential "compliance trap" where planners and operators rely on third-party data and IRC's request	MOD-032 IRO-010 TOP-003	**Theme:** Minimum categories or types of data that must be provided to transmission planners, transmission operators, transmission owners, and distribution providers that are necessary to predict the behavior of all

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
that the final rule specify the data to be submitted by all IBRs (i.e., registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate) and transmission devices using similar technologies, we direct NERC to determine through its standards development process the minimum categories or types of data that must be provided to transmission planners, transmission operators, transmission owners, and distribution providers necessary to predict the behavior of all IBRs and to ensure that compliance obligations are clear. As discussed in more detail in section IV.C of this final rule, we are also directing NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models that accurately reflect the behavior of all IBRs during steady state, short-circuit, and dynamic conditions. By contrast, we believe that a directive to task distribution providers as the appropriate registered entity to collect and share the modeling data and parameters of IBR-DERs in the aggregate is preferable to deferring to the stakeholder process as suggested by APS. The distribution provider, as the entity providing and operating the lines between the transmission and distribution systems, is the entity best situated to have access to the data necessary for accurate estimation and, other than Indicated Trade Associations that suggested the piecemeal approach already discussed above, no commenter identified other potential entities as an equally efficient option."		IBRs and to ensure that compliance obligations are clear (ERO Approved Acceptable Criteria for Models/IEEE1547 ref./modify req./Tech rationale) **Applicability:** Transmission Planners, Transmission Operators, Transmission Owners, and Distribution Providers • The DT added Requirement R1, Part 1.4 to specify dynamic model submission requirements in Planning Coordinator/Transmission Planner data requirements and reporting procedures. • The focus of Requirement R1 Part 1.4 is obtaining accurate and usable models for IBRs. New Requirement R2 Part 2.3 provides that models with known deficiencies, such that the ERO included them on the Unacceptable Model List, shall not be submitted without technical justification. • Attachment 1 was modified to categorize the types of data required as per the directive (IBR, aggregate DER, Storage) necessary to facilitate model development. • Requirement R2, Part 2.1 requires entities to estimate unregistered IBR and IBR-DER data if the entity responsible for providing such data is unable to gather it.
P122. "Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop	MOD-032 IRO-010	**Theme**: Require the use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady state, short-

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions when developing planning, operations, and interconnection-wide models. For example, the new or modified Reliability Standards could reference the NERC approved component model list, which defines the models that may be used, and those models that may not be used, for specific types of studies. This approved component model list includes WECC's IBR models. Without requiring the use of approved industry generic library models, Bulk-Power System planners and operators may not be able to create system models that adequately predict IBR behaviors and subsequent impacts on the Bulk-Power System."	TOP-003	circuit, and dynamic conditions when developing planning, operations, and Interconnection-wide models. While FERC Order No. 901 directed NERC to "develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions" (P 108), the DT determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their Interconnection-wide models and subsequently their planning cases. The DT considered that many entities have a different understanding for what is a "generic model", and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The DT further considered that NERC as the ERO does not presently maintain an "acceptable model library", but rather an "unacceptable model library", and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion. Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		To bookend these criteria for acceptable models, proposed Requirement R2 would also require any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The Unacceptable Models List includes models that NERC has identified over time as having known issues. While the DT initially proposed to foreclose the use of such models, the DT considered feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The DT believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns. The DT debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the DT ultimately decided to include this requirement in Requirement R2 as it relates to how entities respond to data specifications. The DT has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the DT has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for entities for Reliability Standards compliance purposes. As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the Reliability and Security Technical Committee. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations would then be considered by the ERO and published on the NERC website. NERC staff are currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing.
P124. "We direct NERC to determine through its standards development process which nation-wide approved component models are needed to build IBR plant models for steady state, short-circuit, and		**Theme:** Nation-wide approved component models are needed to build IBR plant models for steady state, short-circuit, and dynamics studies. (Uniform Modeling framework)

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
dynamics studies. We acknowledge NERC's comment that user-defined models may be helpful for specific local reliability studies; however, the user-defined model cannot be used in place of nation-wide approved component models for regional analysis or interconnection-wide analysis because the user-defined model may cause non-convergence and other issues. However, NERC may allow the submission of user-defined models alongside the approved industry generic IBR model. Various entities do not accept user-defined models or only accept them for limited instances along with the open-source code which then allows internal model components to be viewed and modified. For example, PJM does not accept user-defined models and requires generic models for model verification in accordance with currently effective Reliability Standards MOD-026-1 and MOD-027-1. NYISO accepts a user-defined model in limited instances but requires either the open-source code (allowing anyone to access the internal model) or dynamic link library data and code files (compiled code that must be decompiled to view the internal model) that must be supplied for existing power flow software and in perpetuity."		The uniform modeling framework established in the proposed MOD-032 will focus on the use and representation of positive sequence phasor domain (PSPD) models in registered entity footprints and in Interconnection-wide models. Interconnection-wide modeling may be different from the models used in specialized studies dedicated to a particular technical objective. The ERO Unacceptable Models List applies to the models where NERC Reliability Standards require its use (generally for planning and operation models where multiple entities share information beyond their portion of the electric system, which includes Interconnection-wide models). Further guidance for interconnection applications can be found in the *NERC Dynamic Model Recommendations*. The DT considered introducing an approved model list for use in building cases specifically for Interconnection-wide analysis through Requirement R1 Part R1.2 of the proposed MOD-032, however, pre-defining a limited set of models that could be used to represent generation and system components is potentially at odds with objectives to also have accurate models, especially as technology rapidly progresses. To meet this directive, the DT modified Requirement R1 of MOD-032 by specifying the use of standard library "generic" models in Interconnection-wide cases while allowing the use of user-defined models. This provision was careful to address typically reported issues associated with user-defined models (UDMs) including non-convergence, by requiring that TP/PCs establish usability requirements for UDMs while incorporating an open, transparent process of identifying deficient models through the use of the "MOD-032 Supporting Documentation – Process for Updating the Unacceptable Models List Maintained by the ERO" and the "ERO Unacceptable Model list". Any TPs/PCs accepting UDMs shall provide

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		their UDM requirements to other PCs/TPs within the Interconnection upon request. The DT believes this approach balances the practical limitations of "generic models" raised by industry at the January 15-16 NERC Industry Engagement Workshop and re-iterated at the June NERC Industry Engagement Workshop with the need for an improved uniform modeling framework. The combination of specifying the use of standard library component models approved and offered by software simulation tools, along with the ERO maintained Unacceptable Model List and its processes, will ensure that models used in interconnection wide analysis are robust enough while accuracy is not compromised to any level of detail deemed necessary. The introductions to this framework increase the data specifications requirements when user-defined models are used. TOP-003 and IRO-010 proposed standards were modified to ensure models submitted are consistent with models submitted under the framework established in MOD-032.
P125. "Accordingly, we direct NERC to develop new or modified Reliability Standards that require the sole use of nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build interconnection-wide models. One example of a way NERC could meet this directive would be to require an equivalent generic library model along with all submissions of user-defined models so that the generic library model can be used when combining	MOD-032 IRO-010 TOP-003	**Theme:** Nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build Interconnection-wide models. (Uniform Modeling framework /Req language) • Nation-wide approved components via generic library models are addressed via the development of a framework established in the proposed MOD-032-2 through improvements to Requirements R1, R2, and R3. The inclusion of ERO Unacceptable Models List, MOD-032 Supporting Document, and additional

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
neighboring transmission system models and in interconnection-wide models."		requirement language aims to ensure uniformity in processes and models to facilitate the exchange of neighboring entities' respective planning/operation models and to build Interconnection-wide models. • The PC and TP are allowed to require provision of generic models, but if equipment-specific models satisfy usability criteria, and processes established through Requirements R1, R2, and R3 of the proposed MOD-032 standard, they are not prohibited. The framework explicitly allows for the submission of equivalent generic library models along with submissions of user-defined models which allows for the use of generic library models when combining neighboring transmission system models and Interconnection-wide models. • TOP-003 and IRO-010 proposed standards were modified to ensure models submitted are consistent with models submitted under the framework established in MOD-032.
P141. "We also direct NERC to require the generator owners of registered IBRs and the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g., planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of registered and unregistered IBRs, including momentary cessation and/or tripping, and all ride through behavior. Recognizing that there may be instances in which transmission owners are unable to gather accurate unregistered IBR modeling data and parameters to	MOD-032 IRO-010 TOP-003	**Applicability**: GO • Nation-wide approved components via generic library models are addressed via the modifications made to MOD-032, including incorporation of an ERO Unacceptable Models list, establishing an improved uniform modeling framework. This approach is aligned with the FERC Order directives while addressing the practical limitations raised by industry at the January 15-16 NERC Industry Engagement Workshop and re-iterated at the June NERC Industry Engagement Workshop. • MOD-032, Attachment 1 was modified to specifically add that capabilities related to momentary cessation, tripping, and Ride-

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
create and maintain accurate unregistered IBR dynamic models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas, dynamic models of unregistered IBRs using estimated data in accordance with this final rule's section IV.B.3 data sharing directives. Further, we direct NERC to require distribution providers to provide to the planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities aggregated dynamic models that adequately represent the dynamic performance of IBR-DERs on their systems that in the aggregate have a material impact on the Bulk-Power System, including momentary cessation and/or tripping, and all ride through behavior (e.g., IBR-DERs in the aggregate modeled by interconnection requirements performance to represent different steady-state and dynamic behavior). Recognizing that there may be instances in which distribution providers are unable to gather data that accurately represents IBR-DERs in the aggregate, we modify the NOPR proposal and direct NERC to include in the proposed new or modified Reliability Standards a requirement that the distribution provider, if unable to gather data of IBR-DERs that in the aggregate have a material impact on		through, be reflected in the required model data for IBR and DER. • Explicit reference to IBR data was added to the TOP-003 and IRO-010 standards along with provisions to ensure that models submitted under these standards are consistent with the models submitted under the framework established in MOD-032.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
the Bulk-Power System, provide to the Bulk-Power System planners and operators (i.e., the data recipients) a dynamic model using estimated data for IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, in accordance with this final rule's section IV.B.3 data sharing directives. Furthermore, we acknowledge that there may be areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider. Therefore, we modify the NOPR proposal and direct NERC to determine the appropriate registered entity responsible for providing adequate data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and to identify the registered entities for coordinating, verifying, and keeping up to date the respective dynamic models. Finally, NERC must ensure that the proposed new or modified Reliability Standards account for the dynamic performance of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System."		
P146. Accordingly, **we direct NERC to develop new or modified Reliability Standards that require the use of the DER_A model or successor models to represent the behaviors of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System at a sufficient level of fidelity for Bulk-Power System planners and operators to create valid planning and operations and interconnection-wide models and to**	MOD-032 IRO-010 TOP-003	**Theme**: IBR-DER Model • As per the directive, the DT is requiring the modeling of aggregate DER through requirement R1 and Attachment 1. The currently available DER_A model is sufficient only for positive sequence phasor domain simulations. With the variety of other simulation domains (such as EMT and short circuit) necessary to study IBRs, mandating this model could prevent TPs or PCs from

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
be able to perform respective system studies. For example, the new or modified Reliability Standards could require models of IBR-DERs (i.e., DER_A model) to adequately reflect the steady-state and dynamic aggregate resource performance in both a transmission area and across the interconnection. Additionally, estimated modeling data and parameters of IBR-DERs that in the aggregate (i.e., DER_A model) have a material impact on the Bulk-Power System could be used where measured and collected data is not available. We believe requiring the DER_A model will address NERC's request for entities to work collaboratively with the state regulators to identify, implement, and perform an effective model validation approach for IBR-DERs in the aggregate as opposed to requiring validated models of IBR-DER in the aggregate that can have a material impact on the reliable operation of the Bulk-Power System.		performing their studies. This further reinforces the DT's election to not require the use of the DER_A model, but rather a model that achieves specific performance criteria and conforms with MOD-032 edits in Attachment 1 and Requirement R1. The fidelity/accuracy components of the FERC directives were generally considered to be within the SAR scopes for Projects 2020-06 and 2021-01, not Project 2022-02. However, the model framework established with the proposed MOD-032-2 does facilitate model fidelity and accuracy by allowing flexibility in model selection (rather than mandating use of a defined set of models). Specific fidelity/accuracy evaluations are beyond the scope of MOD-032. • The DT considered referencing the DER_A model specifically, but refrained due to the rapidly evolving nature of models and concerns for the time required to update such a reference in a NERC Standard. Additionally, the DT is not specifying particular library models for other resources, so specifying a particular model for DER will invite challenges. Further, challenges with precisely defining and determining what a "successor model" is could potentially create more future reliability risks. The standard as currently written allows for additional future models of higher fidelity to be accommodated.
P157. We believe the development of new or modified Reliability Standards is an important corollary to NERC's ongoing effort to identify and register generator owners and operators of IBRs. Although NERC's registration changes will not at this time address IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, we believe APS's concerns	MOD-032 TOP-003 IRO-010	**Theme:** The responsible entity for IBR-DER data when there is no registered DP. Upon a decent amount of conversation, the DT determined that if there is no registered Distribution Provider, then the next best entity would be a Transmission Owner. The DT created a footnote to Attachment 1 stating: "The Distribution Provider is the typical responsible entity for

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
regarding system-wide model validation is addressed in NERC's Reliability Guidelines and through the use of the EPRI DER Settings Database. We recognize that some distribution providers may not be able to provide a precise set of modeling data and parameters that accurately represent IBR-DERs in the aggregate. For these situations, NERC has provided a technical means to estimate in aggregating the needed IBR-DER modeling data and parameters (i.e., for the DER_A model) in the IBR-DER Data Collection Guideline. Further, NERC's 2021 Aggregate DER Model Verification Guideline provides transmission planners and planning coordinators with tools and techniques that can be adapted for their specific systems to verify that aggregate DER models (i.e., DER_A models) are a suitable representation of these resources in planning assessments. **Furthermore, for those areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we modify the NOPR proposal to direct NERC to determine the appropriate registered entity responsible for the data and parameters of IBR-DERs in the aggregate and to establish a process that requires identified registered entities to coordinate, validate, and keep up to date the system models.**		collecting and providing data for DERs connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider's system. The Transmission Owner is the typical responsible entity for collecting and providing data for DER where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner's system." The use of the word "typical" is intentional to indicate the most likely entity based on the DT's broad understanding but allows flexibility per Requirement 1 for the PC/TPs to select a more appropriate entity or entities in their area based on regional or jurisdictional differences.
P161. "Pursuant to section 215(d)(5) of the FPA, we modify the NOPR proposal to provide additional specificity to explain coordination and keep up to date in a timely manner the verified data and models of	MOD-032 IRO-010 TOP-003	The DT modified MOD-032 to ensure it captures the uniform framework with modeling criteria, a registered modeling designee, and necessary data exchange requirements. Modifications in TOP-003 and IRO-010 are

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate in the system models. **Specifically, we direct NERC to develop new or modified Reliability Standards that require planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities to establish for each interconnection a uniform framework with modeling criteria, a registered modeling designee, and necessary data exchange requirements both between themselves and with the generator owners, transmission owners, and distribution providers to coordinate the creation of transmission planning, operations, and interconnection-wide models (i.e., system models) and the validation of each respective system model.** Further, we direct NERC to include in the new or modified Reliability Standards a requirement for generator owners, transmission owners, and distribution providers to regularly update and communicate the verified data and models of registered IBRs, unregistered IBRs, and IBR-DERs by comparing their resulting models against actual operational behavior to achieve and maintain necessary modeling accuracy for inclusion of these resources in the system models. For those areas with IBR-DERs in the aggregate that have a material impact on the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we modify the NOPR proposal to direct NERC to determine the appropriate registered entity		intended to promote consistency in models submitted for planning purposes and operations purposes. • A uniform modeling framework is established in the proposed MOD-032-2 through improvements to R1, R2, and R3. The inclusion of ERO Unacceptable Models List, MOD-032 Supporting Document, and additional requirement language aims to ensure uniformity in processes and models to facilitate the exchange of neighboring entities' respective planning/operation models and to build Interconnection-wide models. • The PC and TP are allowed to require provision of standard library models, but if user-written models satisfy usability criteria, and processes established through R1, R2, and R3 of the proposed MOD-032 standard, they are not prohibited. The framework explicitly allows for the submission of standard library models along with submission of user-written models which allows for the use of standard library models when combining neighboring transmission system models and Interconnection-wide models. • The DT added IBRs (including unregistered-IBRs) and DER (including IBR-DER) to Attachment 1 of the MOD-032 standard. While the TO would be the typical entity for providing unregistered IBR data and the DP would be the typical entity to provide DER data (as noted in Attachment 1 of MOD-032), the DT modified the Requirement language to allow the Planning Coordinator and each of its Transmission Planners to identify the most appropriate entity to provide the data listed in Attachment 1 of MOD-032-2. Determination if an unregistered IBR or aggregate IBR-DER would "materially affect" the Bulk-Power System, requires engineering judgment and is not something that would be appropriate to

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
responsible for the models of those IBR-DERs and to determine the registered entities responsible for updating, verifying, and coordinating models for IBR-DERs in the aggregate to meet the system models directives. NERC may implement this directive by modifying Reliability Standards MOD-032-1 and MOD-033-2 or by developing new Reliability Standards to establish requirements mandating an annual process to coordinate, validate, and keep up-to-date the transmission planning, operations, and interconnection-wide models."		precisely specify in a reliability standard. Thus, Attachment 1 footnote 7 was added to explicitly allow Transmission Planners and Planning Coordinators to specify DER thresholds that may be appropriate when considering impact to their local areas. • The DT made changes to the IRO-010 and TOP-003 standards to include IBRs specifically (see R1 of each standard). To the extent modeling data is deemed necessary under IRO-010 and TOP-003, it should be consistent with modeling data provided for planning purposes. Therefore, the DT made changes to the IRO-010 and TOP-003 standards to require that model submissions for operations purposes under IRO-010 and TOP-003 are consistent with the model submissions for planning purposes. The fidelity/accuracy components of the FERC directives were generally considered to be within the SAR scopes for Projects 2020-06 and 2021-01, not Project 2022-02. However, the model framework established with the proposed MOD-032-2 does facilitate model fidelity and accuracy by allowing flexibility in model selection (rather than mandating use of a defined set of models). Specific fidelity/accuracy evaluations are beyond the scope of MOD-032. MOD-032-1 already mandated a "schedule for submission of data at least once every 13 calendar months." This requirement is maintained in MOD-032-2. With regards to that part of the directive addressing a "registered model designee", NERC considered the directive and concluded that the present framework, with enhancements since 2023, presents an equally effective and efficient alternative to designating a model designee for

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		Interconnection-wide model building that is a registered entity. Further, this framework has distinct advantages over designating a responsible entity in that it maintains ongoing oversight, rather than compliance/audit-focused oversight. **Registered Modeling Designee:** The current MOD-032, Requirement R1, Part 1.1 requires the Planning Coordinator (PC) and each of its Transmission Planners (TPs) to identify the Entity responsible for each required item in Attachment 1. Requirement R3 requires notification from the PC or TP regarding technical concerns with the data submitted under Requirement R2. Additionally, a new Requirement R2, Part 2.2 has been added to require models provided under MOD-026 to be accepted by the Transmission Planner. This allows a more detailed model that has also been verified to receive a review and coordination in order to be accepted by the TP. These requirements allow for the coordination and model updates needed by registered entities. In addition, Requirement R4 requires each PC to make available models for its planning area under R2 to the Electric Reliability Organization (ERO) or its designee to support the creation of the Interconnection-wide cases. The ERO has designated Entities for each Interconnection, such as Texas Regional Entity, Western Electric Coordinating Council (WECC), and Eastern Interconnection Reliability Assessment Group (ERAG). Regarding the ERAG, there is an Eastern Interconnection Regional Entity

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		Agreement[1]. In this agreement, important connections to MOD-032 are acknowledged, like the following: • Oversight of the Multiregional Modeling Working Group[2] (MMWG, whose membership is comprised of one power flow representative and one dynamics representative from each of the Data Submitting Entities (comprised of Planning Coordinators or group of Planning Coordinators) and non-voting representatives as follows: one liaison representative each of the EI Regions and the ERAG Chair, a coordinator from each of the organizations that provides model development services to MMWG, and NERC and FERC staff liaisons. ○ The purpose of the MMWG is to coordinate, in a timely manner, the development of designated power flow and dynamics simulation base case models that realistically simulate steady state and dynamic bulk electric system behavior of the Eastern Interconnection. ○ To ensure cases and models are done in a consistent fashion, the MMWG holds three annual meetings along with conference calls as needed. The MMWG roster includes a FERC liaison who can attend all meetings. The group maintains a case building procedure manual[3] that is used by its members. The manual contains a set of data checks that are performed on the steady state and dynamic cases.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		In addition, the DT has considered the following information provided by the MOD-032 Designee Group: **MOD-032 Designee Group:** The electric grid is evolving at an unprecedented pace, driven by the rapid integration of inverter-based resources (IBRs), changing load characteristics, and emerging technologies. As the system transforms, too must the models we use to study and understand its behavior. We recognize the growing challenge of obtaining and coordinating accurate dynamic models for IBRs, including securing the appropriate parameters needed to ensure that simulation results reflect real-world system performance. Addressing these modeling challenges is essential to maintaining the reliability and resilience of the bulk power system and requires close collaboration, and the MOD-032 designees along with PCs are committed to and holding data providers accountable for model coordination and model quality. The MOD-032 designees are committed to ensuring that the model quality is maintained and there is a mechanism in place for the PC/TP to gather the appropriate information from the Generator Owners (GO). NERC facilitates the designee group of Regional Entity staff who are responsible for designee activities. This group meets periodically to discuss case quality metrics and to improve the interconnection case-building process. A sub-team has been assembled to write a MOD-032 SAR to add authority for the Designee to enforce model quality. Overall, the FERC directive has been addressed through current and updated requirements/processes.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
P226. "Although we are not directing NERC to include implementation dates in its informational filing and are leaving determination of the proposed effective dates to the standards development process, we are concerned that the lack of a time limit for implementation could allow identified issues to remain unresolved for a significant and indefinite period. Therefore, we emphasize that industry has been aware of and alerted to the need to address the impacts of IBRs on the Bulk-Power System since at least 2016. The number of events, NERC Alerts, reports, whitepapers, guidelines, and ongoing standards projects more than demonstrate the need for the expeditious implementation of new or modified Reliability Standards addressing IBR data sharing, data and model validation, planning and operational studies, and performance requirements. Thus, in that light, the Commission will consider the justness and reasonableness of each new or modified Reliability Standard's implementation plan when it is submitted for Commission approval. Further, we believe that there is a need to have all of the directed Reliability Standards effective and enforceable well in advance of 2030 and direct NERC to ensure that the associated implementation plans sequentially stagger the effective and enforceable dates to ensure an orderly industry transition for complying with the IBR directives in this final rule prior to that date."	MOD-032 IRO-010 TOP-003	**Theme:** Sufficient timeframe. The DT felt that four years was an appropriate timeframe for the MOD-032, IRO-010, and TOP-003 implementation times. It is understood that based on what is required via MOD-032, industry would need two years to hold meetings with stakeholders to establish processes for collecting the needed models and data, and then an additional two years to update models based on the new requirements, etc. However, taking into consideration the FERC Order 901 implementation deadline of 2030, the DT settled on a three-year implementation time knowing that milestone 4 revisions still need to be implemented by 2030 and are dependent on the Milestone 3 implementation plan time. Three- year implementation plans were also selected for TOP-003 and IRO-010 to align potential new data requests under TOP-003 and IRO-010 with the expected data availability under MOD-032 processes.

Chapter 4: Version History 9

Overview/Introduction

FERC issued Order No. 901 on October 23, 2023, directing "NERC to develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions when developing planning, operations, and interconnection-wide models. For example, the new or modified Reliability Standards could reference the NERC approved component model list, which defines the models that may be used, and those models that may not be used, for specific types of studies. This approved component model list includes WECC's IBR models. Without requiring the use of approved industry generic library models, Bulk-Power System planners and operators may not be able to create system models that adequately predict IBR behaviors and subsequent impacts on the Bulk-Power System."

Proposed Reliability Standard MOD-032-2 addresses the reliability issue identified by FERC in Order No. 901 in a manner that considers advancements in user written models since the issuance of Order No. 901, perspectives of planning entities across North America, and the historical practice of the ERO, which has been to maintain a use of unacceptable models, rather than acceptable models, due to the practical difficulties of keeping an acceptable model library up to date in a timely manner.

Reliability Standard MOD-032-2 requires the Planning Coordinator and Transmission Planner to include specifications addressing the use of standard library models, user-written models meeting certain minimum usability requirements to minimize the risk of non-convergence, or both. To minimize the use of models with known deficiencies, Transmission Planners and Planning Coordinators must also include provisions to require any entity submitted on the Unacceptable Model List to include a technical rationale supporting its use.

The Unacceptable Models List identifies models that are generally considered not acceptable for purposes of model submissions under the MOD-032, TOP-003, and IRO-010 Reliability Standards due to identified issues with usability or accuracy impacting the ability to develop planning or operational horizon cases necessary to support analysis of the reliability of the interconnected transmission system. However, it is recognized that the use of such models may be appropriate in some cases, such as where there is no feasible means for procuring an alternative model that may better represent the behavior of legacy equipment. Any use of such models must include a technical rationale supporting its use.

Disclaimers

Interconnection-wide modeling requirements may differ from the requirements of specialized studies dedicated to a particular technical objective. Thus, models deemed acceptable for planning purposes may be deemed unacceptable by a receiving entity for certain operations applications.

Updates to the Unacceptable Models List

Refer to the Supporting Document section of MOD-032.

Chapter 1: Unacceptable Models List

Models that have been identified as unacceptable are listed in Table 1 below. Revisions to this list may be made in accordance with the process described in the Supporting Document section of the MOD-032 standard.

Table 1: Unacceptable Model List		
Known Unacceptable Model Name	**Model Description**	**Effective**
Renewable Energy Models		
WT3G1, WT3G2, wt3g	Generic Type 3 WTG Generator/Converter Model - Doubly-fed induction generator	Effective Date of MOD-032-2
WT4G1, WT4G2, wt4g	Generic Type 4 WTG Generator/Converter Model - Variable speed generator with full converter	Effective Date of MOD-032-2
WT3E1, wt3e	Generic Type 3 WTG Electrical Control Model	Effective Date of MOD-032-2
WT4E1, WT4E2, wt4e	Generic Type 4 WTG Electrical Control Model	Effective Date of MOD-032-2
WT3T1, wt3t	Generic Type 3 WTG Turbine Model	Effective Date of MOD-032-2
WT3P1, wt3p	Generic Type 3 WTG Pitch Control Model	Effective Date of MOD-032-2
WT12A1, wt1p, wt2p	Generic Type 1 and 2 WTG Pitch Control Model	Effective Date of MOD-032-2
WT4E1, wt4t	Generic Type 4 WTG Power Converter Model	Effective Date of MOD-032-2
wt4p	Generic Type 4 Pitch Control Model	Effective Date of MOD-032-2
REECB1, REECBU1, reec_b	Generic Phase 2 PV Electrical Controls Model	Effective Date of MOD-032-2
Machine Models		
GENSAL, gensal	Salient Pole Generator Model (IEEE Std 1110 §5.3.1 Model 2.1)	Effective Date of MOD-032-2
GENCLS, gencls	Classical Generator Model (IEEE Std 1110 §5.4.2)	Effective Date of MOD-032-2
GENTRA	Transient Level Generator Model	Effective Date of MOD-032-2
Excitation System Models		
texs	General Purpose Transformer Fed Excitation System	Effective Date of MOD-032-2
SEXS, sexs	Simplified Excitation System	Effective Date of MOD-032-2
EX2000	GE EX2000 Excitation System	Effective Date of MOD-032-2
Turbine-Governor Models		
lm2500	LM 2500 Aero-Derivative Gas Turbine Governor Model	Effective Date of MOD-032-2
Known Unacceptable Model Name	**Model Description**	**Effective**

Table 1: Unacceptable Model List		
lm6000	LM 6000 Aero-Derivative Gas Turbine Governor Model	Effective Date of MOD-032-2
URGS3T, gast	WECC Gas Turbine Governor Model	Effective Date of MOD-032-2
GAST	Gas Turbine-Governor Model	Effective Date of MOD-032-2
GAST2A	Gas Turbine-Governor Model	Effective Date of MOD-032-2
GASTWD	Gas turbine-governor	Effective Date of MOD-032-2
IEEEG2	1981 IEEE Type 2 General Approx. Linear Ideal Hydro Model	Effective Date of MOD-032-2
WESGOV	Westinghouse Digital Governor Model for Gas Turbines	Effective Date of MOD-032-2
Load Models		
motorc	Phasor Model of Single-Phase Air-Conditioner Compressor Motor	Effective Date of MOD-032-2

Chapter 2: Unacceptable Models Technical Rationale

Table 2 below provides the technical rationale for each unacceptable model included on the current Unacceptable Models List.

The purpose of this list of unacceptable models is to develop and maintain a repository of models deemed acceptable by the ERO and industry stakeholders for use in developing interconnection-wide models developed by the MOD-032 Designee. The NERC System Analysis and Modeling Subcommittee (SAMS) initially developed this list, and it is now maintained and updated by ERO staff in accordance with MOD-032 Supporting Document. This list seeks to bring together multiple sources of data to ensure uniformity in the use of models across Interconnections. While models may be deemed 'obsolete' or 'deprecated' due to known issues, these models are not removed from the software vendor libraries for various reasons. However, these models should not be used to represent specific facilities within Interconnection-wide models. For additional information about this list, please contact NERC staff at advancedsystemanalyticsmodeling@nerc.net with any questions.

Table 2: Unacceptable Model List

Known Unacceptable Model Name	Rationale For Inclusion
Renewable Energy Models	
WT3G1, WT3G2, wt3g	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT4G1, WT4G2, wt4g	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT3E1, wt3e	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT4E1, WT4E2, wt4e	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT3T1, wt3t	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT3P1, wt3p	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT12A1, wt1p, wt2p	Unable to represent common Type 1 wind pitch control logic.
WT4E1, wt4t	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
wt4p	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
REECB1, REECBU1, reec_b	Inability to represent momentary cessation or other voltage dependent current logic common in the equipment the model was stated to represent.
Machine Models	

Table 2: Unacceptable Model List	
Known Unacceptable Model Name	**Rationale For Inclusion**
GENSAL, gensal	Uses simplifying approximations for saturation as additive terms over exponential or quadratic curves. Further, ignores the q-axis saturation completely.
GENCLS, gencls	Does not allow for representation of excitation system and turbine/speed governor models
GENTRA	Simplified model that ignores sub transient effects, leading to numerical instability problems.
Excitation System Models	
texs	Simplified, early generation model considered obsolete. Refer to IEEE Std 421.5
SEXS, sexs	Simplified, early generation model considered obsolete. Refer to IEEE Std 421.5
EX2000	Field current limiter latch in the model is unable to represent the field equipment for simulation in power system software. Replace with AC7B or ex21br
Turbine-Governor Models	
lm2500	No supporting documentation implemented in software, proprietary model with no added model support.
lm6000	No supporting documentation implemented in software, proprietary model with no added model support.
URGS3T, gast	Simple representation of steam turbine-governor system with insufficient model capability for modern digital controllers.
GAST	Simple representation of steam turbine-governor system with insufficient model capability for modern digital controllers.
GAST2A	Simple representation of steam turbine-governor system with insufficient model capability and flexibility for modern digital controllers.
GASTWD	Simple representation of steam turbine-governor system with insufficient model capability and flexibility for modern digital controllers.
IEEEG2	Model uses an oversimplified governor model applicable only to first swing stability. Deprecated with other hydro governor models.
WESGOV	Simple representation of steam turbine-governor system with insufficient model capability and flexibility for modern digital controllers.
Load Models	
motorc	Experimental load model. Should not be used for generation resources

Chapter 3: Sample Submission Form

This form is a sample to explain what is deemed a full application to change a model designation in the Unacceptable Models List.

Section 1: Submitting Entity Information			
Name of Person submitting			
Organization(s)			
Sector (if known)			
Telephone		Email	

Section 2: Model Identifying Information	
Model Name	
Alternative Model Name(s) as implemented in software	
Equipment Model is stated to represent	
Indicate desired Action	☐ Add model to the Unacceptable Models List ☐ Remove model from the Unacceptable Models List

Section 3: Technical Supporting Documentation and Description	
Description of model ability to meet small signal Disturbances	
Description of model ability to meet large signal Disturbances	
Please cite and link any industry approved documentation regarding this model's small and large signal disturbances	
Describe the technical document attachments that support the above questions	
Please identify any information in this application that may meet the criteria for Confidential Information, as defined in Section 1500 of the NERC Rules of Procedure	

Section 4: Process Tracking	
Date Submitted to ERO	
Model Status	☐ Submitted to the ERO ☐ Assigned ERO Review team ☐ Investigation and review by ERO and submitting entity ☐ Remanded by NERC RSTC (or its successor) ☐ Approved by the NERC RSTC (or its successor)
Date of Approval	
Date of Model Notice to Industry	

Attachments

If available, please include at least one report that uses Hardware-in-the-Loop, Software-in-the-Loop, or actual System response (e.g., in a commissioning test) to demonstrate the model's ability or inability to achieve its stated purpose. At least one attachment should detail the model's error boundaries to represent its stated equipment with the test description and procedure outlined in that report. Entities shall label any attachment that may meet the criteria for Confidential Information under NERC Rules of Procedure Section 1500, along with the basis for the designation (e.g., Confidential Business and Market Information, Critical Electric Infrastructure Information, etc.). If any of this information is not available to the supporting entity, please provide an explanation.

Chapter 4: Version History

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2022-02 Uniform Modeling Framework for IBR

Formal Comment Period Open through September 10, 2025

Now Available

A 34-day formal comment period for **Project 2022-02 Uniform Modeling Framework for IBR**, is open through **8 p.m. Eastern, Wednesday, September 10, 2025** for the following standards and implementation plan:

- MOD-032-2 – Data for Power System Modeling and Analysis
- IRO-010-6 – Reliability Coordinator Data and Information Specification and Collection
- TOP-003-8 – Transmission Operator and Balancing Authority Data and Information Specification and Collection
- Implementation Plan

The standard drafting team's considerations of the responses received from the previous comment period are reflected in this draft of the standard.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Additional ballots for the standards and implementation plan, as well as the non-binding polls of the associated Violation Risk Factors and Violation Severity Levels will be conducted **August 28 - September 10, 2025**.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Jordan Mallory (via email) or at 470-479-7538. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2022-02 Uniform Modeling Framework for IBR observer list” in the Description Box.

There were 68 sets of responses, including comments from approximately 153 different people from approximately 103 companies representing 8 of the Industry Segments as shown in the table on the following pages.

Questions

1. Do you agree with the proposed MOD-032-2 modifications? If you do not support the modifications made, please provide rationale and proposed language on how you would address the FERC Order 901 directives.

2. Do you agree with the proposed IRO-010-6 and TOP-003-8 modifications? If you do not support the modifications made, please provide rationale and proposed language on how you would address the FERC Order 901 directives.

3. Do you agree that the modifications for the proposed reliability standards (MOD-032-2, IRO-010-6, and TOP-003-8) address the scope of the standard authorization request (SAR) in a cost-effective manner? If you do not agree, please provide alternatives that would address the SAR scope in a more cost-effective manner.

4. Do you agree with the proposed ERO Unacceptable Models List? If you do not agree, please provide alternative language and explain the rationale that, if made, would result in your support.

5. Provide any additional comments for the drafting team to consider, if desired.

1. Do you agree with the proposed MOD-032-2 modifications? If you do not support the modifications made, please provide rationale and proposed language on how you would address the FERC Order 901 directives.

Thomas Foltz - AEP - 5	
Answer	No
Document Name	
Comment	

The SDT's response to AEP's previous comments states that "Attachment 1 does not create obligations for entities to provide data, but specifies the data items that need to be covered by the PC/TP data reporting procedures and requirements." While this is true, a compliance obligation nonetheless remains on the PC/TP to document data reporting requirements that address or cover the items in Attachment 1. We maintain that the items as given in 7a and 10a of the Dynamics column are too all-encompassing for positive sequence modeling, particularly "momentary cessation" and "ride-through," so the recommendations made in our previously submitted comments remain the same. While there are provisions for representing voltage and frequency protection settings in positive sequence simulations, "momentary cessation, tripping, and ride-through" are too open-ended, and may not be able to be represented completely in positive sequence phasor domain simulations, and lack the clarity needed to be certain of compliance. AEP suggests the following be used instead:

7a. "In the absence of project specific data, include estimated, assumed, or typical voltage and frequency protection settings."

10a. "Include estimated, assumed, or typical aggregate voltage and frequency protection settings."

The SDT's response also stated that they "received an overwhelming response from industry stating that there are different functional entities who could collect and provide data for DER where there is no associated registered DP between the DER connection point" and that "this could be the Transmission Owner, Distribution Provider, Generator Owner, Balancing Authority, Resource Planner, etc." While AEP appreciates the addition of footnote 7 of Attachment 1 Data Reporting Requirements and the flexibility it provides in allowing aggregate thresholds to be specified, it is difficult to envision GOs, BAs, and RPs as being potentially held responsible for DER aggregation modeling. As stated in our previous comments, FERC Order 2222 DER aggregators would seem to be well-positioned to coordinate with their constituent DERs, consolidate the necessary modeling and planning data, and meet compliance obligations. AEP recommends that consideration be given in pursuing FERC Order 2222 DER aggregators for this purpose.

AEP is concerned that R1.1 allows the PC and TP to determine the entity who is ultimately responsible to obtain each of the required items in Attachment 1. In effect, two Functional Entities are essentially given authority to decide who bears both the responsibility and ultimate risk of obtaining data from entities with no obligations to provide it. Our concern is if the assigned entity is one that neither owns nor operates the equipment, and this possibility is a contributor to our decision to vote negative on MOD-032.

Response	

Andy Thomas - Duke Energy - 1,3,5,6 - SERC,RF	
Answer	No
Document Name	
Comment	

Duke Energy supports the incorporation of the following EEI comment:

…"EEI appreciates the inclusion of the Abeyance Language, however, the language could be clearer and less repetitive. The subjectivity of the language (e.g., sincere intent) should be removed because it places unnecessary compliance risk the functional entities responsible. To resolve our concerns, we offer the following edits in boldface for NERC consideration."

Duke Energy supports the incorporation of the following EEI edits with one additional time change (see strike-through):

"For a period of two [three] years following the **enforcement** date of Reliability Standard MOD-032-2 Requirement R2 under the associated implementation plan, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C of the Rules of Procedure for a failure to comply with Reliability Standard MOD-032-2 Requirement R2 Part 2.1 with respect to the provision of estimated aggregate DER data or estimated data for **unregistered IBRs. While the CEA will not pursue compliance actions during this period for entities who develop estimates for aggregate DER data and unregistered IBR data that include the supporting data explanation and methods used as detailed in Requirement R2 subpart 2.1, they will pursue actions against entities who do not supply the required estimates, or the explanation of the limits or their methods used to create the estimates provided**. Entities shall participate in any compliance monitoring activities undertaken by the CEA during this potential noncompliance abeyance period and submit documentation as requested."

Additionally, Duke Energy does not agree with the modifications to IRO-010-6 and TOP-003-8, specifically for requirement R1.5.3 (both standards). MOD-032 and MOD-26 require models, and the PC and TP are required to jointly develop the models without RC or TOP input. Multiple modeling tasks may be required with significant additional cost if all four entities (RC, PC, TP, and TOP) do not coordinate their modeling needs. Therefore, Duke Energy recommends adding RC and TOP coordination language to R1 requirement of MOD-032-2. (Reference: Q1 – NERC Project 2022-02 Comment Form, due 9/10/2025)

Response

Mark Garza - FirstEnergy - FirstEnergy Corporation - 4, Group Name FE Voter

Answer	No
Document Name	

Comment

FirstEnergy offers the following concerns toward the scope of Unregistered IBRs related to inclusion of GO/GOP Category 2's definition in MOD-032-2.

Requirement R2.1. states "Data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.
R2.1. refers to IBRs that do not meet the BES Definition or Generator Owner Category 2 criteria. This requirement brings all IBRs into applicability of the standard regardless of size or interconnectivity.
Project 2024-01 passed on May 7, 2025, and adds "Category 2" non-BES IBRs to the Generator Owner definition in the NERC Glossary of Terms. Category 2 IBRs include generation facilities that meet or exceed 20 MVA and are interconnected at or above 60 kV. The intent of Project 2024-01 was to include IBRs that do not meet the BES Definition but have a material impact on the reliability of the BES. Including IBRs that do not have a material impact on the reliability of the BES does not contribute to the reliability of the BES and adds unnecessary work for registered Generator Owners.
The reliability standard itself should not define applicability to reliability standards. The BES Definition and Generator Owner category 2 criteria alone should define applicability.
In addition, entities that own IBRs that do not meet the BES Definition or Generator Owner Category 2 criteria may not be required to register as a

Generator Owner and therefore are not held to compliance with the reliability standards. This creates an unfair advantage.
FirstEnergy considers it a bad precedent to bring in generation facilities that do not meet the BES Definition or Generator Owner category 2 criteria.

For FirstEnergy offers the following 3rd bullet under R2.1:

"Data for an IBR that is not a DER and meets the criteria for Generator Owner registration under the NERC Glossary of Terms, including Category 2 IBRs as defined in Project 2024-01. Data for IBRs that do not meet these criteria may be requested only if the Planning Coordinator or Transmission Planner determines that such resources have a material impact on the reliability of the BES."

MH appreciates the SDT ‘s consideration of our comments in the previous revision of the draft standard. In general, we are OK with the changes made to Requirement R1 of MOD-032-2; however, we would like to propose some wording and format changes to improve the clarity, as indicated below.

1.4. Specifications of the following items for dynamic model submissions:

1.4.1. The type of dynamic models accepted:

standard library models incorporated within the software(s) utilized to create the Interconnection-wide case(s);

user-defined models; or

both standard library models and user-defined models.

1.4.2. Where user-defined models are accepted,

1.4.2.1. Usability requirements for any submitted user-defined models, including, at a minimum, requirements to provide model documentation and instructions for model set up and use.

1.4.2.2. Each Planning Coordinator and Transmission Planner shall provide their user-defined model requirements within 90 calendar days of receiving a written request for such data from other Planning Coordinators and Transmission Planners within the Interconnection.

Attachment 1, Footnote 3 effectively requires that all DERs are modeled, despite Footnote 7 allowing the procedure developed per R1 to define aggregation thresholds for DERs. Footnote 3 should instead read "For purposes of this item, aggregate Demand at each bus under item 1 is the Demand aggregated at the bus after removing any offsets due to DERs modeled at that bus according to the data requirements and reporting procedures developed by the PC and TPs per R1."

LG&E/KU does not support the revisions to MOD-032 due to the introduction of ambiguous compliance scenarios that are likely to arise from the revisions. The modifications to Requirement R1 Part 1.1 requiring the Transmission Planner (TP) to identify the entity responsible for providing data for all items in Attachment 1: (1) exceeded the scope of changes necessary to address FERC Order 901 directives, (2) removed certainty for functional entities regarding their obligations, and (3) failed to address FERC's explicit directive "to determine the appropriate registered entity responsible for providing data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System." In regard to point 3, it should be noted that the revised MOD-032 standard not only hands off the assignment of a responsible entity to TPs, it also fails to require that such entities be "registered entities." The formerly described issues aside, the revisions to MOD-032 have the potential to put TPs in a spot where compliance with the standard is unclear. If a TP assigns an unregistered entity responsibility for providing DER data under Requirement R1 Part 1.1, and the unregistered entity fails to provide	

data (or estimated data), it is not clear who is in violation. The TP has correctly performed its job under Requirement R1 Part 1.1, but the unregistered entity is not subject to NERC standards The standard does not explicitly give the TP the right to provide its own estimate in these cases, nor does it say that the TP must assume the compliance burden on behalf of the unregistered entities. Ultimately, whether the TP supplements their own estimate or proceeds with no DER data, they venture into territory with unknown compliance repercussions.

Suggesting that TPs have other means to enforce compliance, such as stakeholder processes, is unsatisfactory. If this were always the case, compliance enforcement authorities would be redundant. LG&E/KU suggests that entities with sufficiently regulated processes that provide a reliable means of obtaining data from entities unregistered with NERC could be granted a regional variation of the standard. However, LG&E/KU maintains that the base NERC standard should be unambiguous on who provides data and that, in the case of DER connected to unregistered entities, NERC must select a registered, functional entity to bear the compliance burden. LG&E/KU suggests striking modifications to Requirement R1 Part 1.1 and all associated changes.

As an alternative means of addressing the FERC Order 901 directives, LG&E/KU suggests either (1) that the Transmission Owner (TO) bear the responsibility for the data associated with unregistered IBRs and DERs connected to unregistered distribution providers, or (2) the that TO bear the responsibility for data associated with unregistered IBRs, and that the TP be responsible only for estimating the data associated with DERs connected to unregistered distribution providers (i.e., direct estimation rather than mandatory attempted data collection and subsequent estimation). For both options, registered Distribution Providers (DPs) should bear the responsibility for data associated with DERs connected to their systems. These options (1) do not make edits outside of the necessary scope to address FERC Order 901 directives, (2) preserve clarity of compliance obligations for functional entities, and (3) address FERC's explicit directive to determine the appropriate registered entity for providing data for DERs connected to unregistered distribution providers.

As written, MOD-032-2, MOD-33, and MOD-026 reviews should be coordinated simultaneously to prevent potential conflicts and/or contradictory requirements. R2.1 should include a new measure that requires to provide evidence of estimation methods, assumptions, etc., for estimated data. As for the ERO Unacceptable Model List process, a decision-making window should be considered to not hamper case builds, and the process should coincide with interconnection case build cycles to streamline compliance.

The proposed MOD-032-2 modifications contain inconsistencies to the term used throughout the standard (i.e.: “entity responsible”. “functional entity”, and “entity”). The only term defined is “functional entity” within Footnote 2. The inconsistency in language is confusing. The references need to be consistent throughout the document. The standard needs to clearly state who is responsible for the evidence required for Compliance. If a single designation is not possible, make clear that the PC and TP shall designated who is responsible in R1.1 and be consistent with the language throughout the Standard. Requirement R2: Registered Tos and DP do not have the ability to provide or collect DER data from unregistered distribution providers. If this data is critical to the reliability of the BPS, then those unregistered distribution providers that have interconnecte4d DER that have a material impact on the BPS should be registered through NER registration criteria and added under 4.1 as a functional entity. We suggest the following language: Distribution Providers (DPs) shall provide aggregate Distributed Energy Resource (DER) data for DERs that have been identified by the responsible PC and TP to have a material impact on the BPS. The DP shall estimate the modeling data and parameters and include an explanation of the limitations of the availability of data, and explanation of the limitations of the data provided, and the method used for estimation. Requirement R3: There doesn’t seem to be a mechanism that a PC or TP can use to compel the model provider to submit a model or data that is acceptable. There is a 90-day response period that could end as an end-less loop if the TP doesn’t accept that the explanation where the technical basis doesn’t respond to the technical concerns.

The DT's Consideration of FERC Order 901 Directives said the following: " the DT did not know how to interpret **material affect** and therefore, left it up to the Planning Coordinator (PC) and each of its Transmission Planners (TP) to review, consider, and determine all unregistered IBR that would be materially impacted."

ACES asserts that the drafting team (DT) remains well within the scope of the directive in establishing a threshold to define "**material affect**" and suggests revising R2.1 as follows:

R2.1 – Each PC/TP shall, at their discretion, require R1 data from functional entities with 20 MVA or greater in total IBR-DER generation within their service territory.

R2.1.1 – For each functional entity with 20 MVA or greater in total IBR-DER generation within their service territory, the entity shall provide R1 data for individual IBR-DER units with a nameplate rating greater than or equal to 5 MVA.

Rationale for 20 MVA Threshold

Historical Precedent

- The 20 MVA threshold has historically served as a continent-wide bright-line criterion distinguishing facilities that materially affect Bulk Power System (BPS) reliability from those that do not.
- This threshold is further supported by its use in defining Category 2 GO/GOP IBRs.

Consistency Across Resource Types

- Fossil fuel generation units under 20 MVA are not required to provide this modeling data. Requiring non-BES IBR-DER data below this threshold would create an inconsistent and potentially inequitable standard.

Avoiding Regional Discrepancies

- Without a DT-defined threshold, PCs/TPs will inevitably apply varying criteria.
- Entities operating in multiple PC/TP areas could face inconsistent and burdensome reporting requirements.

Improved Data Quality and Model Accuracy

- Setting the threshold at 20 MVA total, with mandatory reporting for units ≥5 MVA, increases the likelihood of obtaining verifiable, high-quality data from functional entities.
- This approach reduces reliance on estimates for small units, resulting in more accurate models.
- Better models directly enhance BPS reliability.

ACES' member North Carolina's Electric Cooperatives shares the following in addition to the threshold advocated for by ACES: **"Without waiving any rights to assert jurisdiction overreach by NERC/FERC, and assuming for the sake of argument that authority exists: Each DP will coordinate with the RC/TP on projects < 5MVA as needed".**

Comment

It does not appear that the language of the MOD-032 Supporting Document: Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO) has considered the role of the Acceptable Models Working Group (AMWG) under Eastern Interconnection Reliability Assessment Group (ERAG) for building and maintaining the Eastern Interconnection models. But as part of the Standard, the Supporting Document likely supersedes the AMWG, and describes a more centralized process for the maintenance of the official Unacceptable Models List. It

does not appear that the language provided by the SDT aligns with the charter of the AMWG, unless the AMWG fits into the general description of the "ERO Staff" under items 2 and 3.

It should be noted that the MOD-032 designee and associated industry groups comprised of Planning Coordinators may have a modeling group that reviews the technical rationale for using models on the ERO Unacceptable Models List (in R3). While outside of the Standard, this should provide consensus on the validity associated with any technical rationale provided by data submitters.

The present draft of MOD-032 does not include any requirement to modify or replace models that are submitted and are on the ERO Unacceptable Models List and do not have a valid technical rationale. This could be accomplished through the addition of a sub-requirement (R3.3).

To facilitate a timely model building process it may be beneficial to reduce the time that the functional entity has to respond to a technical concern from the PC/TP from 90 to 30 days (R3.2.).

Anna Martinson - MRO - 1,2,3,4,5,6 - MRO, Group Name MRO Group

Answer	No
Document Name	

Comment

The MRO NSRF appreciates the SDT's consideration of comments in the previous ballot and the revisions to the standard made in response. However, the MRO NSRF still has the following concerns:

· The inconsistency of terms used throughout the standard (i.e.: "entity responsible ", "functional entity", "entity"). None of these terms are defined except "functional entity" in Footnote 2, and the inconsistency in language is confusing at best or even misleading, bringing ambiguity to a Reliability Standard. These references need to use a consistent term throughout the document. A Reliability Standard should clearly state who is responsible for the evidence required for Compliance. If a single designation is not possible, make it clear that the PC and TP shall designate who is responsible in R1.1 and be consistent with this language throughout the Standard.

· Requirement R2

While the MRO NSRF understands the need for improved modeling, Distribution Providers (DP) are the only entities who have information on DERs interconnected to their distribution systems. Registered entities (TO and DP) do not have the ability to provide or collect DER data from unregistered distribution providers. If this data is critical to the reliability of the BPS, then those unregistered distribution providers that have interconnected DERs that have a material impact on the BPS should be registered through NERC registration criteria and added under 4.1 as a Functional Entity. Moreover, DPs are to provide DER data that has a material impact on the BPS and subpart 2.1 should reflect this important consideration. To address our concerns, Distribution Providers (DPs) shall provide aggregate Distributed Energy Resource (DER) data for DERs that have been identified by the responsible PC and TP to have a material impact on the BPS. The DP shall estimate the modeling data and parameters and include an explanation of the limitations of the availability of data, an explanation of the limitations of any data provided, and the method used for estimation.

· Requirement R3 Concerns

There doesn't seem to be any mechanism whereby a PC or TP can compel the model provider to submit a model or data that is acceptable. There is a 90-day response period that potentially become an end-less loop if the TP doesn't accept the explanation where the technical basis doesn't respond to the technical concerns.

· Section C: Compliance Concerns

Potential Noncompliance (PNC) Abeyance Period

This does not provide any sense of comfort to those entities that are providing estimates to the best of their knowledge that they will not be held in non-compliance by an auditor. This section needs further clarification and not be subject to any Auditor's interpretation. Use of ambiguous words such as "Good Faith" are not auditable and are very subjective and therefore inappropriate in a Reliability Standard. Additionally, there is no guarantee that the Abeyance Period is 1) long enough for NERC to create a new Registered entity (DP-DER) which was the original intent of the Abeyance, 2) will even be approved as it is still a "Potential".

· Section E: Associated Documents

"MOD-032 Supporting Document, Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO)"

As currently presented, this document is NOT part of the Reliability Standard and is NOT enforceable as such and should be maintained as a separate standalone document with the ERO Unacceptable Models List. To keep it at the end of the Standard gives the impression that it is enforceable and part of the standard. However, we believe that the Model Criteria should be included in the affected Reliability Standards and only changed when those Standards are modified and as such it should be an enforceable part of the standard and NOT an Associated Document as listed in Section E.

The MRO NSRF recommends removing the title from Section E as an Associated Document and making it part of MOD-032. Replace the title: MOD-032 Supporting Document with Attachment 2.

· Footnote concerns

o Footnote 1:

The MRO NSRF does not agree with Footnote 1. Data required should be specified within each sub-bullet of each column for both steady-state and dynamics. Failure to do this creates potential confusion. This situation is further amplified by the inclusion of new registered entities such as category 2 GOs.

o Footnote 6:

TO and DP have no ability to collect or provide aggregate data for DERs that are not connected to their system. If DER data is needed from unregistered DP to preserve the reliability of the BPS, then those entities should be registered.

Comment

While we support the efforts of the drafting team for Draft 2 of MOD-032, there are concerns.

{C}· Use of varying phrases of “entity responsible “or “functional entity”, or “entity”. None of these terms are defined except “functional entity” in Footnote 2 and are confusing at best or misleading, bringing ambiguity to a Reliability Standard. This needs to be consistent throughout the document whichever term is used. A Reliability Standard should know who is responsible for what is required for Compliance. If not, make it clear that the PC and TP shall designate who is responsible in R1.1 and be consistent with this language throughout the Standard.

R1.1 The data listed in Attachment 1, including the entity responsible for each required item **as determined by the PC and TP.**

{C}· Alignment with Project 2024-01

ATC does not agree that MOD-032-2 has been sufficiently aligned with the Project 2024-01 Implementation Plan. As stated in the Project 2024-01 Implementation Plan that Category 2 GOs will be held responsible for GO requirements contained in MOD-032, yet the currently proposed MOD-032-2 Reliability Standard Applicability Section does not clearly identify those entities. While we recognize the proposed definition of GO includes both Category 1 & 2, ATC submits that that the following clarifying addition be added to 4.1.3 of the Applicability Section of MOD-032-2 (shown in **boldface**):

4.1.3 Generator Owner **- Category 1 and 2**

{C}· Requirement R2 Concerns

While it is understood that there is a need for improved modeling, Distribution Providers (DP) are the only entities who have information on DERs interconnected to their distribution systems. Registered entities (TO and DP) do not have the ability to provide or collect DER data from unregistered DP. If this data is critical to the reliability of the BPS, then unregistered DPs that have interconnected DERs that have a material impact on the BPS should be registered through NERC registration criteria and added as under 4.1 as a Functional Entity. Moreover, DPs are to provide DER data that has a material impact on the BPS and subpart 2.1 should reflect this important consideration. To address our concerns, **Distribution Providers (DPs) shall provide** aggregate Distributed Energy Resource (DER) data **for DERs that have been identified by the responsible PC and TP that have a material impact on the BPS**. **T**he **DP** shall estimate the modeling data and parameters and include an explanation of the limitations of the availability of data, an explanation of the limitations of any data provided, and the method used for estimation.

{C}· Requirement R3 Concerns

There doesn't seem to be any mechanism whereby a PC or TP can compel the model provider to submit a model or data that is acceptable. There is a 90-day response period that potentially could end as an end-less loop if the TP doesn't accept that the explanation where the technical basis doesn't respond to the technical concerns.

{C}· Attachment 1 Concerns

Steady State Concerns

Item 9 **–** TOs are entirely dependent on DPs and should therefore be removed from have direct responsibility for Aggregate DER data.

Dynamics Concerns

Item 10 – Consistent with previous comments, TOs should be removed from Item 10. They have no ability to provide aggregate DER data on any distribution system (registered or unregistered) because they do not own or interconnect those resources directly.

For DERs that are connected to UFLS Only DPs distribution providers, aggregated DER data connected to their distribution systems and information detailing DERs connected to UFLS schemes should be obtained from those registered entities. Additionally, UFLS and UVLS tripping capacity of DERs should be provided

The term "aggregate" should also be clarified for Item 10.

To address our concerns, we offer the following edits (in **boldface** and strikethrough):

10. Aggregate Distributed Energy Resource (DER) data [DP, TOs **UFLS DPs**]

b. Indication whether DERs is subject to tripping in conjunction with are part of any UFLS or UVLS schemes **and provide estimates of the affected aggregated tripping capacity on those schemes.**

{C}· Section C: Compliance Concerns

Potential Noncompliance (PNC) Abeyance Period

This does not provide any sense of comfort to those entities that are providing estimates to the best of their knowledge that they will not be held in non-compliance by an auditor. This section needs further clarification and not subject to any Auditor's interpretation. Use of ambiguous words such as Good Faith are not auditable and very subjective and inappropriate in a Reliability Standard. And there is no guarantee that the Abeyance Period is 1)

long enough for NERC to create a new Registered entity (DP-DER) which was the original intent of the Abeyance, 2) will even be approved as it is still a “Potential”.

{C}· Section E: Associated Documents

MOD-032 Supporting Document, Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO) in the standard. It is NOT part of the Reliability Standard and is NOT enforceable as such and should be maintained as a separate standalone document with the ERO Unacceptable Models List.

To keep it at the end of the Standard gives the impression that it is enforceable and part of the standard.

However, we believe that the Model Criteria should be included in the affected Reliability Standards and only changed when those Standards are modified and as such it should be an enforceable part of the standard and NOT an Associated Document as listed in Section E.

Recommendation is to remove the title from Section E as an Associated Document and make it part of MOD-032. Replace the title: *MOD-032 Supporting Document* with *Attachment 2*.

{C}· Footnote concerns

Footnote 1**:**

ATC does not agree with Footnote 1. Data required should be specified within each sub-bullet of each column for both steady-state and dynamics. Failure to do this creates potential confusion. This situation is further amplified by the inclusion of new registered entities such as category 2 GOs.

Footnote 6**:**

TO and DP have no ability to collect or provide aggregate data for DERs that are not connected to their system. If DER data is needed from unregistered DP to preserve the reliability of the BPS, then those entities should be registered.

Eric Sutlief - CMS Energy - Consumers Energy Company - 3,4,5 - RF	
Answer	No
Document Name	

Comment
While the drafting team has attempted to acknowledge the need for an aggregation threshold for DER that materially affects the reliability of the Bulk Power system and has added footnote 7 to attachment 1, footnote 3 contradicts this consideration by omitting a minimum threshold for which gross demand and DER aggregation would not need to be segregated, therefore inadvertently requiring a DP to have all information necessary to account for the DER and rendering provisions under requirement R2.1. useless. R2.1 focuses on aggregate DER data and not gross demand data which is impacted by DER data. DP's may have specific RERRA-jurisdictional regulatory limitations that prevent a DP's ability to parse gross demand from net demand due to BTMG. This is potentially avoided by setting an adequate minimum threshold for DER sizing determined to materially affect the reliability of the bulk power system, filtering out the smaller DER installations where separate metering is unavailable. We recommend the drafting team should expand the intent of footnote 7 to apply to gross vs net demand aggregations in footnote 3 or expand provisions in R2.1 to acknowledge aggregations of gross demand and DER resources, allowing for explanation of limitations in supporting data reporting for aggregate demand as currently defined in attachment 1.

Cain Braveheart - Bonneville Power Administration - 1,3,5,6 - WECC

Answer	Yes
Document Name	

Comment

BPA reiterates its previous comment regarding the TO not being the “appropriate registered entity to be responsible for providing estimations of unregistered load”. BPA asserts ‘actual’ data is the foundation for modeling of the bulk-power system. Without this crucial information, BPA believes estimating small/discrete unregistered IBRs is vague and doesn’t lend itself to creating models aligned with industry ‘best practice’ standards. BPA continues to recommend estimated base information come from the Regional Entity or require the submission of valid data from registered DER and IBR generators.

Additionally, as the DT mentioned in its response to industry comments “modifying NERC registration criteria is not a feasible option for addressing FERC 901 directives within the required timelines”, BPA believes a better, more ‘actual’ data driven alternative for future consideration, is requiring unregistered entities register under a new compliance registry type, such as “DP-DER”.

As this is a new area of focus, opportunity to learn, and refine, BPA agrees with the DT’s Technical Rationale that this standard is a great candidate for an abeyance period. BPA appreciates the inclusion of Section C, bullet 2, CMEP, Potential Noncompliance (PNC) Abeyance Period. This will allow industry to adapt, gain a better understanding, and make the necessary improvements.

In conclusion, BPA appreciates the urgency that NERC is responding to FERC directives but asserts NERC reliability standards should drive reliability. BPA believes grid modeling from ‘actual’ data leads to reliable outcomes.

Josh Schumacher - Black Hills Corporation - 6, Group Name Black Hills Corporation Segments 1, 3, 5, 6	
Answer	Yes
Document Name	

Comment

Black Hills Corporation does not object to the proposed changes made to MOD-032-2, however we do agree with EEI's suggested non-substantive changes for the drafting team to consider.

We agree with the concerns shared by EEI members that the lack of specificity regarding the delegation to the PC & TP to determine which entities are responsible for the data requirements in Attachment 1 could lead to some unforeseen difficulties in requesting the data, especially when non-registered entities are involved. The Abeyance Language helps for the short term but may not be the best long-term solution.

Black Hills Corporation agrees with EEI on removing bullet 4 from Section E "Process for Updating the Unacceptable Models List Maintained by the ERO" since this is already an attachment to MOD-032-2. This process document should be marked as Attachment 2 to clearly show separation between it and Attachment 1.

Black Hills Corporation also agrees with the changes to the Abeyance Language suggested by EEI to make it more clear. The suggested changes from EEI are in bold below:

For a period of two years following the **enforcement** date of Reliability Standard MOD-032-2 Requirement R2 under the associated implementation plan, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C **of** the Rules of Procedure for a failure to comply with Reliability Standard MOD-032-2 Requirement R2 Part 2.1 with respect to the provision of estimated aggregate DER data or estimated data **for unregistered IBRs. While the CEA will not pursue compliance actions during this period for entities who develop estimates for aggregate DER data and unregistered IBR data that include the supporting data explanation and methods used as detailed in Requirement R2 subpart 2.1, they will pursue actions against entities who do not supply the required estimates, or the explanation of the limits or their methods used to create the estimates provided.** Entities shall participate in any compliance monitoring activities undertaken by the CEA during this potential noncompliance abeyance period and submit documentation as requested.

USV understands the FERC Order 901 directives and the need to approve the MOD-032 modifications as proposed. However, there are still concerns with the resources required for entities to fulfill the obligations, this is particularly important for smaller entities with limited budgets and time. USV believes that once the standard is implemented, the industry can gain a better understanding of how to achieve the same reliability gain without any additional burdens on entities.

AZPS supports the following comments submitted by EEI on behalf of its members.

EEI members continue to have concerns related to the decision to delegate to the PC and TP, in Requirement 1, the determination of which entities are responsible for the data requirements contained in Attachment 1. To clarify their concerns, this lack of specificity has the potential of creating unforeseen difficulties for both the PCs and TPs requesting the data and those entities identified as being responsible for supplying this data, particularly where non-registered entities are involved. And while the Abeyance language will likely be helpful at alleviating these problems in the short term, it is unclear whether this temporary solution will remedy this issue over the long term.

EEI suggests deleting from Section E (Associated Documents) bullet 4, “Process for Updating the Unacceptable Models List Maintained by the ERO” since this document is an attachment to MOD-032-2. Additionally, this process document should be marked and identified as Attachment 2, because as currently contained within MOD-032-2 there is no separation between Attachment 1 and this process document.

Finally, EEI appreciates the inclusion of the Abeyance Language, however, the language could be clearer and less repetitive**.** The subjectivity of the language (e.g., sincere intent) should be removed because it places unnecessary compliance risk on the functional entities responsible. To resolve our concerns, we offer the following suggested language for NERC consideration.

For a period of two years following the enforcement date of Reliability Standard MOD-032-2 Requirement R2 under the associated implementation plan, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C of the Rules of Procedure for a failure to comply with Reliability Standard MOD-032-2 Requirement R2 Part 2.1 with respect to the provision of estimated aggregate DER data or estimated data for unregistered IBRs. While the CEA will not pursue compliance actions during this period for entities who develop estimates for aggregate DER data and unregistered IBR data that include the supporting data explanation and methods used as detailed in Requirement R2 subpart 2.1, they will pursue actions against entities who do

not supply the required estimates, or the explanation of the limits or their methods used to create the estimates provided. Entities shall participate in any compliance monitoring activities undertaken by the CEA during this potential noncompliance abeyance period and submit documentation as requested.

Regarding R1.4.2 - It is unclear whether this should be applied retroactively to the existing user written models. Its better that this be explicitly clarified within the standard itself .

In Attachment 1, page 15, the ISO/RTO Council (IRC) Standards Review Committee (SRC) requests additional clarity regarding the following statement: *"The joint Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1 will specify each entity's responsibility and data flow processes."* In the Consideration of Comments, could the drafting team please clarify how detailed the expectations are with respect to the data flow? Specifically, to what level of granularity should entities describe responsibilities and data exchanges within these processes?

Comment

Southern Company does not object to the proposed changes made to MOD-032-2 and appreciates the drafting team's efforts in addressing concerns from Draft 1 of MOD-032-2. However, we offer some input and non-substantive changes for the DT consideration.

Requirement R1 Part 1.1 and Attachment 1 - While Southern Company appreciates the clarification provided in the technical rationale, Southern Company is concerned that not requiring the PC/TP to designate NERC registered functional entities in Requirement R1 could lead to a gap in enforceability. Southern Company recommends adding the word 'Functional' in front of entities to make it clear that the standard requires the PC/TP to designate registered functional entities. While Southern Company agrees that data can be sourced from both registered and unregistered entities, a registered entity must be specified as responsible in Requirement R1 for Requirement R2 to be fully enforceable.

Requirement R2 Part 2.2 – Southern Company appreciates the alignment of proposed standards MOD-032-2 and MOD-026-2. While the intent is clear in the technical rationale, Southern Company proposes the language below to better align with MOD-026-2.

"…, the functional entity shall provide the models **that its Transmission Planner received and provided a written notification that the model(s) and accompanying documentation are acceptable in accordance with** MOD-026, where such models are available."

Additionally, Southern Company supports EEI Comments.

2. Do you agree with the proposed IRO-010-6 and TOP-003-8 modifications? If you do not support the modifications made, please provide rationale and proposed language on how you would address the FERC Order 901 directives.

Kennedy Meier - Electric Reliability Council of Texas, Inc. - 2

Answer	No
Document Name	

Comment

As IRO-010-6, Requirement R1, Part 1.1 is currently drafted, it is unclear if the phrase “as deemed necessary by the Reliability Coordinator” at the end of Part 1.1 applies only to “identification of the entities responsible for responding to the specification” or if it applies to every category of data and information listed in Part 1.1. To address this ambiguity, ERCOT recommends that the phrase “as deemed necessary by the Reliability Coordinator” be moved from the end of Part 1.1 to the beginning of the list of data and information in Part 1.1, as follows:

A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments**, *as deemed necessary by the Reliability Coordinator*,** including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification.

A similar ambiguity exists in the current draft of TOP-003-8. Consequently, ERCOT recommends that corresponding modifications be made to Requirement R1, Part 1.1 and Requirement R2, Part 2.1 in TOP-003-8.

MEC agrees with the comments of the MRO NSRF. However, none of these concerns rise to the level of a negative ballot for MEC. Consideration and clarifications around the concerns expressed in the MRO NSRF comments would make for a better Reliability Standard if there is opportunity for substantive revisions.

Anna Martinson - MRO - 1,2,3,4,5,6 - MRO, Group Name MRO Group	
Answer	No
Document Name	
Comment	
The MRO NSRF would appreciate more clarity on “as applicable” as it is used in multiple sub-requirements throughout these two standards. Additionally, the MRO NSRF requests the changes to TOP and IRO be based upon requirements for using the data, potentially as envisioned in Milestone 4. As written, the use of planning models in the real-time operations, “as applicable”, seems to create a requirement the RC or BA gather data that may be of no value to these entities. Under the current standards, the information needed may be gathered by those entities if it is needed for reliability. If this change stands, it may require the RC and BA gather data for compliance purposes only and provide no real time value.

Comment	
It is the opinion of ACES that NERC registered entities should not be subjected to potential violations of multiple NERC Reliability Standards Requirements for a single action. In other words, we contend that by including requirements for model submissions in both MOD-032-2 and in a documented data specification(s), responsible entities will now be subject to a form of double jeopardy (i.e., claim preclusion). ACES recommends only requiring model submissions under MOD-032-2 and subsequently striking the following newly proposed requirement parts: IRO-010-6 Requirement R1 Part 1.5.3, TOP-003-8 Requirement R1 Part 1.5.3, and TOP-003-8 Requirement R2 Part 2.5.3.

Adrian Harris - Adrian Harris On Behalf of: Kirsten Rowley, Midcontinent ISO, Inc., 2; - Adrian Harris, Group Name RTO/ISO Council Standard Review Committee	
Answer	No
Document Name	2022-02_Unofficial_Comment_Form SRC.docx
Comment	
The RC and BA are able to obtain the necessary model information to support real time assessments, real-time monitoring, and analysis within the current standards. Accordingly, we believe the proposed modification is unnecessary. Until such time as there is an obligation on the RC or BA to use the data in real time, then these changes are premature or unwarranted SRC is concerned about the phrasing with “as applicable” and the requirements to use planning models. This phrase is unclear for how it may be applied during an audit. Additional clarity could be added by clarifying at the discretion of the RC, these models may be used. If there are criteria envisioned it would be more appropriate to document those in the standard itself rather than leverage the planning models in the operational requirements.

The focus should be on using data for real-time operations that do not gather data as mentioned by other participants. These standards (IRO-010/TOP-003) were created to have needed data that have been produced by other standards.

TAL believes the intent of 2.5.3 is well intended, but that this standard does not belong in TOP-003-8, R2. R2 is a BA standard. R2.5.3 seems to be a modeling standard. R2.5.3 seems redundant with respect to other modeling and commissioning standards being developed. TAL believes that in all practical sense, this must be accomplished in planning standards, which come into play during interconnection studies, model verification and validation processes and commissioning.

BC Hydro appreciates the drafting team responsiveness to our comments and the subsequent revisions to Requirements R1 Part 1.5.3 in IRO-010-6 and TOP-003-8 and Requirement R2 Part 2.5.3 in TOP-003-8, which now require the RC, BA and TOP functions to maintain in their data specs methods for entities to provide data and information, including “Requirements for model submissions to be consistent with the model submitted for planning purposes”. We noted in the Technical Rationale the stated objective of aligning the planning and operations models with reference to MOD-032-2, applicable on the Long-term Planning Time Horizon, as the typical driver for planning models submission. However, BC Hydro suggests that	

additional clarity in the context of the IRO-010 and TOP-003 standards, which are applicable in the Operations Planning Time Horizon, on modeling requirements possibly not in scope of the RC/BA/TOP.

If the intent is to mandate that entities identified in R1 Part 1.1 to submit system models consistent with those generated per MOD-032-3 (where possible as discussed in the Technical Rationale), BC Hydro suggests that the wording be revised to better reflect this. As drafted, it is not immediately clear which requirements the data spec documentation must include, and whether these requirements pertain to the models, models submission, or both.

Proposed wording for 1.5.3: Provisions for any model required for submission under the R1 data specification be consistent with the models created in accordance with MOD-032-2.

Per the NERC ROP, Section 300, reliability standards should use ‘clear language’: “Responsible entities, using reasonable judgment and in keeping with good utility practices, are able to arrive at a consistent interpretation of the required performance”. With that, BPA has concerns as to how the proposed TOP-003 R1.5.3 language “consistent with the model submitted for planning purposes, as applicable” will be interpreted by an auditor. BPA believes the current state estimation model and planning models differ in many cases. Where there are differences, those differences are usually driven by the unavailability of real time data for that model or the need to simplify it to obtain consistent solutions. In the technical rationale document, the drafting team claims the “as applicable” addresses that. Based on the seemingly open nature of R1.5.3, BPA has uncertainty that industry’s interpretation of “as applicable” will be the same as that of an auditor. BPA seeks clarity from the drafting team.

3. Do you agree that the modifications for the proposed reliability standards (MOD-032-2, IRO-010-6, and TOP-003-8) address the scope of the standard authorization request (SAR) in a cost-effective manner? If you do not agree, please provide alternatives that would address the SAR scope in a more cost-effective manner.

Mark Garza - FirstEnergy - FirstEnergy Corporation - 4, Group Name FE Voter

Comment
ACES does not believe the proposed modifications to MOD-032-2 represent the most cost-effective means of addressing FERC Directive 901. ACES asserts that the DT remains well within the scope of the directive in establishing a threshold to define “material affect.” By proactively setting a threshold of 20 MVA or greater in aggregate and requiring mandatory reporting for inverter-based resource - distributed energy resources (IBR-DER) with individual nameplate ratings of 5 MVA or greater, the DT can satisfy the intent of the Standard Authorization Request (SAR) while enabling a more economically viable implementation for industry stakeholders. This approach allows entities to provide more meaningful and actionable data to the Planning Coordinator (PC) and Transmission Planner (TP), without incurring the significant compliance, legal, and accounting burdens associated with parsing and aggregating distribution-level interconnection agreements for small-scale IBR-DER units. Distribution providers would be able to leverage existing billing and metering systems to determine aggregate IBR-DER values and assess applicability under MOD-032-2 Requirement R2.1. This methodology is expected to offer a more practical and cost-effective path to compliance with FERC Directive 901. Furthermore, the resulting data provided to the PC/TP would likely be of higher quality, as individual nameplate data for IBR-DER units rated at or above 5 MVA is more readily obtainable and verifiable. This targeted reporting would yield more reliable data than estimates derived from significantly smaller IBR-DER units. Finally, this approach would reduce the volume of data sets requiring manual review and integration by the PC/TP, thereby lowering resource demands and improving overall cost efficiency.

For MOD-032, there will be an administrative burden due to the need to:

· Develop a methodology and process for the estimation process for data that is not available to the TO. This would not be a one-time effort but year over year as DER increases.

· Increased outreach to other entities such as registered DPs for their best estimate on the modeling.

· There will be a need to increase personnel to do the work that is already a tight market for applicable employees.

MEC agrees with the comments of the MRO NSRF. However, none of these concerns rise to the level of a negative ballot for MEC. Consideration and clarifications around the concerns expressed in the MRO NSRF comments would make for a better Reliability Standard if there is opportunity for substantive revisions.

4. Do you agree with the proposed ERO Unacceptable Models List? If you do not agree, please provide alternative language and explain the rationale that, if made, would result in your support.

Steven Taddeucci - NiSource - Northern Indiana Public Service Co. - 3

Answer	No
Document Name	

Comment

NIPSCO does not believe that models on the unapproved list should be allowed to be used, even if technical justification is provided for doing so. There are legitimate reasons why these models should not be used, so a path for their potential inclusion should not be provided.

Transmission Planners cannot submit models to the regional case build process that are not approved models. By allowing this, we will create a very costly and unproductive loop where DER models that are unacceptable keep getting sent back from the TP to the DP until they are acceptable. A standalone methodology would be better as mentioned by other participants.

The act of renaming is creating a new list, not just replacing the old, acceptable model list. The ERO Unacceptable Models List does not have industry consensus and was not established through the standards process. TVA does not believe it should be referenced in a compliance standard. In its place, TVA recommends specifications for standard models (where appropriate and available), user-written models (where appropriate and with adequate documentation), and other models (when no alternative is available and requiring justification for use).

AEP does not believe that models on the unapproved list should be allowed to be used, even if technical justification is provided for doing so. There are legitimate reasons why these models should not be used, so a path for their potential inclusion should not be provided.

It does not appear that the language of the MOD-032 Supporting Document: Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO) has considered the role of the AMWG under ERAG for building and maintaining the Eastern Interconnection models. I believe this document is more formal, and describes a more centralized process for the maintenance of the official Unacceptable Models List. It does not appear that the language provided by the SDT aligns with the charter of the AMWG, unless the AMWG fits into the general description of the "ERO Staff" under items 2 and 3.

Andy Thomas - Duke Energy - 1,3,5,6 - SERC,RF	
Answer	
Document Name	
Comment	
Duke Energy believes MOD-032-2 R2.2 creates Requirement duplication by providing models already outlined and required in NERC MOD-026. The duplication creates the potential for non-compliance in two separate Standards, while also introducing overlapping documentation and reporting and possibly conflicting deadlines. Because MOD-032-2 R2.2 results in increased risk of Non-Compliance for the applicable entities, Duke Energy recommends R2.2 be deleted from the Standard.

We do not agree that the TO is the appropriate entity for collecting and providing data for DER where there is no associated registered DP between the DER connection point and the TO's system. In the NY area, the most appropriate entity would be the NYISO; this requirement should be moved to the BA/PC. The NYISO is in a better position to require entities to submit the required data when they join the market; individual TOs cannot. The NYISO has processes for maintaining the necessary system representation data to comply with FERC, NERC, NPCC, and NYSRC requirements.

Joshua London - Eversource Energy - 1,3, Group Name Eversource	
Answer	
Document Name	
Comment	
Eversource suggests defining or modifying the phrase “standard library models” in MOD-032 R1.4.1 to make it less application-specific as this phrase has no set meaning in some software.	

Eversource suggests the removal of Footnote 5 from Attachment 1 of MOD-032. This phrase provides little to no value and only provides speculation whereas Requirement R1.1 already defines a mechanism to assign ownership. In some regions, these data points may not be provided by the TO, but the footnote seems to imply that it should.

The 2022-02 Technical Rationale (TR) in its IRO-010-6 and TOP-003-8 section (page 14) seems to indicate that modifications were made to “add reference to MOD-032”, however the only reference to MOD-032 has been added in the 2022-02 TR via the clarification on the intent behind the revised R1 Part 1.5.3 (and R2 Part 2.5.3 for TOP-003 only). Please clarify if the intention is to add a MOD-032 reference to Standards as well.

Comment
To reiterate, TAL believes the intent of 2.5.3 is well intended, but that this standard does not belong in TOP-003-8, R2. R2 is a BA standard. R2.5.3 seems to be a modeling standard. R2.5.3 seems redundant with respect to other modeling and commissioning standards being developed. TAL believes that in all practical sense, this must be accomplished in planning standards, which come into play during interconnection studies, model verification and validation processes and commissioning.

Answer	
Document Name	2022-02_Unofficial_Comment_Form_Additional_Posting_NSRF v9.10.2025.docx

Comment

The MRO NSRF encourages clear and consistent identification of which generation assets standards are applicable to. The currently proposed MOD-032-2 Reliability Standard Applicability Section does not clearly identify those entities. While we recognize the proposed definition of GO includes both Category 1 & 2, the MRO NSRF proposes that the following be added to 4.1.3 of the Applicability Section of MOD-032-2 (shown in boldface):

4.1.3 Generator Owner - **Category 1 and 2**

Comment

DP’s likely do not have in-house expertise available to comply with providing dynamic models of aggregated DER resources; even estimated modeling when certified modeling is unavailable due to regulatory limitations. NERC and the drafting team should consider resource availability of the consultants who will be required to support DP’s in the new compliance obligation as implementation plans are determined.

There were 68 sets of responses, including comments from approximately 153 different people from approximately 103 companies representing 8 of the Industry Segments as shown in the table on the following pages.

All comments submitted can be reviewed in their original format on the project page.

If you feel that your comment has been overlooked, let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, contact Manager of Standards Information, Nasheema Santos (via email) or at (404) 290-6796.

Questions

1. Do you agree with the proposed MOD-032-2 modifications? If you do not support the modifications made, please provide rationale and proposed language on how you would address the FERC Order 901 directives.

2. Do you agree with the proposed IRO-010-6 and TOP-003-8 modifications? If you do not support the modifications made, please provide rationale and proposed language on how you would address the FERC Order 901 directives.

3. Do you agree that the modifications for the proposed reliability standards (MOD-032-2, IRO-010-6, and TOP-003-8) address the scope of the standard authorization request (SAR) in a cost-effective manner? If you do not agree, please provide alternatives that would address the SAR scope in a more cost-effective manner.

4. Do you agree with the proposed ERO Unacceptable Models List? If you do not agree, please provide alternative language and explain the rationale that, if made, would result in your support.

5. Provide any additional comments for the drafting team to consider, if desired.

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

Comment	

The SDT's response to AEP's previous comments states that "Attachment 1 does not create obligations for entities to provide data, but specifies the data items that need to be covered by the PC/TP data reporting procedures and requirements." While this is true, a compliance obligation nonetheless remains on the PC/TP to document data reporting requirements that address or cover the items in Attachment 1. We maintain that the items as given in 7a and 10a of the Dynamics column are too all-encompassing for positive sequence modeling, particularly "momentary cessation" and "ride-through," so the recommendations made in our previously submitted comments remain the same. While there are provisions for representing voltage and frequency protection settings in positive sequence simulations, "momentary cessation, tripping, and ride-through" are too open-ended, and may not be able to be represented completely in positive sequence phasor domain simulations, and lack the clarity needed to be certain of compliance. AEP suggests the following be used instead:

7a. "In the absence of project specific data, include estimated, assumed, or typical voltage and frequency protection settings."

10a. "Include estimated, assumed, or typical aggregate voltage and frequency protection settings."

The SDT's response also stated that they "received an overwhelming response from industry stating that there are different functional entities who could collect and provide data for DER where there is no associated registered DP between the DER connection point" and that "this could be the Transmission Owner, Distribution Provider, Generator Owner, Balancing Authority, Resource Planner, etc." While AEP appreciates the addition of footnote 7 of Attachment 1 Data Reporting Requirements and the flexibility it provides in allowing aggregate thresholds to be specified, it is difficult to envision GOs, BAs, and RPs as being potentially held responsible for DER aggregation modeling. As stated in our previous comments, FERC Order 2222 DER aggregators would seem to be well-positioned to coordinate with their constituent DERs, consolidate the necessary modeling and planning data, and meet compliance obligations. AEP recommends that consideration be given in pursuing FERC Order 2222 DER aggregators for this purpose.

AEP is concerned that R1.1 allows the PC and TP to determine the entity who is ultimately responsible to obtain each of the required items in Attachment 1. In effect, two Functional Entities are essentially given authority to decide who bears both the responsibility and ultimate risk of obtaining data from entities with no obligations to provide it. Our concern is if the assigned entity is one that neither owns nor operates the equipment, and this possibility is a contributor to our decision to vote negative on MOD-032.

Response	
Thank you for your comment. FERC No. 901 directives (p141) specifically identify representation of "momentary cessation, tripping, and ride-through". To the extent such information is not available or cannot be adequately represented, Requirement R2 allows for data estimation along with an explanation of data limitations. The PC/TP should be able to develop data procedures that allow the data to be obtained from the best and most reliable sources available. The DT believes that this is best determined at the PC/TP level rather than dictated by NERC in MOD-032. The DT does not anticipate PCs and TPs requiring data from unregistered entities without some level of assurance (local authority, etc.) that those entities are the best and most reliable sources of information. The fact is that industry largely depends on data from entities that are not registered under NERC (OEMs, vendors, consultants, etc.) and it could be detrimental to reliability and model fidelity to obligate the PC/TP to only obtain data from NERC-registered entities. The drafting team proposed this flexibility (which does, in fact, allow the PC/TP to specify data from FERC Order 2222 DER Aggregators as suggested, if deemed feasible and appropriate) as an effective and efficient alternative to specifying a NERC-registered entity who would be obligated to provide such data for all scenarios that would be aligned with a more literal interpretation of the FERC directives.

Comment	
Duke Energy supports the incorporation of the following EEI comment:	

…"EEI appreciates the inclusion of the Abeyance Language, however, the language could be clearer and less repetitive. The subjectivity of the language (e.g., sincere intent) should be removed because it places unnecessary compliance risk the functional entities responsible. To resolve our concerns, we offer the following edits in boldface for NERC consideration."

Duke Energy supports the incorporation of the following EEI edits with one additional time change (see strike-through):

"For a period of two [three] years following the **enforcement** date of Reliability Standard MOD-032-2 Requirement R2 under the associated implementation plan, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C of the Rules of Procedure for a failure to comply with Reliability Standard MOD-032-2 Requirement R2 Part 2.1 with respect to the provision of estimated aggregate DER data or estimated data for **unregistered IBRs. While the CEA will not pursue compliance actions during this period for entities who develop estimates for aggregate DER data and unregistered IBR data that include the supporting data explanation and methods used as detailed in Requirement R2 subpart 2.1, they will pursue actions against entities who do not supply the required estimates, or the explanation of the limits or their methods used to create the estimates provided**. Entities shall participate in any compliance monitoring activities undertaken by the CEA during this potential noncompliance abeyance period and submit documentation as requested."

Additionally, Duke Energy does not agree with the modifications to IRO-010-6 and TOP-003-8, specifically for requirement R1.5.3 (both standards). MOD-032 and MOD-26 require models, and the PC and TP are required to jointly develop the models without RC or TOP input. Multiple modeling tasks may be required with significant additional cost if all four entities (RC, PC, TP, and TOP) do not coordinate their modeling needs. Therefore, Duke Energy recommends adding RC and TOP coordination language to R1 requirement of MOD-032-2. (Reference: Q1 – NERC Project 2022-02 Comment Form, due 9/10/2025)

Response

Thank you for your comments. Please see the DT's response to EEI.

Additionally, Abeyance language is drafted by NERC Compliance. Two years is appropriate to feed into any changes needed for MOD-032-2. This also is in sync with Requirement R2, which based on the implementation plan, would really give three years total.

Please see the updated IRO and TOP language. IRO and TOP language allows flexibility and the link to MOD-026 allows that connection. This points back to FERC Order 901 on accuracy.

FirstEnergy offers the following concerns toward the scope of Unregistered IBRs related to inclusion of GO/GOP Category 2's definition in MOD-032-2.

Requirement R2.1. states "Data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.
R2.1. refers to IBRs that do not meet the BES Definition or Generator Owner Category 2 criteria. This requirement brings all IBRs into applicability of the standard regardless of size or interconnectivity.
Project 2024-01 passed on May 7, 2025, and adds "Category 2" non-BES IBRs to the Generator Owner definition in the NERC Glossary of Terms. Category 2 IBRs include generation facilities that meet or exceed 20 MVA and are interconnected at or above 60 kV. The intent of Project 2024-01 was to include IBRs that do not meet the BES Definition but have a material impact on the reliability of the BES. Including IBRs that do not have a material impact on the reliability of the BES does not contribute to the reliability of the BES and adds unnecessary work for registered Generator Owners.
The reliability standard itself should not define applicability to reliability standards. The BES Definition and Generator Owner category 2 criteria alone should define applicability.
In addition, entities that own IBRs that do not meet the BES Definition or Generator Owner Category 2 criteria may not be required to register as a Generator Owner and therefore are not held to compliance with the reliability standards. This creates an unfair advantage.
FirstEnergy considers it a bad precedent to bring in generation facilities that do not meet the BES Definition or Generator Owner category 2 criteria.

For FirstEnergy offers the following 3rd bullet under R2.1:

"Data for an IBR that is not a DER and meets the criteria for Generator Owner registration under the NERC Glossary of Terms, including Category 2 IBRs as defined in Project 2024-01. Data for IBRs that do not meet these criteria may be requested only if the Planning Coordinator or Transmission Planner determines that such resources have a material impact on the reliability of the BES."

Response	
Thank you for your comments. FERC Order 901 is intended to bring in all IBR, including DER. The DT drafted MOD-032 to include all IBR, including DER. With regards to material impact, that is engineering judgement. 901 focuses on BPS versus BES.

Response	
Thank you for your comments. Estimation is only allowed in areas where unregistered DER data cannot be collected. This is for the typical entity, which would be the Distribution Provider and Transmission Owner. Requirement R2 Part 2.1 is an "if" statement. If you already have the data, then you would not need to complete 2.1. See FERC Order No. 901 P 104.

MH appreciates the SDT ‘s consideration of our comments in the previous revision of the draft standard. In general, we are OK with the changes made to Requirement R1 of MOD-032-2; however, we would like to propose some wording and format changes to improve the clarity, as indicated below.

1.4. Specifications of the following items for dynamic model submissions:

1.4.1. The type of dynamic models accepted:

standard library models incorporated within the software(s) utilized to create the Interconnection-wide case(s);

user-defined models; or

both standard library models and user-defined models.

1.4.2. Where user-defined models are accepted,

1.4.2.1. Usability requirements for any submitted user-defined models, including, at a minimum, requirements to provide model documentation and instructions for model set up and use. **1.4.2.2.** Each Planning Coordinator and Transmission Planner shall provide their user-defined model requirements within 90 calendar days of receiving a written request for such data from other Planning Coordinators and Transmission Planners within the Interconnection.

Attachment 1, Footnote 3 effectively requires that all DERs are modeled, despite Footnote 7 allowing the procedure developed per R1 to define aggregation thresholds for DERs. Footnote 3 should instead read "For purposes of this item, aggregate Demand at each bus under item 1 is the Demand aggregated at the bus after removing any offsets due to DERs modeled at that bus according to the data requirements and reporting procedures developed by the PC and TPs per R1."

Thank you for your comment. Please see the DT's clarifying updates made to footnote 3 of MOD-032-2. The intent of the DT was to tie connection between footnote 3 and footnote 7. In general, if there is a significant difference between gross load and net load, that is probably a good indication of where the DER aggregation threshold should be set. Nevertheless, the following could be added to FN3 if deemed necessary (and non-substantive by the DT: "Note that this may be impacted by an aggregation threshold for DER specified under footnote 7."

LG&E/KU does not support the revisions to MOD-032 due to the introduction of ambiguous compliance scenarios that are likely to arise from the revisions. The modifications to Requirement R1 Part 1.1 requiring the Transmission Planner (TP) to identify the entity responsible for providing data for all items in Attachment 1: (1) exceeded the scope of changes necessary to address FERC Order 901 directives, (2) removed certainty for functional entities regarding their obligations, and (3) failed to address FERC's explicit directive "to determine the appropriate registered entity responsible for providing data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System." In regard to point 3, it should be noted that the revised MOD-032 standard not only hands off the assignment of a responsible entity to TPs, it also fails to require that such entities be "registered entities."

The formerly described issues aside, the revisions to MOD-032 have the potential to put TPs in a spot where compliance with the standard is unclear. If a TP assigns an unregistered entity responsibility for providing DER data under Requirement R1 Part 1.1, and the unregistered entity fails to provide data (or estimated data), it is not clear who is in violation. The TP has correctly performed its job under Requirement R1 Part 1.1, but the unregistered entity is not subject to NERC standards The standard does not explicitly give the TP the right to provide its own estimate in these cases, nor does it say that the TP must assume the compliance burden on behalf of the unregistered entities. Ultimately, whether the TP supplements their own estimate or proceeds with no DER data, they venture into territory with unknown compliance repercussions.

Suggesting that TPs have other means to enforce compliance, such as stakeholder processes, is unsatisfactory. If this were always the case, compliance enforcement authorities would be redundant. LG&E/KU suggests that entities with sufficiently regulated processes that provide a reliable means of obtaining data from entities unregistered with NERC could be granted a regional variation of the standard. However, LG&E/KU maintains that the base NERC standard should be unambiguous on who provides data and that, in the case of DER connected to

unregistered entities, NERC must select a registered, functional entity to bear the compliance burden. LG&E/KU suggests striking modifications to Requirement R1 Part 1.1 and all associated changes.

As an alternative means of addressing the FERC Order 901 directives, LG&E/KU suggests either (1) that the Transmission Owner (TO) bear the responsibility for the data associated with unregistered IBRs and DERs connected to unregistered distribution providers, or (2) the that TO bear the responsibility for data associated with unregistered IBRs, and that the TP be responsible only for estimating the data associated with DERs connected to unregistered distribution providers (i.e., direct estimation rather than mandatory attempted data collection and subsequent estimation). For both options, registered Distribution Providers (DPs) should bear the responsibility for data associated with DERs connected to their systems. These options (1) do not make edits outside of the necessary scope to address FERC Order 901 directives, (2) preserve clarity of compliance obligations for functional entities, and (3) address FERC's explicit directive to determine the appropriate registered entity for providing data for DERs connected to unregistered distribution providers.

Response

Thank you for your comments. In the hypothetical scenario provided, the TP should ensure that they identify a NERC-registered entity to provide data. The TP would not be "correctly performing" their job if assigning data obligations to unregistered entities that they have no assurance/expectation of getting data from. The Standard does not require the TP to assign data obligations to unregistered entities, but it allows such an exchange for cases where the TP has an opportunity to get better data from an unregistered entity. The DT views this as a more effective and efficient approach to meeting FERC 901 directives in various jurisdictions across the continent than having NERC dictate that TPs must only request/obtain certain data only from certain specific registered entities. Please also see the Technical Rationale for additional info on legacy language.

Comment

As written, MOD-032-2, MOD-33, and MOD-026 reviews should be coordinated simultaneously to prevent potential conflicts and/or contradictory requirements. R2.1 should include a new measure that requires to provide evidence of estimation methods, assumptions, etc.,

for estimated data. As for the ERO Unacceptable Model List process, a decision-making window should be considered to not hamper case builds, and the process should coincide with interconnection case build cycles to streamline compliance.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. Each standard has a different process. This would depend upon each standard individually and does not make sense to be connected simultaneously. The team reviewed possible proposals for M2 and determined that the measure is accurate as drafted. It would be expected for an entity to provide evidence for the estimation piece following what the Requirement R2 Part language states. Regarding streamlining case builds, it may not be the same timeframe and changes to the Unacceptable Models List will be date stamped version as of beginning of case build would be considered. See the process outlined in the MOD-032 standard. Trying to align this would create complications to the process.

The proposed MOD-032-2 modifications contain inconsistencies to the term used throughout the standard (i.e.: "entity responsible". "functional entity", and "entity"). The only term defined is "functional entity" within Footnote 2. The inconsistency in language is confusing. The references need to be consistent throughout the document. The standard needs to clearly state who is responsible for the evidence required for Compliance. If a single designation is not possible, make clear that the PC and TP shall designated who is responsible in R1.1 and be consistent with the language throughout the Standard.

Requirement R2: Registered Tos and DP do not have the ability to provide or collect DER data from unregistered distribution providers. If this data is critical to the reliability of the BPS, then those unregistered distribution providers that have interconnecte4d DER that have a material impact on the BPS should be registered through NER registration criteria and added under 4.1 as a functional entity. We suggest the following language:

Distribution Providers (DPs) shall provide aggregate Distributed Energy Resource (DER) data for DERs that have been identified by the responsible PC and TP to have a material impact on the BPS. The DP shall estimate the modeling data and parameters and include an explanation of the limitations of the availability of data, and explanation of the limitations of the data provided, and the method used for estimation.

Requirement R3: There doesn't seem to be a mechanism that a PC or TP can use to compel the model provider to submit a model or data that is acceptable. There is a 90-day response period that could end as an end-less loop if the TP doesn't accept that the explanation where the technical basis doesn't respond to the technical concerns.

Response	

Thank you for your comments.

As described in the Technical Rationale, "Requirement R1, Part 1.1 was modified to require that the PC and TP data requirements and reporting procedures include the responsible entity for data items listed in Attachment 1. To be clear, the "entity" to be identified would be the entity type or category (i.e., Transmission Owner), not specific companies for each data item. This modification aligns with changes made to the introductory paragraph in Attachment 1 clarifying that data obligations are established by the PC/TP modeling data requirements and reporting procedures rather than the listing of typical functional entities in Attachment 1. The intention of this addition is not to create an administrative requirement for the PC and TP to maintain separate lists identifying entity obligations, but to reinforce PC/TP authority to request data from appropriate entities, thereby creating obligations for those entities to provide the requested data. In most cases, it is expected that data requirements and reporting procedures would inherently identify the entities required to provide data. Further, this modification is intended to give the PC/TP flexibility to identify (and specify within their data requirements and reporting procedures) the best source for necessary data, even if that source is not a NERC functional entity. However, only NERC functional entities are subject to mandatory compliance with NERC Reliability Standards, so the PC/TP is unlikely to assign other entities without a local authority to create data obligations outside of NERC enforcement." In addition, the varying phrases should be read in context of how the standard is drafted. Functional entities are listed in the Applicability Section of the introduction in MOD-032-2.

There is nothing that precludes an entity from requesting DER data from unregistered distribution providers. If an entity can show that they made the effort to contact the unregistered entity and no response was received, then Requirement R2 Part 2.1 would take place where the entity would complete an estimation. This comment goes against FERC Order 901 and what has been directed of industry. It is important for reliability purposes that unregistered IBRs that are connected to the grid are identified for reliability purposes. In addition, TO has been listed as one of the typical entities for providing DER data, but would not have to be assigned based on the flexibility provided via Requirement R1 Part 1.1.

As mentioned above, please see FERC Order No. 901 P 105 and 106, which states, "We also recognize that there may be instances where distribution providers are similarly unable to gather adequate modeling data and parameters from IBR-DERs. Accordingly, to account for instances in which distribution providers are unable to gather adequate modeling data and parameters of IBR-DERs to create and maintain IBR-DER models, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require that each distribution provider, if unable to gather accurate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided

by IBR-DERs, and (4) the method used for estimation. In support of above, we further direct NERC to consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters." P. 106: "Finally, as noted by commenters, we recognize that there may be instances where IBR-DERs are connected to an entity that does not meet the criteria for registration with NERC as a distribution provider. For those areas with IBR-DERs that in the aggregate materially affect the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we direct NERC to determine the appropriate registered entity responsible for providing data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, or, when unable to gather such accurate IBR-DERs data, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation." It is expected that the PC/TP need to work with data providers. The proposed language is an improvement in that the previous language did not give the PC/TP any recourse if the responding entity responded but was not really responsive to the technical concern.

The DT's Consideration of FERC Order 901 Directives said the following: " the DT did not know how to interpret **material affect** and therefore, left it up to the Planning Coordinator (PC) and each of its Transmission Planners (TP) to review, consider, and determine all unregistered IBR that would be materially impacted."

ACES asserts that the drafting team (DT) remains well within the scope of the directive in establishing a threshold to define "**material affect**" and suggests revising R2.1 as follows:

R2.1 – Each PC/TP shall, at their discretion, require R1 data from functional entities with 20 MVA or greater in total IBR-DER generation within their service territory.

R2.1.1 – For each functional entity with 20 MVA or greater in total IBR-DER generation within their service territory, the entity shall provide R1 data for individual IBR-DER units with a nameplate rating greater than or equal to 5 MVA.

Rationale for 20 MVA Threshold

Historical Precedent

- The 20 MVA threshold has historically served as a continent-wide bright-line criterion distinguishing facilities that materially affect Bulk Power System (BPS) reliability from those that do not.
- This threshold is further supported by its use in defining Category 2 GO/GOP IBRs.

Consistency Across Resource Types

- Fossil fuel generation units under 20 MVA are not required to provide this modeling data. Requiring non-BES IBR-DER data below this threshold would create an inconsistent and potentially inequitable standard.

Avoiding Regional Discrepancies

- Without a DT-defined threshold, PCs/TPs will inevitably apply varying criteria.

- Entities operating in multiple PC/TP areas could face inconsistent and burdensome reporting requirements.

Improved Data Quality and Model Accuracy

- Setting the threshold at 20 MVA total, with mandatory reporting for units ≥5 MVA, increases the likelihood of obtaining verifiable, high-quality data from functional entities.
- This approach reduces reliance on estimates for small units, resulting in more accurate models.
- Better models directly enhance BPS reliability.

ACES' member North Carolina's Electric Cooperatives shares the following in addition to the threshold advocated for by ACES: **"Without waiving any rights to assert jurisdiction overreach by NERC/FERC, and assuming for the sake of argument that authority exists: Each DP will coordinate with the RC/TP on projects < 5MVA as needed".**

Response

Thank you for your comments.

As referenced in the Technical Rationale, NERC has published a study concluding that a 0 MW threshold is appropriate for data collection purposes. The DT concluded that even if a threshold was applied, data would still need to be collected to verify and ensure that a threshold was not being exceeded. Further, the DT determined that there is no strong technical justification for any particular universal DER threshold. If fact, any universal threshold would likely be inappropriate for many areas, so the DT created the flexibility for the PC/TP to make this determination for their local region. The proposed solution in the ACES comment does not address the potential aggregate impact of thousands of kW-scale DERs. The DT contends that the FERC concern is less about getting more detailed models for 5 MW (and larger) facilities (as most transmission planners are unlikely to utilize such detailed modeling for distribution-connected facilities) but being aware of and appropriately representing aggregations of smaller facilities at the T-D interface.

Material affect - see Consideration of FERC Directive. The DT stated: "Determination if an unregistered IBR or aggregate IBR-DER would “materially affect” the Bulk Power System, requires engineering judgment and is not something that would be appropriate to precisely specify in a reliability standard. Thus, Attachment 1 footnote 7 was added to explicitly allow Transmission Planners and Planning Coordinators to specify DER thresholds that may be appropriate when considering impact to their local areas."

I still struggle with R2 2.1: "If the responsible entity, as identified in Requirement R1 Part 1.1, is unable to gather unregistered Inverter-based Resource (IBR)1 data or aggregate Distributed Energy Resource (DER) data, the responsible entity shall estimate the modeling data and parameters and include an explanation of the limitations of 1 As used in this standard, the phrase “unregistered IBR” refers to a Bulk-Power System connected IBR that does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes. MOD-032-21 — Data for Power System Modeling and Analysis Initial Draft of MOD-032-2 April 2025 Page 6 of 25 the availability of data, an explanation of the limitations of any data provided, and the method used for estimation. " This creates a burden to the DP and the data may not be accurate enough for study purposes. Documenting the limitations will not address the data inaccuracies. A possible recommendation is is to provide a mechanism for the unregistered DER”s to become registered and therefore subjected to the same compliance obligations as registered DER’s

Thank you for your comments. A PC/TP could implement a more stringent requirement related to unacceptable models (e.g., not allowing them even with a rationale, or requiring the submission of a specific set of models) to align with a higher level modeling group such as the AMWG. Thus, it does not appear that MOD-032-2 would conflict with such a group, though the DT acknowledges that it would be beneficial for AMWG policies to align with the ERO document and MOD-032-2.	

If justification of an UM needing to be removed from the UML, can be provided through the process outlined in MOD-032.

If an unacceptable model is submitted without a technical rationale, it would be a compliance violation for the model submitter. Similar to any and every model that is submitted (even an "acceptable" model that is parameterized poorly and creates initialization or simulation issues), the TP and PC must make a determination of whether it can be used in a case-building process (with the acknowledgement that resolution of a model issue may not align with the deadline to finalize a base case). This may be completely separate from pursuing a technical concern under R3. MOD-032-2 does not specify any requirements for replacing or modifying unacceptable models, because that process is very dependent on the situation and requires engineering judgment (and finalizing a base case with the "unacceptable" model may end up being the best option).

Based on language from FERC Order 901, specific requirements for aggregate DER data are included in Attachment 1. However, other language from that order, which is incorporated in R2.1, recognized estimation may be necessary. This should be considered similarly to the understanding that load forecasts are not going to be 100% accurate, but provide valuable information nonetheless.

In addition, the DT answered this comment to the best of our ability. The comment received is confusing as it appears to be pointing to the first draft completed by the DT.

It does not appear that the language of the MOD-032 Supporting Document: Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO) has considered the role of the Acceptable Models Working Group (AMWG) under Eastern Interconnection Reliability Assessment Group (ERAG) for building and maintaining the Eastern Interconnection models. But as part of the Standard, the Supporting Document likely supersedes the AMWG, and describes a more centralized process for the maintenance of the official Unacceptable Models List. It does not appear that the language provided by the SDT aligns with the charter of the AMWG, unless the AMWG fits into the general description of the "ERO Staff" under items 2 and 3.

It should be noted that the MOD-032 designee and associated industry groups comprised of Planning Coordinators may have a modeling group that reviews the technical rationale for using models on the ERO Unacceptable Models List (in R3). While outside of the Standard, this should provide consensus on the validity associated with any technical rationale provided by data submitters.

The present draft of MOD-032 does not include any requirement to modify or replace models that are submitted and are on the ERO Unacceptable Models List and do not have a valid technical rationale. This could be accomplished through the addition of a sub-requirement (R3.3).

To facilitate a timely model building process it may be beneficial to reduce the time that the functional entity has to respond to a technical concern from the PC/TP from 90 to 30 days (R3.2.).

Comment	

The MRO NSRF appreciates the SDT's consideration of comments in the previous ballot and the revisions to the standard made in response. However, the MRO NSRF still has the following concerns:

· The inconsistency of terms used throughout the standard (i.e.: "entity responsible ", "functional entity", "entity"). None of these terms are defined except "functional entity" in Footnote 2, and the inconsistency in language is confusing at best or even misleading, bringing ambiguity to a Reliability Standard. These references need to use a consistent term throughout the document. A Reliability Standard should clearly state who is responsible for the evidence required for Compliance. If a single designation is not possible, make it clear that the PC and TP shall designate who is responsible in R1.1 and be consistent with this language throughout the Standard.

· Requirement R2

While the MRO NSRF understands the need for improved modeling, Distribution Providers (DP) are the only entities who have information on DERs interconnected to their distribution systems. Registered entities (TO and DP) do not have the ability to provide or collect DER data from unregistered distribution providers. If this data is critical to the reliability of the BPS, then those unregistered distribution providers that have interconnected DERs that have a material impact on the BPS should be registered through NERC registration criteria and added under 4.1 as a Functional Entity. Moreover, DPs are to provide DER data that has a material impact on the BPS and subpart 2.1 should reflect this important consideration. To address our concerns, Distribution Providers (DPs) shall provide aggregate Distributed Energy Resource (DER) data for DERs that have been identified by the responsible PC and TP to have a material impact on the BPS. The DP shall estimate the modeling data and

parameters and include an explanation of the limitations of the availability of data, an explanation of the limitations of any data provided, and the method used for estimation.

· Requirement R3 Concerns

There doesn't seem to be any mechanism whereby a PC or TP can compel the model provider to submit a model or data that is acceptable. There is a 90-day response period that potentially become an end-less loop if the TP doesn't accept the explanation where the technical basis doesn't respond to the technical concerns.

· Section C: Compliance Concerns

Potential Noncompliance (PNC) Abeyance Period

This does not provide any sense of comfort to those entities that are providing estimates to the best of their knowledge that they will not be held in non-compliance by an auditor. This section needs further clarification and not be subject to any Auditor's interpretation. Use of ambiguous words such as "Good Faith" are not auditable and are very subjective and therefore inappropriate in a Reliability Standard. Additionally, there is no guarantee that the Abeyance Period is 1) long enough for NERC to create a new Registered entity (DP-DER) which was the original intent of the Abeyance, 2) will even be approved as it is still a "Potential".

· Section E: Associated Documents

"MOD-032 Supporting Document, Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO)"

As currently presented, this document is NOT part of the Reliability Standard and is NOT enforceable as such and should be maintained as a separate standalone document with the ERO Unacceptable Models List. To keep it at the end of the Standard gives the impression that it is enforceable and part of the standard. However, we believe that the Model Criteria should be included in the affected Reliability Standards and only changed when those Standards are modified and as such it should be an enforceable part of the standard and NOT an Associated Document as listed in Section E.

The MRO NSRF recommends removing the title from Section E as an Associated Document and making it part of MOD-032. Replace the title: MOD-032 Supporting Document with Attachment 2.

· Footnote concerns o Footnote 1: The MRO NSRF does not agree with Footnote 1. Data required should be specified within each sub-bullet of each column for both steady-state and dynamics. Failure to do this creates potential confusion. This situation is further amplified by the inclusion of new registered entities such as category 2 GOs. o Footnote 6: TO and DP have no ability to collect or provide aggregate data for DERs that are not connected to their system. If DER data is needed from unregistered DP to preserve the reliability of the BPS, then those entities should be registered.

Response	
Thank you for your comments. As described in the Technical Rationale, “Requirement R1, Part 1.1 was modified to require that the PC and TP data requirements and reporting procedures include the responsible entity for data items listed in Attachment 1. To be clear, the “entity” to be identified would be the entity type or category (i.e., Transmission Owner), not specific companies for each data item. This modification aligns with changes made to the introductory paragraph in Attachment 1 clarifying that data obligations are established by the PC/TP modeling data requirements and reporting procedures rather than the listing of typical functional entities in Attachment 1. The intention of this addition is not to create an administrative requirement for the PC and TP to maintain separate lists identifying entity obligations, but to reinforce PC/TP authority to request data from appropriate entities, thereby creating obligations for those entities to provide the requested data. In most cases, it is expected that data requirements and reporting procedures would inherently identify the entities required to provide data. Further, this modification is intended to give the PC/TP flexibility to identify (and specify within their data requirements and reporting procedures) the best source for necessary data, even if that source is not a NERC functional entity. However, only NERC functional entities are subject to mandatory compliance with NERC Reliability Standards, so the PC/TP is unlikely to assign other entities without a local authority to create data obligations outside of NERC enforcement.” In addition, the varying phrases should be read in context of how the standard is drafted. Functional entities are listed in the Applicability Section of the introduction in MOD-032-2.	

There is nothing that precludes an entity from requesting DER data from unregistered distribution providers. If an entity can show that they made the effort to contact the unregistered entity and no response was received, then Requirement R2 Part 2.1 would take place where the entity would complete an estimation. This comment goes against FERC Order 901 and what has been directed of industry. It is important for reliability purposes that unregistered IBRs that are connected to the grid are identified for reliability purposes. In addition, TO has been listed as one of the typical entities for providing DER data, but would not have to be assigned based on the flexibility provided via Requirement R1 Part 1.1.

As mentioned above, please see FERC Order No. 901 P 105 and 106, which states, "We also recognize that there may be instances where distribution providers are similarly unable to gather adequate modeling data and parameters from IBR-DERs. Accordingly, to account for instances in which distribution providers are unable to gather adequate modeling data and parameters of IBR-DERs to create and maintain IBR-DER models, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require that each distribution provider, if unable to gather accurate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation. In support of above, we further direct NERC to consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters."

P. 106: "Finally, as noted by commenters, we recognize that there may be instances where IBR-DERs are connected to an entity that does not meet the criteria for registration with NERC as a distribution provider. For those areas with IBR-DERs that in the aggregate materially affect the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we direct NERC to determine the appropriate registered entity responsible for providing data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, or, when unable to gather such accurate IBR-DERs data, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation."

It is expected that the PC/TP need to work with data providers. The proposed language is an improvement in that the previous language did not give the PC/TP any recourse if the responding entity responded but was not really responsive to the technical concern.

At the outset, while any such abeyance period would need to be approved by the NERC Board of Trustees and the applicable governmental authorities, the phrase "potential noncompliance (PNC)" refers to a finding that an entity may have not complied with a Reliability Standard and not an abeyance period that NERC may or may not determine to pursue.

It is NERC's intent that the Potential Noncompliance Abeyance language would provide some assurance to entities that NERC would not pursue violations through the enforcement process provided that entities were taking steps to comply with the standard in "good faith". The phrase "good faith" is generally understood to require an "honest belief of purpose, faithful performance of duties, observance of dealing standards, or an absence of fraudulent intent." (Cornell Law School, Legal Information Institute). For example, an entity provided its estimates and supporting explanations in a timely manner and consistent with TP/PC data specification and reporting instructions, but there was some dispute about the quality of the estimate provided or the effort taken to collect data from the owner. While such compliance language is not subject to industry ballot, NERC appreciates the feedback and has revised the section to provide more clarity consistent with the comment.

Entities are correct in that they are not subject to compliance with the Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO) located at the end of MOD-032-2 Standard. The Unacceptable Models List Maintained by the Electric Reliability Organization (ERO) actual document will be maintained outside standards due to the possibility that other standards may choose to reference this particular document. The process located in MOD-032 holds the ERO accountable by having to follow the process when adding or removing an unacceptable model to or from the list itself. At this time, the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO) can be located on the 2022-02 project page of the NERC website. Following the October 2025 launch of the new NERC website, entities will be able to locate the Unacceptable Models List on the MOD-032-2 Standards page. While the MOD-032 page has not been developed yet, here is the link to access what the MOD-032-1 page looks like. Each standard will have its own standards page to access the standard, implementation plan, and other important documents associated with that specific standard.

In addition, to prevent confusion, the 4th bullet under Section E has been removed and additional language has been added to the MOD-032 Supporting Document page. To be clear, NERC must follow the process specified at the end of MOD-032, and if any changes to the process need to be made, a standards development project must be created to modify the process itself. This approach ensures consistency in the process of maintaining the ERO Unacceptable Models List.

Footnote 1:
No changes to Footnote 1. GO would be included upon the enforcement date. Jordan to look up date. See response in first comment to ATC. This footnote focuses on PC/TP and not the GO.

Footnote 6: As mentioned above, under the proposed definition of Generator Owner adopted by the NERC Board in August 2025 and pending FERC approval, the term "Generator Owner" as used in MOD-032-2 would include owners of both Category 1 and Category 2 assets. In MOD-032-2 case, it refers to both and no changes need to be made. When a DP is unregistered, the TP/PC will identify the appropriate entity. The TO tends to be the best back up, but based on comments received over the drafts, this flexibility is needed for some entities who would lean on other entities to gather the data needed.

MEC agrees with the comments of the MRO NSRF. However, none of these concerns rise to the level of a negative ballot for MEC. Consideration and clarifications around the concerns expressed in the MRO NSRF comments would make for a better Reliability Standard if there is opportunity for substantive revisions.

While we support the efforts of the drafting team for Draft 2 of MOD-032, there are concerns.

{C}· Use of varying phrases of "entity responsible "or "functional entity", or "entity". None of these terms are defined except "functional entity" in Footnote 2 and are confusing at best or misleading, bringing ambiguity to a Reliability Standard. This needs to be consistent throughout the document whichever term is used. A Reliability Standard should know who is responsible for what is required for Compliance. If not, make it clear that the PC and TP shall designate who is responsible in R1.1 and be consistent with this language throughout the Standard.

R1.1 The data listed in Attachment 1, including the entity responsible for each required item **as determined by the PC and TP.**

{C}· Alignment with Project 2024-01

ATC does not agree that MOD-032-2 has been sufficiently aligned with the Project 2024-01 Implementation Plan. As stated in the Project 2024-01 Implementation Plan that Category 2 GOs will be held responsible for GO requirements contained in MOD-032, yet the currently proposed MOD-032-2 Reliability Standard Applicability Section does not clearly identify those entities. While we recognize the proposed definition of GO includes both Category 1 & 2, ATC submits that that the following clarifying addition be added to 4.1.3 of the Applicability Section of MOD-032-2 (shown in **boldface**):

4.1.3 Generator Owner **- Category 1 and 2**

{C}· Requirement R2 Concerns

While it is understood that there is a need for improved modeling, Distribution Providers (DP) are the only entities who have information on DERs interconnected to their distribution systems. Registered entities (TO and DP) do not have the ability to provide or collect DER data from unregistered DP. If this data is critical to the reliability of the BPS, then unregistered DPs that have interconnected DERs that have a material impact on the BPS should be registered through NERC registration criteria and added as under 4.1 as a Functional Entity. Moreover, DPs are to provide DER data that has a material impact on the BPS and subpart 2.1 should reflect this important consideration. To address our concerns, **Distribution Providers (DPs) shall provide** aggregate Distributed Energy Resource (DER) data **for DERs that have been identified by the responsible PC and TP that have a material impact on the BPS**. **T**he **DP** shall estimate the modeling data and parameters and include an explanation of the limitations of the availability of data, an explanation of the limitations of any data provided, and the method used for estimation.

{C}· Requirement R3 Concerns

There doesn't seem to be any mechanism whereby a PC or TP can compel the model provider to submit a model or data that is acceptable. There is a 90-day response period that potentially could end as an end-less loop if the TP doesn't accept that the explanation where the technical basis doesn't respond to the technical concerns.

{C}· Attachment 1 Concerns

Steady State Concerns

Item 9 **–** TOs are entirely dependent on DPs and should therefore be removed from have direct responsibility for Aggregate DER data.

Dynamics Concerns

Item 10 – Consistent with previous comments, TOs should be removed from Item 10. They have no ability to provide aggregate DER data on any distribution system (registered or unregistered) because they do not own or interconnect those resources directly.

For DERs that are connected to UFLS Only DPs distribution providers, aggregated DER data connected to their distribution systems and information detailing DERs connected to UFLS schemes should be obtained from those registered entities. Additionally, UFLS and UVLS tripping capacity of DERs should be provided

The term “aggregate” should also be clarified for Item 10.

To address our concerns, we offer the following edits (in **boldface** and strikethrough):

10. Aggregate Distributed Energy Resource (DER) data [DP, TOs **UFLS DPs**]

b. Indication whether DERs is subject to tripping in conjunction with are part of any UFLS or UVLS schemes **and provide estimates of the affected aggregated tripping capacity on those schemes.**

{C}· Section C: Compliance Concerns

Potential Noncompliance (PNC) Abeyance Period

This does not provide any sense of comfort to those entities that are providing estimates to the best of their knowledge that they will not be held in non-compliance by an auditor. This section needs further clarification and not subject to any Auditor’s interpretation. Use of ambiguous words such as Good Faith are not auditable and very subjective and inappropriate in a Reliability Standard. And there is no guarantee that the Abeyance Period is 1) long enough for NERC to create a new Registered entity (DP-DER) which was the original intent of the Abeyance, 2) will even be approved as it is still a “Potential”.

{C}· Section E: Associated Documents

MOD-032 Supporting Document, Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO) in the standard. It is NOT part of the Reliability Standard and is NOT enforceable as such and should be maintained as a separate standalone document with the ERO Unacceptable Models List.

To keep it at the end of the Standard gives the impression that it is enforceable and part of the standard.

However, we believe that the Model Criteria should be included in the affected Reliability Standards and only changed when those Standards are modified and as such it should be an enforceable part of the standard and NOT an Associated Document as listed in Section E.

Recommendation is to remove the title from Section E as an Associated Document and make it part of MOD-032. Replace the title: *MOD-032 Supporting Document* with *Attachment 2*.

{C}· Footnote concerns

Footnote 1**:**

ATC does not agree with Footnote 1. Data required should be specified within each sub-bullet of each column for both steady-state and dynamics. Failure to do this creates potential confusion. This situation is further amplified by the inclusion of new registered entities such as category 2 GOs.

Footnote 6**:**

TO and DP have no ability to collect or provide aggregate data for DERs that are not connected to their system. If DER data is needed from unregistered DP to preserve the reliability of the BPS, then those entities should be registered.

Thank you for your comments.
As described in the Technical Rationale, “Requirement R1, Part 1.1 was modified to require that the PC and TP data requirements and reporting procedures include the responsible entity for data items listed in Attachment 1. To be clear, the “entity” to be identified would be the entity type or category (i.e., Transmission Owner), not specific companies for each data item. This modification aligns with changes made to the introductory paragraph in Attachment 1 clarifying that data obligations are established by the PC/TP modeling data requirements and reporting procedures rather than the listing of typical functional entities in Attachment 1. The intention of this addition is not to create an

administrative requirement for the PC and TP to maintain separate lists identifying entity obligations, but to reinforce PC/TP authority to request data from appropriate entities, thereby creating obligations for those entities to provide the requested data. In most cases, it is expected that data requirements and reporting procedures would inherently identify the entities required to provide data. Further, this modification is intended to give the PC/TP flexibility to identify (and specify within their data requirements and reporting procedures) the best source for necessary data, even if that source is not a NERC functional entity. However, only NERC functional entities are subject to mandatory compliance with NERC Reliability Standards, so the PC/TP is unlikely to assign other entities without a local authority to create data obligations outside of NERC enforcement." In addition, the varying phrases should be read in context of how the standard is drafted. Functional entities are listed in the Applicability Section of the introduction in MOD-032-2.

There is nothing that precludes an entity from requesting DER data from unregistered distribution providers. If an entity can show that they made the effort to contact the unregistered entity and no response was received, then Requirement R2 Part 2.1 would take place where the entity would complete an estimation. This comment goes against FERC Order 901 and what has been directed of industry. It is important for reliability purposes that unregistered IBRs that are connected to the grid are identified for reliability purposes. In addition, TO has been listed as one of the typical entities for providing DER data, but would not have to be assigned based on the flexibility provided via Requirement R1 Part 1.1.

As mentioned above, please see FERC Order No. 901 P 105 and 106, which states, "We also recognize that there may be instances where distribution providers are similarly unable to gather adequate modeling data and parameters from IBR-DERs. Accordingly, to account for instances in which distribution providers are unable to gather adequate modeling data and parameters of IBR-DERs to create and maintain IBR-DER models, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require that each distribution provider, if unable to gather accurate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation. In support of above, we further direct NERC to consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters."

P. 106: "Finally, as noted by commenters, we recognize that there may be instances where IBR-DERs are connected to an entity that does not meet the criteria for registration with NERC as a distribution provider. For those areas with IBR-DERs that in the aggregate materially affect the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we direct NERC to determine the appropriate registered entity responsible for providing data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, or, when unable to gather such accurate IBR-DERs data, to provide instead to the Bulk-Power System planners and operators in their

areas: (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation."

It is expected that the PC/TP need to work with data providers. The proposed language is an improvement in that the previous language did not give the PC/TP any recourse if the responding entity responded but was not really responsive to the technical concern.

At the outset, while any such abeyance period would need to be approved by the NERC Board of Trustees and the applicable governmental authorities, the phrase "potential noncompliance (PNC)" refers to a finding that an entity may have not complied with a Reliability Standard and not an abeyance period that NERC may or may not determine to pursue.

It is NERC's intent that the Potential Noncompliance Abeyance language would provide some assurance to entities that NERC would not pursue violations through the enforcement process provided that entities were taking steps to comply with the standard in "good faith". The phrase "good faith" is generally understood to require an "honest belief of purpose, faithful performance of duties, observance of dealing standards, or an absence of fraudulent intent." (Cornell Law School, Legal Information Institute). For example, an entity provided its estimates and supporting explanations in a timely manner and consistent with TP/PC data specification and reporting instructions, but there was some dispute about the quality of the estimate provided or the effort taken to collect data from the owner. While such compliance language is not subject to industry ballot, NERC appreciates the feedback and has revised the section to provide more clarity consistent with the comment.

Entities are correct in that they are not subject to compliance with the Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO) located at the end of MOD-032-2 Standard. The Unacceptable Models List Maintained by the Electric Reliability Organization (ERO) actual document will be maintained outside standards due to the possibility that other standards may choose to reference this particular document. The process located in MOD-032 holds the ERO accountable by having to follow the process when adding or removing an unacceptable model to or from the list itself. At this time, the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO) can be located on the 2022-02 project page of the NERC website. Following the October 2025 launch of the new NERC website, entities will be able to locate the Unacceptable Models List on the MOD-032-2 Standards page. While the MOD-032 page has not been developed yet, here is the link to access what the MOD-032-1 page looks like. Each standard will have its own standards page to access the standard, implementation plan, and other important documents associated with that specific standard.

In addition, to prevent confusion, the 4th bullet under Section E has been removed and additional language has been added to the MOD-032 Supporting Document page. To be clear, NERC must follow the process specified at the end of MOD-032 and if any changes to the process

need to be made, a standards development project must be created to modify the process itself. This approach ensures consistency in the process of maintaining the ERO Unacceptable Models List.

Footnote 1:
No changes to Footnote 1. GO would be included upon the enforcement date. Jordan to look up date. See response in first comment to ATC. This footnote focuses on PC/TP and not the GO.

Footnote 6:
As mentioned above, under the proposed definition of Generator Owner adopted by the NERC Board in August 2025 and pending FERC approval, the term "Generator Owner" as used in MOD-032-2 would include owners of both Category 1 and Category 2 assets. In MOD-032-2 case, it refers to both and no changes need to be made. When a DP is unregistered, the TP/PC will identify the appropriate entity. The TO tends to be the best back up, but based on comments received over the drafts, this flexibility is needed for some entities who would lean on other entities to gather the data needed.

Comment	

While the drafting team has attempted to acknowledge the need for an aggregation threshold for DER that materially affects the reliability of the Bulk Power system and has added footnote 7 to attachment 1, footnote 3 contradicts this consideration by omitting a minimum threshold for which gross demand and DER aggregation would not need to be segregated, therefore inadvertently requiring a DP to have all information necessary to account for the DER and rendering provisions under requirement R2.1. useless. R2.1 focuses on aggregate DER data and not gross demand data which is impacted by DER data. DP's may have specific RERRA-jurisdictional regulatory limitations that prevent a DP's ability to parse gross demand from net demand due to BTMG. This is potentially avoided by setting an adequate minimum threshold for DER sizing determined to materially affect the reliability of the bulk power system, filtering out the smaller DER installations where separate metering is unavailable. We recommend the drafting team should expand the intent of footnote 7 to apply to gross vs net demand aggregations in footnote 3 or expand provisions in R2.1 to acknowledge aggregations of gross demand and DER resources, allowing for explanation of limitations in supporting data reporting for aggregate demand as currently defined in attachment 1.

Response

Thank you for your comments. Please see the DT's clarifying updates made to footnote 3 of MOD-032-2. The intent of the DT was to tie connection between footnote 3 and footnote 7.

In general, if there is a significant difference between gross load and net load, that is probably a good indication of where the DER aggregation threshold should be set. Nevertheless, the following could be added to FN3 if deemed necessary (and non-substantive by the DT: "Note that this may be impacted by an aggregation threshold for DER specified under footnote 7."

Based on language from FERC Order 901, specific requirements for aggregate DER data are included in Attachment 1. However, other language from that order which is incorporated in R2.1 recognized estimation may be necessary. This should be considered similarly to the understanding that load forecasts are not going to be 100% accurate but provide valuable information nonetheless.

Wesley Yeomans - New York State Reliability Council - 10

Answer	No
Document Name	

Comment

We do not agree with R2.1; estimating parameters is not appropriate. If additional data is needed, then it should be required for those GO/GOP entities to submit it to the applicable authority.

Likes 0	
Dislikes 0	

Response

Thank you for your comments. Estimation is only allowed in areas where unregistered DER data cannot be collected. This is for the typical entity, which would be the Distribution Provider and Transmission Owner. Requirement R2 Part 2.1 is an "if" statement. If you already have the data, then you would not need to complete 2.1. See FERC Order No. 901 P 104.

NextEra agrees with the modifications to MOD-032, however supports EEI's request to modify the Abeyance language of Section C, as provided below:

For a period of two years following the **enforcement** date of Reliability Standard MOD-032-2 Requirement R2 under the associated implementation plan, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C **of** the Rules of Procedure for a failure to comply with Reliability Standard MOD-032-2 Requirement R2 Part 2.1 with respect to the provision of estimated aggregate DER data or estimated data **for unregistered IBRs. While the CEA will not pursue compliance actions during this period for entities who develop estimates for aggregate DER data and unregistered IBR data that include the supporting data explanation and methods used as detailed in Requirement R2 subpart 2.1, they will pursue actions against entities who do not supply the required estimates, or the explanation of the limits or their methods used to create the estimates provided.** Entities shall participate in any compliance monitoring activities undertaken by the CEA during this potential noncompliance abeyance period and submit documentation as requested.

Comment	

BPA reiterates its previous comment regarding the TO not being the "appropriate registered entity to be responsible for providing estimations of unregistered load". BPA asserts 'actual' data is the foundation for modeling of the bulk-power system. Without this crucial information,

BPA believes estimating small/discrete unregistered IBRs is vague and doesn't lend itself to creating models aligned with industry 'best practice' standards. BPA continues to recommend estimated base information come from the Regional Entity or require the submission of valid data from registered DER and IBR generators.

Additionally, as the DT mentioned in its response to industry comments "modifying NERC registration criteria is not a feasible option for addressing FERC 901 directives within the required timelines", BPA believes a better, more 'actual' data driven alternative for future consideration, is requiring unregistered entities register under a new compliance registry type, such as "DP-DER".

As this is a new area of focus, opportunity to learn, and refine, BPA agrees with the DT's Technical Rationale that this standard is a great candidate for an abeyance period. BPA appreciates the inclusion of Section C, bullet 2, CMEP, Potential Noncompliance (PNC) Abeyance Period. This will allow industry to adapt, gain a better understanding, and make the necessary improvements.

In conclusion, BPA appreciates the urgency that NERC is responding to FERC directives but asserts NERC reliability standards should drive reliability. BPA believes grid modeling from 'actual' data leads to reliable outcomes.

Response

Thank you for your comments. FERC Order 901 directed estimation. As described in the Technical Rationale, "Requirement R1, Part 1.1 was modified to require that the PC and TP data requirements and reporting procedures include the responsible entity for data items listed in Attachment 1. To be clear, the "entity" to be identified would be the entity type or category (i.e., Transmission Owner), not specific companies for each data item. This modification aligns with changes made to the introductory paragraph in Attachment 1 clarifying that data obligations are established by the PC/TP modeling data requirements and reporting procedures rather than the listing of typical functional entities in Attachment 1. The intention of this addition is not to create an administrative requirement for the PC and TP to maintain separate lists identifying entity obligations, but to reinforce PC/TP authority to request data from appropriate entities, thereby creating obligations for those entities to provide the requested data. In most cases, it is expected that data requirements and reporting procedures would inherently identify the entities required to provide data. Further, this modification is intended to give the PC/TP flexibility to identify (and specify within their data requirements and reporting procedures) the best source for necessary data, even if that source is not a NERC functional entity. However, only NERC functional entities are subject to mandatory compliance with NERC Reliability Standards, so the PC/TP is unlikely to assign other entities without a local authority to create data obligations outside of NERC enforcement." In addition, the varying phrases

should be read in context of how the standard is drafted. Functional entities are listed in the Applicability Section of the introduction in MOD-032-2.

There is nothing that precludes an entity from requesting DER data from unregistered distribution providers. If an entity can show that they made the effort to contact the unregistered entity and no response was received, then Requirement R2 Part 2.1 would take place where the entity would complete an estimation. This comment goes against FERC Order 901 and what has been directed of industry. It is important for reliability purposes that unregistered IBRs that are connected to the grid are identified for reliability purposes. In addition, TO has been listed as one of the typical entities for providing DER data but would not have to be assigned based on the flexibility provided via Requirement R1 Part 1.1.

As mentioned above, please see FERC Order No. 901 P 105 and 106, which states, "We also recognize that there may be instances where distribution providers are similarly unable to gather adequate modeling data and parameters from IBR-DERs. Accordingly, to account for instances in which distribution providers are unable to gather adequate modeling data and parameters of IBR-DERs to create and maintain IBR-DER models, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require that each distribution provider, if unable to gather accurate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation. In support of above, we further direct NERC to consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters."

P. 106: "Finally, as noted by commenters, we recognize that there may be instances where IBR-DERs are connected to an entity that does not meet the criteria for registration with NERC as a distribution provider. For those areas with IBR-DERs that in the aggregate materially affect the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we direct NERC to determine the appropriate registered entity responsible for providing data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, or, when unable to gather such accurate IBR-DERs data, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation."

It is expected that the PC/TP need to work with data providers. The proposed language is an improvement in that the previous language did not give the PC/TP any recourse if the responding entity responded, but was not really responsive to the technical concern.

This is an option for entities who are unable to gather the data. In addition, NERC staff is looking into future registration, but making that happen did not fit within the timeline of this project.

Thank you for your support on other parts. Abeyance period.

Comment	
Black Hills Corporation does not object to the proposed changes made to MOD-032-2, however we do agree with EEI's suggested non-substantive changes for the drafting team to consider.	

We agree with the concerns shared by EEI members that the lack of specificity regarding the delegation to the PC & TP to determine which entities are responsible for the data requirements in Attachment 1 could lead to some unforeseen difficulties in requesting the data, especially when non-registered entities are involved. The Abeyance Language helps for the short term but may not be the best long-term solution. Black Hills Corporation agrees with EEI on removing bullet 4 from Section E "Process for Updating the Unacceptable Models List Maintained by the ERO" since this is already an attachment to MOD-032-2. This process document should be marked as Attachment 2 to clearly show separation between it and Attachment 1. Black Hills Corporation also agrees with the changes to the Abeyance Language suggested by EEI to make it more clear. The suggested changes from EEI are in bold below: For a period of two years following the **enforcement** date of Reliability Standard MOD-032-2 Requirement R2 under the associated implementation plan, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C **of** the Rules of Procedure for a failure to comply with Reliability Standard MOD-032-2 Requirement R2 Part 2.1 with respect to the provision of estimated aggregate DER data or estimated data **for unregistered IBRs. While the CEA will not pursue compliance actions during this period for entities who develop estimates for aggregate DER data and unregistered IBR data that include the supporting data explanation and methods used as detailed in Requirement R2 subpart 2.1, they will pursue actions against entities who do not supply the required estimates, or the explanation of the limits or their methods used to create the estimates provided.** Entities shall participate in any compliance monitoring activities undertaken by the CEA during this potential noncompliance abeyance period and submit documentation as requested.

AZPS supports the following comments submitted by EEI on behalf of its members.

EEI members continue to have concerns related to the decision to delegate to the PC and TP, in Requirement 1, the determination of which entities are responsible for the data requirements contained in Attachment 1. To clarify their concerns, this lack of specificity has the potential of creating unforeseen difficulties for both the PCs and TPs requesting the data and those entities identified as being responsible for supplying this data, particularly where non-registered entities are involved. And while the Abeyance language will likely be helpful at alleviating these problems in the short term, it is unclear whether this temporary solution will remedy this issue over the long term.

EEI suggests deleting from Section E (Associated Documents) bullet 4, "Process for Updating the Unacceptable Models List Maintained by the ERO" since this document is an attachment to MOD-032-2. Additionally, this process document should be marked and identified as Attachment 2, because as currently contained within MOD-032-2 there is no separation between Attachment 1 and this process document.

Finally, EEI appreciates the inclusion of the Abeyance Language, however, the language could be clearer and less repetitive. The subjectivity of the language (e.g., sincere intent) should be removed because it places unnecessary compliance risk on the functional entities responsible. To resolve our concerns, we offer the following suggested language for NERC consideration.

For a period of two years following the enforcement date of Reliability Standard MOD-032-2 Requirement R2 under the associated implementation plan, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C of the Rules of Procedure for a failure to comply with Reliability Standard MOD-032-2 Requirement R2 Part 2.1 with respect to the provision of estimated aggregate DER data or

estimated data for unregistered IBRs. While the CEA will not pursue compliance actions during this period for entities who develop estimates for aggregate DER data and unregistered IBR data that include the supporting data explanation and methods used as detailed in Requirement R2 subpart 2.1, they will pursue actions against entities who do not supply the required estimates, or the explanation of the limits or their methods used to create the estimates provided. Entities shall participate in any compliance monitoring activities undertaken by the CEA during this potential noncompliance abeyance period and submit documentation as requested.

In Attachment 1, page 15, the ISO/RTO Council (IRC) Standards Review Committee (SRC) requests additional clarity regarding the following statement: *"The joint Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1 will specify each entity's responsibility and data flow processes."* In the Consideration of Comments, could the drafting team please clarify how detailed the expectations are with respect to the data flow? Specifically, to what level of granularity should entities describe responsibilities and data exchanges within these processes?	
Likes 0	
Dislikes 0	
Response	

Thank you for your comments. The DT recognizes that PC/TP data collection practices vary across the continent, and it would not be appropriate for NERC to mandate a particular process for collecting data. There is no "granularity" expectation, but entities within the process should understand their roles. For example, a DP may be required to provide DER data, but the process may require that data to be provided through a TP or TO rather than requiring data to be provided directly from the DP to the PC.

Thank you for your comments. The PC/TP should be able to develop data procedures that allow the data to be obtained from the best and most reliable sources available. The DT believes that this is best determined at the PC/TP level rather than dictated by NERC in MOD-032. The DT does not anticipate PCs and TPs requiring data from unregistered entities without some level of assurance (local authority, etc.) that those entities are the best and most reliable sources of information. The fact is that industry largely depends on data from entities that are not registered under NERC (OEMs, vendors, consultants, etc.) and it could be detrimental to reliability and model fidelity to obligate the MOD-032 PC/TP data procedures to only point to NERC-registered entities for data collection.

EEI does not object to the proposed changes made to MOD-032-2 and appreciates the improvements made since Draft 1. However, we offer some non-substantive changes for DT consideration.

Some EEI members continue to have concerns related to the decision to delegate to the PC and TP, in Requirement 1, the determination of which entities are responsible for the data requirements contained in Attachment 1. This lack of specificity has the potential of creating unforeseen difficulties for both the PCs and TPs requesting the data and those entities identified as being responsible for supplying this data, particularly where non-registered entities are involved. And while the Abeyance language will likely be helpful at alleviating these problems in the short term, it is unclear whether this temporary solution will remedy this issue over the long term. Nevertheless, we look forward to working with NERC to resolve any issues that might arise surrounding this concern, should this issue manifest itself into legitimate problems.

EEI suggests deleting from Section E (Associated Documents) bullet 4, "Process for Updating the Unacceptable Models List Maintained by the ERO" since this document is an attachment to MOD-032-2. Additionally, this process document should be marked and identified as Attachment 2, because as currently contained within MOD-032-2 there is no separation between Attachment 1 and this process document.

Finally, EEI appreciates the inclusion of the Abeyance Language, however, the language could be clearer**.** The subjectivity of the language (e.g., sincere intent) should be removed because it places unnecessary compliance risk the functional entities responsible. To resolve our concerns, we offer the following edits in boldface for NERC consideration. (*STRIKETHROUGHS REMOVED*)

For a period of two years following the **enforcement** date of Reliability Standard MOD-032-2 Requirement R2 under the associated implementation plan, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C **of** the Rules of Procedure for a failure to comply with Reliability Standard MOD-032-2 Requirement R2 Part 2.1 with respect to the provision of estimated aggregate DER data or estimated data **for unregistered IBRs. While the CEA will not pursue compliance actions during this period for entities who develop**

Comment
Southern Company does not object to the proposed changes made to MOD-032-2 and appreciates the drafting team's efforts in addressing concerns from Draft 1 of MOD-032-2. However, we offer some input and non-substantive changes for the DT consideration. Requirement R1 Part 1.1 and Attachment 1 - While Southern Company appreciates the clarification provided in the technical rationale, Southern Company is concerned that not requiring the PC/TP to designate NERC registered functional entities in Requirement R1 could lead to a gap in enforceability. Southern Company recommends adding the word 'Functional' in front of entities to make it clear that the standard requires the PC/TP to designate registered functional entities. While Southern Company agrees that data can be sourced from both registered and unregistered entities, a registered entity must be specified as responsible in Requirement R1 for Requirement R2 to be fully enforceable. Requirement R2 Part 2.2 – Southern Company appreciates the alignment of proposed standards MOD-032-2 and MOD-026-2. While the intent is clear in the technical rationale, Southern Company proposes the language below to better align with MOD-026-2. "…, the functional entity shall provide the models **that its Transmission Planner received and provided a written notification that the model(s) and accompanying documentation are acceptable in accordance with** MOD-026, where such models are available." Additionally, Southern Company supports EEI Comments.

Thank you for your comments. The PC/TP should be able to develop data procedures that allow the data to be obtained from the best and most reliable sources available. The DT believes that this is best determined at the PC/TP level rather than dictated by NERC in MOD-032. The DT does not anticipate PCs and TPs requiring data from unregistered entities without some level of assurance (local authority, etc.) that those entities are the best and most reliable sources of information. The fact is that industry largely depends on data from entities that are not registered under NERC (OEMs, vendors, consultants, etc.) and it could be detrimental to reliability and model fidelity to obligate the MOD-032 PC/TP data procedures to only point to NERC-registered entities for data collection. • Please see the updated abeyance language.

- Bullet 4 from section E has been removed.
- Please see updated language added to the MOD-032-2 supporting document section of the standard.

2. Do you agree with the proposed IRO-010-6 and TOP-003-8 modifications? If you do not support the modifications made, please provide rationale and proposed language on how you would address the FERC Order 901 directives.	
Kennedy Meier - Electric Reliability Council of Texas, Inc. - 2	
Answer	No

Comment	
As IRO-010-6, Requirement R1, Part 1.1 is currently drafted, it is unclear if the phrase "as deemed necessary by the Reliability Coordinator" at the end of Part 1.1 applies only to "identification of the entities responsible for responding to the specification" or if it applies to every category of data and information listed in Part 1.1. To address this ambiguity, ERCOT recommends that the phrase "as deemed necessary by the Reliability Coordinator" be moved from the end of Part 1.1 to the beginning of the list of data and information in Part 1.1, as follows: A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments**, *as deemed necessary by the Reliability Coordinator*,** including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification. A similar ambiguity exists in the current draft of TOP-003-8. Consequently, ERCOT recommends that corresponding modifications be made to Requirement R1, Part 1.1 and Requirement R2, Part 2.1 in TOP-003-8.

The MRO NSRF would appreciate more clarity on “as applicable” as it is used in multiple sub-requirements throughout these two standards. Additionally, the MRO NSRF requests the changes to TOP and IRO be based upon requirements for using the data, potentially as envisioned in Milestone 4. As written, the use of planning models in the real-time operations, “as applicable”, seems to create a requirement the RC or BA gather data that may be of no value to these entities. Under the current standards, the information needed may be gathered by those entities if it is needed for reliability. If this change stands, it may require the RC and BA gather data for compliance purposes only and provide no real time value.

Response	
Thank you for your comments. The inclusion of “as applicable” allows for variation as necessary for application in the operations horizon. For example, consistent models would not be appropriate if an update was made to a planning model for known pending changes, which should not be reflected in the operations models prior to implementation. Please see updates made to TOP and IRO to provide non-substantive clarity for the RC, BA, and TOP.

Comment	
It is the opinion of ACES that NERC registered entities should not be subjected to potential violations of multiple NERC Reliability Standards Requirements for a single action. In other words, we contend that by including requirements for model submissions in both MOD-032-2 and in a documented data specification(s), responsible entities will now be subject to a form of double jeopardy (i.e., claim preclusion). ACES recommends only requiring model submissions under MOD-032-2 and subsequently striking the following newly proposed requirement parts: IRO-010-6 Requirement R1 Part 1.5.3, TOP-003-8 Requirement R1 Part 1.5.3, and TOP-003-8 Requirement R2 Part 2.5.3.

Thank You for your comments. These modifications were made in response to FERC Order 901 directives related to usage of a uniform framework in the development of planning and operations models. Planning model submissions in accordance with MOD-032-2 will reflect this uniform framework. Thus, requiring that operations model submissions be consistent with planning model submissions ensures that they also reflect the uniform framework as directed by FERC in Order 901. TOP and IRO allow the RC, TOP, and BA to determine what is necessary to provide. Please see updates made to TOP and IRO to provide non-substantive clarity for the RC, BA, and TOP.

Answer	No
Document Name	2022-02_Unofficial_Comment_Form SRC.docx
Comment	
The RC and BA are able to obtain the necessary model information to support real time assessments, real-time monitoring, and analysis within the current standards. Accordingly, we believe the proposed modification is unnecessary. Until such time as there is an obligation on the RC or BA to use the data in real time, then these changes are premature or unwarranted SRC is concerned about the phrasing with "as applicable" and the requirements to use planning models. This phrase is unclear for how it may be applied during an audit. Additional clarity could be added by clarifying at the discretion of the RC, these models may be used. If there are criteria envisioned it would be more appropriate to document those in the standard itself rather than leverage the planning models in the operational requirements.

TAL believes the intent of 2.5.3 is well intended, but that this standard does not belong in TOP-003-8, R2. R2 is a BA standard. R2.5.3 seems to be a modeling standard. R2.5.3 seems redundant with respect to other modeling and commissioning standards being developed. TAL believes that in all practical sense, this must be accomplished in planning standards, which come into play during interconnection studies, model verification and validation processes and commissioning.

Comment	
BC Hydro appreciates the drafting team responsiveness to our comments and the subsequent revisions to Requirements R1 Part 1.5.3 in IRO-010-6 and TOP-003-8 and Requirement R2 Part 2.5.3 in TOP-003-8, which now require the RC, BA and TOP functions to maintain in their data	

specs methods for entities to provide data and information, including “Requirements for model submissions to be consistent with the model submitted for planning purposes”. We noted in the Technical Rationale the stated objective of aligning the planning and operations models with reference to MOD-032-2, applicable on the Long-term Planning Time Horizon, as the typical driver for planning models submission. However, BC Hydro suggests that additional clarity in the context of the IRO-010 and TOP-003 standards, which are applicable in the Operations Planning Time Horizon, on modeling requirements possibly not in scope of the RC/BA/TOP. If the intent is to mandate that entities identified in R1 Part 1.1 to submit system models consistent with those generated per MOD-032-3 (where possible as discussed in the Technical Rationale), BC Hydro suggests that the wording be revised to better reflect this. As drafted, it is not immediately clear which requirements the data spec documentation must include, and whether these requirements pertain to the models, models submission, or both. Proposed wording for 1.5.3: Provisions for any model required for submission under the R1 data specification be consistent with the models created in accordance with MOD-032-2.

Per the NERC ROP, Section 300, reliability standards should use 'clear language': "Responsible entities, using reasonable judgment and in keeping with good utility practices, are able to arrive at a consistent interpretation of the required performance". With that, BPA has concerns as to how the proposed TOP-003 R1.5.3 language "consistent with the model submitted for planning purposes, as applicable" will be	

interpreted by an auditor. BPA believes the current state estimation model and planning models differ in many cases. Where there are differences, those differences are usually driven by the unavailability of real time data for that model or the need to simplify it to obtain consistent solutions. In the technical rationale document, the drafting team claims the "as applicable" addresses that. Based on the seemingly open nature of R1.5.3, BPA has uncertainty that industry's interpretation of "as applicable" will be the same as that of an auditor. BPA seeks clarity from the drafting team.

Response	
Thank you for your comments. Models used in operations should be consistent with those used in planning as applicable. The inclusion of "as applicable" allows for variation as necessary for application in the operations horizon. One example where consistent models would not be appropriate is an update made to a planning model for known pending changes, which should not be reflected in the operations models prior to implementation. These modifications were made in response to FERC Order 901 directives related to usage of a uniform framework in the development of planning and operations models. Planning model submissions in accordance with MOD-032-2 will reflect this uniform framework. Thus, requiring that operations model submissions be consistent with planning model submissions ensures that they also reflect the uniform framework as directed by FERC in Order 901. Please see updates made to TOP and IRO to provide non-substantive clarity for the RC, BA, and TOP.

Response	

Thank you for your comment. Per FERC Order 901 P 103: “We recognize that there may be limitations on the ability of certain transmission owners to provide all data about unregistered IBRs that Bulk-Power System transmission planners and operators may need for the reliable operation of the Bulk-Power System. Likewise, there may be limitations on the ability of certain distribution providers to provide all data about IBR-DERs in the aggregate that Bulk-Power System transmission planners and operators may need for the reliable operation of the Bulk-Power System.” Based on this information, it was determined that an estimation is better than nothing, and this is only needed if the functional entity is unable to gather data needed from the respective entity. When new requirements are created, there is going to come change in work. The DT did the best it could to ensure administrative burdens on entities outside of what is required from the FERC Order. In addition, it may not end up being the TOs responsibility based on the outcome of Requirement R1. See TR. There is DER in certain markets that provides other data, etc.

TOP-003 and IRO-010 Requirements to gather data that is not needed or utilized by the RC or BA become an administrative burden to track and assess. Other expenses to store the unnecessary data highlight the ineffectiveness of costs.	
Likes 0	

Dislikes 0	

Response
Thank you for your comment. The DT reviewed existing IRO-010 and TOP-003 versions and found that both standards had broad requirements language that encompassed generation and storage resources, including IBR. Nevertheless, to ensure no ambiguity that FERC Order 901 requirements are met, the DT included explicit references to IBR-specific data and parameters and pointed to the uniform framework through an alignment between planning and operations models. These requirements are only as applicable, and the DT does not find this to be administrative in nature for reliability needs. The DT worked to strengthen Requirement R1 in that it is not adding any new data collection from what is already deemed necessary.

Jodirah Green - ACES Power Marketing - 1,3,4,5,6 - MRO,WECC,Texas RE,SERC,RF, Group Name ACES Collaborators	
Answer	No

Document Name	

Comment

ACES does not believe the proposed modifications to MOD-032-2 represent the most cost-effective means of addressing FERC Directive 901. ACES asserts that the DT remains well within the scope of the directive in establishing a threshold to define “material affect.” By proactively setting a threshold of 20 MVA or greater in aggregate and requiring mandatory reporting for inverter-based resource - distributed energy resources (IBR-DER) with individual nameplate ratings of 5 MVA or greater, the DT can satisfy the intent of the Standard Authorization Request (SAR) while enabling a more economically viable implementation for industry stakeholders.

This approach allows entities to provide more meaningful and actionable data to the Planning Coordinator (PC) and Transmission Planner (TP), without incurring the significant compliance, legal, and accounting burdens associated with parsing and aggregating distribution-level interconnection agreements for small-scale IBR-DER units. Distribution providers would be able to leverage existing billing and metering systems to determine aggregate IBR-DER values and assess applicability under MOD-032-2 Requirement R2.1. This methodology is expected to offer a more practical and cost-effective path to compliance with FERC Directive 901.

Furthermore, the resulting data provided to the PC/TP would likely be of higher quality, as individual nameplate data for IBR-DER units rated at or above 5 MVA is more readily obtainable and verifiable. This targeted reporting would yield more reliable data than estimates derived from significantly smaller IBR-DER units. Finally, this approach would reduce the volume of data sets requiring manual review and integration by the PC/TP, thereby lowering resource demands and improving overall cost efficiency.

Response

Thank you for your comment. As referenced in the Technical Rationale, NERC has published a study concluding that a 0 MW threshold is appropriate for data collection purposes. The DT concluded that even if a threshold was applied, data would still need to be collected to verify and ensure that a threshold was not being exceeded. Further, the DT determined that there is no strong technical justification for any particular universal DER threshold. In fact, any universal threshold would likely be inappropriate for many areas, so the DT created the flexibility for the PC/TP to make this determination for their local region. The proposed solution in the ACES comment does not address the

potential aggregate impact of thousands of kW-scale DERs. The DT contends that the FERC concern is less about getting more detailed models for 5 MW (and larger) facilities (as most transmission planners are unlikely to utilize such detailed modeling for distribution-connected facilities) but being aware of and appropriately representing aggregations of smaller facilities at the T-D interface. Material affect - see Consideration of FERC Directive. The DT stated: "Determination if an unregistered IBR or aggregate IBR-DER would "materially affect" the Bulk Power System, requires engineering judgment and is not something that would be appropriate to precisely specify in a reliability standard. Thus, Attachment 1 footnote 7 was added to explicitly allow Transmission Planners and Planning Coordinators to specify DER thresholds that may be appropriate when considering impact to their local areas." There is nothing that precludes ACES from identifying a threshold needed based on how MOD-032 has been drafted (See footnote 7). Therefore, because you can set your threshold, the drafting team does not agree that this presents a cost effective issue.

Comment	

For MOD-032, there will be an administrative burden due to the need to:

· Develop a methodology and process for the estimation process for data that is not available to the TO. This would not be a one-time effort but year over year as DER increases.

· Increased outreach to other entities such as registered DPs for their best estimate on the modeling.

· There will be a need to increase personnel to do the work that is already a tight market for applicable employees.

Response

Thank you for your comment. Per FERC Order 901 P 103: "We recognize that there may be limitations on the ability of certain transmission owners to provide all data about unregistered IBRs that Bulk-Power System transmission planners and operators may need for the reliable operation of the Bulk-Power System. Likewise, there may be limitations on the ability of certain distribution providers to provide all data about IBR-DERs in the aggregate that Bulk-Power System transmission planners and operators may need for the reliable operation of the Bulk-Power System." Based on this information, it was determined that an estimation is better than nothing, and this is only needed if the functional entity is unable to gather data needed from the respective entity.

The DT acknowledges that new requirements to collect data not currently collected will come with increased burdens. The DT did the best it could to provide flexibility and minimize administrative burdens on entities while satisfying the directives from the FERC Order.

In addition, MOD-032-2 does not mandate Transmission Owner responsibility for DER data. Requirement R1 allows the flexibility for the PC/TP to determine the best entity to provide DER data in their local area (with the understanding that certain markets may provide better alternative sources for DER data - see TR for some examples).

Comment

MEC agrees with the comments of the MRO NSRF. However, none of these concerns rise to the level of a negative ballot for MEC. Consideration and clarifications around the concerns expressed in the MRO NSRF comments would make for a better Reliability Standard if there is opportunity for substantive revisions.

4. Do you agree with the proposed ERO Unacceptable Models List? If you do not agree, please provide alternative language and explain the rationale that, if made, would result in your support.	
Steven Taddeucci - NiSource - Northern Indiana Public Service Co. - 3	
Answer	No
Document Name	
Comment	
NIPSCO does not believe that models on the unapproved list should be allowed to be used, even if technical justification is provided for doing so. There are legitimate reasons why these models should not be used, so a path for their potential inclusion should not be provided.

Response	
Thank you for your comment. Based on feedback received in draft 1, many entities felt there are certain situations where a model that is unacceptable today, may be the best fit for an older unit, etc. The DT decided to provide flexibility, allowing an unacceptable model to be submitted in conjunction with a technical rationale justifying the use of that model. However, the DT believes that there in nothing in MOD-032 that would prevent a PC/TP from implementing more stringent data reporting requirements (e.g. not allowing any models from the UML) if deemed appropriate for their area.

Comment	

Transmission Planners cannot submit models to the regional case build process that are not approved models. By allowing this, we will create a very costly and unproductive loop where DER models that are unacceptable keep getting sent back from the TP to the DP until they are acceptable. A standalone methodology would be better as mentioned by other participants.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. MOD-032 allows flexibility in what models need to be collected, but in PC/TP procedures, it would be recommended that the TP/PC be familiar with the MMWG, ERAG, WECC requirements and incorporate them as needed.

The act of renaming is creating a new list, not just replacing the old, acceptable model list. The ERO Unacceptable Models List does not have industry consensus and was not established through the standards process. TVA does not believe it should be referenced in a compliance standard. In its place, TVA recommends specifications for standard models (where appropriate and available), user-written models (where appropriate and with adequate documentation), and other models (when no alternative is available and requiring justification for use).

Response	
Thank you for your comment. In approval of the MOD-032-2 Reliability Standard, The Unacceptable Models List Maintained by the ERO did go through the development process as a starting point for this document. Any modifications need to follow the process provided in the MOD-032 standard. This document originally came out of the SAMs group and is a well-known document throughout industry. In addition, reasons as to why unacceptable models are added to the Unacceptable Models List are located in chapter 2 of the UML document. Lastly, Additions to or removals from the UML can be made through the process outlined in MOD-032.

It does not appear that the language of the MOD-032 Supporting Document: Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO) has considered the role of the AMWG under ERAG for building and maintaining the Eastern Interconnection models. I believe this document is more formal, and describes a more centralized process for the maintenance of the official Unacceptable Models List. It does not appear that the language provided by the SDT aligns with the charter of the AMWG, unless the AMWG fits into the general description of the "ERO Staff" under items 2 and 3.

Response	
Thank you for your comment. A PC/TP could implement a more stringent requirement related to unacceptable models (e.g., not allowing them even with a rationale, or requiring the submission of a specific set of models) to align with a higher level modeling group such as the AMWG. Thus, it does not appear that MOD-032-2 would conflict with such a group, though the DT acknowledges that it would be beneficial for AMWG policies to align with the ERO document and MOD-032-2. If justification of an UM needing to be removed from the UML, can be provided through the process outlined in MOD-032. Additions to or removals from the UML can be made through the process outlined in MOD-032. In addition, the ERAG and MMWG perform the MOD-032 designee functions per the process within the EASTERN INTERCONNECTION REGIONAL ENTITY AGREEMENT that is located on the MMWG website.	

If an unacceptable model is submitted without a technical rationale, it would be a compliance violation for the model submitter. Similar to any and every model that is submitted (even an "acceptable" model that is parameterized poorly and creates initialization or simulation issues), the TP and PC must make a determination of whether it can be used in a case-building process (with the acknowledgement that resolution of a model issue may not align with the deadline to finalize a base case). This may be completely separate from pursuing a technical concern under R3. MOD-032-2 does not specify any requirements for replacing or modifying unacceptable models, because that process is very dependent on the situation and requires engineering judgment (and finalizing a base case with the "unacceptable" model may end up being the best option).

In addition, the ERAG and MMWG is the MOD-032 designee per the process within the EASTERN INTERCONNECTION REGIONAL ENTITY AGREEMENT and is located on the MMWG website.

See link to agreement language above. https://www.rfirst.org/wp-content/uploads/2023/10/EI-Regional-Entity-Agmt-Final-Signed.pdf

5. Provide any additional comments for the drafting team to consider, if desired.	
Thomas Foltz - AEP - 5	
Answer	
Document Name	
Comment	
AEP recommends that the Attachment “Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO)” be removed from the MOD-032 standard, and added instead to the ERO Unacceptable Models List document.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. Based on comments received during draft 1, multiple commenters requested the Unacceptable Models Listed Maintained by the ERO go through the standards development process. By adding the process for this respective document to MOD-032 allows that process to take place. Therefore, based on comments received in this draft, majority of industry is in agreement with the process being a supporting document to the MOD-032 standard.

Andy Thomas - Duke Energy - 1,3,5,6 - SERC,RF	
Answer	
Document Name	
Comment	
Duke Energy believes MOD-032-2 R2.2 creates Requirement duplication by providing models already outlined and required in NERC MOD-026. The duplication creates the potential for non-compliance in two separate Standards, while also introducing overlapping documentation and reporting and possibly conflicting deadlines. Because MOD-032-2 R2.2 results in increased risk of Non-Compliance for the applicable entities, Duke Energy recommends R2.2 be deleted from the Standard.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. FERC Order No. 901 directives require collection of accurate models for use in both planning and operations. Within the paradigm of NERC standards, data collection requirements are established under MOD-032 while model accuracy is ensured through model verification and validation requirements under MOD-026. Joint discussions between the Project 2022-02 and 2020-06 teams concluded that the most effective way to satisfy the FERC directive was for MOD-032 to require provision of "the models accepted by the Transmission Planner under MOD-026, where such models are available".

Response

Thank you for your comment. Representing the impact of UVLS and UFLS on DER (i.e., tripping DER along with the load that is tripped) is essential to designing effective UVLS and UFLS programs. Further details are included in the published Reliability Guideline and White Paper that are referenced in the Technical Rationale. If this item is excluded from MOD-032, industry will eventually need to grapple with modifying processes for gathering DER data to address this issue (a draft SAR to modify PRC-006 to address DER impacts on UFLS program design is being considered under the RSTC and points to addressing this issue if not addressed under Project 2022-02). The DT believes that establishing processes for developing and collecting this information in conjunction with other DER data under MOD-032 is the most efficient approach.

Lincoln Burton - Con Ed - Consolidated Edison Co. of New York - 3

Answer	
Document Name	

Comment

We do not agree that the TO is the appropriate entity for collecting and providing data for DER where there is no associated registered DP between the DER connection point and the TO's system. In the NY area, the most appropriate entity would be the NYISO; this requirement should be moved to the BA/PC. The NYISO is in a better position to require entities to submit the required data when they join the market; individual TOs cannot. The NYISO has processes for maintaining the necessary system representation data to comply with FERC, NERC, NPCC, and NYSRC requirements.

Response

Thank you for your comment.
There is nothing that precludes an entity from requesting DER data from unregistered distribution providers. If an entity can show that they made the effort to contact the unregistered entity and no response was received, then Requirement R2 Part 2.1 would take place where the

entity would complete an estimation. This comment goes against FERC Order 901 and what has been directed of industry. It is important for reliability purposes that unregistered IBRs that are connected to the grid are identified for reliability purposes. In addition, TO has been listed as one of the typical entities for providing DER data, but would not have to be assigned based on the flexibility provided via Requirement R1 Part 1.1. This could allow NYISO to directly connect data from DERs within the area.

As mentioned above, please see FERC Order No. 901 P 105 and 106, which states, "We also recognize that there may be instances where distribution providers are similarly unable to gather adequate modeling data and parameters from IBR-DERs. Accordingly, to account for instances in which distribution providers are unable to gather adequate modeling data and parameters of IBR-DERs to create and maintain IBR-DER models, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require that each distribution provider, if unable to gather accurate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation. In support of above, we further direct NERC to consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters."

P. 106: "Finally, as noted by commenters, we recognize that there may be instances where IBR-DERs are connected to an entity that does not meet the criteria for registration with NERC as a distribution provider. For those areas with IBR-DERs that in the aggregate materially affect the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we direct NERC to determine the appropriate registered entity responsible for providing data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, or, when unable to gather such accurate IBR-DERs data, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation."

Comment
We do not agree that the TO is the appropriate entity for collecting and providing data for DER where there is no associated registered DP between the DER connection point and the TO's system. In the NY area, the most appropriate entity would be the NYISO; this requirement should be moved to the BA/PC. The NYISO is in a better position to require entities to submit the required data when they join the market; individual TOs cannot. The NYISO has processes for maintaining the necessary system representation data to comply with FERC, NERC, NPCC, and NYSRC requirements.

Response
Thank you for your comment. There is nothing that precludes an entity from requesting DER data from unregistered distribution providers. If an entity can show that they made the effort to contact the unregistered entity and no response was received, then Requirement R2 Part 2.1 would take place where the entity would complete an estimation. This comment goes against FERC Order 901 and what has been directed of industry. It is important for reliability purposes that unregistered IBRs that are connected to the grid are identified for reliability purposes. In addition, TO has been listed as one of the typical entities for providing DER data, but would not have to be assigned based on the flexibility provided via Requirement R1 Part 1.1. This could allow NYISO to directly connect data from DERs within the area.

As mentioned above, please see FERC Order No. 901 P 105 and 106, which states, "We also recognize that there may be instances where distribution providers are similarly unable to gather adequate modeling data and parameters from IBR-DERs. Accordingly, to account for instances in which distribution providers are unable to gather adequate modeling data and parameters of IBR-DERs to create and maintain IBR-DER models, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require that each distribution provider, if unable to gather accurate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation. In support of above, we further direct NERC to consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters."

P. 106: "Finally, as noted by commenters, we recognize that there may be instances where IBR-DERs are connected to an entity that does not meet the criteria for registration with NERC as a distribution provider. For those areas with IBR-DERs that in the aggregate materially affect the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we direct NERC to determine the appropriate registered entity responsible for providing data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, or, when unable to gather such accurate IBR-DERs data, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation."

Eversource suggests defining or modifying the phrase “standard library models” in MOD-032 R1.4.1 to make it less application-specific as this phrase has no set meaning in some software.

Eversource suggests the removal of Footnote 5 from Attachment 1 of MOD-032. This phrase provides little to no value and only provides speculation whereas Requirement R1.1 already defines a mechanism to assign ownership. In some regions, these data points may not be provided by the TO, but the footnote seems to imply that it should.

Response

Thank you for your comment. FERC Order 901 directs NERC to develop reliability standards that require “the use of approved industry generic library IBR models”. However, pre-defining a limited set of models (i.e., a library of models) that could be used to represent generation and system components is potentially at odds with objectives to also have accurate models, especially as technology rapidly progresses. To align with industry practices while addressing the directives of the FERC Order, the DT referenced standard library models incorporated within software as well as usability requirements for user-defined models (where accepted) in Requirement R1, Part 1.4, rather than defining an inclusive model library.

Footnote 5 indicates that the PC/TP data requirements and reporting procedures need to account for IBRs that are not DERs and do not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes. It also indicates that the TO is typically responsible for such data. The DT was attempting to address FERC Order 901 with regards to the TO and providing clarity to industry on the "typical" entity, without restricting applicability based on other comments received over the course of this project.

The 2022-02 Technical Rationale (TR) in its IRO-010-6 and TOP-003-8 section (page 14) seems to indicate that modifications were made to "add reference to MOD-032", however the only reference to MOD-032 has been added in the 2022-02 TR via the clarification on the intent behind the revised R1 Part 1.5.3 (and R2 Part 2.5.3 for TOP-003 only). Please clarify if the intention is to add a MOD-032 reference to Standards as well.

To reiterate, TAL believes the intent of 2.5.3 is well intended, but that this standard does not belong in TOP-003-8, R2. R2 is a BA standard. R2.5.3 seems to be a modeling standard. R2.5.3 seems redundant with respect to other modeling and commissioning standards being developed. TAL believes that in all practical sense, this must be accomplished in planning standards, which come into play during interconnection studies, model verification and validation processes and commissioning.

Thank you for your comment. Representing the impact of UVLS and UFLS on DER (i.e., tripping DER along with the load that is tripped) is essential to designing effective UVLS and UFLS programs. Further details are included in the published Reliability Guideline and White Paper that are referenced in the Technical Rationale. If this item is excluded from MOD-032, industry will eventually need to grapple with modifying processes for gathering DER data to address this issue (a draft SAR to modify PRC-006 to address DER impacts on UFLS program design is being considered under the RSTC and points to addressing this issue if not addressed under Project 2022-02). The DT believes that establishing processes for developing and collecting this information in conjunction with other DER data under MOD-032 is the most efficient approach.

Response	
Thank you for your comment. NERC maintains a designee agreement for the entities designated to build Interconnection-wide cases as seen in R4 of MOD-032. These agreements allow for the entities to build a separate list that is more restrictive if they desire. MOD-032 allows flexibility in what types of models need to be collected. It would be recommended that the TP/PC be familiar with the requirements of	

entities designated to build Interconnection-wide cases (e.g. MMWG, ERAG, WECC) and incorporate them into their data collection procedures as needed.

NIPSCO recommends that the Attachment “Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO)” be removed from the MOD-032 standard, and added instead to the ERO Unacceptable Models List document.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. Multiple commenters to draft 1 requested that the Unacceptable Models List Maintained by the ERO go through the standards development process. Including the process for updating this document within MOD-032 ensures that any changes to the Unacceptable Models list follow a process that is established through the standards development process. Based on comments received in this draft, a majority of industry is in agreement with this compromise approach.

The MRO NSRF encourages clear and consistent identification of which generation assets standards are applicable to. The currently proposed MOD-032-2 Reliability Standard Applicability Section does not clearly identify those entities. While we recognize the proposed definition of GO includes both Category 1 & 2, the MRO NSRF proposes that the following be added to 4.1.3 of the Applicability Section of MOD-032-2 (shown in boldface): 4.1.3 Generator Owner - **Category 1 and 2**

Response
Thank you for your comment. These modifications were made in response to FERC Order 901 directives related to usage of a uniform framework in the development of planning and operations models. Planning model submissions in accordance with MOD-032-2 will reflect this uniform framework. Thus, requiring that operations model submissions be consistent with planning model submissions ensures that they also reflect the uniform framework as directed by FERC in Order 901. Please see updates made to TOP and IRO to provide non-substantive clarity for the RC, BA, and TOP.

DP's likely do not have in-house expertise available to comply with providing dynamic models of aggregated DER resources; even estimated modeling when certified modeling is unavailable due to regulatory limitations. NERC and the drafting team should consider resource availability of the consultants who will be required to support DP's in the new compliance obligation as implementation plans are determined.

Response

Thank you for your comment. The level of detail is determined locally by the PC/TP, but it is expected that TPs and PCs will need to work together with TOs and DPs to establish feasible processes and formats for collecting DER data. Those processes could specify the provision of dynamic models or basic data that planners could translate into dynamic models. The SPIDERWG has published several Reliability Guidelines related to the collection of DER data and parameterizing models (such as the DER_A model) to represent aggregate DER. The DT intentionally refrained from specifying provision of "dynamic models" for DER, but instead refers to "aggregate DER data". That data must represent certain capabilities in accordance with attachment 1, but attachment 1 alternatively allows for collection of "information that can be used to infer those items for modeling purposes".

Wesley Yeomans - New York State Reliability Council - 10

Answer	
Document Name	

Comment

We do not agree that the TO is the appropriate entity for collecting and providing data for DER where there is no associated registered DP between the DER connection point and the TO's system. In the NY area, the most appropriate entity would be the NYISO; this requirement should be moved to the BA/PC. The NYISO is in a better position to require entities to submit the required data when they join the market; individual TOs cannot. The NYISO has processes for maintaining the necessary system representation data to comply with FERC, NERC, NPCC, and NYSRC requirements.

Reminder
Standards Announcement
Project 2022-02 Uniform Modeling Framework for IBR

Additional Ballots and Non-binding Polls Open through September 10, 2025

Now Available

Additional ballots for **Project 2022-02 Uniform Modeling Framework for IBR** and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels are open through **8 p.m. Eastern Wednesday, September 10, 2025** for the following standards and implementation plan:

- MOD-032-2 – Data for Power System Modeling and Analysis
- IRO-010-6 – Reliability Coordinator Data and Information Specification and Collection
- TOP-003-8 – Transmission Operator and Balancing Authority Data and Information Specification and Collection
- Implementation Plan

The drafting team's considerations of the responses received from the last comment period are reflected in this draft of the standard.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Balloting

Members of the ballot pools associated with this project can log in and submit their votes by accessing the Standards Balloting and Commenting System (SBS) here.

Note: Votes cast in previous ballots, will not carry over to additional ballots. It is the responsibility of the registered voter in the ballot pools to place votes again. To ensure a quorum is reached, if you do not want to vote affirmative or negative, cast an abstention.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*

- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will review all responses received during the comment period and determine the next steps of the project.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Jordan Mallory (via email) or at 470-479-7538. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2022-02 Uniform Modeling Framework for IBR observer list” in the Description Box.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

MOD-032-2 is posted for a 5-day final ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
(The above was Posted under IRPTF SAR pre–Order No. 901)	
30-day formal comment period with initial ballot	April 17 – May 16, 2025
34-day formal comment period with ballot	August 8 –September 10, 2025

Anticipated Actions	Date
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resource (DER): A generator or energy storage technology connected to a distribution system that is capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including one connected behind the meter of an end-use customer that is supplied from a distribution system.

A. Introduction

1. **Title:** Data for Power System Modeling and Analysis

2. **Number:** MOD-032-2

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Balancing Authority

   4.1.2 Distribution Provider

   4.1.3 Generator Owner

   4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

   4.1.5 Resource Planner

   4.1.6 Transmission Owner

   4.1.7 Transmission Planner

   4.1.8 Transmission Service Provider

5. **Effective Date:** See Implementation Plan for Project 2022-02.

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1, including the entity responsible for each required item.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

1.4. Specifications of the following items for dynamic model submissions:

1.4.1. Required submission of:

- standard library models incorporated within the software(s) utilized to create the Interconnection-wide case(s);
- user-defined models; or
- both standard library models and user-defined models.

1.4.2. Where user-defined models are accepted, usability requirements for any submitted user-defined models including, at a minimum, requirements to provide model documentation and instructions for model set up and use.

1.4.2.1. Each Planning Coordinator and Transmission Planner shall provide their user-defined model requirements within 90 calendar days of receiving a written request for such data from other Planning Coordinators and Transmission Planners within the Interconnection.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. If a functional entity is required to provide data for one or more of the following and is unable to gather such data, the functional entity shall provide an estimate of the data, an explanation of the limitations of the estimated data, and the method used for estimation;

- Aggregate DER data; or
- Data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.

2.2. If a functional entity is required to provide dynamic models, the functional entity shall provide the models accepted by the Transmission Planner under MOD-026, where such models are available.

2.3. If a functional entity provides a model that is included on the Unacceptable Models List maintained by the ERO in accordance with the process described in the MOD-032 Supporting Document, the functional entity shall also provide a technical rationale justifying the use of that model.

M2. Each functional entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data that is responsive to the technical concern.

3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each functional entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. **Compliance Monitoring Process**

   1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

   1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

   The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

   - Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

   If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

   The Compliance Enforcement Authority shall keep the last audit records, and all requested and submitted subsequent audit records.

2. **Compliance Monitoring and Enforcement Program:** Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

3. **Potential Noncompliance (PNC) Abeyance Period:**
Potential Noncompliance (PNC) Abeyance Period: For a period of two years following the phased-in compliance date of Reliability Standard MOD-032-2 Requirement R2 under the associated implementation plan, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C to the Rules of Procedure for a failure to comply with Reliability Standard MOD-032-2 Requirement R2 Part 2.1 with respect to the provision of estimated aggregate DER data or estimated data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes against any entity acting in good faith to comply with the standard in accordance with the relevant implementation plan. "Good faith" in this context refers to a sincere intention to

comply with Reliability Standard MOD-032-2 Requirement R2 Part 2.1, following a reasonable and serious assessment by the entity in determining how this Reliability Standard should be applied to its particular facts and circumstances. For example, the CEA may not pursue compliance enforcement actions during this period for entities who submit estimated data and include the supporting data explanation and methods used as detailed in Requirement R2 Part 2.1 in a timely manner. The CEA may pursue actions against entities who do not submit data with supporting explanation and methods in a timely manner. Entities shall participate in any compliance monitoring activities undertaken by the CEA during this potential noncompliance abeyance period and submit documentation as requested.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include less than or equal to 25% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 25%, but less than or equal to 50% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 50%, but less than or equal to 75% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) did not develop any steady-state, dynamics, and short circuit modeling data requirements and reporting procedures required by Requirement R1; OR The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 75% of the required components specified in Requirement R1.
R2.	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider did not

	steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide less than or equal to 25% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but less than or equal to 25% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission	steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 25%, but less than or equal to 50% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 25%, but less than or equal to 50% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider,	steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 50%, but less than or equal to 75% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 50%, but less than or equal to 75% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider,	provide any steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s); OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 75% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission

	Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in less than or equal to 15 calendar days after the specified date.	Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 15, but less than or equal to 30 calendar days after the specified date.	Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 30, but less than or equal to 45 calendar days after the specified date.	Planner(s) and Planning Coordinator(s), but greater than 75% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 45 calendar days after the specified date.
R3.	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission

	Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response within 105 calendar days (or within 15 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response within greater than 105 calendar days, but less than or equal to 120 calendar days (or within greater than 15 calendar days, but less than or equal to 30 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response within greater than 120 calendar days, but less than or equal to 135 calendar days (or within greater than 30 calendar days, but less than or equal to 45 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R3 within 135 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).

MOD-032-2 – ATTACHMENT 1
Data Reporting Requirements

The table below indicates the information[1] that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in Interconnection-wide cases. The joint Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1 will specify entity responsibility and data flow processes. The typical functional entity[2] responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The data reported shall be identified by the bus number, name, and/or identifier that is assigned in conjunction with the Planning Coordinator, Transmission Owner, or Transmission Planner.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics**	**short circuit**
1. Each bus [TO] a. Nominal voltage b. Area, zone and owner 2. Aggregate Demand[3] [DP] a. Real and reactive power* b. In-service status* 3. Generating and storage units[4] [GO, TO[5], RP (for future planned resources only)] a. Real power capabilities - gross maximum and minimum values b. Reactive power capabilities - maximum and minimum values at real power capabilities in 3a above c. Station service auxiliary load for normal plant configuration (provide data in the same manner as that required for aggregate Demand under item 2, above). d. Regulated bus* and voltage set point* (as typically provided by the TOP) e. Machine MVA base	1. Generator [GO, RP (for future planned resources only)] 2. Excitation System [GO, RP (for future planned resources only)] 3. Governor [GO, RP (for future planned resources only)] 4. Power System Stabilizer [GO, RP (for future planned resources only)] 5. Aggregate Demand[3] [DP] 6. Wind plant model (for plants with type 1 and type 2 wind turbines) [GO] 7. Inverter-Based Resource [GO, TO[5]] a. Parameters, settings, or capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control 8. Static Var Systems and FACTS [GO, TO, DP] 9. DC System Models [TO] 10. Aggregate Distributed Energy Resource (DER) data[7] [DP, TO][6]	1. Provide for all applicable elements in column "steady-state" [GO, RP, TO, DP] a. Positive sequence data b. Negative sequence data c. Zero sequence data 2. Mutual Line Impedance Data [TO] 3. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics**	**short circuit**
f. Generator step up transformer data (provide same data as that required for transformer under item 6, below) g. Generator type (hydro, wind, fossil, solar, nuclear, etc.) h. In-service status* 4. AC Transmission Line or Circuit [TO] a. Impedance parameters (positive sequence) b. Susceptance (line charging) c. Ratings (normal and emergency)* d. In-service status* 5. DC Transmission Systems [TO] 6. Transformer (voltage and phase-shifting) [TO] a. Nominal voltages of windings b. Impedance(s) c. Tap ratios (voltage or phase angle)* d. Minimum and maximum tap position limits e. Number of tap positions (for both the ULTC and NLTC) f. Regulated bus (for voltage regulating transformers)* g. Ratings (normal and emergency)* h. In-service status* 7. Reactive compensation (shunt capacitors and reactors) [TO] a. Admittances (MVars) of each capacitor and reactor b. Regulated voltage band limits* (if mode of operation not fixed) c. Mode of operation (fixed, discrete, continuous, etc.) d. Regulated bus* (if mode of operation not fixed) e. In-service status* 8. Static Var Systems [TO] a. Reactive limits b. Voltage set point* c. Fixed/switched shunt, if applicable d. In-service status* 9. Aggregate Distributed Energy Resource (DER) data[7] [DP, TO][6] a. Location (bus from item 1)	a. parameters, settings, or capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control or information that can be used to infer those items for modeling purposes. b. Indication whether DERs are subject to tripping in conjunction with UFLS or UVLS. 11. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]	

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics**	**short circuit**
b. Real power capability c. DER type (solar, battery, diesel generator, etc.) 10. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]		

Attachment 1 Data Reporting Requirements Footnotes

1. Data specified in the sub-bullets of each column that are required for both steady-state and dynamics are not duplicated in the table.
2. For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Distribution Provider (DP), Generator Owner (GO), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).
3. For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 under Steady State Column that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. (Note: This may be impacted by an aggregation threshold for DER specified under footnote 7.) A Distribution Provider is the typical responsible entity for providing this information, generally through coordination with the Transmission Owner.
4. Generating and storage units include IBRs and synchronous condensers.
5. The Transmission Owner is the typical entity responsible for collecting and providing data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.
6. The Distribution Provider is the typical responsible entity for collecting and providing data for DERs connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider’s system. The Transmission Owner is the typical responsible entity for collecting and providing data for DERs where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner’s system.
7. Aggregation thresholds for DERs may be specified in the joint Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1.

MOD-032 Supporting Document

Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO)

The Unacceptable Models List is maintained separately by NERC as the ERO. This Supporting Document describes the process by which changes may be made to the Unacceptable Models List. This process may only be revised through the NERC Standards Development Process.

The following steps shall be taken to add a model to or remove a model from the Unacceptable Models List:

1. Any person or entity may submit a request to the ERO to add or remove a model from the Unacceptable Models List. This request shall include, at a minimum:
    a. The model name;
    b. Alternative model name(s), if any;
    c. Organization(s) the submitting entity represents;
    d. Description of the model's stated intent;
    e. Request to add model as an "unacceptable" model or remove "unacceptable" model designation;
    f. Technical supporting documentation describing the ability or inability of the model to appropriately represent small and large disturbance behavior;
    g. Identification of any Confidential Information as defined in Section 1500 of the NERC Rules of Procedure; and
    h. An explanation, if any of the above technical support items are unavailable to the submitting entity.
2. ERO staff shall review and evaluate the information in the Unacceptable Models List change request, along with any group or subcommittee of the NERC Reliability and Security Technical Committee, or its successor (RSTC), charged with assisting in such reviews. If no such group or subcommittee has been identified, ERO staff may work with other industry subject matter experts as needed to review and evaluate the request.
3. ERO staff shall provide public notice that identifies the model being considered for addition to or removal from the list, includes a non-confidential summary of the rationale offered, and provides at least 30 days to submit comments.
4. The results of the ERO review and the recommended action shall be presented to the NERC RSTC in a duly noticed public meeting.
5. The NERC RSTC may recommend the NERC Vice President of Engineering and Standards approve the change request, reject the change request, or remand the application back to the ERO to work with the submitting entity. If the NERC RSTC recommends approving

the change request, the NERC RSTC shall also recommend an effective date for the change.

6. The NERC Vice President of Engineering and Standards, considering the recommendation of the NERC RSTC, shall approve the change request, reject the change request, or remand the application back to ERO staff to work with the submitting entity. If approved, the NERC Vice President of Engineering and Standards shall also determine the effective date for the change.
7. The ERO shall provide public notice of a change to the Unacceptable Models List along with the effective date of the change. The revised Unacceptable Models List shall be posted to the NERC website and filed with the applicable governmental authorities for informational purposes.

Version History

Version	Date	Action	Change Tracking
1	February 6, 2014	Adopted by the NERC Board of Trustees.	Developed to consolidate and replace MOD-010-0, MOD -011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1
1	May 1, 2014	FERC Order issued approving MOD-032-1.	See Implementation Plan posted on the Reliability Standards web page for details on enforcement dates for Requirements.
2	TBD	Adopted by the NERC Board of Trustees.	FERC Order No. 901 Revisions by Project 2022-02.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

MOD-032-2 is posted for a 5-day final ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
(The above was Posted under IRPTF SAR pre–Order No. 901)	
30-day formal comment period with initial ballot	April 17 – May 16, 2025
34-day formal comment period with ballot	August 8 –September 10, 2025

Anticipated Actions	Date
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resource (DER): A generator or energy storage technology connected to a distribution system that is capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including one connected behind the meter of an end-use customer that is supplied from a distribution system.

A. Introduction

1. **Title:** Data for Power System Modeling and Analysis

2. **Number:** MOD-032-2

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Balancing Authority

   4.1.2 Distribution Provider

   4.1.3 Generator Owner

   4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

   4.1.5 Resource Planner

   4.1.6 Transmission Owner

   4.1.7 Transmission Planner

   4.1.8 Transmission Service Provider

5. **Effective Date:** See Implementation Plan for Project 2022-02.

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1, including the entity responsible for each required item.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

1.4. Specifications of the following items for dynamic model submissions:

1.4.1. Required submission of:

- standard library models incorporated within the software(s) utilized to create the Interconnection-wide case(s);
- user-defined models; or
- both standard library models and user-defined models.

1.4.2. Where user-defined models are accepted, usability requirements for any submitted user-defined models including, at a minimum, requirements to provide model documentation and instructions for model set up and use.

1.4.2.1. Each Planning Coordinator and Transmission Planner shall provide their user-defined model requirements within 90 calendar days of receiving a written request for such data from other Planning Coordinators and Transmission Planners within the Interconnection.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. If a functional entity is required to provide data for one or more of the following and is unable to gather such data, the functional entity shall provide an estimate of the data, an explanation of the limitations of the estimated data, and the method used for estimation:

- Aggregate DER data; or
- Data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.

2.2. If a functional entity is required to provide dynamic models, the functional entity shall provide the models accepted by the Transmission Planner under MOD-026, where such models are available.

2.3. If a functional entity provides a model that is included on the Unacceptable Models List maintained by the ERO in accordance with the process described in the MOD-032 Supporting Document, the functional entity shall also provide a technical rationale justifying the use of that model.

M2. Each functional entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data, that is responsive to the technical concern.

3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each functional entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. **Compliance Monitoring Process**

   1.1. **Compliance Enforcement Authority:** "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

   1.2. **Evidence Retention:** The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

   The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

   - Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

   If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

   The Compliance Enforcement Authority shall keep the last audit records, and all requested and submitted subsequent audit records.

2. **Compliance Monitoring and Enforcement Program:** Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

3. **Potential Noncompliance (PNC) Abeyance Period:**
   For a period of two years following the phased-in compliance date of Reliability Standard MOD-032-2 Requirement R2 under the associated implementation plan, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C to the Rules of Procedure for a failure to comply with Reliability Standard MOD-032-2 Requirement R2, Part 2.1 with respect to the provision of estimated aggregate DER data or estimated data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes against any entity acting in good faith to comply with the standard in accordance with the relevant implementation plan. "Good faith" in this

context refers to a sincere intention to comply with Reliability Standard MOD-032-2 ~~regarding the provision of aggregate DER data or data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes in accordance with the data requirements and reporting procedures for the Planning Coordinator's planning area developed under Requirement R1, subject to the estimation requirements of~~ Requirement R2, Part 2.1, following a reasonable and serious assessment by the entity in determining how this Reliability Standard should be applied to its particular facts and circumstances. For example, the CEA may not pursue compliance enforcement actions during this period for entities who submit estimated data and include the supporting data explanation and methods used as detailed in Requirement R2 Part 2.1 in a timely manner. The CEA may pursue actions against entities who do not submit data with supporting explanation and methods in a timely manner. Entities shall participate in any compliance monitoring activities undertaken by the CEA during this potential noncompliance abeyance period and submit documentation as requested.

Violation Severity Levels

MOD-032-2 – ATTACHMENT 1
Data Reporting Requirements

The table below indicates the information[1] that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in Interconnection-wide cases. The joint Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1 will specify entity responsibility and data flow processes. The typical functional entity[2] responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The data reported shall be identified by the bus number, name, and/or identifier that is assigned in conjunction with the Planning Coordinator, Transmission Owner, or Transmission Planner.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics**	**short circuit**
1. Each bus [TO] a. Nominal voltage b. Area, zone and owner 2. Aggregate Demand[3] [DP] a. Real and reactive power* b. In-service status* 3. Generating and storage units[4] [GO, TO[5], RP (for future planned resources only)] a. Real power capabilities - gross maximum and minimum values b. Reactive power capabilities - maximum and minimum values at real power capabilities in 3a above c. Station service auxiliary load for normal plant configuration (provide data in the same manner as that required for aggregate Demand under item 2, above). d. Regulated bus* and voltage set point* (as typically provided by the TOP) e. Machine MVA base	1. Generator [GO, RP (for future planned resources only)] 2. Aggregate Demand[3] [DP] 6. Wind plant model (for plants with type 1 and type 2 wind turbines) [GO] 7. Inverter-Based Resource [GO, TO[5]] a. Parameters, settings, or capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control 8. Static Var Systems and FACTS [GO, TO, DP] 9. DC System Models [TO] 10. Aggregate Distributed Energy Resource (DER) data[7] [DP, TO][6]	1. Provide for all applicable elements in column "steady-state" [GO, RP, TO, DP] a. Positive sequence data b. Negative sequence data c. Zero sequence data 2. Mutual Line Impedance Data [TO] 3. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics**	**short circuit**
f. Generator step up transformer data (provide same data as that required for transformer under item 6, below) g. Generator type (hydro, wind, fossil, solar, nuclear, etc.) h. In-service status* 4. AC Transmission Line or Circuit [TO] a. Impedance parameters (positive sequence) b. Susceptance (line charging) c. Ratings (normal and emergency)* d. In-service status* 5. DC Transmission Systems [TO] 6. Transformer (voltage and phase-shifting) [TO] a. Nominal voltages of windings b. Impedance(s) c. Tap ratios (voltage or phase angle)* d. Minimum and maximum tap position limits e. Number of tap positions (for both the ULTC and NLTC) f. Regulated bus (for voltage regulating transformers)* g. Ratings (normal and emergency)* h. In-service status* 7. Reactive compensation (shunt capacitors and reactors) [TO] a. Admittances (MVars) of each capacitor and reactor b. Regulated voltage band limits* (if mode of operation not fixed) c. Mode of operation (fixed, discrete, continuous, etc.) d. Regulated bus* (if mode of operation not fixed) e. In-service status* 8. Static Var Systems [TO] a. Reactive limits b. Voltage set point* c. Fixed/switched shunt, if applicable d. In-service status* 9. Aggregate Distributed Energy Resource (DER) data[7] [DP, TO][6] a. Location (bus from item 1)	a. parameters, settings, or capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control or information that can be used to infer those items for modeling purposes. b. Indication whether DERs are subject to tripping in conjunction with UFLS or UVLS. 11. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]	

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics**	**short circuit**
b. Real power capability c. DER type (solar, battery, diesel generator, etc.) 10. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]		

Attachment 1 Data Reporting Requirements Footnotes

1. Data specified in the sub-bullets of each column that are required for both steady-state and dynamics are not duplicated in the table.
2. For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Distribution Provider (DP), Generator Owner (GO), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).
3. For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 under Steady State Column that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. (Note: This may be impacted by an aggregation threshold for DER specified under footnote 7.) A Distribution Provider is the typical responsible entity for providing this information, generally through coordination with the Transmission Owner.
4. Generating and storage units include IBRs and synchronous condensers.
5. The Transmission Owner is the typical entity responsible for collecting and providing data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.
6. The Distribution Provider is the typical responsible entity for collecting and providing data for DERs connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider's system. The Transmission Owner is the typical responsible entity for collecting and providing data for DERs where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner's system.
7. Aggregation thresholds for DERs may be specified in the joint Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1.

MOD-032 Supporting Document

Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO)

The Unacceptable Models List is maintained separately by NERC as the ERO. This Supporting Document ~~attachment~~ describes the process by which changes may be made to the Unacceptable Models List. This process may only be revised through the NERC Standards Development Process.

The following steps shall be taken to add a model to or remove a model from the Unacceptable Models List:

1. Any person or entity may submit a request to the ERO to add or remove a model from the Unacceptable Models List. This request shall include, at a minimum:
   a. The model name;
   b. Alternative model name(s), if any;
   c. Organization(s) the submitting entity represents;
   d. Description of the model's stated intent;
   e. Request to add model as an "unacceptable" model or remove "unacceptable" model designation;
   f. Technical supporting documentation describing the ability or inability of the model to appropriately represent small and large disturbance behavior;
   g. Identification of any Confidential Information as defined in Section 1500 of the NERC Rules of Procedure; and
   h. An explanation, if any of the above technical support items are unavailable to the submitting entity.
2. ERO staff shall review and evaluate the information in the Unacceptable Models List change request, along with any group or subcommittee of the NERC Reliability and Security Technical Committee, or its successor (RSTC), charged with assisting in such reviews. If no such group or subcommittee has been identified, ERO staff may work with other industry subject matter experts as needed to review and evaluate the request.
3. ERO staff shall provide public notice that identifies the model being considered for addition to or removal from the list, includes a non-confidential summary of the rationale offered, and provides at least 30 days to submit comments.
4. The results of the ERO review and the recommended action shall be presented to the NERC RSTC in a duly noticed public meeting.
5. The NERC RSTC may recommend the NERC Vice President of Engineering and Standards approve the change request, reject the change request, or remand the application back

to the ERO to work with the submitting entity. If the NERC RSTC recommends approving the change request, the NERC RSTC shall also recommend an effective date for the change.

6. The NERC Vice President of Engineering and Standards, considering the recommendation of the NERC RSTC, shall approve the change request, reject the change request, or remand the application back to ERO staff to work with the submitting entity. If approved, the NERC Vice President of Engineering and Standards shall also determine the effective date for the change.
7. The ERO shall provide public notice of a change to the Unacceptable Models List along with the effective date of the change. The revised Unacceptable Models List shall be posted to the NERC website and filed with the applicable governmental authorities for informational purposes.

Version History

Version	Date	Action	Change Tracking
1	February 6, 2014	Adopted by the NERC Board of Trustees.	Developed to consolidate and replace MOD-010-0, MOD -011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1
1	May 1, 2014	FERC Order issued approving MOD-032-1.	See Implementation Plan posted on the Reliability Standards web page for details on enforcement dates for Requirements.
2	TBD	Adopted by the NERC Board of Trustees.	FERC Order No. 901 Revisions by Project 2022-02.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

MOD-032-2 is posted for a 5-day final ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
30-day formal comment period with initial ballot	April 17 – May 16, 2025
34-day formal comment period with ballot	August 8 –September 10, 2025

Anticipated Actions	Date
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resource (DER): A generator or energy storage technology connected to a distribution system that is capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including one connected behind the meter of an end-use customer that is supplied from a distribution system.

A. Introduction

1. **Title:** **Data for Power System Modeling and Analysis**

2. **Number:** **MOD-032-~~1~~2**

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   ~~1.1.~~4.1. Functional Entities:

   ~~1.1.1~~4.1.1 Balancing Authority

   4.1.2 Distribution Provider

   ~~1.1.2~~4.1.3 Generator Owner

   ~~**1.1.3** Load Serving Entity~~

   ~~1.1.4~~4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

   ~~This proposed standard combines "Planning Authority" with "Planning Coordinator" in the list of applicable functional entities. The NERC Functional Model lists "Planning Coordinator" while the registration criteria list "Planning Authority," and they are not yet synchronized. Until that occurs, the proposed standard applies to both Planning Authority and Planning Coordinator.~~

   ~~1.1.5~~4.1.5 Resource Planner

   ~~1.1.6~~4.1.6 Transmission Owner

   ~~1.1.7~~4.1.7 Transmission Planner

   ~~1.1.8~~4.1.8 Transmission Service Provider

5. **Effective Date:** See Implementation Plan for Project 2022-02.

   ~~MOD-032-1, Requirement R1 shall become effective on the first day of the first calendar quarter that is 12 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, MOD-032-1, Requirement R1 shall become effective on the first day of the first calendar quarter that is 12 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

   ~~MOD-032-1, Requirements R2, R3, and R4 shall become effective on the first day of the first calendar quarter that is 24 months after the date that the standard is~~

approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, MOD-032-1, Requirements R2, R3, and R4 shall become effective on the first day of the first calendar quarter that is 24 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

Background:

MOD-032-1 exists in conjunction with MOD-033-1, both of which are related to system-level modeling and validation. Reliability Standard MOD-032-1 is a consolidation and replacement of existing MOD-010-0, MOD-011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1, and it requires data submission by applicable data owners to their respective Transmission Planners and Planning Coordinators to support the Interconnection-wide case building process in their Interconnection. Reliability Standard MOD-033-1 is a new standard, and it requires each Planning Coordinator to implement a documented process to perform model validation within its planning area.

The transition and focus of responsibility upon the Planning Coordinator function in both standards are driven by several recommendations and FERC directives from FERC Order No. 693, which are discussed in greater detail in the rationale sections of the standards. One of the most recent and significant set of recommendations came from the NERC Planning Committee's System Analysis and Modeling Subcommittee (SAMS). SAMS proposed several improvements to the modeling data standards, to include consolidation of the standards (the SAMS whitepaper is available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here: http://www.nerc.com/comm/PC/Agendas%20Highlights%20and%20Minutes%20DL/2012/2012_Dec_PC%20Agenda.pdf).

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1, including the entity responsible for each required item.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

1.4. Specifications of the following items for dynamic model submissions:

1.4.1. Required submission of:

- standard library models incorporated within the software(s) utilized to create the Interconnection-wide case(s);
- user-defined models; or
- both standard library models and user-defined models.

1.4.2. Where user-defined models are accepted, usability requirements for any submitted user-defined models including, at a minimum, requirements to provide model documentation and instructions for model set up and use.

1.4.2.1. Each Planning Coordinator and Transmission Planner shall provide their user-defined model requirements within 90 calendar days of receiving a written request for such data from other Planning Coordinators and Transmission Planners within the Interconnection.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. If a functional entity is required to provide data for one or more of the following and is unable to gather such data, the functional entity shall provide an estimate of the data, an explanation of the limitations of the estimated data, and the method used for estimation;

- Aggregate DER data; or
- Data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.

2.2. If a functional entity is required to provide dynamic models, the functional entity shall provide the models accepted by the Transmission Planner under MOD-026, where such models are available.

2.3. If a functional entity provides a model that is included on the Unacceptable Models List maintained by the ERO in accordance with the process described in the MOD-032 Supporting Document, the functional entity shall also provide a technical rationale justifying the use of that model.

M2. Each ~~registered~~functional entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

~~2.1.~~3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data~~;~~, that is responsive to the technical concern.

~~3.1.~~3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each ~~registered~~functional entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance ~~with~~ as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

2. Compliance Monitoring and ~~Assessment Processes~~ Enforcement Program:
Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for ~~a list of~~performing compliance monitoring and ~~assessment processes~~enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

~~**1.3. Additional Compliance Information**~~

~~None~~

3. Potential Noncompliance (PNC) Abeyance Period:
For a period of two years following the phased-in compliance date of Reliability Standard MOD-032-2 Requirement R2 under the associated implementation plan, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C to the Rules of Procedure for a failure to comply with Reliability Standard MOD-032-2 Requirement R2, Part 2.1 with respect to the provision of estimated aggregate DER data or

estimated data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes against any entity acting in good faith to comply with the standard in accordance with the relevant implementation plan. “Good faith” in this context refers to a sincere intention to comply with Reliability Standard MOD-032-2 ~~regarding the provision of aggregate DER data or data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes in accordance with the data requirements and reporting procedures for the Planning Coordinator’s planning area developed under Requirement R1, subject to the estimation requirements of~~ Requirement R2, Part 2.1, following a reasonable and serious assessment by the entity in determining how this Reliability Standard should be applied to its particular facts and circumstances. For example, the CEA may not pursue compliance enforcement actions during this period for entities who submit estimated data and include the supporting data explanation and methods used as detailed in Requirement R2 Part 2.1 in a timely manner. The CEA may pursue actions against entities who do not submit data with supporting explanation and methods in a timely manner. Entities shall participate in any compliance monitoring activities undertaken by the CEA during this potential noncompliance abeyance period and submit documentation as requested.

~~Table of Compliance Elements~~

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include less than or equal to 25% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 25%, but less than or equal to 50% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 50%, but less than or equal to 75% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) ~~Coordinator~~ did not develop any steady-state, dynamics, and short circuit modeling data requirements and reporting procedures required by Requirement R1; OR The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 75% of the required components specified in Requirement R1.

R2.	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide less than or equal to 25% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but less than or equal to 25% of	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 25%, but less than or equal to 50% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 50%, but less than or equal to 75% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider did not provide any steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s); OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 75% of the required data specified in Attachment 1;

	the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in less than or equal to 15 calendar days after the specified date.	greater than 25%, but less than or equal to 50% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 15, but less than or equal to 30 calendar days after the specified date.	greater than 50%, but less than or equal to 75% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 30, but less than or equal to 45 calendar days after the specified date.	OR The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 75% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner, ~~Load Serving Entity,~~ Resource Planner, Transmission Owner or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its

				Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 45 calendar days after the specified date.
R3.	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement ~~R4~~R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement ~~R4~~R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement ~~R4~~R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response	The Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement ~~R4~~R3 within 135 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).

	within 105 calendar days (or within 15 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	within greater than 105 calendar days, but less than or equal to 120 calendar days (or within greater than 15 calendar days, but less than or equal to 30 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	within greater than 120 calendar days, but less than or equal to 135 calendar days (or within greater than 30 calendar days, but less than or equal to 45 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	
R4.	The Planning Coordinator made available the required data to the ERO or its designee, but failed to provide less than or equal to 25% of the required data in the format specified by the ERO or its designee. MOD-032-2 – ATTACHMENT 1~~:~~

Data Reporting Requirements

The table below indicates the information[1] that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in ~~*the*~~ Interconnection-wide cases. ~~*A*~~The joint Planning Coordinator ~~*may*~~/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1 will specify ~~*additional information that includes specific information required for each item in the table below. Each*~~entity responsibility and data flow processes. The typical functional *entity*~~[1]~~[2] responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The data reported shall be ~~*as*~~ identified by the bus number, name, and/or identifier that is assigned in conjunction with the ~~*PC, TO*~~Planning Coordinator, Transmission Owner, or ~~*TP.*~~ Transmission Planner.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** ~~*(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*~~	**short circuit**
1. Each bus [TO] a. ~~n~~Nominal voltage b. ~~a~~Area, zone and owner 2. Aggregate Demand~~[3]~~[2] [~~LSE~~DP] a. ~~r~~Real and reactive power* b. ~~i~~In-service status*	1. ~~Guidelines and Technical Basis~~

~~For purposes of jointly developing steady-state, dynamics, and short circuit modeling data requirements and reporting procedures under Requirement R1, if a Transmission Planner (TP) and Planning Coordinator (PC) mutually agree, a TP may collect and aggregate some or all data from providing entities, and the TP may then provide that data directly to the PC(s) on behalf of the providing entities. The submitting entities are responsible for getting the data to both the TP and the PC, but nothing precludes them from arriving at mutual agreements for them to provide it to the TP, who then provides it to the PC. Such agreement does not relieve the submitting entity from responsibility under the standard, nor does it make the consolidating entity liable for the submitting entities' compliance under the standard (in essence, nothing precludes parties from agreeing to consolidate or act as a conduit to pass the data, and it is in fact encouraged in certain circumstances, but the requirement is aimed at the act of submitting the data). Notably, there is no requirement for the TP to provide data to the PC. The intent, in part, is to address potential concerns from entities that they would otherwise be responsible for the quality, nature, and sufficiency of the data provided by other entities.~~

~~The requirement in Part 1.3 to include specifications for distribution or posting of the data requirements and reporting procedures could be accomplished in many ways, to include posting on a Web site, distributing directly, or through other methods that the Planning Coordinator and each of its Transmission Planners develop.~~

~~An entity submitting data per the requirements of this standard who needs to determine the PC for the area, as a starting point, should contact the local Transmission Owner (TO) for information on the TO's PC. Typically, the PC will be the same for both the local TO and those entities connected to the TO's system. If this is not the case, the local TO's PC can typically provide contact information on other PCs in the area. If the entity (e.g., a Generator Owner [GO]) is requesting connection of a new generator, the entity can determine who the PC is for that area at the time a generator connection request is submitted. Often the TO and PC are the same entity, or the TO can provide information on contacting the PC. The entity should specify as the reason for the request to the TO that the entity needs to provide data to the PC according to this standard. Nothing in the proposed requirement language of this standard is intended to preclude coordination between entities such that one entity, serving only as a conduit, provides the other entity's data to the PC. This can be accomplished if it is mutually agreeable by, for example, the GO (or other entity), TP, and the PC. This does not, however, relieve the original entity from its obligations under the standard to provide data, nor does it pass on the compliance obligation of the entity. The original entity is still accountable for making sure that the data has been provided to the PC according to the requirements of this standard.~~

~~The standard language recognizes that differences exist among the Interconnections. Presently, the Eastern/Quebec and Texas Interconnections build seasonal cases on an annual basis, while the Western Interconnection builds cases on a continuous basis throughout the year. The intent of the standard is not to change established processes and procedures in each of the Interconnections, but to create a framework to support both what is already in place or what it may transition into in the future, and~~

~~to provide further guidance in a common platform for the collection of data that is necessary for the building of the Interconnection-wide case(s).~~

~~The construct that these standards replace did not specifically list which Functional Entities were required to provide specific data. Attachment 1 specifically identifies the entities responsible for the data required for the building of the Interconnection-wide case(s).~~

~~Rationale:~~

~~During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.~~

~~Rationale for R1:~~

~~This requirement consolidates the concepts from the original data requirements from MOD-011-0, Requirement R1, and MOD-013-0, Requirement R1. The original requirements specified types of steady-state and dynamics data necessary to model and analyze the steady-state conditions and dynamic behavior or response within each Interconnection. The original requirements, however, did not account for the collection of short-circuit data also required to perform short-circuit studies. The addition of short-circuit data also addresses the outstanding directive from FERC Order No. 890, paragraph 290.~~

~~In developing a performance-based standard that would address the data requirements and reporting procedures for model data, it was prohibitively difficult to account for all of the detailed technical concerns associated with the preparation and submittal of model data given that many of these concerns are dependent upon evolving industry modeling needs and software vendor terminology and product capabilities.~~

~~This requirement establishes the Planning Coordinator jointly with its Transmission Planners as the developers of technical model data requirements and reporting procedures to be followed by the data owners in the Planning Coordinator's planning area. FERC Order No. 693, paragraphs 1155 and 1162, also direct that the standard apply to Planning Coordinators. The inclusion of Transmission Planners in the applicability section is intended to ensure that the Transmission Planners are able to participate jointly in the development of the data requirements and reporting procedures.~~

~~This requirement is also consistent with the recommendations from the NERC System Analysis and Modeling Subcommittee (SAMS) White Paper titled "Proposed Improvements for NERC MOD Standards", available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here:~~

Aside from recommendations in support of strengthening and improving MOD-010 through MOD-015, the SAMS paper included the following suggested improvements:

1) reduce the quantity of MOD standards;
2) add short circuit data as a requirement to the MOD standards; and
3) supply data and models:
    a. add requirement identifying who provides and who receives data;
    b. identify acceptability;
    c. standard format;
    d. how to deal with new technologies (user written models if no standard model exists); and
    e. shareability.
4) These suggested improvements are addressed by combining the existing standards into two new standards, one standard for the submission and collection of data, and one for the validation of the planning models. Adding the requirement for the submittal of short circuit data is also an improvement from the existing standards, consistent with FERC Order No. 890, paragraph 290. In supplying data, the approach clearly identifies what data is required and which Functional Entity is required to provide the data.
5) The requirement uses an attachment approach to support data collection. The attachment specifically lists the entities that are required to provide each type of data and the steady-state, dynamics, and short circuit data that is required.
6) Finally, the decision to combine steady-state, dynamics, and short circuit data requirements into one requirement rather than three reflects that they all support the requirement of submission of data in general.

Rationale for R2:

This requirement satisfies the directive from FERC Order No. 693, paragraph 1155, which directs that "the planning authority should be included in this Reliability Standard because the planning authority is the entity responsible for the coordination and integration of transmission facilities and resource plans, as well as one of the entities responsible for the integrity and consistency of the data."

Rationale for R3:

In order to maintain a certain level of accuracy in the representation of a power system, the data that is submitted must be correct, periodically checked, and updated. Data used to perform steady-state, dynamics, and short circuit studies can change, for example, as a result of new planned transmission construction (in comparison to as-built information) or changes performed during the restoration of the transmission network due to weather-related events. One set of data that changes on a more frequent basis is load data, and updates to load data are needed when new improved forecasts are created.

~~This requirement provides a mechanism for the Planning Coordinator and Transmission Planner (that does not exist in the current standards) to collect corrected data from the entities that have the data. It provides a feedback loop to address technical concerns related to the data when the Planning Coordinator or Transmission Planner identifies technical concerns, such as concerns about the usability of data or simply that the data is not in the correct format and cannot be used. The requirement also establishes a time-frame for response to address timeliness.~~

~~Rationale for R4:~~

~~This requirement will replace MOD-014 and MOD-015.~~

~~This requirement recognizes the differences among Interconnections in model building processes, and it creates an obligation for Planning Coordinators to make available data for its planning area.~~

~~The requirement creates a clear expectation that Planning Coordinators will make available data that they collect under Requirement R2 in support of their respective Interconnection-wide case(s). While different entities in each Interconnection create the Interconnection-wide case(s), the requirement to submit the data to the "ERO or its designee" supports a framework whereby NERC, in collaboration and agreement with those other organizations, can designate the appropriate organizations in each Interconnection to build the specific Interconnection-wide case(s). It does not prescribe a specific group or process to build the larger Interconnection-wide case(s), but only requires the Planning Coordinators to make available data in support of their creation, consistent with the SAMS Proposed Improvements to NERC MOD Standards (at page 3) that, "industry best practices and existing processes should be considered in the development of requirements, *as many entities are successfully coordinating their efforts.*" (Emphasis added).~~

~~This requirement is about the Planning Coordinator's obligation to make information available for use in the Interconnection-wide case(s); it is not a requirement to build the Interconnection-wide case(s).~~

~~For example, under current practice, the Eastern Interconnection Reliability Assessment Group (ERAG) builds the Eastern Interconnection and Quebec Interconnection-wide cases, the Western Electricity Coordinating Council (WECC) builds the Western Interconnection-wide cases, and the Electric Reliability Council of Texas (ERCOT) builds the Texas Interconnection-wide cases. This requirement does not require a change to that construct, and, assuming continued agreement by those organizations, ERAG, WECC, and ERCOT could be the "designee" for each Interconnection contemplated by this requirement. Similarly, the requirement does not prohibit transition, and the requirement remains for the Planning Coordinators to make available the information to the ERO or to whomever the ERO has coordinated with and designated as the recipient of such information for purposes of creation of each of the Interconnection–wide cases.~~

Attachment 1 Data Reporting Requirements Footnotes

1. Data specified in the sub-bullets of each column that are required for both steady-state and dynamics are not duplicated in the table.
2. For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Distribution Provider (DP), Generator Owner (GO), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).
3. For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 under Steady State Column that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. (Note: This may be impacted by an aggregation threshold for DER specified under footnote 7.) A Distribution Provider is the typical responsible entity for providing this information, generally through coordination with the Transmission Owner.
4. Generating and storage units include IBRs, and synchronous condensers.
5. The Transmission Owner is the typical entity responsible for collecting and providing data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.
6. The Distribution Provider is the typical responsible entity for collecting and providing data for DERs connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider's system. The Transmission Owner is the typical responsible entity for collecting and providing data for DERs where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner's system.
7. Aggregation thresholds for DERs may be specified in the joint Planning Coordinator/Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1.

MOD-032 Supporting Document

Process for Updating the Unacceptable Models List Maintained by the Electric Reliability Organization (ERO)

The Unacceptable Models List is maintained separately by NERC as the ERO. This Supporting Document describes the process by which changes may be made to the Unacceptable Models List. This process may only be revised through the NERC Standards Development Process.

The following steps shall be taken to add a model to or remove a model from the Unacceptable Models List:

1. Any person or entity may submit a request to the ERO to add or remove a model from the Unacceptable Models List. This request shall include, at a minimum:
   a. The model name;
   b. Alternative model name(s), if any;
   c. Organization(s) the submitting entity represents;
   d. Description of the model's stated intent;
   e. Request to add model as an "unacceptable" model or remove "unacceptable" model designation;
   f. Technical supporting documentation describing the ability or inability of the model to appropriately represent small and large disturbance behavior;
   g. Identification of any Confidential Information as defined in Section 1500 of the NERC Rules of Procedure; and
   h. An explanation, if any of the above technical support items are unavailable to the submitting entity.
2. ERO staff shall review and evaluate the information in the Unacceptable Models List change request, along with any group or subcommittee of the NERC Reliability and Security Technical Committee, or its successor (RSTC), charged with assisting in such reviews. If no such group or subcommittee has been identified, ERO staff may work with other industry subject matter experts as needed to review and evaluate the request.
3. ERO staff shall provide public notice that identifies the model being considered for addition to or removal from the list, includes a non-confidential summary of the rationale offered, and provides at least 30 days to submit comments.
4. The results of the ERO review and the recommended action shall be presented to the NERC RSTC in a duly noticed public meeting.

5. The NERC RSTC may recommend the NERC Vice President of Engineering and Standards approve the change request, reject the change request, or remand the application back to the ERO to work with the submitting entity. If the NERC RSTC recommends approving the change request, the NERC RSTC shall also recommend an effective date for the change.
6. The NERC Vice President of Engineering and Standards, considering the recommendation of the NERC RSTC, shall approve the change request, reject the change request, or remand the application back to ERO staff to work with the submitting entity. If approved, the NERC Vice President of Engineering and Standards shall also determine the effective date for the change.
7. The ERO shall provide public notice of a change to the Unacceptable Models List along with the effective date of the change. The revised Unacceptable Models List shall be posted to the NERC website and filed with the applicable governmental authorities for informational purposes.

Version History

Version	Date	Action	Change Tracking
1	February 6, 2014	Adopted by the NERC Board of Trustees.	Developed to consolidate and replace MOD-010-0, MOD -011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1
1	May 1, 2014	FERC Order issued approving MOD-032-1.	See Implementation Plan posted on the Reliability Standards web page for details on enforcement dates for Requirements.
2	TBD	Adopted by the NERC Board of Trustees.	FERC Order No. 901 Revisions by Project 2022-02.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

IRO-010-6 is posted for a 5-day ballot period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
30-day formal comment period with initial ballot	April 17 – May 16, 2025
25-day formal comment period with ballot	August 8 –September 10, 2025

Anticipated Actions	Date
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

A. Introduction

1. **Title:** Reliability Coordinator Data and information Specification and Collection
2. **Number:** IRO-010-6
3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact reliability, by ensuring each Reliability Coordinator has the data and information it needs to plan, monitor and assess the operation of its Reliability Coordinator Area.
4. **Applicability:**
   - **4.1.** Reliability Coordinator
   - **4.2.** Balancing Authority
   - **4.3.** Generator Owner
   - **4.4.** Generator Operator
   - **4.5.** Transmission Operator
   - **4.6.** Transmission Owner
   - **4.7.** Distribution Provider
5. **Effective Date:** See Implementation Plan for Project 2022-02.

B. Requirements

R1. The Reliability Coordinator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include, but not be limited to: *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments, as deemed necessary by the Reliability Coordinator, including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1 Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints.

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide data and information that includes, but is not limited to:

1.5.1 Specific deadlines or periodicity in which data and information is to be provided;

1.5.2 Performance criteria for the availability and accuracy of data and information, as applicable;

1.5.3 Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operations purposes, as applicable;

1.5.4 Provisions to update or correct data and information, as applicable or necessary;

1.5.5 A mutually agreeable format; and

1.5.6 A mutually agreeable method(s) for securely transferring data and information.

M1. The Reliability Coordinator shall make available its dated, current, in force documented specification(s) for data and information.

R2. The Reliability Coordinator shall distribute its data and information specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

M2. The Reliability Coordinator shall make available evidence that it has distributed its specification(s) to entities that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. This evidence could include, but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or email records.

R3. Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall satisfy the obligations of the documented specifications. *(Violation Risk Factor: Medium) (Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations)*

M3. The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall make available evidence that it satisfied the obligations of the documented specification using the specified criteria. Such evidence could include, but is not limited to electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain its dated, current, in force documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R1, Measure M1 as well as any documents in force since the last compliance audit.
- The Reliability Coordinator shall keep evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R2 and Measure M2.
- Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R3 and Measurement M3.

1.3. Compliance Monitoring and Enforcement Program:
"Compliance Monitoring and Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower	Moderate	High	Severe
R1	The Reliability Coordinator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Reliability Coordinator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
For the Requirement R2 VSLs only, the intent of the drafting team is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				

R#	Violation Severity Levels			
	Lower	Moderate	High	Severe
R2	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, and Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to four or more entities, or more than 15% of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R3	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications, but failed to meet one of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications, but failed to meet two of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications, but failed to meet any of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 did not satisfy the obligations of the documented specifications.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

IRO-010-6 is posted for a 5-day ballot period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
30-day formal comment period with initial ballot	April 17 – May 16, 2025
25-day formal comment period with ballot	August 8 –September 10, 2025

Anticipated Actions	Date
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

A. Introduction

1. **Title:** Reliability Coordinator Data and information Specification and Collection
2. **Number:** IRO-010-6
3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact reliability, by ensuring each Reliability Coordinator has the data and information it needs to plan, monitor and assess the operation of its Reliability Coordinator Area.
4. **Applicability:**
   - **4.1.** Reliability Coordinator
   - **4.2.** Balancing Authority
   - **4.3.** Generator Owner
   - **4.4.** Generator Operator
   - **4.5.** Transmission Operator
   - **4.6.** Transmission Owner
   - **4.7.** Distribution Provider
5. **Effective Date:** See Implementation Plan for Project 2022-02.

B. Requirements

R1. The Reliability Coordinator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include, but not be limited to: *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments, as deemed necessary by the Reliability Coordinator, including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification ~~as deemed necessary by the Reliability Coordinator~~.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1 Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints.

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide data and information that includes, but is not limited to:

1.5.1 Specific deadlines or periodicity in which data and information is to be provided;

1.5.2 Performance criteria for the availability and accuracy of data and information, as applicable;

1.5.3 Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operations purposes, as applicable;

1.5.4 Provisions to update or correct data and information, as applicable or necessary;

1.5.5 A mutually agreeable format; and

1.5.6 A mutually agreeable method(s) for securely transferring data and information.

M1. The Reliability Coordinator shall make available its dated, current, in force documented specification(s) for data and information.

R2. The Reliability Coordinator shall distribute its data and information specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

M2. The Reliability Coordinator shall make available evidence that it has distributed its specification(s) to entities that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. This evidence could include, but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or email records.

R3. Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall satisfy the obligations of the documented specifications. *(Violation Risk Factor: Medium) (Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations)*

M3. The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall make available evidence that it satisfied the obligations of the documented specification using the specified criteria. Such evidence could include, but is not limited to electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain its dated, current, in force documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R1, Measure M1 as well as any documents in force since the last compliance audit.
- The Reliability Coordinator shall keep evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R2 and Measure M2.
- Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R3 and Measurement M3.

1.3. Compliance Monitoring and Enforcement Program:
"Compliance Monitoring and Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower	Moderate	High	Severe
R1	The Reliability Coordinator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Reliability Coordinator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
For the Requirement R2 VSLs only, the intent of the drafting team is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				

R#	Violation Severity Levels			
	Lower	Moderate	High	Severe
R2	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, and Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to four or more entities, or more than 15% of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R3	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications, but failed to meet one of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications, but failed to meet two of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications, but failed to meet any of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 did not satisfy the obligations of the documented specifications.

D. Regional Variances

None.

E. Interpretations

None.

Description of Current Draft

IRO-010-6 is posted for a 5-day final ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
30-day formal comment period with initial ballot	April 17 – May 16, 2025
34-day formal comment period with ballot	August 8 –September 10, 2025

Anticipated Actions	Date
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

A. Introduction

1. **Title:** Reliability Coordinator Data and information Specification and Collection

2. **Number:** IRO-010-~~5~~6

3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact reliability, by ensuring each Reliability Coordinator has the data and information it needs to plan, monitor and assess the operation of its Reliability Coordinator Area.

4. **Applicability:**

   4.1. Reliability Coordinator

   4.2. Balancing Authority

   4.3. Generator Owner

   4.4. Generator Operator

   4.5. Transmission Operator

   4.6. Transmission Owner

   4.7. Distribution Provider

5. **Effective Date:** See Implementation Plan for Project ~~2021-06.~~2022-02.

B. Requirements

R1. The Reliability Coordinator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include but not be limited to: *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments, as deemed necessary by the Reliability Coordinator, including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification ~~as deemed necessary by the Reliability Coordinator~~.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1 Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints.

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide data and information that includes, but is not limited to ~~.~~:

1.5.1 Specific deadlines or periodicity in which data and information is to be provided;

1.5.2 Performance criteria for the availability and accuracy of data and information, as applicable;

1.5.3 Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operations purposes, as applicable;

~~**1.5.3**~~**1.5.4** Provisions to update or correct data and information, as applicable or necessary ~~.~~;

~~1.5.4~~1.5.5 A mutually agreeable format~~.~~; and

~~1.5.5~~1.5.6 A mutually agreeable method(s) for securely transferring data and information.

M1. The Reliability Coordinator shall make available its dated, current, in force documented specification(s) for data and information.

R2. The Reliability Coordinator shall distribute its data and information specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

M2. The Reliability Coordinator shall make available evidence that it has distributed its specification(s) to entities that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. This evidence could include, but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or ~~e-mail~~email records.

R3. Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall satisfy the obligations of the documented specifications. *(Violation Risk Factor: Medium) (Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations)*

M3. The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, ~~Reliability Coordinator,~~ Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall make available evidence that it satisfied the obligations of the documented specification using the specified criteria. Such evidence could include, but is not limited to electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" ~~(CEA)~~ means NERC or the Regional Entity~~, or any entity as otherwise designated by an Applicable Governmental Authority,~~ in their respective roles of monitoring and~~/or~~ enforcing compliance with the ~~mandatory and enforceable~~NERC Reliability Standards ~~in their respective jurisdictions~~.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the ~~CEA~~Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain its dated, current, in force documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R1, Measure M1 as well as any documents in force since the last compliance audit.
- The Reliability Coordinator shall keep evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R2~~,~~ and Measure M2.
- Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R3 and Measurement M3.

1.3. Compliance Monitoring and Enforcement Program:
~~As defined in the NERC Rules of Procedure,~~ "Compliance Monitoring and Enforcement Program" ~~refers~~or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the ~~identification~~NERC Rules of Procedure) or the Commission-approved program of ~~the processes~~a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that ~~will be used to evaluate data or~~

~~information~~is responsible for ~~the purpose of assessing performance or outcomes~~performing compliance monitoring and enforcement activities with ~~the associated reliability standard~~respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower	Moderate	High	Severe
R1.	The Reliability Coordinator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Reliability Coordinator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
For the Requirement R2 VSLs only, the intent of the ~~SDT~~DT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				

R#	Violation Severity Levels			
	Lower	Moderate	High	Severe
R2.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, and Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to four or more entities, or more than 15% of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R3.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet one of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet two of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet any of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 did not satisfy the obligations of the documented specification.

Board adoption	October 14, 2025

A. Introduction

1. **Title:** Transmission Operator and Balancing Authority Data and Information Specification and Collection

2. **Number:** TOP-003-8

3. **Purpose:** To ensure that each Transmission Operator and Balancing Authority has the data and information it needs to plan, monitor, and assess the operation of its Transmission Operator Area or Balancing Authority Area.

4. **Applicability:**

   4.1 Functional Entities:

   4.1.1 Transmission Operator

   4.1.2 Balancing Authority

   4.1.3 Generator Owner

   4.1.4 Generator Operator

   4.1.5 Transmission Owner

   4.1.6 Distribution Provider

5. **Effective Date:** See Implementation Plan for Project 2022-02.

B. Requirements and Measures

R1. Each Transmission Operator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments, as deemed necessary by the Transmission Operator, including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1. Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide the data and information that includes, but is not limited to:

1.5.1. Specified deadlines or periodicity in which data and information is to be provided;

1.5.2. Performance criteria for the availability and accuracy of data and information as applicable;

1.5.3. Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operations purposes, as applicable;

1.5.4. Provisions to update or correct data and information, as applicable or

necessary;

1.5.5. A mutually agreeable format;

1.5.6. Mutually agreeable method(s) for securely transferring data and information.

M1. Each Transmission Operator shall make available its dated, current, in force documented specification(s) for data and information.

R2. Each Balancing Authority shall maintain documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. The data specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

2.1. A list of data and information needed by the Balancing Authority to support its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments, as deemed necessary by the Balancing Authority, including non-Bulk Electric System data and information, IBR-specific data and parameters, and external network data and information, and identification of the entity responsible for responding to the specification.

2.2. Provisions for notification of current Protection System and Remedial Action Scheme status or degradation that impacts System reliability.

2.3. Provisions for notification of BES generating unit(s) status during local forecasted cold weather to include:

2.3.1. Operating limitations based on:

2.3.1.1. capability and availability;

2.3.1.2. fuel supply and inventory concerns;

2.3.1.3. fuel switching capabilities; and

2.3.1.4. environmental constraints.

2.3.2. Generating unit(s) minimum:

2.3.2.1. design temperature; or

2.3.2.2. historical operating temperature; or

2.3.2.3. current cold weather performance temperature determined by an engineering analysis.

2.4. Identification of a mutually agreeable process in resolving conflicts;

2.5. Methods for the entity identified in Part 2.1 to provide data and information that includes, but is not limited to:

2.5.1. Specific deadlines or periodicity in which data and information is to be provided;

2.5.2. Performance criteria for the availability and accuracy of data and information, as applicable;

2.5.3. Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operations purposes, as applicable;

2.5.4. Provisions to update or correct data and information, as applicable or necessary.

2.5.5. A mutually agreeable format.

2.5.6. A mutually agreeable method(s) for securely transferring data and information.

M2. Each Balancing Authority shall make available its dated, current, in force documented specification(s) for data and information.

R3. Each Transmission Operator shall distribute its data and information specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M3. Each Transmission Operator shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or email records.

R4. Each Balancing Authority shall distribute its data and information specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. Each Balancing Authority shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, or email records.

R5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a data and information specification(s) in Requirement R3 or R4 shall satisfy the obligations of the documented specifications. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator

Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall make available evidence that it has satisfied the obligations of the documented specification. Such evidence could include, but is not limited to, electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority (CEA) may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Transmission Operator shall retain its dated, current, in force, documented specification for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R1 and Measurement M1 as well as any documents in force since the last compliance audit.
- Each Balancing Authority shall retain its dated, current, in force, documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R2 and Measurement M2, as well as any documents in force since the last compliance audit.
- Each Transmission Operator shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R3 and Measurement M3.
- Each Balancing Authority shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R4 and Measurement M4.
- Each Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R5 and Measurement M5.

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Transmission Operator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Transmission Operator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R2	The Balancing Authority did not include two or fewer of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include three of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include four of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include any of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. OR, The Balancing Authority did not have a documented specification(s) for the data and information necessary for it to perform its analysis functions,

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				Real-time monitoring, and Near-Term Energy Reliability Assessments.
For the Requirement R3 and R4 VSLs only, the intent of the drafting team is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				
R3	The Transmission Operator did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R4	The Balancing Authority did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term	The Balancing Authority did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time	The Balancing Authority did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability	The Balancing Authority did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
	Energy Reliability Assessments.	monitoring, and Near-Term Energy Reliability Assessments.	Assessments.	
R5	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet one of the parts in Requirement R1, Part1.5 or Requirement R2, Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet two of the parts in Requirement R1, Part 1.5 or Requirement R2, Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet three or more of the parts in Requirement R1, Part 1.5 or Requirement R2, Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 did not satisfy the obligations of the documented specifications.

5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

A. Introduction

1. **Title:** Transmission Operator and Balancing Authority Data and Information Specification and Collection
2. **Number:** TOP-003-8
3. **Purpose:** To ensure that each Transmission Operator and Balancing Authority has the data and information it needs to plan, monitor, and assess the operation of its Transmission Operator Area or Balancing Authority Area.
4. **Applicability:**
   - **4.1** Functional Entities:
     - **4.1.1** Transmission Operator
     - **4.1.2** Balancing Authority
     - **4.1.3** Generator Owner
     - **4.1.4** Generator Operator
     - **4.1.5** Transmission Owner
     - **4.1.6** Distribution Provider
5. **Effective Date:** See Implementation Plan for Project 2022-02.

B. Requirements and Measures

R1. Each Transmission Operator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments, as deemed necessary by the Transmission Operator, including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification ~~as deemed necessary by the Transmission Operator~~.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1. Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide the data and information that includes, ~~at a minimum,~~ but is not limited to~~the following~~:

1.5.1. Specified deadlines or periodicity in which data and information is to be provided;

1.5.2. Performance criteria for the availability and accuracy of data and information as applicable;

1.5.3. Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operations purposes, as applicable;

1.5.4. Provisions to update or correct data and information, as applicable or necessary;

1.5.5. A mutually agreeable format;

1.5.6. Mutually agreeable method(s) for securely transferring data and information.

M1. Each Transmission Operator shall make available its dated, current, in force documented specification(s) for data and information.

R2. Each Balancing Authority shall maintain documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. The data specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

2.1. A list of data and information needed by the Balancing Authority to support its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments, as deemed necessary by the Balancing Authority, including non-Bulk Electric System data and information, IBR-specific data and parameters, and external network data and information~~, as deemed necessary by the Balancing Authority~~, and identification of the entity responsible for responding to the specification.

2.2. Provisions for notification of current Protection System and Remedial Action Scheme status or degradation that impacts System reliability.

2.3. Provisions for notification of BES generating unit(s) status during local forecasted cold weather to include:

2.3.1. Operating limitations based on:

2.3.1.1. capability and availability;

2.3.1.2. fuel supply and inventory concerns;

2.3.1.3. fuel switching capabilities; and

2.3.1.4. environmental constraints.

2.3.2. Generating unit(s) minimum:

2.3.2.1. design temperature; or

2.3.2.2. historical operating temperature; or

2.3.2.3. current cold weather performance temperature determined by an engineering analysis.

2.4. Identification of a mutually agreeable process in resolving conflicts;

2.5. Methods for the entity identified in Part 2.1 to provide data and information that includes~~, at a minimum the following~~but is not limited to:

2.5.1. Specific deadlines or periodicity in which data and information is to be provided;

2.5.2. Performance criteria for the availability and accuracy of data and information, as applicable;

2.5.3. Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operations purposes, as applicable;

2.5.4. Provisions to update or correct data and information, as applicable or necessary.

2.5.5. A mutually agreeable format.

2.5.6. A mutually agreeable method(s) for securely transferring data and information.

M2. Each Balancing Authority shall make available its dated, current, in force documented specification(s) for data and information.

R3. Each Transmission Operator shall distribute its data and information specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M3. Each Transmission Operator shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or email records.

R4. Each Balancing Authority shall distribute its data and information specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. Each Balancing Authority shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, or email records.

R5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a data and information specification(s) in Requirement R3 or R4 shall satisfy the obligations of the documented specifications. *[Violation Risk Factor: Medium] [Time Horizon: Operations*

Planning, Same-Day Operations, Real-time Operations]

M5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall make available evidence that it has satisfied the obligations of the documented specification. Such evidence could include, but is not limited to, electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority (CEA) may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Transmission Operator shall retain its dated, current, in force, documented specification for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R1 and Measurement M1 as well as any documents in force since the last compliance audit.
- Each Balancing Authority shall retain its dated, current, in force, documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R2 and Measurement M2, as well as any documents in force since the last compliance audit.
- Each Transmission Operator shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R3 and Measurement M3.
- Each Balancing Authority shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R4 and Measurement M4.
- Each Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of

the documented specifications in accordance with Requirement R5 and Measurement M5.

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Transmission Operator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Transmission Operator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R2	The Balancing Authority did not include two or fewer of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include three of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include four of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include any of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. OR, The Balancing Authority did not have a documented specification(s) for the data and information necessary for it to perform its analysis functions,

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				Real-time monitoring, and Near-Term Energy Reliability Assessments.
For the Requirement R3 and R4 VSLs only, the intent of the drafting team is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				
R3	The Transmission Operator did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R4	The Balancing Authority did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term	The Balancing Authority did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time	The Balancing Authority did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability	The Balancing Authority did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
	Energy Reliability Assessments.	monitoring, and Near-Term Energy Reliability Assessments.	Assessments.	
R5	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet one of the parts in Requirement R1, Part1.5 or Requirement R2, Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet two of the parts in Requirement R1, Part 1.5 or Requirement R2, Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet three or more of the parts in Requirement R1, Part 1.5 or Requirement R2, Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 did not satisfy the obligations of the documented specifications.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

TOP-003-8 is posted for a 5-day final ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
30-day formal comment period with initial ballot	April 17 – May 16, 2025
34-day formal comment period with ballot	August 8 –September 10, 2025

Anticipated Actions	Date
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

A. Introduction

1. **Title:** Transmission Operator and Balancing Authority Data and Information Specification and Collection

2. **Number:** TOP-003-~~7~~8

3. **Purpose:** To ensure that each Transmission Operator and Balancing Authority has the data and information it needs to plan, monitor, and assess the operation of its Transmission Operator Area or Balancing Authority Area.

4. **Applicability:**

   4.1 Functional Entities:

   4.1.1 Transmission Operator

   4.1.2 Balancing Authority

   4.1.3 Generator Owner

   4.1.4 Generator Operator

   4.1.5 Transmission Owner

   4.1.6 Distribution Provider

5. **Effective Date:** See Implementation Plan for Project 2022-~~03~~02.

B. Requirements and Measures

R1. Each Transmission Operator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments, as deemed necessary by the Transmission Operator, including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification ~~as deemed necessary by the Transmission Operator~~.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1. Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide the data and information that includes, at a minimum, the following~~.~~:

1.5.1. Specified deadlines or periodicity in which data and information is to be provided;

1.5.2. Performance criteria for the availability and accuracy of data and information as applicable;

1.5.3. Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operations purposes, as applicable;

~~1.5.3.~~**1.5.4.** Provisions to update or correct data and information, as applicable

or necessary;

~~1.5.4.~~1.5.5. A mutually agreeable format;

~~1.5.5.~~1.5.6. Mutually agreeable method(s) for securely transferring data and information.

M1. Each Transmission Operator shall make available its dated, current, in force documented specification(s) for data and information.

R2. Each Balancing Authority shall maintain documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. The data specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

2.1. A list of data and information needed by the Balancing Authority to support its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments, as deemed necessary by the Balancing Authority, including non-Bulk Electric System data and information, IBR-specific data and parameters, and external network data and information, ~~as deemed necessary by the Balancing Authority,~~ and identification of the entity responsible for responding to the specification.

2.2. Provisions for notification of current Protection System and Remedial Action Scheme status or degradation that impacts System reliability.

2.3. Provisions for notification of BES generating unit(s) status during local forecasted cold weather to include:

2.3.1. Operating limitations based on:

2.3.1.1. capability and availability;

2.3.1.2. fuel supply and inventory concerns;

2.3.1.3. fuel switching capabilities; and

2.3.1.4. environmental constraints.

2.3.2. Generating unit(s) minimum:

2.3.2.1. design temperature; or

2.3.2.2. historical operating temperature; or

2.3.2.3. current cold weather performance temperature determined by an engineering analysis.

2.4. Identification of a mutually agreeable process in resolving conflicts;

2.5. Methods for the entity identified in Part 2.1 to provide data and information that includes at a minimum the following~~.~~:

2.5.1. Specific deadlines or periodicity in which data and information is to be provided;

2.5.2. Performance criteria for the availability and accuracy of data and information, as applicable;

2.5.3. Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operations purposes, as applicable;

~~**2.5.3.**~~**2.5.4.** Provisions to update or correct data and information, as applicable or necessary.

~~**2.5.4.**~~**2.5.5.** A mutually agreeable format.

~~**2.5.5.**~~**2.5.6.** A mutually agreeable method(s) for securely transferring data and information.

M2. Each Balancing Authority shall make available its dated, current, in force documented specification(s) for data and information.

R3. Each Transmission Operator shall distribute its data and information specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M3. Each Transmission Operator shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or ~~e-mail~~email records.

R4. Each Balancing Authority shall distribute its data and information specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. Each Balancing Authority shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, or ~~e-mail~~email records.

R5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a data and information specification(s) in Requirement R3 or R4 shall satisfy the obligations of the documented specifications. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in

Requirement R3 or R4 shall make available evidence that it has satisfied the obligations of the documented specification. Such evidence could include, but is not limited to, electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority (CEA) may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

~~Each responsible~~The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its ~~CEA~~Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Transmission Operator shall retain its dated, current, in force, documented specification for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R1 and Measurement M1 as well as any documents in force since the last compliance audit.
- Each Balancing Authority shall retain its dated, current, in force, documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R2 and Measurement M2, as well as any documents in force since the last compliance audit.
- Each Transmission Operator shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R3 and Measurement M3.
- Each Balancing Authority shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R4 and Measurement M4.
- Each Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall retain evidence

for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R5 and Measurement M5.

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Transmission Operator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Transmission Operator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R2	The Balancing Authority did not include two or fewer of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include three of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include four of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include any of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. OR, The Balancing Authority did not have a documented specification(s) for the data and information necessary for it to perform its analysis functions,

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				Real-time monitoring, and Near-Term Energy Reliability Assessments.
For the Requirement R3 and R4 VSLs only, the intent of the ~~Standard~~ Drafting Team (~~SDT~~DT) is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				
R3	The Transmission Operator did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R4	The Balancing Authority did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term	The Balancing Authority did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time	The Balancing Authority did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability	The Balancing Authority did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
	Energy Reliability Assessments.	monitoring, and Near-Term Energy Reliability Assessments.	Assessments.	
R5	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet one of the parts in Requirement R1 Part1.5 or Requirement R2 Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet two of the parts in Requirement R1 Part 1.5 or Requirement R2 Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet three or more of the parts in Requirement R1 Part 1.5 or Requirement R2 Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 did not satisfy the obligations of the documented specifications.

Implementation Plan

Project 2022-02 Uniform Modeling Framework for IBR

Applicable Standard(s)

- Reliability Standard MOD-032-2 Data for Power System Modeling and Analysis
- Reliability Standard IRO-010-6 Reliability Coordinator Data and information Specification and Collection
- Reliability Standard TOP-003-8 Transmission Operator and Balancing Authority Data and Information Specification and Collection

Requested Retirement(s)

- Reliability Standard MOD-032-1 Data for Power System Modeling and Analysis
- Reliability Standard IRO-010-5 Reliability Coordinator Data and information Specification and Collection
- Reliability Standard TOP-003-7 Transmission Operator and Balancing Authority Data and Information Specification and Collection

Prerequisite Standard(s)

These standard(s) or definitions must be approved before the Applicable Standard becomes effective:

- None

Applicable Entities

- See subject standards

Glossary of Terms used in NERC Reliability Standards

This section includes a newly defined term used in the NERC Reliability Standards. The new definition listed below becomes approved when the proposed standard is approved. When the standard becomes effective, the defined term will be removed from the individual standard and added to the NERC Glossary.

Proposed New Definition:

Distributed Energy Resource (DER):

A generator or energy storage technology connected to a distribution system that is capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including one connected behind the meter of an end-use customer that is supplied from a distribution system.

Background

As the penetration of DERs continues to increase across the many distribution systems connected both directly and indirectly to the North American Bulk-Power System (BPS), it is necessary to account for the potential impacts of DERs on reliability in the planning, operation, and design of the BPS. The NERC System Planning Impacts of Distributed Energy Resources Working Group (SPIDERWG) has identified the need for improved modeling of aggregate DERs for planning studies (including both utility-scale and retail-scale DERs) conducted by Transmission Planners (TPs) and Planning Coordinators (PCs), including updated modeling data requirements specific to DERs.

Further, in Order No. 901,[1] the U.S. Federal Energy Regulatory Commission ("FERC") found that it is imperative for NERC to develop new or modified Reliability Standards to address reliability concerns "related to IBRs at all stages of interconnection, planning, and operations."[2]. Among other things, FERC directed NERC to develop requirements addressing the provision of IBR and DER data to the entities responsible for the planning and operation of the BPS. Detailed information on the specific FERC Order No. 901 directives addressed through this project is available in Project 2022-02 Consideration of Order No. 901 Directives.

Proposed Reliability Standard MOD-032-2 replaces Load-Serving Entity with Distribution Provider as an applicable entity. Data items specific to IBRs and DERs were added to Attachment 1: Data Reporting Requirements, consistent with addressing the FERC Order No. 901 directives. Proposed Reliability Standard MOD-032-2 also adds a new Part 1.4 in Requirement R1, which would require the Planning Coordinator and Transmission Planner to specify submission of standard library dynamic models, user-defined models or both. Allowing the specification of standard library models incorporated within modeling software is responsive to FERC concerns about usability and allows PCs to maintain current requirements for generic models that may be necessary for the creation of large Interconnection-wide base cases. Allowing the specification of user-defined models is responsive to industry feedback expressed during the NERC Industry Engagement workshops. New Requirement R1, Part 1.4.2 is responsive to FERC concerns about model usability and non-convergence by requiring PCs and TPs that accept user-defined models to specify usability requirements and require appropriate model documentation and instructions. New Requirement R2, Part 2.1 addresses estimation of unregistered IBR or DER data where actual data is not available, consistent with the directives in Order No. 901. New Requirement R2, Part 2.2 addresses the provision of dynamic models accepted under the MOD-026 standard, and new Requirement R2, Part 2.3 requires any entity submitting a model included on the Unacceptable Model List maintained by the ERO to include a technical rationale with its submission supporting the use of the model. Altogether, these modifications establish a uniform modeling framework that incorporates both IBR and DER data and facilitates model accuracy in alignment with FERC Order No. 901.

[1] Reliability Standards to Address Inverter-Based Resources, Order No. 901, 185 FERC ¶ 61,042 (2023).
[2] Id. at P 25

Revisions in the Reliability Standards TOP-003-8 and IRO-010-6 data specification standards specify that entities responsible for developing and distributing data specifications shall include requirements for model submissions consistent with the model submitted for planning purposes, as applicable.

General Considerations

In developing this implementation plan, the drafting team (DT) considered the time that would be necessary to update modeling data requirements and reporting procedures for MOD-032-2, including identifying the proper reporting entity for modeling data related to IBRs (including IBRs that are not DERs and do not meet the criteria that would require the owner(s) to register with NERC for mandatory Reliability Standards compliance purposes) and aggregate DERs. The DT also considered that the standard would become applicable to the Distribution Provider (DP) for the first time. During the 24 months prior to the effective date of Requirement R1, the applicable entities would be expected to participate in PC/TP processes to change the modeling data reporting requirements related to IBRs and aggregate DERs and should be able to start working on data collection processes and methods. The applicable entities in Requirement R2 would then have an additional 12 months to complete and implement data collection prior to the compliance dates of Requirements R2, R3, and R4. This timeline also allows for the development of new data estimation processes developed under MOD-032-2 Requirement R2, Part 2.1 and for the development of technical rationale to support the use of models included on the Unacceptable Model List maintained by the ERO, where applicable. Requirements adjusted in Reliability Standards IRO-010-6 and TOP-003-8 may not be practical to implement prior to full implementation of MOD-032-2, and therefore were set to the same implementation timeline. One additional limitation the DT considered is the requirement for all FERC Order No. 901 directives to be fully implemented by January 1, 2030, including those to be addressed by future standard revisions that may be dependent upon the implementation of these standard revisions.

In summary, this implementation plan would provide a full 36 months for MOD-032 Requirements R2, R3, R4, IRO-010, and TOP-003 from FERC approval until data is required to be reported under the revised requirements. During the phased-in compliance period for Requirements R2-R4, entities shall continue to provide data and perform other required actions in accordance with specifications developed under Reliability Standard MOD-032-1, unless entities are able to comply with the revised requirements sooner.

Effective Date and Phased-In Compliance Dates

The effective date for the proposed Reliability Standard and NERC Glossary term Distributed Energy Resource is provided below. Where the DT identified the need for a longer implementation period for compliance with a particular section of a proposed Reliability Standard (i.e., an entire Requirement or a portion thereof), the additional time for compliance with that section is specified below. The phased-in compliance date for those particular sections represents the date that entities must begin to comply with that particular section of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

Reliability Standard MOD-032-2

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for Reliability Standard MOD-032-2 Requirements R2, R3, and R4

Entities shall not be required to comply with Requirements R2, R3, and R4 relating to revised Planning Coordinator and Transmission Planner data requirements and reporting procedures developed under MOD-032-2 Requirement R1 and Attachment 1 until 12 months after the effective date of Reliability Standard MOD-032-2.

During the phased-in compliance period, entities shall continue to comply with Requirements R2, R3, and R4 related to Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under MOD-032-1 Requirement R1 and Attachment 1 unless they are compliant with revised Planning Coordinator/Transmission Planner data requirements and reporting procedures under Reliability Standard MOD-032-2 Requirement R1.

Definition – Distributed Energy Resource (DER)

Where approval by an applicable governmental authority is required, the definition of Distributed Energy Resource (DER) shall become effective on the first day of the first calendar quarter that is after the effective date of the applicable governmental authority's order approving Reliability Standard MOD-032-2, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the definition shall become effective on the first day of the first calendar quarter that is after the date that Reliability Standard MOD-032-2 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Reliability Standard IRO-010-6

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Reliability Standard TOP-003-8

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Retirement Date

Reliability Standard MOD-032-1

Reliability Standard MOD-032-1 shall be retired immediately prior to the effective date of Reliability Standard MOD-032-2 in the particular jurisdiction in which the revised standard is becoming effective.

Reliability Standard IRO-010-5

Reliability Standard IRO-010-5 shall be retired immediately prior to the effective date of Reliability Standard IRO-010-6 in the particular jurisdiction in which the revised standard is becoming effective.

Reliability Standard TOP-003-7

Reliability Standard TOP-003-7 shall be retired immediately prior to the effective date of Reliability Standard TOP-003-8 in the particular jurisdiction in which the revised standard is becoming effective.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Violation Risk Factor and Violation Severity Level Justifications

Project 2022-02 Uniform Modeling Framework for IBR

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in Project 2022-02 Uniform Modeling Framework for Inverter-Based Resources (IBRs). Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in the Federal Energy Regulatory Commission (FERC)-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The drafting team applied the following North American Electric Reliability Corporation (NERC) criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on a Single Violation, not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

MOD-032-2

VRF Justification for MOD-032-2, Requirement R1

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard. The modifications made to Requirement R1 require model submission in accordance with the Criteria for Acceptable Models maintained by the ERO. This is similar to other sub-requirements in Requirements R1; therefore, the VRF remained a low.

VSL Justification for MOD-032-2, Requirement R1

Please refer to the VSL table below.

VRF Justification for MOD-032-2, Requirement R2

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard. “Load Serving Entity” was replaced with “Distribution Provider” from Requirement R2 in MOD-032-2. In addition, Requirement R2 added a sub-requirement requiring if entity is unable to gather unregistered IBR data or Distributed Energy Resource (DER) data to complete an estimate. These modifications align with the medium risk requirement and therefore, the VRF remained medium.

VSL Justification for MOD-032-2, Requirement R2

Please refer to the VSL table located below**.**

VRF Justification for MOD-032-2, Requirement R3

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard. The modifications made to Requirement R3 were administrative in nature; therefore, the VRF remained a low.

VSL Justification for MOD-032-2, Requirement R3

Please refer to the VSL table located below**.**

VRF Justification for MOD-032-2, Requirement R4

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R4

The VSL did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSLs for MOD-032-1, Requirement 1			
Lower	**Moderate**	**High**	**Severe**
The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include less than or equal to 25% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 25%, but less than or equal to 50% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 50%, but less than or equal to 75% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) did not develop any steady-state, dynamics, and short circuit modeling data requirements and reporting procedures required by Requirement R1; OR The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 75% of the required components specified in Requirement R1.

VSL Justifications for MOD-032-1, Requirement 1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement was modified by adding an additional sub-requirement to Requirement R1. The proposed VSL was modified to reflect the additional sub-requirement. It does not have an unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The updated sub-requirement requires the responsible entity to follow the Criteria for Acceptable Models document maintained by the Electric Reliability Organization. The VSLs are not binary and do not contain ambiguous language.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement; therefore, it is consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VSLs for MOD-032-1, Requirement 2			
Lower	**Moderate**	**High**	**Severe**
The Balancing Authority, Distribution Provider, Generator Owner Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide less than or equal to 25% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but less than or equal to 25% of the required data failed to meet data format, shareability, level	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 25%, but less than or equal to 50% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 25%, but less than or equal to 50% of the required data failed to meet data format,	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 50%, but less than or equal to 75% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 50%, but less than or equal to 75% of the required data failed to meet data format,	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider did not provide any steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s); OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but failed to provide greater than 75% of the required data specified in Attachment 1; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner,

of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in less than or equal to 15 calendar days after the specified date.	shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 15, but less than or equal to 30 calendar days after the specified date.	shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 30, but less than or equal to 45 calendar days after the specified date.	Transmission Owner, or Transmission Service Provider provided steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s), but greater than 75% of the required data failed to meet data format, shareability, level of detail, or case type specifications; OR The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner or Transmission Service Provider failed to provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) within the schedule specified by the data requirements and reporting procedures, but did provide the data in greater than 45 calendar days after the specified date.

VSL Justifications for MOD-032-1, Requirement 2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	"Load Serving Entity" was replaced with "Distribution Provider" from Requirement R2 and a sub-requirement was added requiring if entity is unable to gather unregistered IBR data or DER data to complete an estimate. The proposed VSL was modified to reflect the additional sub-requirement language. It does not have an unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The updated sub-requirement requires the entity if it is unable to gather unregistered IBR data or DER data to complete an estimate. The VSLs are not binary and do not contain ambiguous language.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement; therefore, it is consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VSLs for MOD-032-1, Requirement 3			
Lower	**Moderate**	**High**	**Severe**
The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response within 105 calendar days (or within 15 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response within greater than 105 calendar days, but less than or equal to 120 calendar days (or within greater than 15 calendar days, but less than or equal to 30 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R3 within 90 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner), but did provide the response within greater than 120 calendar days, but less than or equal to 135 calendar days (or within greater than 30 calendar days, but less than or equal to 45 calendar days after the longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).	The Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider failed to provide a written response to its Transmission Planner(s) or Planning Coordinator(s) according to the specifications of Requirement R3 within 135 calendar days (or within a longer period agreed upon by the notifying Planning Coordinator or Transmission Planner).

VSL Justifications for MOD-032-1, Requirement 3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement was modified by replacing Load Serving Entity with Distribution provider. The proposed VSL was modified to reflect this modification. It does not have an unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The VSLs are not binary and do not contain ambiguous language.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

IRO-010-5

VRF Justification for IRO-010-5, Requirement R1

The VRF did not change from the previously FERC approved IRO-010-4 Reliability Standard. The modifications made to Requirement R1 require IBR-specific data and parameters to be added to the list of data and information needed by the Reliability Coordinator per Part 1.1. and model submission in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization per Part 1.5.3. This is similar to other sub-requirements in R1; therefore, the VRF remained a low.

VSL Justification for IRO-010-5, Requirement R1

Please refer to the VSL table located below.

VRF Justification for IRO-010-5, Requirement R1

The VRF did not change from the previously FERC approved IRO-010-4 Reliability Standard.

VSL Justification for IRO-010-5, Requirement R2

The VSL did not change from the previously FERC approved IRO-010-4 Reliability Standard.

VRF Justification for IRO-010-5, Requirement R3

The VRF did not change from the previously FERC approved IRO-010-4 Reliability Standard.

VSL Justification for IRO-010-5, Requirement R3

The VSL did not change from the previously FERC approved IRO-010-4 Reliability Standard.

VSLs for IRO-010-5, Requirement 1			
Lower	**Moderate**	**High**	**Severe**
The Reliability Coordinator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Reliability Coordinator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

VSL Justifications for IRO-010-5, Requirement 1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement was modified by adding additional sub-requirements to Requirement R1. The purposed VSL was modified to reflect the additional sub requirement. It does not have an unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The VSLs are not binary and do not contain ambiguous language.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement; therefore, it is consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

TOP-003-8

VRF Justification for TOP-003-8, Requirement R1

The VRF did not change from the previously FERC approved TOP-003-8 Reliability Standard. The modifications made to Requirement R1 require IBR-specific data and parameters to be added to the list of data and information needed by the Reliability Coordinator per Part 1.1. and model submission in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization per Part 1.5.3. This is similar to other sub-requirements in R1; therefore, the VRF remained a low.

VSL Justification for TOP-003-8, Requirement R1

Please refer to the VSL table located below.

VRF Justification for TOP-003-8, Requirement R2

The VRF did not change from the previously FERC approved TOP-003-8 Reliability Standard. The modifications made to Requirement R1 require IBR-specific data and parameters to be added to the list of data and information needed by the Reliability Coordinator per Part 1.1. and model submission in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization per Part 1.5.3. This is similar to other sub-requirements in R1; therefore, the VRF remained a low.

VSL Justification for TOP-003-8, Requirement R2

The VSL did not change from the previously FERC approved TOP-003-7 Reliability Standard.

VRF Justification for TOP-003-8, Requirement R3

The VRF did not change from the previously FERC approved TOP-003-7 Reliability Standard.

VSL Justification for TOP-003-8, Requirement R3

The VSL did not change from the previously FERC approved TOP-003-7 Reliability Standard.

VSL Justifications for TOP-003-8, Requirement 2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement was modified by adding additional sub-requirements to Requirement R2. The proposed VSL was modified to reflect the additional sub requirement. It does not have an unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSL uses the same terminology as used in the associated requirement; therefore, it is consistent with the requirement.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement; therefore, it is consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

September 2025

MOD-032-2 – Data for Power System Modeling and Analysis

Rationale for Applicability Section

For MOD-032-2, Load-Serving Entity (LSE) was replaced with Distribution Provider (DP) because of the removal of LSEs from the NERC registry criteria. It should be noted that Generator Owner (GO) applicability includes both Category 1 GO and Category 2 GO consistent with proposed revisions to the definitions of those terms developed under Project 2024-01 Rules of Procedure Definitions Alignment.

Additionally, the drafting team (DT) reviewed the dual applicability to Planning Authority (PA) and Planning Coordinator and determined that it was most appropriate to reference both terms in the applicability section until NERC registration criteria are updated to use only a single term. The posted "Appendix 5B: Statement of Compliance Registry Criteria," dated June 27, 2024, still uses both terms and, arguably, the PA term is used more prominently. However, the explanation included in MOD-032-1 refers to synchronization between registration criteria and the NERC functional model which is not maintained, was never formally approved, and is only posted as a historical document. Therefore, the DT excluded the explanatory language from MOD-032-2 Applicability Section.

Rationale for Distributed Energy Resource (DER) Definition

The DT has proposed that a definition for DER be added to the *NERC Glossary of Terms used in Reliability Standards* (NERC Glossary of Terms). The approved standard authorization request (SAR) to revise MOD-032, submitted December 2021, noted that "it may be needed (based on the discretion of the DT) to add a definition for 'Distributed Energy Resource (DER)' to the NERC Glossary of Terms" in conjunction with adding DER data to Attachment 1, the main purpose of this SAR.[1] The DT found it necessary to draft a DER definition to clarify the usage of this term within the standard. Further, the DT recognized benefits of a NERC Glossary of Terms definition to bring alignment and consistency of term usage across Reliability Standards. Additionally, the term Inverter-Based Resource (IBR) was recently defined in the NERC Glossary of Terms under Project 2020-06 for a similar reason. Finally, the DT was comprised of team members with adequate experience to propose a definition, including members of the NERC SPIDERWG and IEEE 1547 working group.

The DT proposes to define Distributed Energy Resource (DER) as follows:

"A generator or energy storage technology connected to a distribution system that is capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including one connected behind the meter of an end-use customer that is supplied from a distribution system."

[1] SAR title "MOD-032-1 Data for Power System Modeling and Analysis", submitted 12/15/2021. Available at: https://www.nerc.com/pa/Stand/Project202202ModificationstoTPL00151andMOD0321DL/2022-02_MOD-032%20SAR%20SPIDERWG_020122.pdf

In developing this definition, the DT considered various DER definitions utilized in the industry and discussed in the NERC System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG) Terms and Definitions Working Document, including the six other definitions described in Appendix D that were not adopted by SPIDERWG. Through this review, the DT determined each of these seven definitions would benefit from refinement to be most suitable for application in MOD-032 and future reliability standards more broadly. It is expected that most reliability standard revision proposals related to DERs would originate from the SPIDERWG. Thus, the DT's intent was to propose a DER definition that aligned with the SPIDERWG working definition, which explicitly excludes demand response and clarifies what is in scope and out of scope with respect to where a DER is connected, rather than the technology type. The DT's concurrence in excluding demand response from the definition of DER is due to demand response characteristics that are typically reflected in base case study assumptions rather than requiring explicit modeling within reliability simulations.

The DT considered adopting a voltage threshold to define distribution. However, industry generally differentiates transmission from distribution based on the functional use of the system rather than technical specifications (e.g., voltage, active power, etc.). Setting aside the Bulk Electric System, that has a NERC definition, defining electric facilities as either transmission or distribution is often based on State law or regulations, ISO/RTO tariff, and/or utility tariffs. There are no conflicts in how applicable entities define distribution and transmission facilities for a given region, even if those definitions vary from region to region. Additionally, the DT considered an active power threshold to define DER and concluded that DER technologies can vary in size, and a threshold might inappropriately exclude technologies that are DER[2]. At the same time, the DT understands that certain applications of DER data, for instance determining when or how a Transmission Planning (TP) or Planning Coordinator (PC) includes DERs into planning processes (e.g., TPL-001), may include active power or other TP or PC defined thresholds.

The DT considered defining DER based on the resource not being connected to the Bulk Power System (BPS), similar to the IEEE 1547-2018 definition that uses "not directly connected to the BPS" to describe DERs. However, the NERC Glossary of Terms definition of BPS does not provide specificity that would enhance a definition of DER beyond an undefined term that is generally used in industry. The phrase "distribution system" was selected to expressly describe the type of electric facilities that would cause a resource to be defined as a DER, if interconnected to those facilities.

The DT recognizes that "distribution system" is not defined in the NERC Glossary of Terms and that the SPIDERWG proposed a definition.[3] The DT reviewed the SPIDERWG definition and concluded that it would not clarify the term DER. The SPIDERWG use of the term "transmission-distribution" interface within a definition of "distribution system" could be considered a circular reference that causes ambiguity. The DT is not proposing a definition for distribution system given any proposed definition could be of limited benefit for clarifying the proposed definition for DER.

[2] NERC has published a study recommending that a zero MVA threshold be used when collecting DER information: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf

[3] SPIDERWG definition of "distribution system": The electrical facilities that are located behind a transmission-distribution transformer that serves multiple end-use customers.
https://www.nerc.com/comm/RSTC/SPIDERWG/SPIDERWG%20Terms%20and%20Definitions%20Working%20Document.pdf

Below is a summary of the rationale for the DT departing from each of the seven definitions when proposing a new DER definition.

SPIDERWG definition
After considering the SPIDERWG definition, the DT determined it provided a useful foundation but needed refinement to be suitable for the intended use. Specifically, the SPIDERWG term included transient types of DER power beyond generation and storage, and it included sources of back-up power that would have no potential grid impacts.

The DT chose to refer to a generator or storage technology specifically, rather than use the SPIDERWG language of "source", to exclude devices or resources that only transiently inject real power (e.g., regenerative elevators, transition switches, etc.). A DER can use various technologies including synchronous machines, induction machines, and power inverters/converters (i.e., IBR). Different types of DERs can utilize a wide range of energy sources including, but not limited to, natural gas, diesel, hydro, storage, wind, and solar. Additionally, the DT intention was to ensure that the scope included facilities "connected behind the meter of an end use customer" that may export Real Power to the power system or offset Real Power load (e.g., residential solar or commercial rooftop solar). This would exclude technologies such as charging-only electric vehicle (EV) installations and controllable load. While not finalized, it is the drafting team's understanding that this determination is consistent with recent proceeding from the IEEE 1547 revision Working Group. To exclude transmission connected load customers that have onsite generation or storage resources, the DER definition clarifies that the behind-the-meter customer "is supplied from a distribution system".

The DT included the language "in non-isolated parallel operation with the Bulk-Power System" to indicate that a distributed energy resource with potential BPS reliability impacts is only one that has electrical connectivity to the BPS. A resource that is only operated in islanded or isolated mode (e.g., back-up generation that only operates when a facility is disconnected from the grid), will not have an impact to the BPS and, therefore, is not of interest from a BPS-reliability perspective. The DT understands the concepts of non-isolated parallel operation versus isolated parallel operation to be commonly understood within the industry. The DT intentionally avoided the term "directly connected" to differentiate electrical connectivity from an electrical connection point. The phrase "connected to the distribution system" speaks to electrical connectivity and the subsequent phrase "including one connected behind the meter of an end use customer" clarifies this connectivity includes a resource directly connected to a customer system (i.e., behind the meter).

IEEE 1547-2018
The DT reviewed the IEEE 1547-2018 definition and found that it contained elements that could supplement the SPIDERWG definition to address the issues identified above. The DT incorporated the explicit reference to generation and storage aspect of the IEEE definition. Further, the IEEE concept of "capable of exporting active power to an EPS" informed the need for capturing non-isolated, long-term paralleling and the sourcing of Real Power (i.e., active power) within the DT definition.

At the same time, the DT did not view the IEEE definition as suitable for the DT's intended use as written. The IEEE term qualifies the DER connection point as "not directly connected to a bulk power system" which the DT viewed as potentially ambiguous. Instead, the DT opted for the "connected to a distribution system" language to point to the electric system location, and how facilities at that location are classified, as a key concept in differentiating DERs from other generators and energy storage technology. The DT considered if it was necessary to define "supplemental DER devices" as part of the DER definition and determined this nuance is not needed for a NERC Glossary of Terms DER definition.

Federal Energy Regulatory Commission (FERC) Energy Primer
The DT identified the FERC Energy Primer definition as being inclusive of load resources (e.g., energy efficiency, demand response) which is not aligned with the SPIDERWG definition. Given the reliability use cases, the DT and SPIDERWG definitions target sources of electric power, with the DT narrowing this definition to be only sources "capable of providing Real Rower." After considering the FERC definition, the DT determined it was not suitable for the intended use.

National Association of Regulatory Utility Commissions (NARUC)
NARUC's definition is also inclusive of load resources (e.g., energy efficiency, demand response) and therefore, the DT concluded it is too broad.

NERC DERTF
The NERC DERTF definition uses the language "resource on the distribution system that produces electricity" which appears to exclude distributed energy storage, a technology necessary for inclusion in the DT definition. Further, the NERC DERTF definition defines DER as anything "not otherwise included in the formal NERC definition of the Bulk Electric System" which the DT views as overly broad.

California Public Utilities Commission (CPUC)
The CPUC definition appears to be based on California legislation and includes energy efficiency, EVs, demand response, renewable generation resources, and energy storage. As is the case for FERC and NARUC definitions above, the inclusion of load resources is overly broad for the NERC Glossary of Terms.

New York Independent System Operator (NYISO)
The NYISO definition only considers market-qualifying resources as DER. This definition's exclusion of a large portion of DER (i.e., retail participation) is too narrow for the reliability planning needs identified by the SPIDERWG DER Modeling Study.

Figure 1 below provides a graphic illustration of the DER definition and the intended scope of facilities that would fall under the proposed definition. Figure 2 below shows that the proposed DER and IBR definitions are compatible, but distinct. Some resources may be classified as a DER, but not an IBR; some resources may be classified as an IBR, but not a DER; some resources may be classified as both a DER and an IBR. Rather than separately define IBR-DER, the DT suggests IBR-DER should be used to reference those devices meeting both the definition of IBR and the definition of DER, as demonstrated by the overlapping area of Figure 2. This relationship between the definitions and the existence of non-IBR storage solutions informed the phrasing of "generator and energy storage technology" to ensure all generators and all storage devices

are included, even if they do not meet the definition of IBR. Note that in Figure 2, "distribution-connected" is shorthand for connected to the distribution system and "bulk system-connected" refers to resources connected to the transmission system.

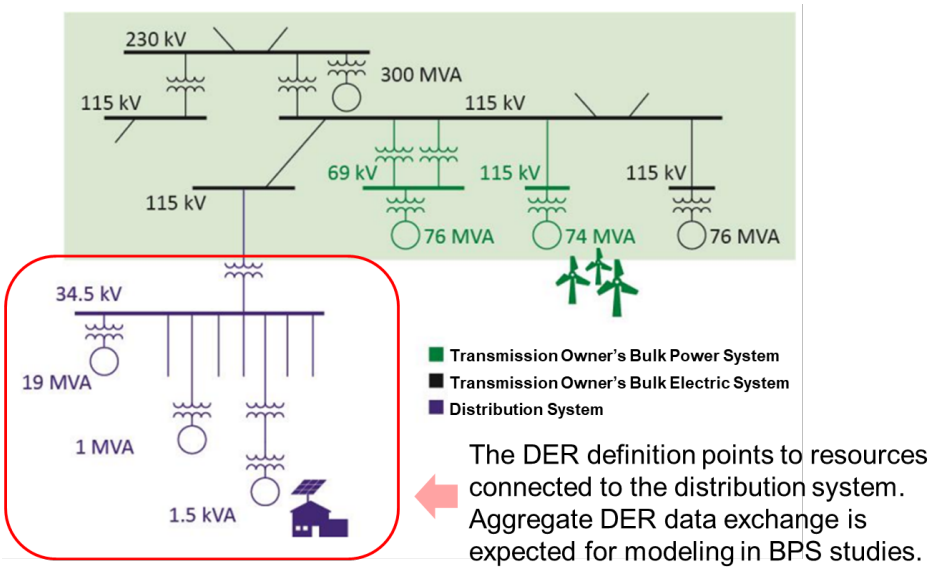

Figure 1: DER Definition Illustration

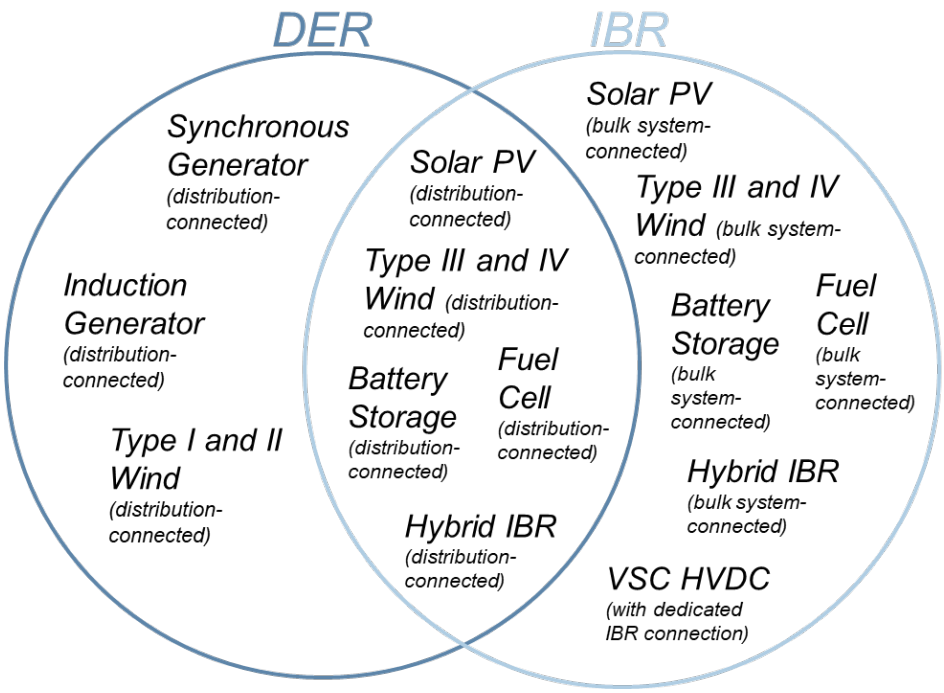

Figure 2: DER and IBR Definition Compatibility

Rationale for Modifications to Requirement R1

Requirement R1, Part 1.1 was modified to require that the PC and TP data requirements and reporting procedures include the responsible entity for data items listed in Attachment 1. To be clear, the "entity" to be identified would be the entity type or category (i.e., Transmission Owner), not specific companies for each data item. This modification aligns with changes made to the introductory paragraph in Attachment 1 clarifying that data obligations are established by the PC/TP modeling data requirements and reporting procedures rather than the listing of typical functional entities in Attachment 1. The intention of this addition is not to create an administrative requirement for the PC and TP to maintain separate lists identifying entity obligations, but to reinforce PC/TP authority to request data from appropriate entities, thereby creating obligations for those entities to provide the requested data. In most cases, it is expected that data requirements and reporting procedures would inherently identify the entities required to provide data. Further, this modification is intended to give the PC/TP flexibility to identify (and specify within their data requirements and reporting procedures) the best source for necessary data, even if that source is not a NERC functional entity. However, only NERC functional entities are subject to mandatory compliance with NERC Reliability Standards, so the PC/TP is unlikely to assign other entities without a local authority to create data obligations outside of NERC enforcement. Such flexibility could allow the TP or PC to directly estimate data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes and aggregated DERs connected to unregistered Distribution Providers based on any information received in accordance with their data requirements and reporting procedures. As an example, data received from DPs in the area that can be assumed to have similar DER adoption profiles. FERC Order 901 uses the phrase "unregistered IBR" but given this is an undefined term and the drafting team received opposition to explaining that term in a footnote, the phrase was replaced in the standard with "an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes." This is the intent of all further references to "unregistered IBR" in this technical rationale.

FERC Order 901 directs NERC to develop reliability standards that require "the use of approved industry generic library IBR models".[4] However, pre-defining a limited set of models (i.e., a library of models) that could be used to represent generation and system components is potentially at odds with objectives to also have accurate models, especially as technology rapidly progresses. To align with industry practices while addressing the directives of the FERC Order, the DT referenced standard library models incorporated within software as well as usability requirements for user-defined models (where accepted) in Requirement R1, Part 1.4, rather than defining an inclusive model library. The DT supports the approach and views it as aligned with the FERC Order directives while addressing the practical limitations raised by industry at the January 15-16 and June 3-5 NERC Industry Engagement Workshops.[5][6] For instance, Order 901 P125 requires "the sole use of nation-wide approved component generic library models" whereas workshop participants raised issues surrounding timelines for approving library models that reflect new IBR products, the accuracy of library models for certain products, timelines associated with updating library models, and referencing a document outside of the standard that could be changed by a process also outside the standard, among other issues.

[4] FERC Order 901 at Paragraph 122.
[5] NERC Industry Engagement Workshop–Reliable IBR Integration and Milestone 3 of FERC Order 901 Agenda
[6] Milestone 3 of FERC Order 901 NERC Industry Engagement Workshop June 3-4 PowerPoint

To address these concerns, Requirement R1, Part 1.4 includes requirements for the PC/TP to specify submission of standard library dynamic models, user-defined models, or both. The phrase user-defined models should be considered interchangeable with user-written models, equipment-specific models, and other such terms. The phrase "user-defined models" was used in MOD-032-2 based on language in FERC Order 901.[7] Allowing the specification of standard library models incorporated within modeling software is responsive to FERC concerns about usability and allows PCs to maintain current requirements for generic models that may be necessary for the creation of large Interconnection-wide base cases. Allowing the specification of user-defined models is responsive to industry feedback expressed during the NERC Industry Engagement workshops. The DT also explicitly ensured PC/TP authority to require submission of both model types, if deemed necessary. Requirement R1, Part 1.4.2 is responsive to FERC concerns about model usability and non-convergence by requiring PCs and TPs that accept user-defined models to specify usability requirements and require appropriate model documentation and instructions.

Rationale for Modifications to Requirement R2

Requirement R2 was modified to require estimation of modeling data if the functional entity required to provide it (typically the Transmission Owner or Distribution Provider) is unable to gather the required data. FERC Order 901 requires the provision of data related to unregistered-IBR and IBR-DER that in the aggregate have a material impact on the BPS.[8] If the data is estimated, Requirement R2 Part 2.1 also requires the entity to provide an explanation of the limitations of the estimated data and the method used for estimation in line with the Order 901 directives.[9] The requirement language intentionally uses the phrase "unable to gather" to mirror the FERC Order 901 language. Limitations of the estimated data is intended to capture both limitations of the availability of data (including instances where there are legal or contractual prohibitions on requesting certain data, no mechanism to enforce collection, or incomplete records of what is connected) and limitations of any data provided (including partially missing or suspect data).

The exact method used for estimation is intentionally left open given the varying levels of data available across the ERO footprint. A few possible examples include:

- A full list of DERs broken down by resource type with limited fields missing and assumed based on other characteristics.
- Real Power capability by resource type with approximate percentage of the resource compliance with various IEEE 1547 versions used for dynamic performance assumptions (known or assumed based on installation date).
- Count of resources by resource type with average size used to estimate Real Power capability.
- Derive values for unregistered DPs based on average of registered DPs in the area (scaled based on total system size).

[7] FERC Order 901 at P124
[8] FERC Order 901 at P104 and P105
[9] FERC Order 901 P104: "if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation."

- Solar capability estimated based on satellite imagery of rooftops.
- Assumptions of regional/national average IBR-DER penetration levels.

Additional guidance for DER estimation can be found in NERC SPIDERWG Reliability Guidelines on the topic.[10]

The DT views the introduction of this estimation provision as alleviating previously expressed compliance obligation concerns around challenges in collecting data for DERs connected to unregistered entities. Further, the addition of compliance abeyance language for the estimation process provides entities the opportunity to hone their estimation process without risk of penalty (provided they proceed in good faith). The approach directed by FERC is flexible as to whether the underlying unregistered IBR and DER data originates from interconnection documentation, measured quantities, estimated quantities, or other sources. Data availability or sufficiency issues, among other factors, may lead to the DP and TO applying a combination of approaches to source the data. The PC and TP modeling data requirements and reporting procedures should identify acceptable methods and their application.

While the FERC Order 901 directives only addressed IBR-DER, meaning that DER technologies based on induction generators or synchronous generators are not explicitly addressed, Project 2022-02 is also assigned a SAR that requires DERs to be addressed in MOD-032 more generally, and the inclusion of all DERs in this revision of the standard removes the need for a second modification under this project. The DT found it practical to have a consistent estimation framework applicable for all DER technologies when DER data cannot be gathered. Therefore, Requirement R2 was intentionally written to have requirements for estimating DER data regardless of the technology type, when an applicable entity is unable to gather the data. The approach FERC directed NERC to use forms the basis for this uniform approach.

Given the challenges with collecting complete and accurate DER data, the DT would still recommend that NERC consider a range of options that could include expanding DP registration criteria or registering DER-only DPs to reduce or eliminate this potential DER data collection gap. However, the process to modify NERC registry criteria and register new entities is beyond the scope of Project 2022-02 and would delay the project beyond the FERC Order 901 Milestone 3 timeline. The DT considered adding "UFLS-Only Distribution Provider" to MOD-032-2 applicability to reduce (but not necessarily eliminate) the potential gaps associated with DER connected to unregistered entities with no compliance obligation. However, the UFLS-Only Distribution Provider can only be obligated to provide data directly associated with UFLS programs (essentially the data identified in Attachment 1 Dynamics Column 10b). Provision of such data in the absence of the other DER data identified in Attachment 1 would not be particularly useful for planners.

Requirement R2, Part 2.2 was added to confirm the relationship and consistency between MOD-026 and MOD-032 indicated in FERC Order 901 Paragraph 143[11]. The DT believes that the intent of FERC Order 901

[10] Reliability Guidelines, Security Guidelines, Technical Reference Documents, and White Papers

[11] FERC Order 901 P143: ""Regarding EPRI's recommendation to require appropriately parameterized plant models, we agree that the model verification process of an IBR model should include steps to ensure that responsible entities provide both verified and appropriately parameterized models. Additionally, we agree with IRC's recommendation that the plant model verification process should include

is to ensure that accurate (validated and verified) models are collected under MOD-032. However, facility models submitted under MOD-032 are often submitted before physical validation can be completed (e.g., for planned facilities). Part 2.2 requires the model submitted by the functional entity be the model that was verified and validated (and accepted by the TP) in accordance with MOD-026, if available.

Requirement R2, Part 2.3 introduces a reference to the Unacceptable Models List (UML) maintained by the ERO. The DT concluded that it would be most appropriate for NERC to maintain the UML as a separate document that could be updated more quickly and frequently than the standard development process. However, any changes to the process for modifying the UML, that is incorporated into MOD-032-2 as a supporting document, would need to be approved through the standard development process.

It is also recognized that models on the UML may be the best available for some generators, particularly for some synchronous generators and for units manufactured by companies that are no longer in business. Part 2.3 allows for the submission of such a model if accompanied by a technical rationale justifying its use. The requirement does not intend any specific level of scrutiny for this rationale, but it also does not prevent the PC or TP from identifying technical concerns with the model or the rationale per Requirement R3. This rationale could include notation of prior usage for synchronous generation as well as models that have been recently added to the UML without time to procure an updated model prior to reporting. A MOD-032 supporting document defines the process for modifying the UML as a sufficient safeguard to prevent arbitrary or unvetted modifications being made to the UML.

Rationale for Modifications to Requirement R3

Requirement R3, Part 3.1 was modified to include the phrase “that is responsive to the technical concern”. The ultimate intent of R3 is to resolve technical concerns that are identified by the PC or TP. However, model providers may not always be able to know that their update or explanation will resolve the planner’s technical concern. The intent of this addition is to convey that the model provider’s obligation does not simply end with providing a response, but further information exchanges between the planner and model provider may be necessary to resolve the technical concern.

Rationale for Modifications to Attachment 1

Data items specific to IBRs and DERs were added to MOD-032-2 Attachment 1: Data Reporting Requirements.

The DT decided to maintain an approach similar to MOD-032-1 where more detailed sub-bullets associated with items are only presented in one column (i.e., some sub-bullets are only listed in the “steady state” column even though the data is also relevant to “dynamics” and/or “short circuit”). This long-standing approach was made explicit in footnote 1 of the MOD-032-2 Reliability Standard.

requirements for equipment to be represented as installed in the field. While we decline to include this level of detail in the directive to NERC, we nonetheless direct NERC to establish a standard uniform model verification process. A uniform model verification process will ensure that all entities use the same set of minimum requirements to verify that all generation resource (i.e., synchronous and non-synchronous) models are complete and that the models accurately represent the dynamic behavior of all generation resources at a sufficient level of fidelity for Bulk-Power System planners and operators to perform valid interconnection-wide, planning, and operational studies. Therefore, we direct NERC to define the model verification process and to require consistency among the model verification processes for existing Reliability Standards (e.g., FAC-002, MOD-026, and MOD-027) and any new or modified Reliability Standards.”

The format of Attachment 1 was modified to minimize replicating footnotes applicable to multiple items by adding a new footnotes section (Attachment 1 Data Reporting Requirements Footnotes) to the document. Along with the reformatting, language was added to the introductory paragraph to clarify that data obligations are established by the PC/TP modeling data requirements and reporting procedures rather than the listing of typical functional entities in Attachment 1. The expectation is that existing reporting requirements will remain the same, but previously implied flexibility is now explicitly granted as it is critical for regional consideration of the appropriate entities to provide information for unregistered IBR and DER.

Modifications for IBR

To incorporate IBR within Attachment 1, "and storage units" was added to generating units in the steady-state column under item 3. "Generating units" already incorporates IBR generators such as solar and wind. Storage is typically not classified as a generation resource because it has no primary energy source and consumes more energy than it injects when considering losses. Therefore, the DT found it necessary to include storage explicitly. Footnote 4, associated with "Generating units and storage", was also updated to explicitly identify IBR as an applicable technology for the item and remove pumped storage now that storage is explicitly identified.

The dynamics column was updated to replace "photovoltaic systems" (PV) with "Inverter-Based Resources" under item 7. IBR encompasses PV, resulting in PV technology still being included under this new item.
The three following sub-items were added to dynamics item 7 based on specific language from the FERC Order 901, Paragraph 141.[12]

- IBR capabilities related to momentary cessation,
- Tripping, and
- Ride-through

"Frequency control" was added as a sub-item because frequency response of IBR is important for studying system reliability. For instance, a 2024 NERC Lessons Learned report shows how IBR frequency response can affect system performance.[13] Frequency control encompasses primary frequency response, fast frequency response (e.g., IEEE 2800-2022, Subclause 6.2), and potentially other frequency responsive controls (e.g., "grid-forming" virtual synchronous machine controls).

"Voltage control" was added to encompass reactive power and voltage control that may affect the dynamic or steady state performance of the plant. NERC's Level 3 Alert on Inverter-Based Resource Performance and Modeling, issued May 2025, contains Essential Action #1 indicating the importance of voltage control performance for normal and post-disturbance operations.[14]

[12] FERC Order 901, P141 states that IBR and IBR-DER data must include "momentary cessation and/or tripping, and all ride through behavior."
[13] NERC, Lessons learned, Incorrect IBR Primary Frequency Response Logic Caused Negative ACE. Available at: https://www.nerc.com/pa/rrm/ea/Lessons%20Learned%20Document%20Library/LL20240501_Incorrect_IBR_Primary_Frequency_Response_Logic_Caused_Negative_ACE.pdf
[14] NERC, IBR Performance and Modeling, Level 3 Alert. May 2025. Available at: https://www.nerc.com/pa/rrm/bpsa/Alerts%20DL/Level%203%20Alert%20Essential%20Actions%20IBR%20Performance%20and%20Modeling.pdf

In order to clarify dynamics item 6, "wind plant model", to not overlap with the new IBR item 7, type 1 and type 2 wind turbines are specifically called out under item 6. These technologies are not IBR.

Footnote 5 indicates that the PC/TP data requirements and reporting procedures need to account for IBRs that are not DERs and do not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes. It also indicates that the TO is typically responsible for such data.

Modifications for DERs

Item 9, "Aggregate Distributed Energy Resource (DER) data" was added to the steady state column with location, real power capability, and DER type (solar, battery, diesel generator, etc.) specified as required subitems. The DT selected these subitems as the minimum information needed to use data and make assumptions for power system modeling and analysis; the PC/TP have the authority to request additional data items as deemed necessary.

The intent is that relevant DER data be available and represented in models of the interconnected transmission system consistent with the NERC approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies. Specific data items listed for DER reflect the minimum information needed to reasonably represent DER in transmission system models. "Aggregate DER" is specified in item 9 to indicate aggregate DER data, rather than individual DER facilities, would be represented in most PC/TP study models.[15] The word "aggregate" was specifically added to Attachment 1 to clarify this point based on industry comments and to align with FERC Order 901. However, Requirement R1 provides the PC and TP great flexibility in developing data requirements and reporting procedures that align with local practices and needs, in addition to the required items listed in the Requirement R1 Parts. Given industry comments on DER data availability, and FERC Order 901 directives, a process is needed for estimating DER data when an entity is unable to gather it. The process for estimating those values is referenced in Requirement R2, Part 2.1.

Footnote 3, associated with "aggregate demand", was modified to clarify that the gross demand is needed at each load serving bus. Collecting and modeling a net demand that incorporates offsets due to output from DERs is not consistent with a modeling framework that explicitly represents DERs. Given the allowance for a PC/TP to specify a threshold per footnote 7, they may confirm gross demand can be assumed to be equivalent to net demand when the difference is under that established threshold. This should be clarified in the level of detail of information requested in Requirement R1, Part 1.2.2.

Dynamics item 5, previously "demand", was updated to be "aggregate demand" to be consistent with the steady state column and general industry practices of modeling load dynamics for aggregate demand (e.g., composite load model).

[15] In certain circumstances (e.g., a very large DER), a TP or PC may decide to represent the individual DER. However, the DT anticipates most DER information will be aggregated based on PC and TP planning practices.

Dynamics item 10 was updated to include "Aggregate Distributed Energy Resource (DER) data" along with the subitems: "parameters, settings, or capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control"; and "indication whether DERs are subject to tripping in conjunction with UFLS or UVLS".

Momentary cessation, tripping, and ride-through of aggregate DERs is needed for dynamics studies. For instance, NERC's Lessons Learned, LL20220401 "Distributed Energy Resource Performance Characteristics during a Disturbance" provided information following the loss of 300 MW of DERs following a system fault. The report indicated that:

> "There is a need to understand how distribution system connected generation, and loads will behave and how they can accurately be modeled under expected system contingencies. Entities should know the behavioral characteristics of DER inverters on their system (both new and old) as well as their number, capabilities, and locations and then report that information to their Balancing Authorities and Reliability Coordinators so their models can be accurate".

Voltage control of DERs can alter the exchange of reactive power between distribution and transmission systems and may affect the results of reliability studies. Examples are described in the approved Reliability Guideline: Bulk Power System Planning under Increasing Penetration of Distributed Energy Resources.

Frequency control must be accounted for because DER interconnection under different standards (e.g., IEEE 1547-2003 versus IEEE 1547-2018) have different frequency response characteristics that may affect dynamics study results. Frequency control in this case typically refers to the frequency-droop characteristic outlined in IEEE 1547-2018, Subclause 6.5.2.7 and adopted in many jurisdictions. However, should other DER frequency controls become common in industry, those would also fall under this category.

As described in the approved Reliability Guideline: Recommended Approaches for UFLS Program Design with Increasing Penetrations of DERs, accurately representing DER tripping as part of UFLS operation is vital for designing and evaluating UFLS programs. Similarly, accurately representing DER tripping as part of UVLS operation is vital for designing and evaluating UVLS programs as described in the approved White Paper: DER Impact to Under Voltage Load Shedding Program Design. In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, the proportion of aggregate DERs subject to each UVLS/UFLS tripping stage should be identified.

In response to comments, the DT added Footnote 7, which explicitly confirms the PC/TPs discretion to specify aggregation thresholds below which they do not consider DER data necessary to collect. Based on the 0 MVA threshold recommendation noted previously, this threshold should only be established following consideration of that DER Modeling Study Report[16].

Inferring DER Capabilities

[16] https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf

Item 10 in the dynamics column indicates that aggregate DER dynamics modeling data may need to be inferred due to data availability and practical limitations. As suggested in the approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies, the in-service date for DERs may be used as a proxy for the PC/TP to make reasonable assumptions about DER capabilities. For example, in a certain jurisdiction DERs installed after a specified date may be required to have a certain ride-through characteristic. Thus, the appropriate Ride-through characteristic representation for DERs in that area could be inferred by the in-service date of the DERs. However, the PC/TP modeling data requirements and reporting procedures may require the provision of alternative information to achieve the same purpose. PC/TP modeling data requirements and reporting procedures may also require more detail and/or additional information. In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, it is expected that the proportion of aggregate DER amount with in-service dates before and after certain threshold dates would be needed (and specified in the PC/TP requirements) to make inferences regarding the overall aggregate DER response characteristics.

Entity responsibilities and coordination

Footnote 6 indicates that the PC/TP data requirements and reporting procedures need to account for situations where DERs are connected to the system of an unregistered DP. When a DER is connected through a registered DP (directly connected to that DP, connected to an unregistered DP that is connected to that DP, or behind the meter of an end-use customer of either) that DP is the typical responsible entity for collecting and providing the DER data. Further, the TO would be the typical responsible entity if there is no system owned by a registered DP between the DER connection point and TO system. This clarification is necessary to reduce the possibility of DERs on the system being unaccounted for by any entity. The DT was responsible for the FERC Order 901 directive requiring an entity to be identified when DERs had no registered DP. It is possible that a company that is a registered Generator Owner may also own resources that do not meet the criteria for registration. That would not change the responsible entity identified per R1, though the owner is encouraged to provide all relevant data to that responsible entity. This point applies broadly, where nothing in the standard is intended to preclude coordination among entities to make sure the responsible entity has the best available information to provide.

The PC/TP may have access to sufficient data for modeling certain DERs through alternative means (e.g., direct registration of DERs or DER aggregators in certain markets). In such cases, the DP (or TO) should not be obligated to provide duplicate DER modeling data, but care will be needed to ensure DERs are not double counted. The PC/TP modeling data requirements and reporting procedures should clearly identify if there are certain classifications of DERs that are excluded from the DP/TO obligation for providing DER modeling data. This in no way absolves a DP/TO from an obligation to provide DER data according to the data requirements and reporting procedures developed by its PC and TP under Requirement R1.

It should be noted that the MOD-032-2 modifications do not change the classification of unregistered IBRs or DERs to become BES facilities subject to NERC reliability standards. Instead, the modifications place a compliance obligation on NERC registered entities (typically DPs or TOs if identified as the responsible entity by the PC/TP) to provide basic information about unregistered IBRs or DERs that are connected to their systems so they can be properly represented in Interconnection-wide cases. There are already existing requirements for such entities to provide information about load connected to their systems. Like load,

unregistered IBRs and DERs are not generally considered to be BES facilities. However, BES reliability assessments require an accurate representation of aggregate load, unregistered IBR, and aggregate DER behavior. The modifications proposed in MOD-032-2 are intended to ensure sufficient data is available to the PC/TP so that appropriate unregistered IBR and DER representations can be included in their BES reliability assessments as required by FERC Order 901 and system planning needs.

IRO-010-6 – Reliability Coordinator Data Specification and Collection; and TOP-003-8 – Transmission Operator and Balancing Authority Data and Information Specification and Collection

The DT reviewed existing IRO-010 and TOP-003 versions and found that both standards had broad requirements language that encompassed generation and storage resources, including IBR as deemed necessary by the RC/TOP/BA. Nevertheless, to ensure no ambiguity that FERC Order 901 requirements are met, the DT included explicit references to IBR-specific data and parameters and pointed to the uniform framework through an alignment between planning and operations models.

Rationale for modifications to add "IBR-specific data and parameters"

The phrase "IBR-specific data and parameters" was added to the following requirements:

- IRO-010-6 Requirement R1, Part 1.1
- TOP-003-8 Requirement R1, Part 1.1
- TOP-003-8 Requirement R2, Part 2.1

These modifications were made in response to FERC Order 901 directives related to the inclusion of IBRs in operations models.[17] The phrase "IBR-specific data and parameters" in the revised IRO-010-06 and TOP-003-8 is intended to reflect what FERC describes in the order as "IBR models that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions". Given that the definition of IBR has no voltage threshold, the addition of IBR-specific data and parameters is inclusive of IBR-DER as referenced in FERC Order 901 and demonstrated by the overlapping area of Figure 2.

Rationale for modifications to add reference to consistency with planning models

"Requirements for necessary model submissions to be consistent with the model submitted for planning purposes, subject to modifications for operation purposes, as applicable" was added to the following requirements:

- IRO-010-6 Requirement R1, Part 1.5.3
- TOP-003-8 Requirement R1, Part 1.5.3
- TOP-003-8 Requirement R2, Part 2.5.3

These modifications were made in response to FERC Order 901 directives related to usage of a uniform framework in the development of planning and operations models. Planning model submissions in accordance with MOD-032-2 will reflect this uniform framework, though additional standards or regional requirements may apply. Thus, requiring that operations model submissions be consistent with planning model submissions ensures that they also reflect the uniform framework as directed by FERC in Order 901. Simulation time constraints in an online operations environment may warrant a reduced model structure complexity; such models may differ from, but should still be consistent with, more complex modeling that is submitted under MOD-032. The inclusion of "as applicable" allows for variation as necessary for application in the operations horizon. For example, consistent models would not be appropriate if an

[17] FERC Order 901 Paragraph 122 and Paragraph 161

update was made to a planning model for known pending changes, which should not be reflected in the operations models prior to implementation.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of FERC Order No. 901 Directives

Milestone 3: Project 2022-02 Uniform Modeling Framework for IBR
September 2025

On October 23, 2023, FERC issued a Final Rule, Order No. 901, directing the North American Electric Reliability Corporation (NERC) to develop new or modified Reliability Standards that address aggregation of data, parameters, and estimation methods to provide the Transmission Planner (TP) and Transmission Operator (TOP) with the estimate values, explanation for limitations on data availability, and the method used for all estimations. This project has a FERC regulatory deadline of November 4, 2025. Below provides the directives from FERC Order 901 along with the drafting team's (DT's) consideration of the directives.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
P7. "… Second, by November 4, 2025, NERC must submit new or modified Reliability Standards addressing the interrelated directives concerning: (1) data sharing for registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate…"	IRO-010 MOD-032 TOP-003	A timeline has been drafted to meet the regulatory deadline of November 4, 2025. Completed tasks listed below. • An industry workshop completed January 14-17, 2025. (outreach) • Many virtual DT meetings completed weekly from January – March 2025. (publicly posted) • In-person DT completed February 11-13, 2025. (publicly posted) • Industry Webinar March 6, 2025. (publicly posted) • DT outreach with trade groups and entities March 3-14, 2025 • Industry comment and ballot period April 17-May 16, 2025. (publicly posted)

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		• A second industry workshop completed June 3-5, 2025. (publicly posted) • Many virtual meetings were completed weekly from May 19-July 23, 2025. • Industry outreach with trade groups and entities July 3-23, 2025. • Industry comment and ballot period August 8-September 10, 2025.
P76. "Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require registered IBR generator owners and operators to provide IBR-specific modeling data and parameters (e.g., steady-state, dynamic, and short circuit modeling information, and control settings for momentary cessation and ramp rates) that accurately represent the registered IBRs to their planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities that are responsible for planning and operating the Bulk-Power System. As several commenters indicate, ensuring the sharing of appropriate IBR modeling data is critical to create and maintain the models used in reliability studies, and in turn to ensure that Bulk-Power System transmission planners or operators are able to plan for, operate, and reliably integrate IBRs onto the Bulk-Power System."	IRO-010 MOD-032 TOP-003	**Theme:** Inverter-Based Resource (IBR) /Generator Owner to provide specific modeling data. IRO-010 and TOP-003: • While TOP-003 and IRO-010 allow any data to be requested, the DT felt it was important to add "IBR-specific data and parameters" specifically to IRO-010-6 Requirements R1, subpart 1.1 and TOP-003-8 Requirement R1, subpart 1.1 and Requirement R2, subpart 2.1 to ensure it is clear what data may be specifically requested to address FERC Order No. 901. In addition, IBR encompasses IBR-DER, and this information could be requested. • The DT considered adding a new subpart at the end of Requirement R1 (e.g., Part 1.6), but after reviewing requirement language, the DT determined the data and information lists within the existing subparts were the appropriate place to capture IBR-specific modeling data and parameters.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		MOD-032: • Generator Owner and Generator Operator – The DT decided to maintain applicability for just the Generator Owner and did not add Generator Operator as a functional entity to the applicability section. If data is needed from the Generator Operator, then the Generator Owner can reach out to the Generator Operator for necessary data via contractual obligations, etc. The DT does not find it necessary to require two applicable entities when one oversees the other. • The DT modified Attachment 1 to include generation and storage units, removed photovoltaic system (covered within IBR) and added Inverter-Based Resources. The wind turbine was updated for clarity that it is for Type 1 and Type 2, which is not included in the IBR definition.
P77. "With regard to AEU and ACP/SEIA's comments that the Commission direct NERC to specify data sharing requirements from transmission owners to generator owners and operators, we believe that this request may already be addressed through each transmission planner's existing processes. For example, the New York Independent System Operator (NYISO) and CAISO both have processes for obtaining such data after demonstrating a need for the specific information requested and that the required information protection and non-disclosure agreements are signed. Nevertheless, to support accurate modeling and performance, we direct NERC to consider during its standards development process AEU and ACP/SEIA's	MOD-032	**Theme:** Information going from Transmission Owner to Generator Owner/Generator Operator (consider): MOD-032 • There is no specific requirement within MOD-032 that requires Transmission Owners to share data with the Generator Owners and Generator Operators (and such a requirement would not be aligned with the purpose of MOD-032). However, Transmission Planners and Planning coordinators have a framework where requests for data can be sent for inclusion for the Interconnection-wide models. At this time, the DT does not see a need for a requirement to be drafted requiring Transmission Owners to provide data to Generator Owners and Generator Operators. The DT believes this is most appropriately addressed

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
suggested data sharing requirements when developing the framework, criteria, and necessary data exchange requirements to meet the registered IBR data sharing directive." **P74.** "AEU and ACP/SEIA ask that, in addition to data provision requirements for generator owners and operators, the Commission direct NERC to specify data sharing requirements from transmission owners to generator owners. For example, AEU explains that generator owners and operators also require data from transmission owners to support accurate modeling and performance, e.g., short circuit data, grid data for offshore wind, information on other power electronic devices around the IBR plant, and voltage harmonics. AEU adds that putting requirements on transmission owners would be consistent with revisions being developed for NERC's Modeling, Data, and Analysis (MOD) Reliability Standards."		through processes that exist outside of the MOD-032 Reliability Standard and concurs with the suggestion in P77 that these processes are already in place.
P78. "Commenters raised general concerns that mandating specific modeling and data submissions would reduce the flexibility and discretion of transmission planners and operators to identify the information they need. We find that, given the need for IBRs to operate in a predictable and reliable manner to ensure the reliable operation of the Bulk-Power System, it is necessary to establish uniform, minimum categories or types of data that must be provided so that Bulk-Power System planners and operators can predict the behavior of all IBRs. As discussed in more	MOD-032 TOP-003 IRO-010	**Theme:** Individual use of approved IBR models. (Uniform modeling framework) **Applicability:** Transmission Planner and Transmission Operator • Modifications made to MOD-032, including incorporation of an ERO Unacceptable Models list, establish an improved uniform modeling framework. IBR has been included in Attachment 1 of MOD-032 under steady state (item 3), dynamics (item 7), and short circuit specifying the minimum types of IBR data and capabilities that need to be collected as required per FERC Order No. 901.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
detail in section IV.C of this final rule, we are also directing NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models that accurately reflect the behavior of all IBRs during steady state, short-circuit, and dynamic conditions."		• Explicit reference to IBR data was added to the TOP-003 and IRO-010 standards along with provisions to ensure that models submitted under these standards are consistent with the models submitted under the framework established in MOD-032.
P86. "As a general matter, we agree with ACP/SEIA regarding the need to balance the burden to generator owners of collecting and providing data collected by disturbance monitoring equipment with the benefit of that data to reliability. Thus, in developing the directed data collection requirements, we direct NERC to consider the burdens of generators collecting and providing data, while assuring that Bulk-Power System operators and planners have the data they need for accurate disturbance monitoring and analysis. Likewise, regarding CAISO's request that the Commission direct NERC to consider requiring registered IBRs to provide additional data, we agree that such data collections may be warranted, and direct **NERC to consider through its standards development process whether additional IBR data points (e.g., telemetry collections or other automated platform integrations) are needed to further enhance real-time visibility of Bulk-Power System operations."**	TOP-003 IRO-010	**Theme:** Disturbance and monitoring (Consider) (real-time operations) **Applicability:** Generator Owner TOP-003/IRO-010 • TOP-003 and IRO-010 Reliability Standards are already structured in an open way so that any type of data needed can be requested at any time. In addition, transmission of information from the plant level is generally dealt with via interconnection agreements and does not rise to the level of a requirement being needed at this time. Lastly, PRC-028 PMU devices must be installed for every IBR installation. These additional monitoring devices will allow additional data requests related to those devices, if the applicable entities find that useful. Because of the two items above (the open method for data requests and the PRC-028 PMU devices), the standard balances the needs for the Transmission Operator to gather the data deemed necessary for reliability without uniform burden on all generating facilities.
P102. "Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal, with modification. Specifically, as proposed in the NOPR, we direct NERC to submit to the Commission for approval one or more new or modified Reliability Standards that require: (1)	MOD-032 IRO-010 TOP-003	**Theme:** 1) Transmission Owner directed to provide data for unregistered IBR and 2) Distribution Provider directed to provide data for IBR-DER **Applicability:** Transmission Owner and Distribution Provider

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
transmission owners to provide to Bulk-Power System planners and operators modeling data and parameters for unregistered IBRs in their transmission owner areas that, individually or in the aggregate, materially affect the reliable operation of the Bulk-Power System and (2) distribution providers to provide to Bulk-Power System planners and operators modeling data and parameters for IBR-DERs in the aggregate in their distribution provider areas where the IBR-DERs in the aggregate materially affect the reliable operation of the Bulk-Power System."		• The DT focused on the MOD-032 standard to address this directive from FERC. The DT added IBRs (including unregistered-IBRs) and DER (including IBR-DER) to Attachment 1 of the MOD-032 standard. In response to comments seeking more precision, the MOD-032 standard uses the phrase "an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes" to refer to the IBR resources encompassed by the term "unregistered IBR" in Order No. 901. • While the DT agrees that the Transmission Owner would be the typical entity for providing unregistered IBR data and the Distribution Provider would be the typical entity to provide DER data (as noted in Attachment 1 of MOD-032), the DT modified the Requirement language in response to comments to allow the Planning Coordinator and each of its Transmission Planners to identify the most appropriate entity to provide the data listed in Attachment 1 of MOD-032-2. Determination if an unregistered IBR or aggregate IBR-DER would "materially affect" the Bulk-Power System, requires engineering judgment and is not something that would be appropriate to precisely specify in a reliability standard. Thus, Attachment 1 footnote 7 was added to explicitly allow Transmission Planners and Planning Coordinators to specify DER thresholds that may be appropriate when considering impact to their local areas. • The DT made changes to the IRO-010 and TOP-003 standards to include IBRs specifically (see R1 of each standard), and to add references back to the MOD-032 standard. The DT determined that the IRO-010 and TOP-003 standards already included language in place to address IBR impacts.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
P104. "Recognizing that there may be instances in which transmission owners are unable to gather adequate unregistered IBR modeling data and parameters to create and maintain unregistered IBR models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation. We believe that this directive appropriately balances commenters' concerns about data accessibility and burden with the established need for transmission owners to provide unregistered IBR modeling data and parameters to Bulk-Power System planners and operators in their transmission owner area. We recognize that estimated modeling data and parameters are approximations of actual modeling data and parameters. We further acknowledge that there is some degree of error in estimated modeling data and parameters. However, on balance we believe that requiring such estimates with explanation of any limitations is an improvement from not having any data at all; and that even estimates will increase the overall adequacy of models and improve	MOD-032 IRO-010 TOP-003	**Theme 1:** 1) Estimation, if not able to get data from unregistered IBRs, 2) an explanation of the limitations of the availability of data, 3) explanation of the limitations of any data provided by unregistered IBRs, and 4) method for estimation. (directive) **Theme 2:** Implement a process or mechanism by which Transmission Owners would receive modeling data and parameters. (consider) **Applicability:** TO • The DT added Requirement R2, Part 2.1 allowing the functional entity to use the method of estimation should it find itself in a place unable to gather unregistered IBR data or DER data. However, it must include an explanation of the limitations of the data provided for unregistered IBRs or DERs (limitations on the availability and of the data provided) and the method used for estimation. • In addition, the DT added an explanation of the resources that are intended to be captured. In proposed MOD-032, "unregistered IBR" are described as IBRs that are not Distributed Energy Resources, as the DT proposes to define that term, and that would not meet the criteria in the NERC Rules of Procedure to register the owner of the IBR for the Generator Owner functional entity registration (as owning either category 1 or category 2 assets). As suggested by commenters, the DT has removed the phrase "Bulk-Power System" from this description to remove any potential for ambiguity in application. • While previous drafts of the MOD-032 standard used the shorthand phrase "unregistered IBR" to establish consistency with FERC Order No. 901, with the more fulsome description of

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
the reliability of the Bulk-Power System. To support this data collection, we further direct **NERC to consider commenters suggestions to implement a process or mechanism by which transmission owners would receive modeling data and parameters."**		those resources in the footnote, the DT moved this description to the requirement text (in lieu of the phrase "unregistered IBR") in response to comments. • It is important to note that Order No. 901 predated the changes NERC made to the Rules of Procedure to ensure that the owners and operators of such IBR resources would be registered with NERC for mandatory compliance purposes. NERC does not register IBRs as resources, but rather the owners of such resources based on the registry criteria for Generator Owner and Generator Operator. There are two categories of each: owners and operators of BES Facilities (category 1 GOs/GOPs); and owners and operators of non-BES inverter based generating resources that either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV (category 2 GOs/GOPs). In Order No. 901 parlance, ownership or operation of IBR resources meeting these criteria would require owner/operator registration and therefore would be considered "registered IBRs". In Order No. 901 parlance, ownership or operation of IBR resources that do not meet these criteria but are connected to a transmission system (i.e., are not Distributed Energy Resources) would not require owner/operator registration and therefore would be considered "unregistered IBR." • The DT discussed implementing a process or mechanism by which Transmission Owners would receive modeling data and parameters in depth. It was determined that if a TO is unable to gather data for unregistered IBRs and DERs, it is better to not

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		mandate a specific process for how Transmission Owners acquire or estimate data. Obtaining data for unregistered IBRs should not pose a significant challenge because such facilities are likely directly connected to a TO system and provision of necessary data should be specified in interconnection agreements or other contracts. Obtaining data for DERs would be more challenging as these facilities are connected to the TO system through a separate unregistered DP. In such cases, it is prudent to allow various estimation methods to be used. • The IRO-010 and TOP-003 Reliability Standards are drafted in a way that is open-ended and allows the respective applicable entities to request data needed. However, project 2022-02 DT added "Inverter-based Resource (IBR) specific data and parameters" to ensure it is clear that entities can request data when needed for operations assessments. To the extent modeling is needed, it should be consistent with modeling data provided under MOD-032 modeling framework. Therefore, the DT made changes to the IRO-010 and TOP-003 standards to require that model submissions for operations purposes under IRO-010 and TOP-003 are consistent with the model submissions for planning purposes under MOD-032, as applicable.
P105. "We also recognize that there may be instances where distribution providers are similarly unable to gather adequate modeling data and parameters from IBR-DERs. Accordingly, to account for instances in which distribution providers are unable to gather adequate modeling data and parameters of IBR-DERs to create and maintain IBR-DER models, we modify the NOPR proposal and direct NERC to develop new or	MOD-032 IRO-010 TOP-003	**Theme 1:** 1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation. (Directive) **Theme 2:** Consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters. (Consider)

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
modified Reliability Standards that require that each distribution provider, if unable to gather accurate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation. In support of above, we further direct NERC to consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters."		**Applicability:** Distribution Provider The DT added a new Requirement R2, Part 2.1 that if the responsible entity is unable to gather unregistered IBR data (*see description above*) or DER data and provide it to the Transmission Planner and Planning Coordinator, as specified in the data requirements and reporting procedures developed under Requirement R1, the responsible entity shall provide an estimate of the modeling data and parameters and include an explanation of the limitations of the data provided for unregistered IBRs or DERs (limitations on the availability and of the data provided) and the method used for estimation. The DT discussed the possible mechanism by which Distribution Providers would receive modeling data and parameters. The DT did not feel this rose to the level of a requirement as the Distribution Provider can ask for the modeling data and parameters from the respective entity.
P106. "Finally, as noted by commenters, we recognize that there may be instances where IBR-DERs are connected to an entity that does not meet the criteria for registration with NERC as a distribution provider. For those areas with IBR-DERs that in the aggregate materially affect the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we direct NERC to determine the appropriate registered entity responsible for providing data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, or, when unable to gather such accurate IBR-DERs data, to provide instead	MOD-032 IRO-010 TOP-003	**Theme:** Who is the responsible entity when no registered DP of IBR-DER (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation. • After much deliberation, the DT determined that if there is no registered Distribution Provider, then the next best entity would be a Transmission Owner. The DT created a footnote to Attachment 1 stating: "The Distribution Provider is the typical responsible entity for collecting and providing data for DERs

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation."		connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider's system. The Transmission Owner is the typical responsible entity for collecting and providing data for DERs where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner's system." • The DT asked industry the following question: "Do you agree that the Transmission Owner (TO) is typically the appropriate responsible entity for collecting and providing data for DER where there is no associated registered DP between the DER connection point and the TO's system?" Some commenters agreed that the TO is the correct entity who should gather data if there is no associated registered DP between the DER connection point and the TO system. However, many comments received stated that the TO has no authority to collect data, and the following entities would be better suited to gather the data needed: Registered DP, Balancing Authority, Planning Coordinator, LSE, Generator Owner, Transmission Operator, and Resource Planner. Based on this feedback, the DT modified the Requirement language to allow the Planning Coordinator and each of its Transmission Planners to identify the most appropriate entity to provide the data listed in Attachment 1 of MOD-032-2.
P108. "Regarding CAISO's concern regarding the potential "compliance trap" where planners and operators rely on third-party data and IRC's request	MOD-032 IRO-010 TOP-003	**Theme:** Minimum categories or types of data that must be provided to transmission planners, transmission operators, transmission owners, and distribution providers that are necessary to predict the behavior of all

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
that the final rule specify the data to be submitted by all IBRs (i.e., registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate) and transmission devices using similar technologies, we direct NERC to determine through its standards development process the minimum categories or types of data that must be provided to transmission planners, transmission operators, transmission owners, and distribution providers necessary to predict the behavior of all IBRs and to ensure that compliance obligations are clear. As discussed in more detail in section IV.C of this final rule, we are also directing NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models that accurately reflect the behavior of all IBRs during steady state, short-circuit, and dynamic conditions. By contrast, we believe that a directive to task distribution providers as the appropriate registered entity to collect and share the modeling data and parameters of IBR-DERs in the aggregate is preferable to deferring to the stakeholder process as suggested by APS. The distribution provider, as the entity providing and operating the lines between the transmission and distribution systems, is the entity best situated to have access to the data necessary for accurate estimation and, other than Indicated Trade Associations that suggested the piecemeal approach already discussed above, no commenter identified other potential entities as an equally efficient option."		IBRs and to ensure that compliance obligations are clear (ERO Approved Acceptable Criteria for Models/IEEE1547 ref./modify req./Tech rationale) **Applicability:** Transmission Planners, Transmission Operators, Transmission Owners, and Distribution Providers • The DT added Requirement R1, Part 1.4 to specify dynamic model submission requirements in Planning Coordinator/Transmission Planner data requirements and reporting procedures. • The focus of Requirement R1 Part 1.4 is obtaining accurate and usable models for IBRs. New Requirement R2 Part 2.3 provides that models with known deficiencies, such that the ERO included them on the Unacceptable Model List, shall not be submitted without technical justification. • Attachment 1 was modified to categorize the types of data required as per the directive (IBR, aggregate DER, Storage) necessary to facilitate model development. • Requirement R2, Part 2.1 requires entities to estimate unregistered IBR and IBR-DER data if the entity responsible for providing such data is unable to gather it.
P122. "Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop	MOD-032 IRO-010	**Theme**: Require the use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady state, short-

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions when developing planning, operations, and interconnection-wide models. For example, the new or modified Reliability Standards could reference the NERC approved component model list, which defines the models that may be used, and those models that may not be used, for specific types of studies. This approved component model list includes WECC's IBR models. Without requiring the use of approved industry generic library models, Bulk-Power System planners and operators may not be able to create system models that adequately predict IBR behaviors and subsequent impacts on the Bulk-Power System."	TOP-003	circuit, and dynamic conditions when developing planning, operations, and Interconnection-wide models. While FERC Order No. 901 directed NERC to "develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions" (P 108), the DT determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their Interconnection-wide models and subsequently their planning cases. The DT considered that many entities have a different understanding for what is a "generic model", and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The DT further considered that NERC as the ERO does not presently maintain an "acceptable model library", but rather an "unacceptable model library", and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion. Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		To bookend these criteria for acceptable models, proposed Requirement R2 would also require any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The Unacceptable Models List includes models that NERC has identified over time as having known issues. While the DT initially proposed to foreclose the use of such models, the DT considered feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The DT believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns. The DT debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the DT ultimately decided to include this requirement in Requirement R2 as it relates to how entities respond to data specifications. The DT has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the DT has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for entities for Reliability Standards compliance purposes. As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the Reliability and Security Technical Committee. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations would then be considered by the ERO and published on the NERC website. NERC staff are currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing.
P124. "We direct NERC to determine through its standards development process which nation-wide approved component models are needed to build IBR plant models for steady state, short-circuit, and		**Theme:** Nation-wide approved component models are needed to build IBR plant models for steady state, short-circuit, and dynamics studies. (Uniform Modeling framework)

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
dynamics studies. We acknowledge NERC's comment that user-defined models may be helpful for specific local reliability studies; however, the user-defined model cannot be used in place of nation-wide approved component models for regional analysis or interconnection-wide analysis because the user-defined model may cause non-convergence and other issues. However, NERC may allow the submission of user-defined models alongside the approved industry generic IBR model. Various entities do not accept user-defined models or only accept them for limited instances along with the open-source code which then allows internal model components to be viewed and modified. For example, PJM does not accept user-defined models and requires generic models for model verification in accordance with currently effective Reliability Standards MOD-026-1 and MOD-027-1. NYISO accepts a user-defined model in limited instances but requires either the open-source code (allowing anyone to access the internal model) or dynamic link library data and code files (compiled code that must be decompiled to view the internal model) that must be supplied for existing power flow software and in perpetuity."		The uniform modeling framework established in the proposed MOD-032 will focus on the use and representation of positive sequence phasor domain (PSPD) models in registered entity footprints and in Interconnection-wide models. Interconnection-wide modeling may be different from the models used in specialized studies dedicated to a particular technical objective. The ERO Unacceptable Models List applies to the models where NERC Reliability Standards require its use (generally for planning and operation models where multiple entities share information beyond their portion of the electric system, which includes Interconnection-wide models). Further guidance for interconnection applications can be found in the *NERC Dynamic Model Recommendations*. The DT considered introducing an approved model list for use in building cases specifically for Interconnection-wide analysis through Requirement R1 Part R1.2 of the proposed MOD-032, however, pre-defining a limited set of models that could be used to represent generation and system components is potentially at odds with objectives to also have accurate models, especially as technology rapidly progresses. To meet this directive, the DT modified Requirement R1 of MOD-032 by specifying the use of standard library "generic" models in Interconnection-wide cases while allowing the use of user-defined models. This provision was careful to address typically reported issues associated with user-defined models (UDMs) including non-convergence, by requiring that TP/PCs establish usability requirements for UDMs while incorporating an open, transparent process of identifying deficient models through the use of the "MOD-032 Supporting Documentation – Process for Updating the Unacceptable Models List Maintained by the ERO" and the "ERO Unacceptable Model list". Any TPs/PCs accepting UDMs shall provide

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		their UDM requirements to other PCs/TPs within the Interconnection upon request. The DT believes this approach balances the practical limitations of "generic models" raised by industry at the January 15-16 NERC Industry Engagement Workshop and re-iterated at the June NERC Industry Engagement Workshop with the need for an improved uniform modeling framework. The combination of specifying the use of standard library component models approved and offered by software simulation tools, along with the ERO maintained Unacceptable Model List and its processes, will ensure that models used in interconnection wide analysis are robust enough while accuracy is not compromised to any level of detail deemed necessary. The introductions to this framework increase the data specifications requirements when user-defined models are used. TOP-003 and IRO-010 proposed standards were modified to ensure models submitted are consistent with models submitted under the framework established in MOD-032.
P125. "Accordingly, we direct NERC to develop new or modified Reliability Standards that require the sole use of nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build interconnection-wide models. One example of a way NERC could meet this directive would be to require an equivalent generic library model along with all submissions of user-defined models so that the generic library model can be used when combining	MOD-032 IRO-010 TOP-003	**Theme:** Nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build Interconnection-wide models. (Uniform Modeling framework /Req language) • Nation-wide approved components via generic library models are addressed via the development of a framework established in the proposed MOD-032-2 through improvements to Requirements R1, R2, and R3. The inclusion of ERO Unacceptable Models List, MOD-032 Supporting Document, and additional

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
neighboring transmission system models and in interconnection-wide models."		requirement language aims to ensure uniformity in processes and models to facilitate the exchange of neighboring entities' respective planning/operation models and to build Interconnection-wide models. • The PC and TP are allowed to require provision of generic models, but if equipment-specific models satisfy usability criteria, and processes established through Requirements R1, R2, and R3 of the proposed MOD-032 standard, they are not prohibited. The framework explicitly allows for the submission of equivalent generic library models along with submissions of user-defined models which allows for the use of generic library models when combining neighboring transmission system models and Interconnection-wide models. • TOP-003 and IRO-010 proposed standards were modified to ensure models submitted are consistent with models submitted under the framework established in MOD-032.
P141. "We also direct NERC to require the generator owners of registered IBRs and the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g., planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of registered and unregistered IBRs, including momentary cessation and/or tripping, and all ride through behavior. Recognizing that there may be instances in which transmission owners are unable to gather accurate unregistered IBR modeling data and parameters to	MOD-032 IRO-010 TOP-003	**Applicability**: GO • Nation-wide approved components via generic library models are addressed via the modifications made to MOD-032, including incorporation of an ERO Unacceptable Models list, establishing an improved uniform modeling framework. This approach is aligned with the FERC Order directives while addressing the practical limitations raised by industry at the January 15-16 NERC Industry Engagement Workshop and re-iterated at the June NERC Industry Engagement Workshop. • MOD-032, Attachment 1 was modified to specifically add that capabilities related to momentary cessation, tripping, and Ride-

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
create and maintain accurate unregistered IBR dynamic models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas, dynamic models of unregistered IBRs using estimated data in accordance with this final rule's section IV.B.3 data sharing directives. Further, we direct NERC to require distribution providers to provide to the planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities aggregated dynamic models that adequately represent the dynamic performance of IBR-DERs on their systems that in the aggregate have a material impact on the Bulk-Power System, including momentary cessation and/or tripping, and all ride through behavior (e.g., IBR-DERs in the aggregate modeled by interconnection requirements performance to represent different steady-state and dynamic behavior). Recognizing that there may be instances in which distribution providers are unable to gather data that accurately represents IBR-DERs in the aggregate, we modify the NOPR proposal and direct NERC to include in the proposed new or modified Reliability Standards a requirement that the distribution provider, if unable to gather data of IBR-DERs that in the aggregate have a material impact on		through, be reflected in the required model data for IBR and DER. • Explicit reference to IBR data was added to the TOP-003 and IRO-010 standards along with provisions to ensure that models submitted under these standards are consistent with the models submitted under the framework established in MOD-032.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
the Bulk-Power System, provide to the Bulk-Power System planners and operators (i.e., the data recipients) a dynamic model using estimated data for IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, in accordance with this final rule's section IV.B.3 data sharing directives. Furthermore, we acknowledge that there may be areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider. Therefore, we modify the NOPR proposal and direct NERC to determine the appropriate registered entity responsible for providing adequate data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and to identify the registered entities for coordinating, verifying, and keeping up to date the respective dynamic models. Finally, NERC must ensure that the proposed new or modified Reliability Standards account for the dynamic performance of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System."		
P146. Accordingly, **we direct NERC to develop new or modified Reliability Standards that require the use of the DER_A model or successor models to represent the behaviors of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System at a sufficient level of fidelity for Bulk-Power System planners and operators to create valid planning and operations and interconnection-wide models and to**	MOD-032 IRO-010 TOP-003	**Theme**: IBR-DER Model • As per the directive, the DT is requiring the modeling of aggregate DER through requirement R1 and Attachment 1. The currently available DER_A model is sufficient only for positive sequence phasor domain simulations. With the variety of other simulation domains (such as EMT and short circuit) necessary to study IBRs, mandating this model could prevent TPs or PCs from

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
be able to perform respective system studies. For example, the new or modified Reliability Standards could require models of IBR-DERs (i.e., DER_A model) to adequately reflect the steady-state and dynamic aggregate resource performance in both a transmission area and across the interconnection. Additionally, estimated modeling data and parameters of IBR-DERs that in the aggregate (i.e., DER_A model) have a material impact on the Bulk-Power System could be used where measured and collected data is not available. We believe requiring the DER_A model will address NERC's request for entities to work collaboratively with the state regulators to identify, implement, and perform an effective model validation approach for IBR-DERs in the aggregate as opposed to requiring validated models of IBR-DER in the aggregate that can have a material impact on the reliable operation of the Bulk-Power System.		performing their studies. This further reinforces the DT's election to not require the use of the DER_A model, but rather a model that achieves specific performance criteria and conforms with MOD-032 edits in Attachment 1 and Requirement R1. The fidelity/accuracy components of the FERC directives were generally considered to be within the SAR scopes for Projects 2020-06 and 2021-01, not Project 2022-02. However, the model framework established with the proposed MOD-032-2 does facilitate model fidelity and accuracy by allowing flexibility in model selection (rather than mandating use of a defined set of models). Specific fidelity/accuracy evaluations are beyond the scope of MOD-032. • The DT considered referencing the DER_A model specifically, but refrained due to the rapidly evolving nature of models and concerns for the time required to update such a reference in a NERC Standard. Additionally, the DT is not specifying particular library models for other resources, so specifying a particular model for DER will invite challenges. Further, challenges with precisely defining and determining what a "successor model" is could potentially create more future reliability risks. The standard as currently written allows for additional future models of higher fidelity to be accommodated.
P157. We believe the development of new or modified Reliability Standards is an important corollary to NERC's ongoing effort to identify and register generator owners and operators of IBRs. Although NERC's registration changes will not at this time address IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, we believe APS's concerns	MOD-032 TOP-003 IRO-010	**Theme:** The responsible entity for IBR-DER data when there is no registered DP. Upon a decent amount of conversation, the DT determined that if there is no registered Distribution Provider, then the next best entity would be a Transmission Owner. The DT created a footnote to Attachment 1 stating: "The Distribution Provider is the typical responsible entity for

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
regarding system-wide model validation is addressed in NERC's Reliability Guidelines and through the use of the EPRI DER Settings Database. We recognize that some distribution providers may not be able to provide a precise set of modeling data and parameters that accurately represent IBR-DERs in the aggregate. For these situations, NERC has provided a technical means to estimate in aggregating the needed IBR-DER modeling data and parameters (i.e., for the DER_A model) in the IBR-DER Data Collection Guideline. Further, NERC's 2021 Aggregate DER Model Verification Guideline provides transmission planners and planning coordinators with tools and techniques that can be adapted for their specific systems to verify that aggregate DER models (i.e., DER_A models) are a suitable representation of these resources in planning assessments. **Furthermore, for those areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we modify the NOPR proposal to direct NERC to determine the appropriate registered entity responsible for the data and parameters of IBR-DERs in the aggregate and to establish a process that requires identified registered entities to coordinate, validate, and keep up to date the system models.**		collecting and providing data for DERs connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider's system. The Transmission Owner is the typical responsible entity for collecting and providing data for DER where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner's system." The use of the word "typical" is intentional to indicate the most likely entity based on the DT's broad understanding but allows flexibility per Requirement 1 for the PC/TPs to select a more appropriate entity or entities in their area based on regional or jurisdictional differences.
P161. "Pursuant to section 215(d)(5) of the FPA, we modify the NOPR proposal to provide additional specificity to explain coordination and keep up to date in a timely manner the verified data and models of	MOD-032 IRO-010 TOP-003	The proposed Milestone 3 Reliability Standards collectively address the Commission's directives in Order No. 901 paragraph 161.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate in the system models. **Specifically, we direct NERC to develop new or modified Reliability Standards that require planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities to establish for each interconnection a uniform framework with modeling criteria, a registered modeling designee, and necessary data exchange requirements both between themselves and with the generator owners, transmission owners, and distribution providers to coordinate the creation of transmission planning, operations, and interconnection-wide models (i.e., system models) and the validation of each respective system model.** Further, we direct NERC to include in the new or modified Reliability Standards a requirement for generator owners, transmission owners, and distribution providers to regularly update and communicate the verified data and models of registered IBRs, unregistered IBRs, and IBR-DERs by comparing their resulting models against actual operational behavior to achieve and maintain necessary modeling accuracy for inclusion of these resources in the system models. For those areas with IBR-DERs in the aggregate that have a material impact on the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we modify the NOPR proposal to direct NERC to determine the appropriate registered entity		The Project 2022-02 DT modified MOD-032 to ensure it captures the uniform framework with modeling criteria, and necessary data exchange requirements for registered IBR, unregistered IBR, and DER (to include IBR-DER). Modifications in TOP-003 and IRO-010 are intended to promote consistency in models submitted for planning purposes and operations purposes so that entities responsible for planning and operating the BPS are all working from similar models that accurately represent the resources within their footprints. • A uniform modeling framework is established in the proposed MOD-032-2 through improvements to R1, R2, and R3 and Attachment 1. The inclusion of the ERO Unacceptable Models List (and additional revision process) and additional requirement language aims to ensure uniformity in processes and models to facilitate the exchange of neighboring entities' respective planning/operation models and to build Interconnection-wide models. Where appropriate, there are flexibilities built into this framework to accommodate differences in planning area modeling needs. • The PC and TP are allowed to require standard library models, but if user-written models satisfy usability criteria, and processes established through R1, R2, and R3 of the proposed MOD-032-2 standard, they are not prohibited. The framework explicitly allows for the submission of standard library models along with submission of user-written models which allows for the use of standard library models when combining neighboring transmission system models and Interconnection-wide models. If user written models are accepted, the PC and TP are required to share their usability criteria with other planning entities within the Interconnection upon request.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
responsible for the models of those IBR-DERs and to determine the registered entities responsible for updating, verifying, and coordinating models for IBR-DERs in the aggregate to meet the system models directives. NERC may implement this directive by modifying Reliability Standards MOD-032-1 and MOD-033-2 or by developing new Reliability Standards to establish requirements mandating an annual process to coordinate, validate, and keep up-to-date the transmission planning, operations, and interconnection-wide models."		• The DT added IBRs (including unregistered-IBRs) and DER (including IBR-DER) to Attachment 1 of the proposed MOD-032-2 standard. While the TO would be the typical entity for providing unregistered IBR data and the DP would be the typical entity to provide DER data (as noted in Attachment 1 of proposed MOD-032-2), the DT recognized that there may be some variations as to whom might have the most accurate and usable data for unregistered resources in the planning area. Therefore, the DT modified the Requirement language to allow the PC and each of its TPs to identify the most appropriate entity to provide the data listed in Attachment 1 of proposed MOD-032-2. • Similarly, a determination if an unregistered IBR or aggregate IBR-DER would "materially affect" the Bulk-Power System requires engineering judgment and the consideration of other material factors, which would not be prudent to prescribe in a Reliability Standard. Thus, Attachment 1 footnote 7 of proposed MOD-032-2 was added to explicitly allow PCs/TPs to specify DER thresholds that may be appropriate when considering impact to their local areas. • The DT made changes to the IRO-010 and TOP-003 standards to include IBRs specifically (see R1 of each standard). To the extent IBR modeling data is deemed necessary under IRO-010 and TOP-003, it should be consistent with modeling data provided for planning purposes. Therefore, the DT made changes to IRO-010 and TOP-003 to require that model submissions for operations purposes under IRO-010 and TOP-003 are consistent with the model submissions for planning purposes. Consistency in models is important to ensure BPS planners and operators are working from similar and high quality models; however, the DT recognized that operations entities may

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		require some adjustments from the model submitted for planning purposes to satisfy the needs in an operations environment. The fidelity/accuracy components of the FERC directives were generally considered to be within the SAR scopes for Projects 2020-06 and 2021-01, rather than Project 2022-02. However, the model framework established with the proposed MOD-032-2 does facilitate model fidelity and accuracy by allowing flexibility in model selection, so that entities may select the most representative model for the resource meeting PC/TP requirements (rather than mandating use of a defined set of models which may quickly become out-of-date). Models that are known to have fidelity issues are not to be submitted without technical justification. Specific fidelity/accuracy evaluations are beyond the scope of MOD-032, but are addressed in other proposed Milestone 3 Reliability Sstandards. The DT confirmed the link between these standards by requiring that models submitted under MOD-032 shall be the models verified under MOD-026, where available. System models developedvalidated under MOD-033 shall be developedperformed in accordance with data provided under MOD-032 and MOD-033. Regarding thate part of the directive to keep models up to date, MOD-032-1 already mandated a "schedule for submission of data at least once every 13 calendar months." This requirement is maintained in proposed MOD-032-2. System models will thus be built on updated data and models, which are verified and validated in accordance with the proposed MOD-033-2 and MOD-026-2 standards. With regards to that part of the p.161 directive addressing a "registered model designee" for building the Interconnection-wide cases, NERC considered the directive and concluded that the present ERO modeling

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		designee framework, with notable enhancements since 2023, presents an equally effective and efficient alternative to designating an entity on the NERC Compliance Registry to perform the tasks of Interconnection-wide model building. Further, the present framework, as enhanced since 2023, has distinct advantages over designating a responsible entity in that it maintains ongoing oversight of the Interconnection case building process, rather than compliance/audit-focused oversight with a retroactive focus. Additional explanation is provided below. **Registered Modeling Designee:** The current MOD-032-1 Requirement R4 requires each PC to make available models for its planning area provided under R2 to the Electric Reliability Organization (ERO) or its designee to support the creation of the Interconnection-wide cases. This is not changed in proposed MOD-032-2 R4. As noted above, proposed MOD-032-2 Requirement R1, Part 1.1 would require the PC and each of its TPs to identify the entity responsible for each required item in Attachment 1. That entity must provide the information under Requirement R2. A new Requirement R2, Part 2.2 has been added to require models provided under MOD-026 to be accepted by the TP, where available Requirement R3 requires notification from the PC or TP regarding technical concerns with the data submitted under Requirement R2. This improved framework for modeling contemplates coordination and model updates as needed by registered entities as models are collected to build the Interconnection-wide cases. As to who builds the Interconnction-wide base case model, the ERO has designated entities with a sufficient wide area view and focus on reliability for each Interconnection to perform this work. For the Texas Interconnection, the Texas Regional Entity performs this work in

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		coordination with ERCOT. For the Western Interconnection, the Western Electric Coordinating Council (WECC) performs this work. For the Eastern Interconnection, the Eastern Interconnection Reliability Assessment Group (ERAG) consisting of MRO, NPCC, RF, and SERC performs this work. The ERAG also performs the base-case model creator function for the Quebec Interconnection in Canada. As the ERO, NERC is responsible for overseeing and ensuring that these designated entities perform the proposed MOD-032-2 Requirement R4 activities. In 2023, the Officers Leadership Team of the ERO Enterprise approved the MOD-032 Designee process document. This process document reflects the maturation of this aspect of the ERO's activities and contains clauses and processes that require the designee for the Interconnection to perform specific duties. Each designee must have certain attributes, including a governance structure responsive to the needs of Planning Coordinators, with clear roles and responsibilities for model creation, transparency in data requirements, establishing timeframes for review cycles, and defining security and access to models. Certain core cases are required as part of this process, including core cases for the ERO for use in seasonal planning studies and event analyses. Other core cases are required for validating Interconnection Frequency Response obligations and event analyses. Lastly, the process requires the development of typical cases to support implementation of the TPL-001 standard. NERC or the Regional Entities may request additional specialized cases as needed. Designated entities have certain responsibilities under this framework, including developing a method for collecting data from all Planning Coordinators and developing and maintaining a case creation manual

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		including the process by which cases must be assembled, tested for quality, and tested for case fidelity according to ERO case quality metrics. NERC will perform an annual case quality assessment, and the designee must address any case model deficiencies identified by NERC. The process also contemplates feedback processes and processes for correcting cases or addressing recurring data or model errors with Planning Coordinators, among other controls, to ensure quality. Regarding the ERAG, there is also an Eastern Interconnection Regional Entity Agreement among MRO, NPCC, RF, and SERC[1]. In this agreement, there are provisions for oversight and coordination in how this group exercises its authority as the MOD-032 designee. Connections to MOD-032 are acknowledged, such as: • Oversight of the Multiregional Modeling Working Group[2] (MMWG, whose membership is comprised of one power flow representative and one dynamics representative from each of the Data Submitting Entities (comprised of Planning Coordinators or group of Planning Coordinators) and non-voting representatives as follows: one liaison representative each of the EI Regions and the ERAG Chair, a coordinator from each of the organizations that provides model development services to MMWG, and NERC and FERC staff liaisons. ○ The purpose of the MMWG is to coordinate, in a timely manner, the development of designated power flow and

1 EI-Regional-Entity-Agmt-Final-Signed.pdf

2 ERAG-MMWG-Charter-2024.pdf

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		dynamics simulation base case models that realistically simulate steady state and dynamic bulk electric system behavior of the Eastern Interconnection. ○ To ensure cases and models are done in a consistent fashion, the MMWG holds three annual meetings along with conference calls as needed. The MMWG roster includes a FERC liaison who can attend all meetings. The group maintains a case building procedure manual[3] that is used by its members. The manual contains a set of data checks that are performed on the steady state and dynamic cases. • Oversight of the Acceptable Model Working Group (AMWG)[4], which is comprised of: (1) Planning Coordinators or group of Planning Coordinators who are responsible for the development and maintenance of an Eastern Interconnection dynamic acceptable model list, and (2) RE and NERC staff who are responsible for coordination and facilitation. ○ The group was formed in 2023 and recently published the first version of its acceptable model list which was posted to the public ERAG website[5]. As models are removed from the acceptable list, the group develops an industry communication to begin removing those models from the annual set of cases.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		○ Oversight includes review of all process changes made to the AMWG procedures to ensure consistency with the NERC case quality metrics. In addition, NERC further considered the following information provided by the MOD-032 Designee Group comprised of members from NERC and the Regional Entities: **MOD-032 Designee Group:** The electric grid is evolving at an unprecedented pace, driven by the rapid integration of inverter-based resources (IBRs), changing load characteristics, and emerging technologies. As the system transforms, the models we use to study and understand its behavior must also transform. We recognize the growing challenge of obtaining and coordinating accurate dynamic models for IBRs, including securing the appropriate parameters needed to ensure that simulation results reflect real-world system performance. Addressing these modeling challenges is essential to maintaining the reliability and resilience of the bulk power system and requires close collaboration, and the MOD-032 designees along with PCs are committed to and holding data providers accountable for model coordination and model quality. The MOD-032 designees are committed to ensuring that the model quality is maintained and there is a mechanism in place for the PC/TP to gather the appropriate information from the Generator Owners (GO). NERC facilitates the designee group of Regional Entity staff who are responsible for designee activities.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		*** In summary, the proposed revisions to the standards addressed in Milestone 3 work, along with the ERO designated entity framework discussed above for building Interconnection-wide cases, address the concerns underlying the Commission's directive in paragraph 161 of Order No. 901 regarding the coordination, updating, and timely development of quality Interconnection-wide models that accurately represent the behavior of IBRs in the Interconnection. Further, this framework advances consistency in modeling used across planning and ERO assessment activities. NERC therefore submits that this framework represents an equally effective and efficient approach to addressing this part of the Commission's paragraph 161 directive to identify a registered modeling designee in the MOD-032 standard.
P226. "Although we are not directing NERC to include implementation dates in its informational filing and are leaving determination of the proposed effective dates to the standards development process, we are concerned that the lack of a time limit for implementation could allow identified issues to remain unresolved for a significant and indefinite period. Therefore, we emphasize that industry has been aware of and alerted to the need to address the impacts of IBRs on the Bulk-Power System since at least 2016. The number of events, NERC Alerts, reports, whitepapers, guidelines, and ongoing standards projects more than demonstrate the need for the expeditious implementation of new or modified Reliability Standards addressing IBR data sharing, data and model validation, planning and operational studies, and performance requirements. Thus, in that light, the	MOD-032 IRO-010 TOP-003	**Theme:** Sufficient timeframe. The DT felt that four years was an appropriate timeframe for the MOD-032, IRO-010, and TOP-003 implementation times. It is understood that based on what is required via MOD-032, industry would need two years to hold meetings with stakeholders to establish processes for collecting the needed models and data, and then an additional two years to update models based on the new requirements, etc. However, taking into consideration the FERC Order 901 implementation deadline of 2030, the DT settled on a three-year implementation time knowing that milestone 4 revisions still need to be implemented by 2030 and are dependent on the Milestone 3 implementation plan time. Three- year implementation plans were also selected for TOP-003 and IRO-010 to align potential new data requests under TOP-003 and IRO-010 with the expected data availability under MOD-032 processes.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
Commission will consider the justness and reasonableness of each new or modified Reliability Standard's implementation plan when it is submitted for Commission approval. Further, we believe that there is a need to have all of the directed Reliability Standards effective and enforceable well in advance of 2030 and direct NERC to ensure that the associated implementation plans sequentially stagger the effective and enforceable dates to ensure an orderly industry transition for complying with the IBR directives in this final rule prior to that date."		

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of FERC Order No. 901 Directives

Milestone 3: Project 2022-02 Uniform Modeling Framework for IBR
September 2025

On October 23, 2023, FERC issued a Final Rule, Order No. 901, directing the North American Electric Reliability Corporation (NERC) to develop new or modified Reliability Standards that address aggregation of data, parameters, and estimation methods to provide the Transmission Planner (TP) and Transmission Operator (TOP) with the estimate values, explanation for limitations on data availability, and the method used for all estimations. This project has a FERC regulatory deadline of November 4, 2025. Below provides the directives from FERC Order 901 along with the drafting team's (DT's) consideration of the directives.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
P7. "… Second, by November 4, 2025, NERC must submit new or modified Reliability Standards addressing the interrelated directives concerning: (1) data sharing for registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate…"	IRO-010 MOD-032 TOP-003	A timeline has been drafted to meet the regulatory deadline of November 4, 2025. Completed tasks listed below. • An industry workshop completed January 14-17, 2025. (outreach) • Many virtual DT meetings completed weekly from January – March 2025. (publicly posted) • In-person DT completed February 11-13, 2025. (publicly posted) • Industry Webinar March 6, 2025. (publicly posted) • DT outreach with trade groups and entities March 3-14, 2025 • Industry comment and ballot period April 17-May 16, 2025. (publicly posted)

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		• A second industry workshop completed June 3-5, 2025. (publicly posted) • Many virtual meetings were completed weekly from May 19-July 23, 2025. • Industry outreach with trade groups and entities July 3-23, 2025. • Industry comment and ballot period August 8-September 10, 2025.
P76. "Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require registered IBR generator owners and operators to provide IBR-specific modeling data and parameters (e.g., steady-state, dynamic, and short circuit modeling information, and control settings for momentary cessation and ramp rates) that accurately represent the registered IBRs to their planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities that are responsible for planning and operating the Bulk-Power System. As several commenters indicate, ensuring the sharing of appropriate IBR modeling data is critical to create and maintain the models used in reliability studies, and in turn to ensure that Bulk-Power System transmission planners or operators are able to plan for, operate, and reliably integrate IBRs onto the Bulk-Power System."	IRO-010 MOD-032 TOP-003	**Theme:** Inverter-Based Resource (IBR) /Generator Owner to provide specific modeling data. IRO-010 and TOP-003: • While TOP-003 and IRO-010 allow any data to be requested, the DT felt it was important to add "IBR-specific data and parameters" specifically to IRO-010-6 Requirements R1, subpart 1.1 and TOP-003-8 Requirement R1, subpart 1.1 and Requirement R2, subpart 2.1 to ensure it is clear what data may be specifically requested to address FERC Order No. 901. In addition, IBR encompasses IBR-DER, and this information could be requested. • The DT considered adding a new subpart at the end of Requirement R1 (e.g., Part 1.6), but after reviewing requirement language, the DT determined the data and information lists within the existing subparts were the appropriate place to capture IBR-specific modeling data and parameters.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		MOD-032: • Generator Owner and Generator Operator – The DT decided to maintain applicability for just the Generator Owner and did not add Generator Operator as a functional entity to the applicability section. If data is needed from the Generator Operator, then the Generator Owner can reach out to the Generator Operator for necessary data via contractual obligations, etc. The DT does not find it necessary to require two applicable entities when one oversees the other. • The DT modified Attachment 1 to include generation and storage units, removed photovoltaic system (covered within IBR) and added Inverter-Based Resources. The wind turbine was updated for clarity that it is for Type 1 and Type 2, which is not included in the IBR definition.
P77. "With regard to AEU and ACP/SEIA's comments that the Commission direct NERC to specify data sharing requirements from transmission owners to generator owners and operators, we believe that this request may already be addressed through each transmission planner's existing processes. For example, the New York Independent System Operator (NYISO) and CAISO both have processes for obtaining such data after demonstrating a need for the specific information requested and that the required information protection and non-disclosure agreements are signed. Nevertheless, to support accurate modeling and performance, we direct NERC to consider during its standards development process AEU and ACP/SEIA's	MOD-032	**Theme:** Information going from Transmission Owner to Generator Owner/Generator Operator (consider): MOD-032 • There is no specific requirement within MOD-032 that requires Transmission Owners to share data with the Generator Owners and Generator Operators (and such a requirement would not be aligned with the purpose of MOD-032). However, Transmission Planners and Planning coordinators have a framework where requests for data can be sent for inclusion for the Interconnection-wide models. At this time, the DT does not see a need for a requirement to be drafted requiring Transmission Owners to provide data to Generator Owners and Generator Operators. The DT believes this is most appropriately addressed

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
suggested data sharing requirements when developing the framework, criteria, and necessary data exchange requirements to meet the registered IBR data sharing directive." **P74.** "AEU and ACP/SEIA ask that, in addition to data provision requirements for generator owners and operators, the Commission direct NERC to specify data sharing requirements from transmission owners to generator owners. For example, AEU explains that generator owners and operators also require data from transmission owners to support accurate modeling and performance, e.g., short circuit data, grid data for offshore wind, information on other power electronic devices around the IBR plant, and voltage harmonics. AEU adds that putting requirements on transmission owners would be consistent with revisions being developed for NERC's Modeling, Data, and Analysis (MOD) Reliability Standards."		through processes that exist outside of the MOD-032 Reliability Standard and concurs with the suggestion in P77 that these processes are already in place.
P78. "Commenters raised general concerns that mandating specific modeling and data submissions would reduce the flexibility and discretion of transmission planners and operators to identify the information they need. We find that, given the need for IBRs to operate in a predictable and reliable manner to ensure the reliable operation of the Bulk-Power System, it is necessary to establish uniform, minimum categories or types of data that must be provided so that Bulk-Power System planners and operators can predict the behavior of all IBRs. As discussed in more	MOD-032 TOP-003 IRO-010	**Theme:** Individual use of approved IBR models. (Uniform modeling framework) **Applicability:** Transmission Planner and Transmission Operator • Modifications made to MOD-032, including incorporation of an ERO Unacceptable Models list, establish an improved uniform modeling framework. IBR has been included in Attachment 1 of MOD-032 under steady state (item 3), dynamics (item 7), and short circuit specifying the minimum types of IBR data and capabilities that need to be collected as required per FERC Order No. 901.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
detail in section IV.C of this final rule, we are also directing NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models that accurately reflect the behavior of all IBRs during steady state, short-circuit, and dynamic conditions."		• Explicit reference to IBR data was added to the TOP-003 and IRO-010 standards along with provisions to ensure that models submitted under these standards are consistent with the models submitted under the framework established in MOD-032.
P86. "As a general matter, we agree with ACP/SEIA regarding the need to balance the burden to generator owners of collecting and providing data collected by disturbance monitoring equipment with the benefit of that data to reliability. Thus, in developing the directed data collection requirements, we direct NERC to consider the burdens of generators collecting and providing data, while assuring that Bulk-Power System operators and planners have the data they need for accurate disturbance monitoring and analysis. Likewise, regarding CAISO's request that the Commission direct NERC to consider requiring registered IBRs to provide additional data, we agree that such data collections may be warranted, and direct **NERC to consider through its standards development process whether additional IBR data points (e.g., telemetry collections or other automated platform integrations) are needed to further enhance real-time visibility of Bulk-Power System operations."**	TOP-003 IRO-010	**Theme:** Disturbance and monitoring (Consider) (real-time operations) **Applicability:** Generator Owner TOP-003/IRO-010 • TOP-003 and IRO-010 Reliability Standards are already structured in an open way so that any type of data needed can be requested at any time. In addition, transmission of information from the plant level is generally dealt with via interconnection agreements and does not rise to the level of a requirement being needed at this time. Lastly, PRC-028 PMU devices must be installed for every IBR installation. These additional monitoring devices will allow additional data requests related to those devices, if the applicable entities find that useful. Because of the two items above (the open method for data requests and the PRC-028 PMU devices), the standard balances the needs for the Transmission Operator to gather the data deemed necessary for reliability without uniform burden on all generating facilities.
P102. "Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal, with modification. Specifically, as proposed in the NOPR, we direct NERC to submit to the Commission for approval one or more new or modified Reliability Standards that require: (1)	MOD-032 IRO-010 TOP-003	**Theme:** 1) Transmission Owner directed to provide data for unregistered IBR and 2) Distribution Provider directed to provide data for IBR-DER **Applicability:** Transmission Owner and Distribution Provider

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
transmission owners to provide to Bulk-Power System planners and operators modeling data and parameters for unregistered IBRs in their transmission owner areas that, individually or in the aggregate, materially affect the reliable operation of the Bulk-Power System and (2) distribution providers to provide to Bulk-Power System planners and operators modeling data and parameters for IBR-DERs in the aggregate in their distribution provider areas where the IBR-DERs in the aggregate materially affect the reliable operation of the Bulk-Power System."		• The DT focused on the MOD-032 standard to address this directive from FERC. The DT added IBRs (including unregistered-IBRs) and DER (including IBR-DER) to Attachment 1 of the MOD-032 standard. In response to comments seeking more precision, the MOD-032 standard uses the phrase "an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes" to refer to the IBR resources encompassed by the term "unregistered IBR" in Order No. 901. • While the DT agrees that the Transmission Owner would be the typical entity for providing unregistered IBR data and the Distribution Provider would be the typical entity to provide DER data (as noted in Attachment 1 of MOD-032), the DT modified the Requirement language in response to comments to allow the Planning Coordinator and each of its Transmission Planners to identify the most appropriate entity to provide the data listed in Attachment 1 of MOD-032-2. Determination if an unregistered IBR or aggregate IBR-DER would "materially affect" the Bulk-Power System, requires engineering judgment and is not something that would be appropriate to precisely specify in a reliability standard. Thus, Attachment 1 footnote 7 was added to explicitly allow Transmission Planners and Planning Coordinators to specify DER thresholds that may be appropriate when considering impact to their local areas. • The DT made changes to the IRO-010 and TOP-003 standards to include IBRs specifically (see R1 of each standard), and to add references back to the MOD-032 standard. The DT determined that the IRO-010 and TOP-003 standards already included language in place to address IBR impacts.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
P104. "Recognizing that there may be instances in which transmission owners are unable to gather adequate unregistered IBR modeling data and parameters to create and maintain unregistered IBR models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation. We believe that this directive appropriately balances commenters' concerns about data accessibility and burden with the established need for transmission owners to provide unregistered IBR modeling data and parameters to Bulk-Power System planners and operators in their transmission owner area. We recognize that estimated modeling data and parameters are approximations of actual modeling data and parameters. We further acknowledge that there is some degree of error in estimated modeling data and parameters. However, on balance we believe that requiring such estimates with explanation of any limitations is an improvement from not having any data at all; and that even estimates will increase the overall adequacy of models and improve	MOD-032 IRO-010 TOP-003	**Theme 1:** 1) Estimation, if not able to get data from unregistered IBRs, 2) an explanation of the limitations of the availability of data, 3) explanation of the limitations of any data provided by unregistered IBRs, and 4) method for estimation. (directive) **Theme 2:** Implement a process or mechanism by which Transmission Owners would receive modeling data and parameters. (consider) **Applicability:** TO • The DT added Requirement R2, Part 2.1 allowing the functional entity to use the method of estimation should it find itself in a place unable to gather unregistered IBR data or DER data. However, it must include an explanation of the limitations of the data provided for unregistered IBRs or DERs (limitations on the availability and of the data provided) and the method used for estimation. • In addition, the DT added an explanation of the resources that are intended to be captured. In proposed MOD-032, "unregistered IBR" are described as IBRs that are not Distributed Energy Resources, as the DT proposes to define that term, and that would not meet the criteria in the NERC Rules of Procedure to register the owner of the IBR for the Generator Owner functional entity registration (as owning either category 1 or category 2 assets). As suggested by commenters, the DT has removed the phrase "Bulk-Power System" from this description to remove any potential for ambiguity in application. • While previous drafts of the MOD-032 standard used the shorthand phrase "unregistered IBR" to establish consistency with FERC Order No. 901, with the more fulsome description of

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
the reliability of the Bulk-Power System. To support this data collection, we further direct **NERC to consider commenters suggestions to implement a process or mechanism by which transmission owners would receive modeling data and parameters."**		those resources in the footnote, the DT moved this description to the requirement text (in lieu of the phrase "unregistered IBR") in response to comments. • It is important to note that Order No. 901 predated the changes NERC made to the Rules of Procedure to ensure that the owners and operators of such IBR resources would be registered with NERC for mandatory compliance purposes. NERC does not register IBRs as resources, but rather the owners of such resources based on the registry criteria for Generator Owner and Generator Operator. There are two categories of each: owners and operators of BES Facilities (category 1 GOs/GOPs); and owners and operators of non-BES inverter based generating resources that either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV (category 2 GOs/GOPs). In Order No. 901 parlance, ownership or operation of IBR resources meeting these criteria would require owner/operator registration and therefore would be considered "registered IBRs". In Order No. 901 parlance, ownership or operation of IBR resources that do not meet these criteria but are connected to a transmission system (i.e., are not Distributed Energy Resources) would not require owner/operator registration and therefore would be considered "unregistered IBR." • The DT discussed implementing a process or mechanism by which Transmission Owners would receive modeling data and parameters in depth. It was determined that if a TO is unable to gather data for unregistered IBRs and DERs, it is better to not

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		mandate a specific process for how Transmission Owners acquire or estimate data. Obtaining data for unregistered IBRs should not pose a significant challenge because such facilities are likely directly connected to a TO system and provision of necessary data should be specified in interconnection agreements or other contracts. Obtaining data for DERs would be more challenging as these facilities are connected to the TO system through a separate unregistered DP. In such cases, it is prudent to allow various estimation methods to be used. • The IRO-010 and TOP-003 Reliability Standards are drafted in a way that is open-ended and allows the respective applicable entities to request data needed. However, project 2022-02 DT added "Inverter-based Resource (IBR) specific data and parameters" to ensure it is clear that entities can request data when needed for operations assessments. To the extent modeling is needed, it should be consistent with modeling data provided under MOD-032 modeling framework. Therefore, the DT made changes to the IRO-010 and TOP-003 standards to require that model submissions for operations purposes under IRO-010 and TOP-003 are consistent with the model submissions for planning purposes under MOD-032, as applicable.
P105. "We also recognize that there may be instances where distribution providers are similarly unable to gather adequate modeling data and parameters from IBR-DERs. Accordingly, to account for instances in which distribution providers are unable to gather adequate modeling data and parameters of IBR-DERs to create and maintain IBR-DER models, we modify the NOPR proposal and direct NERC to develop new or	MOD-032 IRO-010 TOP-003	**Theme 1:** 1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation. (Directive) **Theme 2:** Consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters. (Consider)

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
modified Reliability Standards that require that each distribution provider, if unable to gather accurate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation. In support of above, we further direct NERC to consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters."		**Applicability:** Distribution Provider The DT added a new Requirement R2, Part 2.1 that if the responsible entity is unable to gather unregistered IBR data (*see description above*) or DER data and provide it to the Transmission Planner and Planning Coordinator, as specified in the data requirements and reporting procedures developed under Requirement R1, the responsible entity shall provide an estimate of the modeling data and parameters and include an explanation of the limitations of the data provided for unregistered IBRs or DERs (limitations on the availability and of the data provided) and the method used for estimation. The DT discussed the possible mechanism by which Distribution Providers would receive modeling data and parameters. The DT did not feel this rose to the level of a requirement as the Distribution Provider can ask for the modeling data and parameters from the respective entity.
P106. "Finally, as noted by commenters, we recognize that there may be instances where IBR-DERs are connected to an entity that does not meet the criteria for registration with NERC as a distribution provider. For those areas with IBR-DERs that in the aggregate materially affect the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we direct NERC to determine the appropriate registered entity responsible for providing data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, or, when unable to gather such accurate IBR-DERs data, to provide instead	MOD-032 IRO-010 TOP-003	**Theme:** Who is the responsible entity when no registered DP of IBR-DER (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation. • After much deliberation, the DT determined that if there is no registered Distribution Provider, then the next best entity would be a Transmission Owner. The DT created a footnote to Attachment 1 stating: "The Distribution Provider is the typical responsible entity for collecting and providing data for DERs

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation."		connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider's system. The Transmission Owner is the typical responsible entity for collecting and providing data for DERs where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner's system." • The DT asked industry the following question: "Do you agree that the Transmission Owner (TO) is typically the appropriate responsible entity for collecting and providing data for DER where there is no associated registered DP between the DER connection point and the TO's system?" Some commenters agreed that the TO is the correct entity who should gather data if there is no associated registered DP between the DER connection point and the TO system. However, many comments received stated that the TO has no authority to collect data, and the following entities would be better suited to gather the data needed: Registered DP, Balancing Authority, Planning Coordinator, LSE, Generator Owner, Transmission Operator, and Resource Planner. Based on this feedback, the DT modified the Requirement language to allow the Planning Coordinator and each of its Transmission Planners to identify the most appropriate entity to provide the data listed in Attachment 1 of MOD-032-2.
P108. "Regarding CAISO's concern regarding the potential "compliance trap" where planners and operators rely on third-party data and IRC's request	MOD-032 IRO-010 TOP-003	**Theme:** Minimum categories or types of data that must be provided to transmission planners, transmission operators, transmission owners, and distribution providers that are necessary to predict the behavior of all

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
that the final rule specify the data to be submitted by all IBRs (i.e., registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate) and transmission devices using similar technologies, we direct NERC to determine through its standards development process the minimum categories or types of data that must be provided to transmission planners, transmission operators, transmission owners, and distribution providers necessary to predict the behavior of all IBRs and to ensure that compliance obligations are clear. As discussed in more detail in section IV.C of this final rule, we are also directing NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models that accurately reflect the behavior of all IBRs during steady state, short-circuit, and dynamic conditions. By contrast, we believe that a directive to task distribution providers as the appropriate registered entity to collect and share the modeling data and parameters of IBR-DERs in the aggregate is preferable to deferring to the stakeholder process as suggested by APS. The distribution provider, as the entity providing and operating the lines between the transmission and distribution systems, is the entity best situated to have access to the data necessary for accurate estimation and, other than Indicated Trade Associations that suggested the piecemeal approach already discussed above, no commenter identified other potential entities as an equally efficient option."		IBRs and to ensure that compliance obligations are clear (ERO Approved Acceptable Criteria for Models/IEEE1547 ref./modify req./Tech rationale) **Applicability:** Transmission Planners, Transmission Operators, Transmission Owners, and Distribution Providers • The DT added Requirement R1, Part 1.4 to specify dynamic model submission requirements in Planning Coordinator/Transmission Planner data requirements and reporting procedures. • The focus of Requirement R1 Part 1.4 is obtaining accurate and usable models for IBRs. New Requirement R2 Part 2.3 provides that models with known deficiencies, such that the ERO included them on the Unacceptable Model List, shall not be submitted without technical justification. • Attachment 1 was modified to categorize the types of data required as per the directive (IBR, aggregate DER, Storage) necessary to facilitate model development. • Requirement R2, Part 2.1 requires entities to estimate unregistered IBR and IBR-DER data if the entity responsible for providing such data is unable to gather it.
P122. "Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop	MOD-032 IRO-010	**Theme**: Require the use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady state, short-

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions when developing planning, operations, and interconnection-wide models. For example, the new or modified Reliability Standards could reference the NERC approved component model list, which defines the models that may be used, and those models that may not be used, for specific types of studies. This approved component model list includes WECC's IBR models. Without requiring the use of approved industry generic library models, Bulk-Power System planners and operators may not be able to create system models that adequately predict IBR behaviors and subsequent impacts on the Bulk-Power System."	TOP-003	circuit, and dynamic conditions when developing planning, operations, and Interconnection-wide models. While FERC Order No. 901 directed NERC to "develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions" (P 108), the DT determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their Interconnection-wide models and subsequently their planning cases. The DT considered that many entities have a different understanding for what is a "generic model", and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The DT further considered that NERC as the ERO does not presently maintain an "acceptable model library", but rather an "unacceptable model library", and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion. Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		To bookend these criteria for acceptable models, proposed Requirement R2 would also require any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The Unacceptable Models List includes models that NERC has identified over time as having known issues. While the DT initially proposed to foreclose the use of such models, the DT considered feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The DT believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns. The DT debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the DT ultimately decided to include this requirement in Requirement R2 as it relates to how entities respond to data specifications. The DT has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the DT has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for entities for Reliability Standards compliance purposes. As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the Reliability and Security Technical Committee. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations would then be considered by the ERO and published on the NERC website. NERC staff are currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing.
P124. "We direct NERC to determine through its standards development process which nation-wide approved component models are needed to build IBR plant models for steady state, short-circuit, and		**Theme:** Nation-wide approved component models are needed to build IBR plant models for steady state, short-circuit, and dynamics studies. (Uniform Modeling framework)

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
dynamics studies. We acknowledge NERC's comment that user-defined models may be helpful for specific local reliability studies; however, the user-defined model cannot be used in place of nation-wide approved component models for regional analysis or interconnection-wide analysis because the user-defined model may cause non-convergence and other issues. However, NERC may allow the submission of user-defined models alongside the approved industry generic IBR model. Various entities do not accept user-defined models or only accept them for limited instances along with the open-source code which then allows internal model components to be viewed and modified. For example, PJM does not accept user-defined models and requires generic models for model verification in accordance with currently effective Reliability Standards MOD-026-1 and MOD-027-1. NYISO accepts a user-defined model in limited instances but requires either the open-source code (allowing anyone to access the internal model) or dynamic link library data and code files (compiled code that must be decompiled to view the internal model) that must be supplied for existing power flow software and in perpetuity."		The uniform modeling framework established in the proposed MOD-032 will focus on the use and representation of positive sequence phasor domain (PSPD) models in registered entity footprints and in Interconnection-wide models. Interconnection-wide modeling may be different from the models used in specialized studies dedicated to a particular technical objective. The ERO Unacceptable Models List applies to the models where NERC Reliability Standards require its use (generally for planning and operation models where multiple entities share information beyond their portion of the electric system, which includes Interconnection-wide models). Further guidance for interconnection applications can be found in the *NERC Dynamic Model Recommendations*. The DT considered introducing an approved model list for use in building cases specifically for Interconnection-wide analysis through Requirement R1 Part R1.2 of the proposed MOD-032, however, pre-defining a limited set of models that could be used to represent generation and system components is potentially at odds with objectives to also have accurate models, especially as technology rapidly progresses. To meet this directive, the DT modified Requirement R1 of MOD-032 by specifying the use of standard library "generic" models in Interconnection-wide cases while allowing the use of user-defined models. This provision was careful to address typically reported issues associated with user-defined models (UDMs) including non-convergence, by requiring that TP/PCs establish usability requirements for UDMs while incorporating an open, transparent process of identifying deficient models through the use of the "MOD-032 Supporting Documentation – Process for Updating the Unacceptable Models List Maintained by the ERO" and the "ERO Unacceptable Model list". Any TPs/PCs accepting UDMs shall provide

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		their UDM requirements to other PCs/TPs within the Interconnection upon request. The DT believes this approach balances the practical limitations of "generic models" raised by industry at the January 15-16 NERC Industry Engagement Workshop and re-iterated at the June NERC Industry Engagement Workshop with the need for an improved uniform modeling framework. The combination of specifying the use of standard library component models approved and offered by software simulation tools, along with the ERO maintained Unacceptable Model List and its processes, will ensure that models used in interconnection wide analysis are robust enough while accuracy is not compromised to any level of detail deemed necessary. The introductions to this framework increase the data specifications requirements when user-defined models are used. TOP-003 and IRO-010 proposed standards were modified to ensure models submitted are consistent with models submitted under the framework established in MOD-032.
P125. "Accordingly, we direct NERC to develop new or modified Reliability Standards that require the sole use of nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build interconnection-wide models. One example of a way NERC could meet this directive would be to require an equivalent generic library model along with all submissions of user-defined models so that the generic library model can be used when combining	MOD-032 IRO-010 TOP-003	**Theme:** Nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build Interconnection-wide models. (Uniform Modeling framework /Req language) • Nation-wide approved components via generic library models are addressed via the development of a framework established in the proposed MOD-032-2 through improvements to Requirements R1, R2, and R3. The inclusion of ERO Unacceptable Models List, MOD-032 Supporting Document, and additional

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
neighboring transmission system models and in interconnection-wide models."		requirement language aims to ensure uniformity in processes and models to facilitate the exchange of neighboring entities' respective planning/operation models and to build Interconnection-wide models. • The PC and TP are allowed to require provision of generic models, but if equipment-specific models satisfy usability criteria, and processes established through Requirements R1, R2, and R3 of the proposed MOD-032 standard, they are not prohibited. The framework explicitly allows for the submission of equivalent generic library models along with submissions of user-defined models which allows for the use of generic library models when combining neighboring transmission system models and Interconnection-wide models. • TOP-003 and IRO-010 proposed standards were modified to ensure models submitted are consistent with models submitted under the framework established in MOD-032.
P141. "We also direct NERC to require the generator owners of registered IBRs and the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g., planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of registered and unregistered IBRs, including momentary cessation and/or tripping, and all ride through behavior. Recognizing that there may be instances in which transmission owners are unable to gather accurate unregistered IBR modeling data and parameters to	MOD-032 IRO-010 TOP-003	**Applicability**: GO • Nation-wide approved components via generic library models are addressed via the modifications made to MOD-032, including incorporation of an ERO Unacceptable Models list, establishing an improved uniform modeling framework. This approach is aligned with the FERC Order directives while addressing the practical limitations raised by industry at the January 15-16 NERC Industry Engagement Workshop and re-iterated at the June NERC Industry Engagement Workshop. • MOD-032, Attachment 1 was modified to specifically add that capabilities related to momentary cessation, tripping, and Ride-

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
create and maintain accurate unregistered IBR dynamic models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas, dynamic models of unregistered IBRs using estimated data in accordance with this final rule's section IV.B.3 data sharing directives. Further, we direct NERC to require distribution providers to provide to the planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities aggregated dynamic models that adequately represent the dynamic performance of IBR-DERs on their systems that in the aggregate have a material impact on the Bulk-Power System, including momentary cessation and/or tripping, and all ride through behavior (e.g., IBR-DERs in the aggregate modeled by interconnection requirements performance to represent different steady-state and dynamic behavior). Recognizing that there may be instances in which distribution providers are unable to gather data that accurately represents IBR-DERs in the aggregate, we modify the NOPR proposal and direct NERC to include in the proposed new or modified Reliability Standards a requirement that the distribution provider, if unable to gather data of IBR-DERs that in the aggregate have a material impact on		through, be reflected in the required model data for IBR and DER. • Explicit reference to IBR data was added to the TOP-003 and IRO-010 standards along with provisions to ensure that models submitted under these standards are consistent with the models submitted under the framework established in MOD-032.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
the Bulk-Power System, provide to the Bulk-Power System planners and operators (i.e., the data recipients) a dynamic model using estimated data for IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, in accordance with this final rule's section IV.B.3 data sharing directives. Furthermore, we acknowledge that there may be areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider. Therefore, we modify the NOPR proposal and direct NERC to determine the appropriate registered entity responsible for providing adequate data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and to identify the registered entities for coordinating, verifying, and keeping up to date the respective dynamic models. Finally, NERC must ensure that the proposed new or modified Reliability Standards account for the dynamic performance of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System."		
P146. Accordingly, **we direct NERC to develop new or modified Reliability Standards that require the use of the DER_A model or successor models to represent the behaviors of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System at a sufficient level of fidelity for Bulk-Power System planners and operators to create valid planning and operations and interconnection-wide models and to**	MOD-032 IRO-010 TOP-003	**Theme**: IBR-DER Model • As per the directive, the DT is requiring the modeling of aggregate DER through requirement R1 and Attachment 1. The currently available DER_A model is sufficient only for positive sequence phasor domain simulations. With the variety of other simulation domains (such as EMT and short circuit) necessary to study IBRs, mandating this model could prevent TPs or PCs from

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
be able to perform respective system studies. For example, the new or modified Reliability Standards could require models of IBR-DERs (i.e., DER_A model) to adequately reflect the steady-state and dynamic aggregate resource performance in both a transmission area and across the interconnection. Additionally, estimated modeling data and parameters of IBR-DERs that in the aggregate (i.e., DER_A model) have a material impact on the Bulk-Power System could be used where measured and collected data is not available. We believe requiring the DER_A model will address NERC's request for entities to work collaboratively with the state regulators to identify, implement, and perform an effective model validation approach for IBR-DERs in the aggregate as opposed to requiring validated models of IBR-DER in the aggregate that can have a material impact on the reliable operation of the Bulk-Power System.		performing their studies. This further reinforces the DT's election to not require the use of the DER_A model, but rather a model that achieves specific performance criteria and conforms with MOD-032 edits in Attachment 1 and Requirement R1. The fidelity/accuracy components of the FERC directives were generally considered to be within the SAR scopes for Projects 2020-06 and 2021-01, not Project 2022-02. However, the model framework established with the proposed MOD-032-2 does facilitate model fidelity and accuracy by allowing flexibility in model selection (rather than mandating use of a defined set of models). Specific fidelity/accuracy evaluations are beyond the scope of MOD-032. • The DT considered referencing the DER_A model specifically, but refrained due to the rapidly evolving nature of models and concerns for the time required to update such a reference in a NERC Standard. Additionally, the DT is not specifying particular library models for other resources, so specifying a particular model for DER will invite challenges. Further, challenges with precisely defining and determining what a "successor model" is could potentially create more future reliability risks. The standard as currently written allows for additional future models of higher fidelity to be accommodated.
P157. We believe the development of new or modified Reliability Standards is an important corollary to NERC's ongoing effort to identify and register generator owners and operators of IBRs. Although NERC's registration changes will not at this time address IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, we believe APS's concerns	MOD-032 TOP-003 IRO-010	**Theme:** The responsible entity for IBR-DER data when there is no registered DP. Upon a decent amount of conversation, the DT determined that if there is no registered Distribution Provider, then the next best entity would be a Transmission Owner. The DT created a footnote to Attachment 1 stating: "The Distribution Provider is the typical responsible entity for

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
regarding system-wide model validation is addressed in NERC's Reliability Guidelines and through the use of the EPRI DER Settings Database. We recognize that some distribution providers may not be able to provide a precise set of modeling data and parameters that accurately represent IBR-DERs in the aggregate. For these situations, NERC has provided a technical means to estimate in aggregating the needed IBR-DER modeling data and parameters (i.e., for the DER_A model) in the IBR-DER Data Collection Guideline. Further, NERC's 2021 Aggregate DER Model Verification Guideline provides transmission planners and planning coordinators with tools and techniques that can be adapted for their specific systems to verify that aggregate DER models (i.e., DER_A models) are a suitable representation of these resources in planning assessments. **Furthermore, for those areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we modify the NOPR proposal to direct NERC to determine the appropriate registered entity responsible for the data and parameters of IBR-DERs in the aggregate and to establish a process that requires identified registered entities to coordinate, validate, and keep up to date the system models.**		collecting and providing data for DERs connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider's system. The Transmission Owner is the typical responsible entity for collecting and providing data for DER where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner's system." The use of the word "typical" is intentional to indicate the most likely entity based on the DT's broad understanding but allows flexibility per Requirement 1 for the PC/TPs to select a more appropriate entity or entities in their area based on regional or jurisdictional differences.
P161. "Pursuant to section 215(d)(5) of the FPA, we modify the NOPR proposal to provide additional specificity to explain coordination and keep up to date in a timely manner the verified data and models of	MOD-032 IRO-010 TOP-003	The proposed Milestone 3 Reliability Standards collectively address the Commission's directives in Order No. 901 paragraph 161.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate in the system models. **Specifically, we direct NERC to develop new or modified Reliability Standards that require planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities to establish for each interconnection a uniform framework with modeling criteria, a registered modeling designee, and necessary data exchange requirements both between themselves and with the generator owners, transmission owners, and distribution providers to coordinate the creation of transmission planning, operations, and interconnection-wide models (i.e., system models) and the validation of each respective system model.** Further, we direct NERC to include in the new or modified Reliability Standards a requirement for generator owners, transmission owners, and distribution providers to regularly update and communicate the verified data and models of registered IBRs, unregistered IBRs, and IBR-DERs by comparing their resulting models against actual operational behavior to achieve and maintain necessary modeling accuracy for inclusion of these resources in the system models. For those areas with IBR-DERs in the aggregate that have a material impact on the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we modify the NOPR proposal to direct NERC to determine the appropriate registered entity		The Project 2022-02 DT modified MOD-032 to ensure it captures the uniform framework with modeling criteria, ~~a registered modeling designee,~~ and necessary data exchange requirements for registered IBR, unregistered IBR, and DER (to include IBR-DER). Modifications in TOP-003 and IRO-010 are intended to promote consistency in models submitted for planning purposes and operations purposes so that entities responsible for planning and operating the BPS are all working from similar models that accurately represent the resources within their footprints. • A uniform modeling framework is established in the proposed MOD-032-2 through improvements to R1, R2, and R3 and Attachment 1. The inclusion of the ERO Unacceptable Models List (and additional revision process)~~, MOD-032 Supporting Document,~~ and additional requirement language aims to ensure uniformity in processes and models to facilitate the exchange of neighboring entities' respective planning/operation models and to build Interconnection-wide models. Where appropriate, there are flexibilities built into this framework to accommodate differences in planning area modeling needs. • The PC and TP are allowed to require ~~provision of~~ standard library models, but if user-written models satisfy usability criteria, and processes established through R1, R2, and R3 of the proposed MOD-032-2 standard, they are not prohibited. The framework explicitly allows for the submission of standard library models along with submission of user-written models which allows for the use of standard library models when combining neighboring transmission system models and Interconnection-wide models. If user written models are accepted, the PC and TP are required to share their

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
responsible for the models of those IBR-DERs and to determine the registered entities responsible for updating, verifying, and coordinating models for IBR-DERs in the aggregate to meet the system models directives. NERC may implement this directive by modifying Reliability Standards MOD-032-1 and MOD-033-2 or by developing new Reliability Standards to establish requirements mandating an annual process to coordinate, validate, and keep up-to-date the transmission planning, operations, and interconnection-wide models."		usability criteria with other planning entities within the Interconnection upon request. • The DT added IBRs (including unregistered-IBRs) and DER (including IBR-DER) to Attachment 1 of the proposed MOD-032-2 standard. While the TO would be the typical entity for providing unregistered IBR data and the DP would be the typical entity to provide DER data (as noted in Attachment 1 of proposed MOD-032-2), the DT recognized that there may be some variations as to whom might have the most accurate and usable data for unregistered resources in the planning area. Therefore, the DT modified the Requirement language to allow the ~~Planning Coordinator~~PC and each of its ~~Transmission Planners~~TPs to identify the most appropriate entity to provide the data listed in Attachment 1 of proposed MOD-032-2. • Similarly, ~~Determination~~ a determination if an unregistered IBR or aggregate IBR-DER would "materially affect" the Bulk-Power System~~,~~ requires engineering judgment and the consideration of other material factors, which would not be ~~is not something that would be appropriate~~prudent to prescribe ~~to precisely specify~~ in a ~~reliability~~ Reliability ~~standard~~Standard. Thus, Attachment 1 footnote 7 of proposed MOD-032-2 was added to explicitly allow ~~Transmission Planners and Planning Coordinators~~PCs/TPs to specify DER thresholds that may be appropriate when considering impact to their local areas. • The DT made changes to the IRO-010 and TOP-003 standards to include IBRs specifically (see R1 of each standard). To the extent IBR modeling data is deemed necessary under IRO-010 and TOP-003, it should be consistent with modeling data provided for planning purposes. Therefore, the DT made changes to ~~the~~ IRO-010 and TOP-

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		003 ~~standards~~ to require that model submissions for operations purposes under IRO-010 and TOP-003 are consistent with the model submissions for planning purposes. Consistency in models is important to ensure BPS planners and operators are working from similar and high quality models; however, the DT recognized that operations entities may require some adjustments from the model submitted for planning purposes to satisfy the needs in an operations environment. The fidelity/accuracy components of the FERC directives were generally considered to be within the SAR scopes for Projects 2020-06 and 2021-01, ~~not~~ rather than Project 2022-02. However, the model framework established with the proposed MOD-032-2 does facilitate model fidelity and accuracy by allowing flexibility in model selection, so that entities may select the most representative model for the resource meeting PC/TP requirements (rather than mandating use of a defined set of models which may quickly become out-of-date). Models that are known to have fidelity issues are not to be submitted without technical justification. Specific fidelity/accuracy evaluations are beyond the scope of MOD-032, but are addressed in other proposed Milestone 3 Reliability Sstandards. The DT confirmed the link between these standards by requiring that models submitted under MOD-032 shall be the models verified under MOD-026, where available. System models developedvalidated under MOD-033 shall be developedperformed in accordance with data provided under MOD-032 and MOD-033. Regarding thate part of the directive to keep models up to date, MOD-032-1 already mandated a "schedule for submission of data at least once every 13 calendar months." This requirement is maintained in proposed MOD-032-2. System models will thus be built on updated data and

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		models, which are verified and validated in accordance with the proposed MOD-033-2 and MOD-026-2 standards. With regards to that part of the p.161 directive addressing a "registered model designee" for building the Interconnection-wide cases, NERC considered the directive and concluded that the present ERO modeling designee framework, with notable enhancements since 2023, presents an equally effective and efficient alternative to designating an entity on the NERC Compliance Registry to perform the tasks of ~~model designee for~~ Interconnection-wide model building ~~that is a registered entity~~. Further, ~~this~~ the present framework, as enhanced since 2023, has distinct advantages over designating a responsible entity in that it maintains ongoing oversight of the Interconnection case building process, rather than compliance/audit-focused oversight with a retroactive focus. Additional explanation is provided below. **Registered Modeling Designee:** The current MOD-032-1 Requirement R4 requires each PC to make available models for its planning area provided under R2 to the Electric Reliability Organization (ERO) or its designee to support the creation of the Interconnection-wide cases. This is not changed in proposed MOD-032-2 R4. As noted above, proposed MOD-032-2~~,~~ Requirement R1, Part 1.1 would require~~s~~ the ~~Planning Coordinator (~~PC~~)~~ and each of its ~~Transmission Planners (~~TPs~~)~~ to identify the ~~Entity~~ entity responsible for each required item in Attachment 1. That entity must provide the information under Requirement R2. ~~Requirement R3 requires notification from the PC or TP regarding technical concerns with the data submitted under Requirement R2. Additionally, a~~ A new Requirement R2, Part 2.2 has been added to require models provided under MOD-026 to be accepted by the ~~Transmission Planner~~TP, where available~~.~~

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		Requirement R3 requires notification from the PC or TP regarding technical concerns with the data submitted under Requirement R2. ~~This allows a more detailed model that has also been verified to receive a review and coordination in order to be accepted by the TP. These requirements~~This improved framework for modeling contemplates coordination and model updates as needed by registered entities as models are collected to build the Interconnection-wide cases. ~~allow for the coordination and model updates needed by registered entities.~~ ~~In addition, Requirement R4 requires each PC to make available models for its planning area under R2 to the Electric Reliability Organization (ERO) or its designee to support the creation of the Interconnection-wide cases.~~As to who builds the Interconnction-wide base case model, ~~T~~the ERO has designated ~~Entities~~ entities with a sufficient wide area view and focus on reliability for each Interconnection to perform this work. For the Texas Interconnection, the ~~, such as~~ Texas Regional Entity performs this work in coordination with ERCOT. For the Western Interconnection, the ~~,~~ Western Electric Coordinating Council (WECC) performs this work. For the Eastern Interconnection, ~~, and~~the Eastern Interconnection Reliability Assessment Group (ERAG) consisting of MRO, NPCC, RF, and SERC performs this work. The ERAG also performs the base-case model creator function for the Quebec Interconnection in Canada. As the ERO, NERC is responsible for overseeing and ensuring that these designated entities perform the proposed MOD-032-2 Requirement R4 activities. In 2023, the Officers Leadership Team of the ERO Enterprise approved the MOD-032 Designee process document. This process document reflects the maturation of this aspect of the ERO's activities and contains clauses and processes that require the designee for the Interconnection to perform specific duties. Each designee must have certain attributes,

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		including a governance structure responsive to the needs of Planning Coordinators, with clear roles and responsibilities for model creation, transparency in data requirements, establishing timeframes for review cycles, and defining security and access to models. Certain core cases are required as part of this process, including core cases for the ERO for use in seasonal planning studies and event analyses. Other core cases are required for validating Interconnection Frequency Response obligations and event analyses. Lastly, the process requires the development of typical cases to support implementation of the TPL-001 standard. NERC or the Regional Entities may request additional specialized cases as needed. Designated entities have certain responsibilities under this framework, including developing a method for collecting data from all Planning Coordinators and developing and maintaining a case creation manual including the process by which cases must be assembled, tested for quality, and tested for case fidelity according to ERO case quality metrics. NERC will perform an annual case quality assessment, and the designee must address any case model deficiencies identified by NERC. The process also contemplates feedback processes and processes for correcting cases or addressing recurring data or model errors with Planning Coordinators, among other controls, to ensure quality. Regarding the ERAG, there is also an Eastern Interconnection Regional Entity Agreement among MRO, NPCC, RF, and SERC[1]. In this agreement,

		there are provisions for oversight and coordination in how this group exercises its authority as the MOD-032 designee. ~~important~~ Cconnections to MOD-032 are acknowledged, ~~like the following~~such as: • Oversight of the Multiregional Modeling Working Group[2] (MMWG, whose membership is comprised of one power flow representative and one dynamics representative from each of the Data Submitting Entities (comprised of Planning Coordinators or group of Planning Coordinators) and non-voting representatives as follows: one liaison representative each of the EI Regions and the ERAG Chair, a coordinator from each of the organizations that provides model development services to MMWG, and NERC and FERC staff liaisons. ○ The purpose of the MMWG is to coordinate, in a timely manner, the development of designated power flow and dynamics simulation base case models that realistically simulate steady state and dynamic bulk electric system behavior of the Eastern Interconnection. ○ To ensure cases and models are done in a consistent fashion, the MMWG holds three annual meetings along with conference calls as needed. The MMWG roster includes a FERC liaison who can attend all meetings. The group maintains a case building procedure manual[3] that is used by its members. The manual contains a set of data checks that are performed on the steady state and dynamic cases.

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		~~The MOD-032 Designee process document that was approved by the Officers Leadership Team (consisting of upper management of all the ERO Enterprise) contains clauses and processes that require the Designee for the interconnection to perform specific duties. Among those duties are to maintain a governance structure to include all the PCs in their respective Interconnection and, in consultation with all of their respective PCs, to create and make available planning cases. These cases are used in the TPL-001 assessments as outlined in the agreements, which includes a direct PC to PC sharing.~~ In addition, ~~the DT has considered the~~NERC further considered the following information provided by the MOD-032 Designee Group comprised of members from NERC and the Regional Entities: **MOD-032 Designee Group:** The electric grid is evolving at an unprecedented pace, driven by the rapid integration of inverter-based resources (IBRs), changing load characteristics, and emerging technologies. As the system transforms, ~~too must~~ the models we use to study and understand its behavior must also transform. We recognize the growing challenge of obtaining and coordinating accurate dynamic models for IBRs, including securing the appropriate parameters needed to ensure that simulation results reflect real-world system performance. Addressing these modeling challenges is essential to maintaining the reliability and resilience of the bulk power system and requires close collaboration, and the MOD-032 designees along with PCs are committed to and holding data providers accountable for model coordination and model quality. The MOD-032 designees are committed to ensuring that the model quality is maintained and there is a mechanism in place for the PC/TP to

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		gather the appropriate information from the Generator Owners (GO). NERC facilitates the designee group of Regional Entity staff who are responsible for designee activities. ~~This group meets periodically to discuss case quality metrics and to improve the interconnection case-building process. A sub-team has been assembled to write a MOD-032 SAR to add authority for the Designee to enforce model quality.~~ *** In summary, the proposed revisions to the standards addressed in Milestone 3 work, along with the ERO designated entity framework discussed above for building Interconnection-wide cases, address the concerns underlying the Commission's directive in paragraph 161 of Order No. 901 regarding the coordination, updating, and timely development of quality Interconnection-wide models that accurately represent the behavior of IBRs in the Interconnection. Further, this framework advances consistency in modeling used across planning and ERO assessment activities. NERC therefore submits that this framework represents an equally effective and efficient approach to addressing this part of the Commission's paragraph 161 directive to identify a registered modeling designee in the MOD-032 standard. ~~Overall, the FERC directive has been addressed through current and updated requirements/processes.~~
P226. "Although we are not directing NERC to include implementation dates in its informational filing and are leaving determination of the proposed effective dates to the standards development process, we are concerned that the lack of a time limit for implementation could allow identified issues to remain unresolved for a significant and indefinite period. Therefore, we emphasize that industry has been aware	MOD-032 IRO-010 TOP-003	**Theme:** Sufficient timeframe. The DT felt that four years was an appropriate timeframe for the MOD-032, IRO-010, and TOP-003 implementation times. It is understood that based on what is required via MOD-032, industry would need two years to hold meetings with stakeholders to establish processes for collecting the needed models and data, and then an additional two years to update models based on the new requirements, etc. However, taking into consideration the FERC Order 901 implementation deadline of 2030, the

FERC Order No. 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
of and alerted to the need to address the impacts of IBRs on the Bulk-Power System since at least 2016. The number of events, NERC Alerts, reports, whitepapers, guidelines, and ongoing standards projects more than demonstrate the need for the expeditious implementation of new or modified Reliability Standards addressing IBR data sharing, data and model validation, planning and operational studies, and performance requirements. Thus, in that light, the Commission will consider the justness and reasonableness of each new or modified Reliability Standard's implementation plan when it is submitted for Commission approval. Further, we believe that there is a need to have all of the directed Reliability Standards effective and enforceable well in advance of 2030 and direct NERC to ensure that the associated implementation plans sequentially stagger the effective and enforceable dates to ensure an orderly industry transition for complying with the IBR directives in this final rule prior to that date."		DT settled on a three-year implementation time knowing that milestone 4 revisions still need to be implemented by 2030 and are dependent on the Milestone 3 implementation plan time. Three- year implementation plans were also selected for TOP-003 and IRO-010 to align potential new data requests under TOP-003 and IRO-010 with the expected data availability under MOD-032 processes.

Overview/Introduction 1
Chapter 1: Unacceptable Models List 2
Chapter 2: Unacceptable Models Technical Rationale 4
Chapter 3: Sample Submission Form 7
Chapter 4: Version History 9

Overview/Introduction

FERC issued Order No. 901 on October 23, 2023, directing "NERC to develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions when developing planning, operations, and interconnection-wide models. For example, the new or modified Reliability Standards could reference the NERC approved component model list, which defines the models that may be used, and those models that may not be used, for specific types of studies. This approved component model list includes WECC's IBR models. Without requiring the use of approved industry generic library models, Bulk-Power System planners and operators may not be able to create system models that adequately predict IBR behaviors and subsequent impacts on the Bulk-Power System."

Proposed Reliability Standard MOD-032-2 addresses the reliability issue identified by FERC in Order No. 901 in a manner that considers advancements in user written models since the issuance of Order No. 901, perspectives of planning entities across North America, and the historical practice of the ERO, which has been to maintain a use of unacceptable models, rather than acceptable models, due to the practical difficulties of keeping an acceptable model library up to date in a timely manner.

Reliability Standard MOD-032-2 requires the Planning Coordinator and Transmission Planner to include specifications addressing the use of standard library models, user-written models meeting certain minimum usability requirements to minimize the risk of non-convergence, or both. To minimize the use of models with known deficiencies, Transmission Planners and Planning Coordinators must also include provisions to require any entity submitted on the Unacceptable Model List to include a technical rationale supporting its use.

The Unacceptable Models List identifies models that are generally considered not acceptable for purposes of model submissions under the MOD-032, TOP-003, and IRO-010 Reliability Standards due to identified issues with usability or accuracy impacting the ability to develop planning or operational horizon cases necessary to support analysis of the reliability of the interconnected transmission system. However, it is recognized that the use of such models may be appropriate in some cases, such as where there is no feasible means for procuring an alternative model that may better represent the behavior of legacy equipment. Any use of such models must include a technical rationale supporting its use.

Disclaimers

Interconnection-wide modeling requirements may differ from the requirements of specialized studies dedicated to a particular technical objective. Thus, models deemed acceptable for planning purposes may be deemed unacceptable by a receiving entity for certain operations applications.

Updates to the Unacceptable Models List

Refer to the Supporting Document section of MOD-032.

Chapter 1: Unacceptable Models List

Models that have been identified as unacceptable are listed in Table 1 below. Revisions to this list may be made in accordance with the process described in the Supporting Document section of the MOD-032 standard.

Table 1: Unacceptable Model List		
Known Unacceptable Model Name	**Model Description**	**Effective**
Renewable Energy Models		
WT3G1, WT3G2, wt3g	Generic Type 3 WTG Generator/Converter Model - Doubly-fed induction generator	Effective Date of MOD-032-2
WT4G1, WT4G2, wt4g	Generic Type 4 WTG Generator/Converter Model - Variable speed generator with full converter	Effective Date of MOD-032-2
WT3E1, wt3e	Generic Type 3 WTG Electrical Control Model	Effective Date of MOD-032-2
WT4E1, WT4E2, wt4e	Generic Type 4 WTG Electrical Control Model	Effective Date of MOD-032-2
WT3T1, wt3t	Generic Type 3 WTG Turbine Model	Effective Date of MOD-032-2
WT3P1, wt3p	Generic Type 3 WTG Pitch Control Model	Effective Date of MOD-032-2
WT12A1, wt1p, wt2p	Generic Type 1 and 2 WTG Pitch Control Model	Effective Date of MOD-032-2
WT4E1, wt4t	Generic Type 4 WTG Power Converter Model	Effective Date of MOD-032-2
wt4p	Generic Type 4 Pitch Control Model	Effective Date of MOD-032-2
REECB1, REECBU1, reec_b	Generic Phase 2 PV Electrical Controls Model	Effective Date of MOD-032-2
Machine Models		
GENSAL, gensal	Salient Pole Generator Model (IEEE Std 1110 §5.3.1 Model 2.1)	Effective Date of MOD-032-2
GENCLS, gencls	Classical Generator Model (IEEE Std 1110 §5.4.2)	Effective Date of MOD-032-2
GENTRA	Transient Level Generator Model	Effective Date of MOD-032-2
Excitation System Models		
texs	General Purpose Transformer Fed Excitation System	Effective Date of MOD-032-2
SEXS, sexs	Simplified Excitation System	Effective Date of MOD-032-2
EX2000	GE EX2000 Excitation System	Effective Date of MOD-032-2
Turbine-Governor Models		
lm2500	LM 2500 Aero-Derivative Gas Turbine Governor Model	Effective Date of MOD-032-2
Known Unacceptable Model Name	**Model Description**	**Effective**

Table 1: Unacceptable Model List		
lm6000	LM 6000 Aero-Derivative Gas Turbine Governor Model	Effective Date of MOD-032-2
URGS3T, gast	WECC Gas Turbine Governor Model	Effective Date of MOD-032-2
GAST	Gas Turbine-Governor Model	Effective Date of MOD-032-2
GAST2A	Gas Turbine-Governor Model	Effective Date of MOD-032-2
GASTWD	Gas turbine-governor	Effective Date of MOD-032-2
IEEEG2	1981 IEEE Type 2 General Approx. Linear Ideal Hydro Model	Effective Date of MOD-032-2
WESGOV	Westinghouse Digital Governor Model for Gas Turbines	Effective Date of MOD-032-2
Load Models		
motorc	Phasor Model of Single-Phase Air-Conditioner Compressor Motor	Effective Date of MOD-032-2

Chapter 2: Unacceptable Models Technical Rationale

Table 2 below provides the technical rationale for each unacceptable model included on the current Unacceptable Models List.

The purpose of this list of unacceptable models is to develop and maintain a repository of models deemed acceptable by the ERO and industry stakeholders for use in developing interconnection-wide models developed by the MOD-032 Designee. The NERC System Analysis and Modeling Subcommittee (SAMS) initially developed this list, and it is now maintained and updated by ERO staff in accordance with MOD-032 Supporting Document. This list seeks to bring together multiple sources of data to ensure uniformity in the use of models across Interconnections. While models may be deemed 'obsolete' or 'deprecated' due to known issues, these models are not removed from the software vendor libraries for various reasons. However, these models should not be used to represent specific facilities within Interconnection-wide models. For additional information about this list, please contact NERC staff at advancedsystemanalyticsmodeling@nerc.net with any questions.

Table 2: Unacceptable Model List

Known Unacceptable Model Name	Rationale For Inclusion
Renewable Energy Models	
WT3G1, WT3G2, wt3g	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT4G1, WT4G2, wt4g	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT3E1, wt3e	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT4E1, WT4E2, wt4e	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT3T1, wt3t	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT3P1, wt3p	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
WT12A1, wt1p, wt2p	Unable to represent common Type 1 wind pitch control logic.
WT4E1, wt4t	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
wt4p	Replaced by 2nd Generation renewable models. 1st Generation generic models have produced numerical instability for on-fault conditions for power electronics represented by this model
REECB1, REECBU1, reec_b	Inability to represent momentary cessation or other voltage dependent current logic common in the equipment the model was stated to represent.
Machine Models	

Table 2: Unacceptable Model List	
Known Unacceptable Model Name	**Rationale For Inclusion**
GENSAL, gensal	Uses simplifying approximations for saturation as additive terms over exponential or quadratic curves. Further, ignores the q-axis saturation completely.
GENCLS, gencls	Does not allow for representation of excitation system and turbine/speed governor models
GENTRA	Simplified model that ignores sub transient effects, leading to numerical instability problems.
Excitation System Models	
texs	Simplified, early generation model considered obsolete. Refer to IEEE Std 421.5
SEXS, sexs	Simplified, early generation model considered obsolete. Refer to IEEE Std 421.5
EX2000	Field current limiter latch in the model is unable to represent the field equipment for simulation in power system software. Replace with AC7B or ex21br
Turbine-Governor Models	
lm2500	No supporting documentation implemented in software, proprietary model with no added model support.
lm6000	No supporting documentation implemented in software, proprietary model with no added model support.
URGS3T, gast	Simple representation of steam turbine-governor system with insufficient model capability for modern digital controllers.
GAST	Simple representation of steam turbine-governor system with insufficient model capability for modern digital controllers.
GAST2A	Simple representation of steam turbine-governor system with insufficient model capability and flexibility for modern digital controllers.
GASTWD	Simple representation of steam turbine-governor system with insufficient model capability and flexibility for modern digital controllers.
IEEEG2	Model uses an oversimplified governor model applicable only to first swing stability. Deprecated with other hydro governor models.
WESGOV	Simple representation of steam turbine-governor system with insufficient model capability and flexibility for modern digital controllers.
Load Models	
motorc	Experimental load model. Should not be used for generation resources

Chapter 3: Sample Submission Form

This form is a sample to explain what is deemed a full application to change a model designation in the Unacceptable Models List.

Section 1: Submitting Entity Information			
Name of Person submitting			
Organization(s)			
Sector (if known)			
Telephone		Email	

Section 2: Model Identifying Information	
Model Name	
Alternative Model Name(s) as implemented in software	
Equipment Model is stated to represent	
Indicate desired Action	☐ Add model to the Unacceptable Models List ☐ Remove model from the Unacceptable Models List

Section 3: Technical Supporting Documentation and Description	
Description of model ability to meet small signal Disturbances	
Description of model ability to meet large signal Disturbances	
Please cite and link any industry approved documentation regarding this model's small and large signal disturbances	
Describe the technical document attachments that support the above questions	
Please identify any information in this application that may meet the criteria for Confidential Information, as defined in Section 1500 of the NERC Rules of Procedure	

Section 4: Process Tracking	
Date Submitted to ERO	
Model Status	☐ Submitted to the ERO ☐ Assigned ERO Review team ☐ Investigation and review by ERO and submitting entity ☐ Remanded by NERC RSTC (or its successor) ☐ Approved by the NERC RSTC (or its successor)
Date of Approval	
Date of Model Notice to Industry	

Attachments

If available, please include at least one report that uses Hardware-in-the-Loop, Software-in-the-Loop, or actual System response (e.g., in a commissioning test) to demonstrate the model's ability or inability to achieve its stated purpose. At least one attachment should detail the model's error boundaries to represent its stated equipment with the test description and procedure outlined in that report. Entities shall label any attachment that may meet the criteria for Confidential Information under NERC Rules of Procedure Section 1500, along with the basis for the designation (e.g., Confidential Business and Market Information, Critical Electric Infrastructure Information, etc.). If any of this information is not available to the supporting entity, please provide an explanation.

Standards Announcement

Project 2022-02 Uniform Modeling Framework for IBR

Final Ballots Open through October 3, 2025

Now Available

Final ballots for **Project 2022-02 Uniform Modeling Framework for IBR** are open through **8 p.m. Eastern, Friday, October 3, 2025** for the following standards and implementation plan:

- MOD-032-2 – Data for Power System Modeling and Analysis
- IRO-010-6 – Reliability Coordinator Data and information Specification and Collection
- TOP-003-8 – Transmission Operator and Balancing Authority Data and Information Specification and Collection
- Implementation Plan

Balloting

In the final ballot, votes are counted by exception. Votes from the previous ballot are automatically carried over in the final ballot. Only members of the applicable ballot pools can cast a vote. Ballot pool members who previously voted have the option to change their vote in the final ballot. Ballot pool members who did not cast a vote during the previous ballot can vote in the final ballot.

Members of the ballot pool(s) associated with this project can log into the Standards Balloting and Commenting System (SBS) and submit votes here.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The voting results will be posted and announced after the ballots close. If approved, the standard will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Jordan Mallory (via email) or at 470-479-7538.
