"TPs, PCs, TOs, and other applicable entities that may need DER information should coordinate with DPs for facilities connected to distribution systems to determine the necessary measurement information that would be of use for DER modeling and model verification and jointly develop requirements or practices that will ensure this data is available. ***As the TPs, PCs, and TOs are dependent on the DP to have the data made available****, this will likely require actions from state regulatory bodies and DPs to establish requirements to gather this information" (page 7 of 61).*

The SDT should consider that Transmission Owners should not be held accountable for demand and DER data that they have no cognizance of. Additionally, the SDT should remember that most DER are smaller than the BES resource threshold or reside on a distribution system. The threshold for an entity to be registered as a Distribution Provider is 75 MW of load. This implies that the majority of DERs are and will be connected to systems outside the scope and visibility of Transmission Owners, as well as existing Distribution Providers. To emphasize this reality: as of 15 May 2023, there were 314 Distribution Providers registered with NERC (excluding UFLS-only DPs). Of those DPs, 96 were not otherwise registered as either a PC, TP, or TO. While it may be misunderstood that only 96 DPs may become newly applicable and participatory in model data collection given the draft changes to MOD-032-2, this ignores that the latest EIA 861 data (collected in 2021; published in 2022) reflects about 1,190 distribution utilities reflecting almost 197,000 distribution circuits in the continental US. In other words, it may be reasonable to conclude that 74% of the distribution utilities in the US do not meet the NERC registration threshold. Furthermore, PCs, TPs, and TOs have no regulatory relationship with these unregistered entities and cannot be held responsible for DER data for which that are not aware.

In June 2022, NERC published its "Inverter-Based Resource Strategy" that recognized efforts necessary to analyze the breakdown of resource size, location, type, and applicability with the BES definition to make a determination of whether the current BES threshold should be updated to reflect the changing resource mix" (page 9 of 10). Subsequently, the NERC Member Representatives Committee (MRC) and Board of Trustees (BOT) technical session on inverter-based resources in February 2023 emphasized the need for a focus on functional registration noting: "industry is increasingly challenged with addressing reliability issues for unregistered inverter-based resources, and those resources are reaching critical mass in some parts of the country. The lack of requirements currently imposed on those resources creates local and regional reliability risks to the BPS in aggregate. This issue compounds in many areas with the growing presence of distributed energy resources (DERs) connected to the distribution system." In response to the FERC directive "Registration of Inverter-based Resources", NERC filed a proposal to modify its Rules of Procedure to "include a new function comprised of owners of IBRs interconnected to the BPS." The Generator Owner – Inverter-Based Resource (GO-IBR) registration would include "owners of IBRs which have aggregate nameplate capacity of less than or equal to 75 MVA and greater than or equal to 20 MVA interconnected at a voltage greater than or equal to 100 kV; or Owners of IBRs which have aggregate nameplate capacity of greater than or equal to 20 MVA interconnected at a voltage less than 100 kV."

Attachment 1 Data Reporting table (Steady State Column items 2, and 9, and Dynamics Column items 5, and 10) has added language indicating that the Transmission Owner (TO) is the responsible entity for submitting modeling data when a demand is not associated with a registered Distribution Provider. AZPS requests clarification regarding the type of entity that would have load, but not be a registered distribution provider. AZPS is concerned that the Transmission Owner may not have the ability to produce or acquire certain load information from an unregistered entity unless there is some other type of contractual relationship in place.

Comment	
Very little has changed from Draft 1 to Draft 2 of the proposed modifications to MOD-032-2. ATC supports the comments from the MRO-NSRF.	

In the Technical Rationale, the Standard Drafting Team acknowledges that there may be challenges in collecting data for DER connected to unregistered entities and that the obligations of this standard may place an unreasonable compliance risk on registered entities. However, despite the acknowledgement of this unreasonable risk, the Standard Drafting Team has put forth in draft 2 similar language, containing the same unreasonable risk for industry consideration. A separate effort should be initiated to explore making DER entities above a specified threshold a NERC registered entity to ensure data will be correctly shared. The DT may also consider waiting until possible modifications have been suggested to MOD-032 in response to FERC Order No. 901 and IBR modeling.

While these modifications are necessary, approving them prior to the DT's documented concerns over the changes to the DP registration creates a disconnect that has the potential for unintended future consequences. SRP recommend the DT crate a SAR for adjusting the definition of DP to include the DER resources prior to moving forward with this effort.

Comment

SPP recommends this drafting team coordinates with the Project 2023-08 drafting team to ensure the appropriate DER data is identified as well as listed to meet the needs of the two standards from an efficient and reliability prospective.

Furthermore, we recommend that the drafting team consider creating an independent registration for the TO with direct connection to DERs (R-DERs). From our perspective, the proposed Attachment 1 (footnotes) does not clearly define the role for this particular Transmission Owner (TO). Moreover, the independent document can be used to provide clarity on the expectation of the role for the TO with direct connection to DERs (R-DERs).

In support of the proposed solution, we recommend that the drafting team review the efforts made in the NERC Rules of Procedures (RoP) in reference to the GO (IBR) and GOP (IBR) pertaining to their definition and registration.

Additionally, we recommend that the drafting team takes into consideration the impact of creating a separate project to address the proposed definition in an independent process. We have the concern that the creation of an independent project for the definition will only delay the efforts of addressing the needs for DER data collection. From our perspective, the definition effort needs to be finalized before pursuing other activities associate with data collection. Finally, SPP recognizes that DPs and TOs have expressed concern with their ability to obtain granular DER data and because of this, the proposed data collection modifications to MOD-032-2 may not be accepted by industry. To help reach consensus, SPP suggests that the drafting team consider an alternative mechanism that would allow the DPs and TOs to forecast DER data based on their knowledge of DER penetration on their systems, especially when the data is not directly available through a NERC standard.

Response

Thank you for your comments. At the time of this response, the 2023-08 team has not been formed yet - that SAR was also initiated at SPIDERWG, so the DT does not expect conflicts in objectives.

6I: Separate registration for TO with DER?/clarify TO obligation & FN5
Footnotes 4 and 5 were combined and modified to add clarity and a more detailed description of the DT intent was added to the Technical Rationale.

6E: GO-IBR to the rescue (related to theme 1D)
The proposed GO-IBR registration effort is primarily intended to capture the smaller transmission-connected resources that don't meet BES definition. Most individual DER will not meet proposed GO-IBR registration criteria (i.e., greater than 20 MVA) so that effort will provide little benefit with respect to making DER data available to PC/TPs. Yet, smaller individual DER installations connected to DP systems can, in aggregate, have a significant impact on BES reliability.

1A: DT should not define DER - separate project needed

The SC approved the DT and the SAR which includes consideration of a DER definition in its scope. The DT considered a range of existing DER definitions with broad applicability across electric system planning and operations in proposing the current version; it is not intended to be specific to MOD-032. The DT recognizes the wide-reaching impacts of this definition. 3B: Data accuracy It is understood that modeling aggregate DER (based on collected data) will involve some assumptions (similar to modeling aggregate load response). The work of the SPIDERWG provides technical references and industry best practices: https://www.nerc.com/pa/Documents/DER_Quick%20Reference%20Guide.pdf.

AES Clean Energy believes that the new requirements for DERs will help TPs and PCs to better understand the root cause of system instability. However, there is still concern about the ability of the TO and DP to obtain the data from unregistered entities that own the DERs. Currently, FAC-001 allows the TO to specify its interconnection requirements which may help TO to obtain the necessary data. However, there is no similar requirement for DP. AES Clean Energy recommends the Standard Drafting Team to look into this as well.

Thank you for your comments. The DT doesn't envision a need to request detailed technical information directly from customers. The DT contends that DPs should already have a record and basic understanding of DER that is connected to their system (e.g., rooftop solar, batteries, etc.) similar to how they have a record and basic understanding of houses, factories, and commercial spaces connected to their system. Such information should be sufficient for PCs an TPs to properly represent potential DER reliability impacts.	
Joshua London - Eversource Energy - 1, Group Name Eversource	
Answer

Buckeye Power, Inc. supports the comments of ACES: We have a great deal of apprehension as it relates to proposed language in Footnote 5 of Attachment 1. Footnote 5 states (emphasis added): "Where DER is connected to an unregistered Distribution Provider, the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information. An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider. This footnote is also applicable to item 10 under the "dynamics" column." By what method should it be determined which registered entity is the "next closest electrically connected". Consider the case wherein a substation owned by an unregistered DP has a feeder from 2 different registered entities. Who is to make the determination as to which registered entity is the "next closest electrically connected" and how? In order to make this determination, a certain amount of knowledge about the other entity's infrastructure is required. Of even greater concern is the continued inclusion of data from unregistered entities despite the open acknowledgment by the SDT of the challenges with collecting said data (see Technical Rationale, paragraph 2). We recommend that the SDT postpone further development of this Project until the GO-IBR and GOP-IBR registration criteria have been approved and can be included in the next draft of MOD-032-2.

Transmission Owner is not listed as a Functional Entity to which the proposed standard(s) should apply in the SAR. The SAR states that the Functional Entities to which the proposed standard(s) should apply are the Transmission Planner (TP), the Planning Coordinator (PC) and the	

Distribution Provider (DP). This section of the SAR is designed to, “assist the NERC Standards Committee in appointing a drafting team with the appropriate members.” The proposed language in ATTACHMENT 1, affects and changes the obligations of the Transmission Owner (TO). Changes to the obligations of the Transmission Owner (TO) were not approved in the SAR and SDT members selected may not provide adequate representation of TOs.

In the Technical Rationale, the Standard Drafting Team acknowledges that there may be challenges in collecting data for DER connected to unregistered entities and that the obligations of this standard may place an unreasonable compliance risk on registered entities. However, despite the acknowledgement of this unreasonable risk, the Standard Drafting Team has put forth in draft 2 similar language, containing the same unreasonable risk for industry consideration. NV ENERGY recommends that the Standard Drafting Team consider utilizing the procedures allowed for by NERC Rules of Procedure to halt activity on this project until such time that issues surrounding data collection from entities who have no obligation to comply are addressed.

NV Energy has concerns with Footnote 5 of Attachment 1:

“Where DER is connected to an unregistered Distribution Provider, the **next closest electrically connected** registered entity (DP or TO) shall request DER data and pass through available information. An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider. This footnote is also applicable to item 10 under the “dynamics” column.”

Transmission Owner is not listed as a Functional Entity to which the proposed standard(s) should apply in the SAR. The SAR states that the Functional Entities to which the proposed standard(s) should apply are the Transmission Planner (TP), the Planning Coordinator (PC) and the Distribution Provider (DP). This section of the SAR is designed to, "assist the NERC Standards Committee in appointing a drafting team with the appropriate members." The proposed language in ATTACHMENT 1, affects and changes the obligations of the Transmission Owner (TO). Changes to the obligations of the Transmission Owner (TO) were not approved in the SAR and SDT members selected may not provide adequate representation of TOs. In the Technical Rationale, the Standard Drafting Team acknowledges that there may be challenges in collecting data for DER connected to unregistered entities and that the obligations of this standard may place an unreasonable compliance risk on registered entities. However, despite the acknowledgement of this unreasonable risk, the Standard Drafting Team has put forth in draft 2 similar language, containing the same unreasonable risk for industry consideration. MRO NSRF recommends that the Standard Drafting Team consider utilizing the procedures

allowed for by NERC Rules of Procedure to halt activity on this project until such time that issues surrounding data collection from entities who have no obligation to comply are addressed.

The NSRF has concerns with Footnote 5 of Attachment 1:

"Where DER is connected to an unregistered Distribution Provider, the **next closest electrically connected** registered entity (DP or TO) shall request DER data and pass through available information. An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider. This footnote is also applicable to item 10 under the "dynamics" column."

By what method should it be determined which registered entity is the "next closest electrically connected?" Consider the case wherein a substation owned by an unregistered DP has a feeder from 2 different registered entities. Who is to make the determination as to which registered entity is the "next closest electrically connected" and how? In order to make this determination, a certain amount of knowledge about the other entity's infrastructure is required.

In closing, the NSRF would like to reemphasize the significant challenges in collecting the data in question from non-NERC-registered entities, challenges that the SDT itself has acknowledged (see Technical Rationale, paragraph 2).We recommend that the SDT postpone further development of this Project until the GO-IBR and GOP-IBR registration criteria have been approved.

Industry might be more open to language that mimics FERC Order 901, Paragraph 141, for Verification of IBR Plant Dynamic Model Performance. The requirements could be modified to allow the Transmission Owner and/or Distribution Providers, if unable to gather accurate DER data, or unable to gather DER data at all, to provide instead to the Bulk-Power System planners and operators in their areas, dynamic models of individual DERs and DERs in the aggregate using ***estimated data***. This would give the Planning Coordinators the latitude to use their best judgement and experience in developing the most accurate models for their areas if they cannot get the data from the DER owners or “unregistered Distribution Providers”.

Comment	
FirstEnergy believes Footnote 5 should be deleted. The next closest DP or TO to an unregistered distribution provider should not be held responsible for providing DER data outside of their control or ability to collect. Further, FirstEnergy supports EEI's comments which state: EEI notes that this project has been listed as a low priority project. While we understand this may have some immediate impacts on the work being conducted by this SDT, we suggest that a two phased approach for the revision of MOD-032 might address the immediate concerns surrounding efforts to align registration under Project 2017-02. Phase 1: Consider completing the work from project 2017-02 Standards Alignment with Registration: Replace Load-Serving Entity (LSE) with Distribution Provider (DP), remove the Planning Authority (PA) functional entity name and keep the Planning Coordinator (PC) functional entity name, and make the associated LSE / DP functional changes to the standard requirements. Phase 2: Please consider addressing additional DER data requirements, after further discussion regarding how GO-IBR and GOP-IBR standards are going to be addressed and what is needed from Distribution Providers regarding unregistered IBRs.

Response	
Thank you for your comments. 6D: issues with "next electrically closest" - need clarification Footnotes 4 and 5 were combined and modified to eliminate the “next closest electrically connected” language and add clarity. A more detailed description of the DT intent was added to the Technical Rationale.	

6T: Prioritize administrative issues with MOD-032/Wait for 901
The DT does not believe that the development of essential requirements related to ensuring appropriate DER data is available to PCs and TPs should be delayed to put the industry behind the curve as they are with IBR performance requirements. The DT believes this is aligned with the urgency conveyed in FERC Order No. 901.

6E: GO-IBR to the rescue (related to theme 1D)
The proposed GO-IBR registration effort is primarily intended to capture the smaller transmission-connected resources that don't meet BES definition. Most individual DER will not meet proposed GO-IBR registration criteria (i.e., greater than 20 MVA) so that effort will provide little benefit with respect to making DER data available to PC/TPs. Yet, smaller individual DER installations connected to DP systems can, in aggregate, have a significant impact on BES reliability.

Standards Announcement
Project 2022-02 Modifications to TPL-001 and MOD-032

Additional Ballots and Non-binding Poll Open through November 20, 2023

Now Available

Additional ballots and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be open **Friday, November 10, 2023** through **8 p.m. Eastern, Monday, November 20, 2023** for the following standard and implementation plan:

- MOD-032-2 – Data for Power System Modeling and Analysis
- Implementation Plan

The standard drafting team's considerations of the responses received from the last comment period are reflected in this draft of the standard.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Balloting

Members of the ballot pools associated with this project can log in and submit their votes by accessing the Standards Balloting and Commenting System (SBS) here.

Note: Votes cast in previous ballots, will not carry over to additional ballots. It is the responsibility of the registered voter in the ballot pools to place votes again. To ensure a quorum is reached, if you do not want to vote affirmative or negative, cast an abstention.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*

- *Please be mindful of ballot and comment period closing dates. We ask to* ***allow at least 48 hours*** *for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts* ***prior to the last day*** *of a comment/ballot period.*

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will review all responses received during the comment period and determine the next steps of the project.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer**,** Ben Wu (via email) or at 470-542-6882. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2022-02 Modifications to TPL-001 and MOD-032 observer list” in the Description Box.

Standards Announcement

Project 2022-02 Modifications to TPL-001 and MOD-032

Formal Comment Period Open through November 20, 2023

Now Available

A formal comment period for **Project 2022-02 Modifications to TPL-001 and MOD-032** is open through **8 p.m. Eastern, Monday, November 20, 2023** for the following standard and implementation plan:

- MOD-032-2 – Data for Power System Modeling and Analysis
- Implementation Plan

The standard drafting team's considerations of the responses received from the previous comment period are reflected in this draft of the standard.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Additional ballots for the standard and implementation plan, as well as the non-binding poll of the

associated Violation Risk Factors and Violation Severity Levels will be conducted **November 10 – 20, 2023**.

For information on the Standards Development Process, refer to the Standard Processes Manual.

Unofficial Nomination Form

Project 2022-02 Uniform Modeling Framework for IBR

Submitting Nominations

Do not use this form for submitting nominations. Use the electronic form to submit nominations for **Project 2022-02 Uniform Modeling Framework for IBR** supplemental drafting team members by **8:00 p.m. Eastern, Monday, June 24, 2024.** This unofficial version is provided to assist nominees in compiling the information necessary to submit the electronic form.

General Information

Additional information is available on the project page. If you have questions, contact Senior Standards Developer, Laura Anderson (via email), or at 404-782-1870.

By submitting a nomination form, you are indicating your willingness and agreement to actively participate in face-to-face meetings and conference calls. Previous drafting or quality review team experience is beneficial, but not required.

Project Information

Project Purpose

FERC Order No. 901 – Milestone 3, Part 1: Modeling and Data Sharing Requirements SAR addresses regulatory directives from the NERC Standards Development Work Plan to respond to FERC Order No. 901. This project addresses the need to ensure the usage of a uniform framework for data sharing and model development. This project will also build mechanisms to allow equipment-specific models, if approved and as needed for model quality, to facilitate model changes as a result of the Milestone 2, 3, and 4 directives that evaluate performance of IBR.

This project must ensure modeling revisions from other IBR performance requirements in other 901-related projects will utilize the uniform framework. The drafting team will develop requirements for data aggregation estimation and data sharing of aggregated data for generation resources not registered by NERC Assets to be included as part of the revisions to the Compliance Registry criteria (“category 2 type assets”) are considered ”registered IBR” and not subject to the project objectives related to aggregated data or estimation methods.

NERC must file the Reliability Standards or definitions developed under Milestone 3 by November 4, 2025.

Standards Affected

- MOD-032
- TOP-003
- IRO-010

Nominee Expertise Requested

For this project, NERC is seeking individuals who possess experience in one or more of the following areas:

- Generation and Transmission Owners of Inverter-Based Resources;
- Generation and Transmission modeling development;
- Planning and Reliability Coordination of protection and controller settings;
- Transmission Planning;
- Balancing Authorities;
- Distribution Providers;
- Familiarity with NERC Standards MOD-032, TOP-003, and IRO-010; and
- Other tasks for identifying, analyzing, and mitigating reliability issues for BES Inverter-Based Resources.

Time Commitment Expectations

Time commitments for most projects include up to two face-to-face meetings per quarter (on average two full working days each meeting) with conference calls scheduled as needed. Team members may agree to individual or subgroup assignments, to work in separate meetings and present to the larger team for discussion and review. Another important component of quality reviews and drafting team efforts is outreach. Members of the team will be expected to conduct industry outreach during the development process to support a successful project outcome.

Project Priority

Each project will be developed according to that project's priority status. While each standard project addresses particular industry needs, some projects will be identified as a higher priority project. A higher priority project may initially include a strict timeline, which may be needed to effectively respond to a FERC Directive or as determined by the NERC Board of Trustees. A higher priority project may also need to increase the frequency of meetings at any time throughout the development process to account for project timeline needs. Similarly, other priority projects may adjust to a lower frequency of meetings throughout the development process to reallocate resources to high priority projects.

This project has been identified as higher priority at this time. The project has a FERC deadline of November 4, 2025. To meet this deadline, the team will meet regularly, up to three times a week on conference calls, with face-to-face meetings scheduled as the members' schedule allows, up to twice a quarter.

Please briefly describe your experience and qualifications to serve on the requested Standard Drafting Team (Bio):

If you are currently a member of any NERC drafting team, please list each team here:

☐ Not currently on any active SAR or standard drafting team.

☐ Currently a member of the following SAR or standard drafting team(s):

If you previously worked on any NERC drafting team, please identify the team(s):

☐ No prior NERC SAR or standard drafting team.

☐ Prior experience on the following team(s):

Acknowledgement that the nominee has read and understands both the *NERC Participant Conduct Policy* and the *Standard Drafting Team Scope* documents, available on NERC Standards Resources.

☐ Yes, the nominee has read and understands these documents.

Select each NERC Region in which you have experience relevant to the Project for which you are volunteering:

☐ MRO ☐ NPCC ☐ RF	☐ SERC ☐ Texas RE ☐ WECC	☐ NA – Not Applicable

Select each Industry Segment that you represent:

☐	1 — Transmission Owners
☐	2 — RTOs, ISOs
☐	3 — Load-serving Entities
☐	4 — Transmission-dependent Utilities
☐	5 — Electric Generators
☐	6 — Electricity Brokers, Aggregators, and Marketers
☐	7 — Large Electricity End Users
☐	8 — Small Electricity End Users

☐	9 — Federal, State, and Provincial Regulatory or other Government Entities
☐	10 — Regional Reliability Organizations and Regional Entities
☐	NA – Not Applicable

Select each Function in which you have current or prior expertise:

☐ Balancing Authority	☐ Transmission Operator
☐ Compliance Enforcement Authority	☐ Transmission Owner
☐ Distribution Provider	☐ Transmission Planner
☐ Generator Operator	☐ Transmission Service Provider
☐ Generator Owner	☐ Purchasing-selling Entity
☐ Interchange Authority	☐ Reliability Coordinator
☐ Load-serving Entity	☐ Reliability Assurer
☐ Market Operator	☐ Resource Planner
☐ Planning Coordinator	

Provide the names and contact information for two references who could attest to your technical qualifications and your ability to work well in a group:

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2022-02 Uniform Modeling Framework for IBR

Nomination Period Open through June 24, 2024

Now Available

Nominations are being sought for supplemental drafting team members through **8 p.m. Eastern, Monday, June 24, 2024**.

Use the electronic form to submit a nomination. Contact Linda Jenkins regarding issues using the electronic form. An unofficial Word version of the nomination form is posted on the Standard Drafting Team Vacancies page and the project page.

Time commitments for most projects include up to two face-to-face meetings per quarter (on average two full working days each meeting) with conference calls scheduled as needed. Team members may agree to individual or subgroup assignments, to work in separate meetings and present to the larger team for discussion and review. Another important component of quality reviews and drafting team efforts is outreach. Members of the team will be expected to conduct industry outreach during the development process to support a successful project outcome.

Project Priority

Each project will be developed according to that project's priority status. While each standard project addresses particular industry needs, some projects will be identified as a higher priority project. A higher priority project may initially include a strict timeline, which may be needed to effectively respond to a FERC Directive or as determined by the NERC Board of Trustees. A higher priority project may also need to increase the frequency of meetings at any time throughout the development process to account for project timeline needs. Similarly, other priority projects may adjust to a lower frequency of meetings throughout the development process to reallocate resources to high priority projects.

This project has been identified as higher priority at this time. The project has a FERC deadline of November 4, 2025. To meet this deadline, the team will meet regularly, up to three times a week on conference calls, with face-to-face meetings scheduled as the members' schedule allows, up to twice a quarter.

Next Steps

The Standards Committee is expected to appoint members to the drafting team in August 2024. Nominees will be notified shortly after they have been appointed.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Laura Anderson (via email) or at 404-782-1870. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2022-02 Uniform Modeling Framework for IBR” in the Title and Description Boxes.

Standard Authorization Request (SAR)

Complete and submit this form, with attachment(s) to the NERC Help Desk. Upon entering the Captcha, please type in your contact information, and attach the SAR to your ticket. Once submitted, you will receive a confirmation number which you can use to track your request.

The North American Electric Reliability Corporation (NERC) welcomes suggestions to improve the reliability of the bulk power system through improved Reliability Standards.

Justification for this proposed standard development project (Check all that apply to help NERC prioritize development)	
☒ Regulatory Initiation	☒ NERC Standing Committee Identified
☒ Emerging Risk (Reliability Issues Steering Committee) Identified	☐ Enhanced Periodic Review Initiated
☒ Reliability Standard Development Plan	☐ Industry Stakeholder Identified

What is the risk to the Bulk Electric System (What Bulk Electric System (BES) reliability benefit does the proposed project provide?):

This Standards Authorization Request (SAR) is initiated by NERC, with consultation of the Reliability Security Technical Committee, to address directives issued by FERC in Order No. 901. FERC issued Order No. 901 on October 19, 2023, which includes directives on new or modified NERC Reliability Standard projects. FERC Order No. 901 addresses a wide spectrum of reliability risks to the grid from the application of inverter-based resources (IBRs); including both utility scale and behind-the-meter or distributed energy resources (DERs).

Within the Order are four milestones that include sets of directives to NERC. In the Order, FERC has directed NERC to propose new or modified standards to mitigate reliability gaps in the current NERC Reliability Standards related to IBRs. Specifically, FERC directed NERC to develop new or modified

Requested information

Reliability Standards to address the following four broad topic areas related to IBRs: (1) data sharing; (2) data and model validation; (3) planning and operational studies; and (4) performance.

In January 2024, NERC filed the initial **Standards Development Work Plan in Response to FERC Order No. 901** (hereafter referred to as the "Work Plan"). A current version of the Work Plan will be maintained here. The Work Plan discusses how NERC will develop Reliability Standards within (Milestones 2-4) to meet FERC's filing deadlines. This Standard Authorization Request addresses Milestone 3 of the Work Plan, related to Reliability Standards for modeling and data sharing requirements to establish sufficient IBR model data and parameters to assure accurate representation of IBR performance within the models. Further, collaborative sharing of this information, and the utilization of this information throughout the lifecycle of IBRs will also be established.

Milestone 3 of the Work Plan covers the development of data provisioning, parameters, and estimation requirements for IBRs. FERC Order No. 901 directives address three categories of IBR: (1) registered IBR, including sub-Bulk Electric System IBRs to be registered under NERC's revised Compliance Registry criteria; (2) unregistered IBR; and (3) IBR-DER, to distinguish registered bulk connected IBRs from unregistered bulk connected IBRs as well as the transmission connected IBRs from distribution-connected IBRs. To be clear, assets to be included as part of revisions to the Compliance Registry criteria ("category 2 type assets") are considered herein as '"registered IBR". NERC must file the Reliability Standards or definitions developed under Milestone 3 by November 4, 2025.

As often discussed within NERC recommendations and publications, the current paradigm of modeling and data sharing leaves the bulk power system (BPS) at a higher than necessary risk for unexpected and undesired inverter-based resource (IBR) performance. Since 2016, approximately 15,000 MW of IBR have unexpectedly reduced output during NERC categorized disturbance events. None of the IBR facilities involved in these disturbances utilized models that could accurately represent the facility's performance during the disturbance event. These discrepancies between modeled and studied performance when compared to real-world performance are driven by current industry modeling practices and a dependence on generic IBR modeling throughout the lifecycle of the IBR facility.

NERC Modeling Guidance [1] states that additional model types, namely manufacturer-specific user-written models, must be used for local reliability studies, during the interconnection process and following commissioning to validate as-built performance – as well as through ongoing validation of performance. The deficiencies within the current state of model quality are well documented. As required by FERC Order No. 901, the development of positive sequence models based on an approved (standard) library of model types must be built into Interconnection-wide cases.

Revisions to data sharing expectations and the creation of a "NERC Approved Model Library" that allows the use of manufacturer-specific models in addition to standard library (generic) models in instances

[1] https://www.nerc.com/pa/RAPA/ModelAssessment/Documents/Dynamic%20Modeling%20Recommendations.pdf

Requested information
where generic modeling cannot represent the performance of the IBR are necessary to ensure BPS reliability through improvements to the inputs of current study practices.
Purpose or Goal (What are the reliability gap(s) or risk(s) to the Bulk Electric System (BES) being addressed, and how does this proposed project provide the reliability-related benefit described above?):
This SAR addresses specific pieces of the NERC filed Work Plan related to Milestone 3 and addresses the various industry comments to meet the regulatory directives of FERC Order No. 901. This project shall coordinate among other projects (i.e., act as a clearing house to tie directive language to standard revisions), develop standard language (i.e., perform the normal duties of a standard development Project), and build upon other Milestones from FERC Order No. 901 Standards Projects to meet regulatory deadlines (i.e., maintain agility based on how FERC Order No. 901 related Projects proceed to meet the directive deadlines). This Project will also address FERC Order No. 901 directives related to aggregation of data, parameters, and estimation methods to provide the Transmission Planner (TP) and Transmission Operator (TOP) with the estimate values, explanation for limitations on data availability, and the method used for all estimations. This project is intended to serve as a data sharing center point for many of the revisions being established within all of the 901-related projects. Performance of IBR during an event (grid disturbance) are identified and corrected within the Standards Development projects pertaining to Milestone 2 of the Work Plan. However, any requisite changes to model data as a result of correcting IBR performance, must be communicated through a uniform model framework to assure all impacted entities and users of the approved models are adequately informed and provided updated models (as developed within this project). Similarly, revisions to model validation being drafted by the drafting team assigned the Milestone 3 Part 2 SAR, must also assure entities follow the uniform model framework established here.
Project Scope (Define the parameters of the proposed project):
The FERC Order No. 901 directives assigned to this SAR are outlined in the Detailed Description section below. The project scope shall address all those directives, and should consider the following objectives during the standards development process: 1. Modify MOD-032 to require the usage of a “NERC-Approved Model Library” (Hereafter: “Model Library”) that contains acceptable (and unacceptable) models and recommendations to facilitate the exchange of neighboring entities’ respective planning and operation models and to be used in Interconnection-wide case creation and in other NERC Reliability Standards for IBR. a. This Model Library will be developed and maintained by NERC. Updates on the Model Library development will be coordinated with the Drafting Team. The Drafting Team may solicit feedback comments of the NERC process from industry as needed. b. The Model Library will be accessible to the general public. NERC will develop an open and transparent process for maintaining the library.

Requested information

c. The Model Library will be consistent with NERC's published Dynamic Modeling Recommendations, primarily:

i. Industry-approved library models are sufficient for use in Interconnection-wide base case creation and interconnection-wide studies;

ii. For local reliability studies (e.g. performance during the interconnection process, model quality validation), equipment-specific models should be used if generic models from the Model Library cannot accurately represent the IBR.

2. Modify applicable Reliability Standards (e.g. MOD-032, TOP-003, and IRO-010) to require Planning Coordinators, Transmission Planners, Reliability Coordinators, Transmission Operators, and Balancing Authorities to ensure usage of a uniform framework that includes modeling criteria consistent with NERC's Dynamic Modeling Recommendations, a registered modeling designee, and necessary data exchange requirements. The framework must require:

a. Data specification and notifications for the data necessary to develop interconnection-wide models and models for other reliability studies;

i. Specifications must include provisions for new, modified, or changed equipment,

ii. Specifications must include provisions for changes to an approved equipment-specific models,

iii. Specifications must include provisions and a periodicity for exchanging estimated aggregated unregistered IBR and DER data.

b. Data exchange of generic models from the Model Library for interconnection-wide model creation that most accurately reflect the behavior of each IBR during steady state, short-circuit, and dynamic conditions;

c. A review and approval process for additional model types from the Model Library (other than generic model types) for other reliability studies;

d. Data exchange of aggregated data, estimation methods, and documented limitations of the availability of accurate data for unregistered IBR and DER as developed by Transmission Owners and Distribution Providers in Item 4.

3. Modify MOD-032 to require Generator Owners (GO) and Transmission Owners (TO) to follow the uniform framework developed in Item 2, specifically;

a. GO and TO of IBR must provide generic models from the Model Library for interconnection-wide model creation that most accurately reflect the behavior of each IBR during steady state, short-circuit, and dynamic conditions;

b. GO and TO of IBR must provide sufficient documentation regarding technical limitations and any inaccuracies as justification for the use of additional equipment-specific models.

i. For instance, a Corrective Action Plan created by a planner or operator to address model quality due to exceeded performance criteria (reference Milestone 3 Part 2 SAR), may

Requested information
necessitate usage of an equipment-specific model instead of a generic model from the Model Library. ii. For instance, studied discrepancies between the generic model and performance or the IBR demonstrated during the interconnection process may necessitate usage of an equipment-specific model instead of a generic model from the Model Library. iii. For instance, discrepancies between the generic model and performance of the IBR during a disturbance (i.e. from a post-event analysis) may necessitate usage of an equipment-specific model instead of a generic model from the Model Library. 4. Modify TOP-003 and IRO-010 to require Transmission Owners and Distribution Providers to establish and implement data aggregation methods for unregistered IBR and DER. These standards must address: a. An estimate of the modeling data and parameters of IBR-DERs and unregistered IBRs, b. An explanation of the limitations of the availability of accurate data, and c. The method used for all estimations. 5. The drafting team shall ensure that implementation plans for new or modified Reliability Standards related to Milestone 3 of the Work Plan are aligned and do not create a reliability gap during implementation.
Detailed Description (Describe the proposed deliverable(s) with sufficient detail for a drafting team to execute the project. If you propose a new or substantially revised Reliability Standard or definition, provide: (1) a technical justification[2] of developing a new or revised Reliability Standard or definition, which includes a discussion of the risk and impact to reliability-of the BES, and (2) a technical foundation document (*e.g.,* research paper) to guide development of the Standard or definition):
The project scope above will need to account for the specific directive text in FERC Order 901 to be successful. The drafting team should consider the specific language in the FERC directives, as well as any comments in the underlying FERC Order No. 901 proceeding that FERC directed NERC to consider as part of the standard development process. **FERC Order 901 Directives Assigned to this SAR:** NERC will maintain a current version of NERC Standards Development's Work Plan to Address FERC Order No. 901 on the NERC website under Reliability Standards Under Development. Included in this Work Plan is a list of the directives in FERC Order No. 901 and their associated mapping of each SAR submitted by NERC. The Work Plan will be updated should any mapping of FERC directives be reassigned due to ongoing work in the various Standards Development Projects. As of April 1, 2024, this SAR will address the following FERC Order No. 901 directives, with the scope for this SAR emphasized in **bold** as appropriate:

[2] The NERC Rules of Procedure require a technical justification for new or substantially revised Reliability Standards. Please attach pertinent information to this form before submittal to NERC.

Requested information

1. "Second, by November 4, 2025, NERC must submit new or modified Reliability Standards addressing the interrelated directives concerning: (1) data sharing for registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate; and (2) data and model validation for registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate." (P 7)
2. "Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require registered IBR generator owners and operators to provide IBR-specific modeling data and parameters (e.g., steady-state, dynamic, and short circuit modeling information ,and control settings for momentary cessation and ramp rates) that accurately represent the registered IBRs to their planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities that are responsible for planning and operating the Bulk-Power System." (P 76)
3. "Nevertheless, to support accurate modeling and performance, we direct NERC to consider during its standards development process AEU and ACP/SEIA's suggested data sharing requirements when developing the framework, criteria, and necessary data exchange requirements to meet the registered IBR data sharing directive." (P 77)
4. "As discussed in more detail in section IV.C of this final rule, we are also directing NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models that accurately reflect the behavior of all IBRs during steady state, short-circuit, and dynamic conditions." (P78)
5. "Likewise, regarding CAISO's request that the Commission direct NERC to consider requiring registered IBRs to provide additional data, we agree that such data collections may be warranted, and direct NERC to consider through its standards development process whether additional IBR data points (e.g., telemetry collections or other automated platform integrations) are needed to further enhance real-time visibility of Bulk-Power System operations." (P 86)
6. "Specifically, as proposed in the NOPR, we direct NERC to submit to the Commission for approval one or more new or modified Reliability Standards that require: (1) transmission owners to provide to Bulk-Power System planners and operators modeling data and parameters for unregistered IBRs in their transmission owner areas that, individually or in the aggregate, materially affect the reliable operation of the Bulk-Power System and (2) distribution providers to provide to Bulk-Power System planners and operators modeling data and parameters for IBR-DERs in the aggregate in their distribution provider areas where the IBR-DERs in the aggregate materially affect the reliable operation of the Bulk-Power System." (P 102)
7. "Recognizing that there may be instances in which transmission owners are unable to gather adequate unregistered IBR modeling data and parameters to create and maintain unregistered IBR models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the

Requested information

availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation." (P 104)

8. "To support this data collection, we further direct NERC to consider commenters suggestions to implement a process or mechanism by which transmission owners would receive modeling data and parameters." (P 104)
9. "Accordingly, to account for instances in which distribution providers are unable to gather adequate modeling data and parameters of IBR-DERs to create and maintain IBR-DER models, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require that each distribution provider, if unable to gather accurate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation." (P 105)
10. "In support of above, we further direct NERC to consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters." (P 105)
11. "For those areas with IBR-DERs that in the aggregate materially affect the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we direct NERC to determine the appropriate registered entity responsible for providing data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, or, when unable to gather such accurate IBR-DERs data, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation." (P 106)
12. "Regarding CAISO's concern regarding the potential "compliance trap" where planners and operators rely on third-party data and IRC's request that the final rule specify the data to be submitted by all IBRs (i.e., registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate) and transmission devices using similar technologies, we direct NERC to determine through its standards development process the minimum categories or types of data that must be provided to transmission planners, transmission operators, transmission owners, and distribution providers necessary to predict the behavior of all IBRs and to ensure that compliance obligations are clear." (P 108)
13. "As discussed in more detail in section IV.C of this final rule, we are also directing NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models that accurately reflect the behavior of all IBRs during steady state, short-circuit, and dynamic conditions." (P 108)

Requested information

14. "Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions when developing planning, operations, and interconnection-wide models." (P 122)
15. "We direct NERC to determine through its standards development process which nation-wide approved component models are needed to build IBR plant models for steady state, short-circuit, and dynamics studies." (P 124)
16. "Accordingly, we direct NERC to develop new or modified Reliability Standards that require the sole use of nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build interconnection-wide models." (P 125)
17. "**We also direct NERC to require** the generator owners of registered IBRs and **the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g., planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of** registered and **unregistered IBRs, including momentary cessation and/or tripping, and all ride through behavior**." (P 141)
18. "Recognizing that there may be instances in which transmission owners are unable to gather accurate unregistered IBR modeling data and parameters to create and maintain accurate unregistered IBR dynamic models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas, dynamic models of unregistered IBRs using estimated data in accordance with this final rule's section IV.B.3 data sharing directives." (P 141)
19. "Further, we direct NERC to require distribution providers to provide to the planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities aggregated dynamic models that adequately represent the dynamic performance of IBR-DERs on their systems that in the aggregate have a material impact on the Bulk-Power System, including momentary cessation and/or tripping, and all ride through behavior (e.g., IBR-DERs in the aggregate modeled by interconnection requirements performance to represent different steady-state and dynamic behavior)." (P141)
20. "Recognizing that there may be instances in which distribution providers are unable to gather data that accurately represents IBR-DERs in the aggregate, we modify the NOPR proposal and direct NERC to include in the proposed new or modified Reliability Standards a requirement that the distribution provider, if unable to gather data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, provide to the Bulk-Power System planners and operators (i.e., the data recipients) a dynamic model using estimated data for IBR-DERs that in

Requested information
the aggregate have a material impact on the Bulk-Power System, in accordance with this final rule's section IV.B.3 data sharing directives." (P 141) 21. "Furthermore, we acknowledge that there may be areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider. Therefore, we modify the NOPR proposal and direct NERC to determine the appropriate registered entity responsible for providing adequate data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and to identify the registered entities for coordinating, verifying, and keeping up to date the respective dynamic models." (P 141) 22. "Finally, NERC must ensure that the proposed new or modified Reliability Standards account for the dynamic performance of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System." (P 141) 23. "Accordingly, we direct NERC to develop new or modified Reliability Standards that require the use of the DER_A model or successor models to represent the behaviors of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System at a sufficient level of fidelity for Bulk-Power System planners and operators to create valid planning and operations and interconnection-wide models and to be able to perform respective system studies." (P 146) 24. "**Furthermore, for those areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we modify the NOPR proposal to direct NERC to determine the appropriate registered entity responsible for the data and parameters of IBR-DERs in the aggregate** and to establish a process that requires identified registered entities to coordinate, validate, and keep up to date the system models." (P 157) 25. "**Specifically, we direct NERC to develop new or modified Reliability Standards that require planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities to establish for each interconnection a uniform framework with modeling criteria, a registered modeling designee, and necessary data exchange requirements both between themselves and with the generator owners, transmission owners, and distribution providers to coordinate the creation of transmission planning, operations, and interconnection-wide models (i.e., system models)** and the validation of each respective system model." (P 161) 26. "Further, we believe that there is a need to have all of the directed Reliability Standards effective and enforceable well in advance of 2030 and direct NERC to ensure that the associated implementation plans sequentially stagger the effective and enforceable dates to ensure an orderly industry transition for complying with the IBR directives in this final rule prior to that date." (P 226)
Cost Impact Assessment, if known (Provide a paragraph describing the potential cost impacts associated with the proposed project):

Requested information
The associated cost with implementation of a new standard is currently unknown, and the modifications necessary for each specific directive are also unknown though they are expected to vary based on DT outcome.
Please describe any unique characteristics of the BES facilities that may be impacted by this proposed standard development project (*e.g.*, Dispersed Generation Resources):
IBRs connected to the transmission system.
To assist the NERC Standards Committee in appointing a drafting team with the appropriate members, please indicate to which Functional Entities the proposed standard(s) should apply (*e.g.*, Transmission Operator, Reliability Coordinator, etc. See the NERC Rules of Procedure Appendix 5A:
This Project should contain appropriate members representing the following Functional Entities: Balancing Authority Distribution Provider Generator Owner Generator Operator Planning Coordinator Reliability Coordinator Transmission Owner Transmission Operator Transmission Planner Reliability Coordinator
Do you know of any consensus building activities[3] in connection with this SAR? If so, please provide any recommendations or findings resulting from the consensus building activity.
FERC Order No. 901 NERC Standards Development Work Plan in Response to FERC Order No. 901 Inverter-Based Resource Activities, Quick Reference Guide Distributed Energy Resource Activities, Quick Reference Guide IBR Registration Initiative, Quick Reference Guide
Are there any related standards or SARs that should be assessed for impact as a result of this proposed project? If so, which standard(s) or project number(s)?
1. SARs: a. SAR titled: Federal Energy Regulatory Commission (FERC) Order No. 901 – Milestone 3, Part 2: IBR Model Validation b. SAR titled: Federal Energy Regulatory Commission (FERC) Order No. 901 – Milestone 3, Part 3: IBR Modeling Revision 2. Active Reliability Standards Projects: a. 2020-06 Verifications of Models and Data for Generators b. 2021-01 Modifications to MOD-025 and PRC-019

[3] Consensus building activities are occasionally conducted by NERC and/or project review teams. They typically are conducted to obtain industry inputs prior to proposing any standard development project to revise, or develop a standard or definition.

Requested information
c. 2022-02 Modifications to TPL-001-5.1 and MOD-032-1 (NERC Standards Development recommends assigning the SAR to this active project) d. 2022-04 EMT Modeling e. 2023-05 Modifications to FAC-001 and FAC-002 f. 2023-08 Modifications of MOD-031 Demand and Energy Data
Are there alternatives (e.g., guidelines, white paper, alerts, etc.) that have been considered or could meet the objectives? If so, please list the alternatives with the benefits of using them.

Reliability Principles	
Does this proposed standard development project support at least one of the following Reliability Principles (Reliability Interface Principles)? Please check all those that apply.	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Market Interface Principles	
Does the proposed standard development project comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

Project 2022-02 Uniform Modeling Framework for IBR Standard Authorization Request (SAR)

Do not use this form for submitting comments. Use the Standards Balloting and Commenting System (SBS) to submit comments on the **Project 2022-02 Uniform Modeling Framework for IBR SAR** by **8 p.m. Eastern, Monday, June 24, 2024.**

Additional information is available on the project page. If you have questions, contact Senior Standards Developer, Laura Anderson (via email), or at 404-782-1870.

Background Information

FERC Order No. 901 – Milestone 3, Part 1: Modeling and Data Sharing Requirements SAR addresses regulatory directives from the NERC Standards Development Work Plan to respond to FERC Order No. 901. This project addresses the need to ensure the usage of a uniform framework for data sharing and model development. This project will also build mechanisms to allow equipment-specific models, if approved and as needed for model quality, to facilitate model changes as a result of the Milestone 2, 3, and 4 directives that evaluate performance of IBR.

This project must ensure modeling revisions from other IBR performance requirements in other 901-related projects will utilize the uniform framework. The drafting team will develop requirements for data aggregation estimation and data sharing of aggregated data for generation resources not registered by NERC Assets to be included as part of the revisions to the Compliance Registry criteria ("category 2 type assets") are considered "registered IBR" and not subject to the project objectives related to aggregated data or estimation methods.

This project has been identified as higher priority at this time. This project has a FERC deadline under Milestone 3 of November 4, 2025.

Questions

1. Do you agree with the proposed scope as described in the SAR? If you do not agree, or if you agree but have comments or suggestions for the project scope, please provide your recommendation and explanation.

   ☐ Yes
   ☐ No

   Comments:

2. Provide any additional comments for the SAR drafting team to consider, if desired.

   Comments:

Standards Announcement

Project 2022-02 Uniform Modeling Framework for IBR Standard Authorization Request (SAR)

Formal Comment Period Open through June 24, 2024

Now Available

A formal comment period for the **Project 2022-02 Uniform Modeling Framework for IBR SAR**, is open through **8 p.m. Eastern, Monday, June 24, 2024**.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The drafting team will review all responses received during the comment period and determine the next steps of the project.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Laura Anderson (via email) or at 404-782-1870. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2022-02 Uniform Modeling Framework for IBR” in the Title and Description Boxes.

Comment Report

Project Name:	2022-02 Uniform Modeling Framework for IBR | Standard Authorization Request
Comment Period Start Date:	5/17/2024
Comment Period End Date:	6/24/2024
Associated Ballots:	

There were 34 sets of responses, including comments from approximately 113 different people from approximately 80 companies representing 10 of the Industry Segments as shown in the table on the following pages.

Questions

1. Do you agree with the proposed scope as described in the SAR? If you do not agree, or if you agree but have comments or suggestions for the project scope, please provide your recommendation and explanation.

2. Provide any additional comments for the drafting team to consider, if desired.

1. Do you agree with the proposed scope as described in the SAR? If you do not agree, or if you agree but have comments or suggestions for the project scope, please provide your recommendation and explanation.

Thomas Foltz - AEP - 3,5,6	
Answer	No
Document Name	

Comment

AEP does not agree with this proposed SAR and recommends that it not be pursued. Despite what modeling guidance may claim, standard library or generic models may not always be the best representation of IBRs or sufficient for use in interconnection-wide cases. Justification for use of equipment-specific or user-defined modeling should not be required. The decision between generic and user-defined models should be left to OEMs and Planning Coordinators / Transmission Planners per MOD-032 R1 data submittal documentation and not dictated in NERC standards. If equipment-specific models are supplied by OEMs and accepted by the PC and TP, it should not be necessary to also supply a generic model unless the PC and TP specify that in their model submittal documentation.

A fundamental problem that renewable generation has introduced at all levels (transmission, sub-transmission, and distribution) and one that these SARs are not truly acknowledging, is how to get verified and validated modeling in support of the interconnection study process such that the modeling studied prior to interconnection accurately represents the projects put into service. To do this verification and validation properly, which MOD-026-2 now under draft attempts to do only after projects are in service (and only BES interconnections), will require a similar process inserted into the interconnection timeline. Such an insertion is likely to extend project timelines and costs significantly. Not only that, we believe it is clear from the NERC disturbance reports that IBR ride-through performance is best evaluated by EMT modeling and simulation platforms given that the positive sequence phasor domain is limited in being able to represent all factors that can affect ride-through. The proposed SAR makes no mention of EMT.

A second problem that these SARs fail to acknowledge is that it is unknown how dynamic model estimation and aggregation of unregistered IBRs and DERs, which the SAR seeks to assign to TOs and DPs, is to be carried out. High-level assumptions must be made because, short of getting equipment-specific data and modeling these IBRs and DERs in individual detail (along with the subsystems to which they are connected, which detail is utterly impractical), there is no means to be certain what is out there and how it will behave in aggregate when put to the test. There have been previous attempts by SPIDER to impose DER modeling data requirements on TOs and DPs which were unsuccessful, at least in part because of the problematic nature of imposing compliance obligations on TOs and DPs to obtain data from unregistered entities. TPs and PCs, RCs and TOPs, TOs and DPs will all have to determine what assumptions to make (and those assumptions will have to be made to fulfill their existing obligations to system reliability as unregistered IBRs and DERs increase) however these functional entities should not be saddled with even more compliance obligations while trying to chart unknown methods of estimation and aggregation.

Comment

The Detailed Description section includes a listing of all FERC 901 directives assigned to Milestone 3. However, this SAR is only Part 1 of four SARS related to Milestone 3. On page 3 of this SAR it says the project scope shall address all those directives listed. To be clear, can the directives be rearranged and aligned with each of the expected four parts so that it is clear which ones apply. This will help the future drafting team.

In Scope item 1, it is noted to modify MOD-032 to require the usage of the NERC-Approved model library. The requirement is not clear whether there is grace period if NERC makes changes to the Model Library. Once NERC declares a model unacceptable, for example, it could take more than one year for an acceptable model to be developed to replace the unacceptable model and get added to the interconnection-wide models.

This SAR contains excessive language that creates confusion as to what the scope and goal of this SAR encompasses.

This SAR is attempting to perform several different functions. Project management and Standards development.

Is this a FERC Order 901 standard development coordination project, ie. Project Management, or a standards development project to address a specific risk? The coordination (project management) of the 901 projects should be separated from the specifics of Modeling and Data sharing requirements.

From the NERC Work Plan, Milestone 3 – Part 1, Data Sharing

Overall Strategy: Collaborate between NERC Standards Development, Engineering, and the RSTC. The scope of this collaboration is to cross check active projects, draft SARs, and pending SARs from RSTC-associated work plans and identify which of those will address aspects of this milestone. Some revisions to draft SARs or active projects will be necessary to focus development on directives in Order No. 901.

This is project management. Multiple projects, standards, and objectives. This can be accomplished outside of a SAR.

1. This project shall coordinate among other projects (i.e., act as a clearing house to tie directive language to standard revisions), develop standard language (i.e., perform the normal duties of a standard development Project), and build upon other Milestones from FERC Order No. 901 Standards Projects to meet regulatory deadlines (i.e., maintain agility based on how FERC Order No. 901 related Projects proceed to meet the directive deadlines).

2. This project is intended to serve as a data sharing center point for many of the revisions being established within all of the 901-related projects. Performance of IBR during an event (grid disturbance) are identified and corrected within the Standards Development projects pertaining to Milestone 2 of the Work Plan. However, any requisite changes to model data as a result of correcting IBR performance, must be communicated through a uniform model framework to assure all impacted entities and users of the approved models are adequately informed and provided updated models (as developed within this project). Similarly, revisions to model validation being drafted by the drafting team assigned the Milestone 3 Part 2 SAR, must also assure entities follow the uniform model framework established here.

3. NERC Modeling Guidance states that additional model types, namely manufacturer-specific user-written models, must be used for local reliability studies, during the interconnection process and following commissioning to validate as-built performance – as well as through ongoing validation of performance. The deficiencies within the current state of model quality are well documented. As required by FERC Order No. 901, the development of positive sequence models based on an approved (standard) library of model types must be built into Interconnection-wide cases.

4. The creation of a “NERC Approved Model Library” that allows the use of manufacturer-specific models in addition to standard library (generic) models in instances.

Additionally, MH requests coordination of this SAR and Project across all IBR/Order 901 Projects to ensure that all the projects collectively address the directives in FERC Order 901 without introducing duplication, overlap or contradictions between projects.

MH is concerned that the SAR does not appear to align with what’s in NERC’s Dynamic Modeling Recommendations whitepaper (see Figure 1).[1]

[1] Dynamic Modeling Recommendations (nerc.com)

Example #1

While the SAR (bottom of page 2) states that: "*NERC Modeling Guidance 1 states that additional model types, namely manufacturer-specific user-written models, must be used for local reliability studies, during the interconnection process and following commissioning to validate as-built performance – as well as through ongoing validation of performance.*"

NERC's Dynamic Modeling Recommendations whitepaper, Figure 1 illustrates that both "**Recommended User Defined Models**" and "**Benchmarked (against UDM or EMT) Library Models Recommended**" can be used for "**Local Reliability Studies**" and "**Plant Interconnection Studies.**"

The SAR also appears to contain conflicts within itself as with the first bullet above (SAR, bottom of page 2) and this bullet (SAR, page 4, section 1.c.ii.):

"For local reliability studies (e.g. performance during the interconnection process, model quality validation), equipment-specific models should be used if generic models from the Model Library cannot accurately represent the IBR."

Example #2

Likewise, there appears to be another conflict between NERC's Dynamic Modeling Recommendations whitepaper and the SAR (page 2): "*As required by FERC Order No. 901, the development of positive sequence models based on an approved (standard) library of model types must be built into Interconnection-wide cases." Here again, the whitepaper illustrates that "Recommended User-Defined Models" are also acceptable.*"

Comment

While beneficial in having all models in one location for use, the creation and maintenance of said Model Library will be significant. Should the RSTC be the owner of the library versus NERC? The FERC Order just directed "NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models" which does not necessarily imply that NERC develops and maintains a Model Library. The SAR indicates that the development of the Model Library will be coordinated with the Drafting Team. Also, the Drafting Team may solicit feedback from industry on the NERC process. This assumes that the Model Library will be developed as the Standard is developed. It does not consider timing period beyond the life of the DT. Also, the comments from industry will be managed through what mechanism? What recourse is considered if the model does not exist in the Model Library? It appears the DT is creating a solution within the SAR and Standard Development efforts that are best left with NERC working with the RSTC when a Model Library is required by approved Standard language.

How will model changes be tracked (and by whom)?

How does this affect FAC-001 and FAC-002 in terms of using the Model Library as a consistent source for modeling?

Comment

Reference 2022-02 Uniform Modeling Framework for IBR Standard Authorization Request, Project Scope section, Version 5, August 14, 2023, for the following Duke Energy recommendations (Questions 1 and 2):

2.a.iii: Minimum threshold for unregistered and aggregate DER should be considered individually to ensure consistently.

2.c: Duke Energy does not believe the PC, TP, RC, TO, TOP, BA have the expertise to approve additional model types. This review and approval process should be handled by an industry group.

4.c: Estimation Methodology should include minimum threshold for modeling (e.g., Aggregate MWs or IBR-DER Penetration Percentage).

Comment

What criteria is to be used and by whom to determine if generic models cannot accurately represent the IBR?

Item #3 under project scope notes that the GO and TO of IBRs must provide sufficient documentation regarding technical limitations and any inaccuracies as justification for use of equipment specific models. What criteria is to be used to make the determination that an equipment specific model should be used?

There is a disconnect between MOD-032 models and what is used as part of the interconnection process. There should be no difference on what models are used for both and MOD-032 should address the interconnection process models as well to eliminate confusion between the two processes.

The SAR Detailed Description section does not provide detail on proposed deliverables to address the directives in FERC Order 901, but rather just restates the directives, which does not meet the intent of this section of the SAR.

The SAR does not provide a clear direction for the industry to evaluate since it still notes several possible paths that need to be determined. Without knowing the path the SDT is taking, we cannot effectively evaluate the SAR.

Allowing a TO or DP to estimate the unregistered IBRs or IBR-DERs that are on their systems does not align with the FERC Order 901 directive to accurately represent the dynamic performance of these facilities.

DP's are not able to estimate unregistered IBR-DER to provide models that meet the level of accuracy required for the purpose of studying the impact of IBR's on the grid. There are also state regulations that may not allow DP's to ask for this type of modeling data. DP's also cannot estimate which

unregistered IBR_DER's can impact the grid. It is recommended for Nerc to work with the RTO's and with the state regulators to mandate this type of data to be supplied and to the extent possible, verified.

Requiring modeling for unregistered IBRs and IBR-DERs is going to be a large cost impact to the affected entities especially if equipment specific models are to be used. For a recent wind project, the initial modelling costs for the site was nearly $500k for a 225MW site with two turbine OEMs and a plant level controller. Equipment specific models were used in this instance and will require on-going O&M costs with the respective OEMs to update the equipment specific models for new model versions and any changes to the site.

Comment

AZPS supports the following comments that were submitted by EEI on behalf of its members:

Project Scope Comments: FERC directives identified in the Detail Description Section as Items 1, 2, 4, 6, 9, 12, 14, 16, 18, 19, 20, 22, 23 and 26 are sufficiently covered in this SAR, assuming adjustments are made in line with the proposed edits below. We further note that Items 3, 5, 8, and 10 do not appear as tasks within the proposed scope, however, all four were identified as directives and need to be addressed. (Noting the following)

Item 3: Consider AEU's and ACP/SEIA's suggested data sharing requirements when developing the framework, criteria and necessary data exchange.

Item 5: Consider CAISO's suggestion to require registered entities to provide additional IBR data points (e.g., telemetry collections or other automated platform integrations) to further enhance real-time visibility of Bulk-Power System operations.

Item 8: Consider new processes or mechanisms to provide Transmission Owners with modeling data and parameters.

Item 10: Consider new processes or mechanisms to provide Distribution Providers with modeling data and parameters.

And lastly, we read Items 11, 17, 21 and 24 to be NERC directed tasks and believe those activities should be removed from the Detailed Description section of this SAR and addressed separately by NERC. Beyond this we offer the following edits to the 5 Items identified in the SAR Project Scope.

Scope Item 1 Comments: Item 1 only contains one task that directly aligns to the work the DT will perform under this project. The rest of Item 1 describes the model library and its attributes and processes, all of which are NERC activities. While we have no concerns with NERC taking responsibility for the model library, it is critical that models contained in that library are compatible with all existing planning software currently available and changes to the model library are only allowed during prescribed intervals/time periods so as not to disrupt responsible entity planning compliance obligations and deadline causing unnecessary rework of planning studies. Given the model library will be done exclusively by NERC and not the DT, Item 1 should be revised to read as follows:

1. Modify MOD-032 to require the usage of a "NERC-Approved Model Library"

Item 2 Comments: EEI suggests removing the reference to NERC's Dynamic Modeling Requirements. While we do not object to using that document as a guide, such language potentially limits the DT from developing requirements that they believe better align with the directive contained in Order 901.

EEI also does not agree with mixing the modeling data requirements associated with MOD-032 with the data collection requirements of TOP-003 and IRO-010. The SAR will be clearer separating these DT tasks. To address these concerns, we offer the following edits to Item 2 below:

2a) Modify Reliability Standard MOD-032 or develop a new Reliability Standard that require**s** Planning Coordinators, Transmission Planners, Reliability Coordinators, Transmission Operators, and Balancing Authorities to use a uniform framework with modeling criteria for each interconnection. The DT should consider integrating appropriate element of NERC's Dynamic Modeling Recommendations as a guide. The revised or new Reliability Standard should contain:

d. Data specification for the data necessary to develop interconnection-wide models and models for other reliability studies;

i. Specifications must include provisions for new, modified, or changed equipment,

ii. Specifications must include provisions for changes to an approved equipment- specific models,

iii. Specifications must include provisions and a periodicity for exchanging estimated aggregated unregistered IBR and DER data.

e. Data exchange of generic models from the Model Library for interconnection-wide model creation that most accurately reflect the behavior of each IBR during steady state, short- circuit, and dynamic conditions;

f. Delete

g. Data exchange of aggregated data, estimation methods, and documented limitations of the availability of accurate data for unregistered IBR and DER as developed by Transmission Owners and Distribution Providers in Item 4.

2b: Modify TOP-003 and IRO-010 or develop new Reliability Standards for the collection of IBR specific models and data that align with the defined specifications as developed within the modified MOD-032 Reliability Standard or new Reliability Standard.

Item 3 Comments: EEI does not agree that MOD-032 is the proper Reliability Standard to require GOs to provide IBR models and data. And while TOs and DPs will be responsible for providing IBR models and data for unregistered IBRs and IBR-DERs in aggregate, TOs should have no part in providing IBR models or data for registered IBRs. To address our concern, we offer the following edits to Item 3:

3. Modify TOP-003 and IRO-010 to require Generator Owners (GO) to provide IBR models and data that conform to the specifications contained in MOD-032, or the new IBR Reliability Standard that meets the requirements identified in Item 2 above, specifically;

a. GO of registered IBR must provide generic models from the Model Library for interconnection- wide model creation that most accurately reflect the behavior of each IBR during steady state, short-circuit, and dynamic conditions;

b. GO of registered IBR must provide sufficient documentation regarding technical limitations and any inaccuracies as justification for the use of additional equipment-specific models.

i. For instance, a Corrective Action Plan created by a planner or operator to address model quality due to exceeded performance criteria (reference Milestone 3 Part 2 SAR), may necessitate usage of an equipment-specific model instead of a generic model from the Model Library.

ii. For instance, studied discrepancies between generic model and performance or IBR demonstrated during the interconnection process may necessitate usage of an equipment-specific model instead of a generic model from the Model Library.

iii. For instance, discrepancies between the generic model and performance of the IBR during a disturbance (i.e. from a post-event analysis) may necessitate usage of an equipment-specific model instead of a generic model from the Model Library.

c. TOs who have unregistered IBRs and DPs who have IBR-DERs that have a material impact on the BPS must provide aggregated dynamic models that adequately represent the dynamic performance of those resources;

d. TOs who have unregistered IBR and DPs who have IBR-DERs that have a material impact on the BPS must provide sufficient documentation regarding technical limitations and any inaccuracies as justification for the use of additional equipment-specific models if unable to gather data from the

affected aggregated resources that have a material impact on the Bulk-Power System, providing to the responsible planners and operators a dynamic model using estimated data for those resources.

Item 4 Comments: EEI does not agree that TOP-003 and IRO-010 are appropriate Reliability Standards to develop aggregation processes for TOs and DPs that have been notified by Transmission Planners that they have unregistered IBRs that materially impact, in aggregate, the reliability of the BPS. To address the Order 901 directives associated with identifying aggregated unregistered IBRs and IBR-DERs that have a material impacts on the BPS, the establishment and implementation of aggregation methods for unregistered IBRs and IBR-DERs that have been defined as having material impacts, and processes for developing and providing estimated data and identifying models for aggregated unregistered IBRs and IBR-DERs that adequately represent the dynamic performance of those resources we suggest the development of a new Reliability Standard. To address these concerns, we offer the following edits for consideration.

4. Develop a new Reliability Standard that:

a. Requires Transmission Planners to identify and notify responsible TOs and DPs when they have unregistered IBRs and IBR-DERs that are having a material impact on BPS reliability.

b. Requires Transmission Owners and Distribution Providers to establish and implement data aggregation methods for unregistered IBRs and IBR-DERs, when they have been notified by their Transmission Planner that these resources are having a material impact on BPS reliability. These processes must address:

- An estimate of the modeling data and parameters of IBR-DERs and unregistered IBRs in aggregate that account for the material impacts on the BPS,
- Selection of dynamic models that they determine to adequately represent the dynamic performance of the unregistered IBRs and IBR-DERs that are materially impacting the BPS,
- An explanation of the limitations of the availability of accurate data, and
- The method used for all estimations.

Item 5 Comments: EEI does not agree that this drafting team should be overseeing work done by other drafting teams. It is sufficient for this drafting team to coordinate with other drafting teams to ensure their work does not duplicate or otherwise overlap the work of other drafting teams. To address our concerns. We offer the following edits:

The drafting team shall coordinate with other drafting teams that have overlapping work, particularly those working on Order 901 directives in order to ensure that new or modified Reliability Standards related to Milestone 3 of the Work Plan are aligned and do not create a reliability gap.

Kimberly Turco - Constellation - 5,6	
Answer	No
Document Name	
Comment	

As explicitly stated, the intent of the uniform framework for data sharing and model development is to ensure all directive of FERC order 901 can be effectively met and all impacted parties/users of the approved models are informed and provided approved models as a result of any requisite changes due to correcting IBR performance. While Constellation agrees with the intent, we are not sure a new standard added is going to be effective in informing and guiding the industry. This will only be burdensome and likely drive confusions as too many processes are being created/revised in short amount of time.

Comment

The NAGF does not agree with the proposed scope as described in the draft SAR for the following reasons:

a. The NAGF recommends that the SAR identify actions to be performed by the Drafting Team. Including unapplicable/background narrative from FERC Order 901 directives in the SAR only adds confusion and uncertainty as to the actions to be performed by the DT.

b. SAR Comment Form Background Information section (page 1) – The NAGF requests additional clarification regarding the statement “Assets to be included as part of the revisions to the Compliance Registry criteria (category 2 type assets) are considered “registered IBR” and not subject to the project objectives related to aggregated data or estimation methods”. The NAGF is unclear as to the reason that developed aggregated data or estimation methods would not apply to determining new category GO/GOPs (Category 2) IBRs that “contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA”.

c. Project Scope comments:

i. Item 1– The NAGF recommends that the NERC-Approved Model Library contain only the acceptable models. Including unacceptable models does not provide value.

ii. Item 1a/b/c – The NAGF understands that NERC will be responsible for developing and maintaining the Model Library. However, it is unclear what work activities, if any, the Drafting Team will perform regarding the Model Library. Coordinating Model Library development with the DT is an administrative function that does not require specific DT work activities. Therefore, recommend removing Items 1a/b/c from the SAR Project Scope section.

iii. Item 3. – The NAGF recommends using a process similar to that currently used for synchronous generation.

d. Detailed Description Section:

i. FERC Order 901 Directives Assigned to this SAR (page 5) – The paragraph states “As of April 1, 2024, this SAR will address the following FERC Order 901 directives, with the scope for this SAR emphasized in bold as appropriate:”. 26 sections of the FERC Order 901 directives are included in the Detailed Description Section of which only 3 are bolded (17, 24, and 25). It is unclear as to value of including the non-bolded narratives and it adds significant confusion to the SAR. Recommend removing the non-bolded FERC Order 901 directive narratives from this section or clearly identify DT work activities associated with these non-bolded narratives.

Project Scope Comments: FERC directives identified in the Detail Description Section as Items 1, 2, 4, 6, 9, 12, 14, 16, 18, 19, 20, 22, 23 and 26 are sufficiently covered in this SAR, assuming adjustments are made in line with the proposed edits below. We further note that Items 3, 5, 8, and 10 do not appear as tasks within the proposed scope, however, all four were identified as directives and need to be addressed. (Noting the following)

a. Item 3: Consider AEU's and ACP/SEIA's suggested data sharing requirements when developing the framework, criteria, and necessary data exchange.

b. }Item 5: Consider CAISO's suggestion to require registered entities to provide additional IBR data points (e.g., telemetry collections or other automated platform integrations) to further enhance real-time visibility of Bulk-Power System operations.

c. Item 8: Consider new processes or mechanisms to provide Transmission Owners with modeling data and parameters.

d. Item 10: Consider new processes or mechanisms to provide Distribution Providers with modeling data and parameters.

And lastly, we read Items 11, 17, 21 and 24 to be NERC directed tasks and believe those activities should be removed from the Detailed Description section of this SAR and addressed separately by NERC. Beyond this we offer the following edits to the 5 Items identified in the SAR Project Scope. All of our edits are in boldface below:

Scope Item 1 Comments: Item 1 only contains one task that directly aligns to the work the DT will perform under this project. The rest of Item 1 describes the model library and its attributes and processes, all of which are NERC activities. While we have no concerns with NERC taking responsibility for the model library, it is critical that models contained in that library are compatible with all existing planning software currently available and changes to the model library are only allowed during prescribed intervals/time periods so as not to disrupt responsible entity planning compliance obligations and deadline causing unnecessary rework of planning studies. Given the model library will be done exclusively by NERC and not the DT, Item 1 should be revised as follows:

Modify MOD-032 to require the usage of a "NERC-Approved Model Library" **Item 2 Comments:** EEI suggests removing the reference to NERC's Dynamic Modeling Requirements. While we do not object to using that document as a guide, such language potentially limits the DT from developing requirements that they believe better align with the directive contained in Order 901. EEI also does not agree with mixing the modeling data requirements associated with MOD-032 with the data collection requirements of TOP-003 and IRO-010. The SAR will be clearer separating these DT tasks. To address these concerns, we offer the following edits to Item 2 below:

2a) Modify Reliability Standard MOD-032 **or develop a new Reliability Standard that** require**s** Planning Coordinators, Transmission Planners, Reliability Coordinators, Transmission Operators, and Balancing Authorities to **use** a uniform framework **with modeling criteria for each interconnection. The DT should consider integrating appropriate elements of** NERC's Dynamic Modeling Recommendations**, using this document as a guide.** The **revised or new Reliability Standard should contain**:

a) Data specification for the data necessary to develop interconnection-wide models and models for other reliability studies;

}i) Specifications must include provisions for new, modified, or changed equipment,

ii) Specifications must include provisions for changes to an approved equipment-specific models,

iii) Specifications must include provisions and a periodicity for exchanging estimated aggregated unregistered IBR and DER data.

b) Data exchange of generic models from the Model Library for interconnection-wide model creation that most accurately reflect the behavior of each IBR during steady state, short- circuit, and dynamic conditions;

c) Data exchange of aggregated data, estimation methods, and documented limitations of the availability of accurate data for unregistered IBR and DER as developed by Transmission Owners and Distribution Providers in Item 4.

2b: **Modify TOP-003 and IRO-010 or develop new Reliability Standards for the collection of IBR specific models and data that align with the defined specifications as developed within the modified MOD-032 Reliability Standard or new Reliability Standard.**

Item 3 Comments: EEI does not agree that MOD-032 is the proper Reliability Standard to require GOs to provide IBR models and data. And while TOs and DPs will be responsible for providing IBR models and data for unregistered IBRs and IBR-DERs in aggregate, TOs should have no part in providing IBR models or data for registered IBRs. To address our concern, we offer the following edits to Item 3:

3. Modify **TOP-003 and IRO-010** to require Generator Owners (GO) to **provide IBR models and data that conform to the specification for contained in MOD-032, or the new IBR Reliability Standard that meets the requirements identified in** Item 2 **above**, specifically;

a. GO of **registered** IBR must provide generic models from the Model Library for interconnection- wide model creation that most accurately reflect the behavior of each IBR during steady state, short-circuit, and dynamic conditions;

b. GO of **registered** IBR must provide sufficient documentation regarding technical limitations and any inaccuracies as justification for the use of additional equipment-specific models.

i. For instance, a Corrective Action Plan created by a planner or operator to address model quality due to exceeded performance criteria (reference Milestone 3 Part 2 SAR), may necessitate usage of an equipment-specific model instead of a generic model from the Model Library.

ii. For instance, studied discrepancies between generic model and performance or IBR demonstrated during the interconnection process may necessitate usage of an equipment-specific model instead of a generic model from the Model Library.

iii. For instance, discrepancies between the generic model and performance of the IBR during a disturbance (i.e., from a post-event analysis) may necessitate usage of an equipment-specific model instead of a generic model from the Model Library.

c. **TOs who have unregistered IBRs and DPs who have IBR-DERs that have a material impact on the BPS must provide aggregated dynamic models that adequately represent the dynamic performance of those resources;**

d. **TOs who have unregistered IBR and DPs who have IBR-DERs that have a material impact on the BPS must provide sufficient documentation regarding technical limitations and any inaccuracies as justification for the use of additional equipment-specific models if unable to gather data from the affected aggregated resources that have a material impact on the Bulk-Power System, providing to the responsible planners and operators a dynamic model using estimated data for those resources.**

Item 4 Comments: EEI does not agree that TOP-003 and IRO-010 are appropriate Reliability Standards to develop aggregation processes for TOs and DPs that have been notified by Transmission Planners that they have unregistered IBRs that materially impact, in aggregate, the reliability of the BPS. To address the Order 901 directives associated with identifying aggregated unregistered IBRs and IBR-DERs that have a material impacts on the BPS, the establishment and implementation of aggregation methods for unregistered IBRs and IBR-DERs that have been defined as having material impacts, and processes for developing and providing estimated data and identifying models for aggregated unregistered IBRs and IBR-DERs that adequately represent the dynamic performance of those resources we suggest the development of a new Reliability Standard. To address these concerns, we offer the following edits for consideration.

4. **Develop a new Reliability Standard that:**

a. **Requires Transmission Planners to identify and notify responsible TOs and DPs when they have unregistered IBRs and IBR-DERs that are having a material impact on BPS reliability.**

b. **R**equire**s** Transmission Owners and Distribution Providers to establish and implement data aggregation methods for unregistered IBR**s** and **IBR-**DER**s**, **when they have been notified by their Transmission Planner that these resources are having a material impact on BPS reliability**. These **processes** must address:

• An estimate of the modeling data and parameters of IBR-DERs and unregistered IBRs **in aggregate that account for the material impacts on the BPS**,

• **Selection of dynamic models that they determine to adequately represent the dynamic performance of the unregistered IBRs and IBR-DERs that are materially impacting the BPS,**

• An explanation of the limitations of the availability of accurate data, and

• The method used for all estimations.

Item 5 Comments: EEI does not agree that this drafting team should be overseeing work done by other drafting teams. It is sufficient for this drafting team to coordinate with other drafting teams to ensure their work does not duplicate or otherwise overlap the work of other drafting teams. To address our concerns. We offer the following edits:

The drafting team shall **coordinate with other drafting teams that have overlapping work, particularly those working on Order 901 directives in order to ensure that** new or modified Reliability Standards related to Milestone 3 of the Work Plan are aligned and do not create a reliability gap.

Comment

Black Hills Corporation agrees with EEI's comprehensive comments, included here:

Project Scope Comments: FERC directives identified in the Detail Description Section as Items 1, 2, 4, 6, 9, 12, 14, 16, 18, 19, 20, 22, 23 and 26 are sufficiently covered in this SAR, assuming adjustments are made in line with the proposed edits below. We further note that Items 3, 5, 8, and 10 do not appear as tasks within the proposed scope, however, all four were identified as directives and need to be addressed. (Noting the following)

a. Item 3: Consider AEU's and ACP/SEIA's suggested data sharing requirements when developing the framework, criteria and necessary data exchange.

b. Item 5: Consider CAISO's suggestion to require registered entities to provide additional IBR data points (e.g., telemetry collections or other automated platform integrations) to further enhance real-time visibility of Bulk-Power System operations.

c. Item 8: Consider new processes or mechanisms to provide Transmission Owners with modeling data and parameters.

d. Item 10: Consider new processes or mechanisms to provide Distribution Providers with modeling data and parameters.

And lastly, we read Items 11, 17, 21 and 24 to be NERC directed tasks and believe those activities should be removed from the Detailed Description section of this SAR and addressed separately by NERC. Beyond this we offer the following edits to the 5 Items identified in the SAR Project Scope. All of our edits are in boldface below:

Scope Item 1 Comments: Item 1 only contains one task that directly aligns to the work the DT will perform under this project. The rest of Item 1 describes the model library and its attributes and processes, all of which are NERC activities. While we have no concerns with NERC taking responsibility for the model library, it is critical that models contained in that library are compatible with all existing planning software currently available and changes to the model library are only allowed during prescribed intervals/time periods so as not to disrupt responsible entity planning compliance obligations and deadline causing unnecessary rework of planning studies. Given the model library will be done exclusively by NERC and not the DT, Item 1 should be revised as follows:

1) Modify MOD-032 to require the usage of a "NERC-Approved Model Library" (*remove:* ***(Hereafter: "Model Library") that contains acceptable (and unacceptable) models and recommendations to facilitate the exchange of neighboring entities' respective planning and operation models and to be used in Interconnection-wide case creation and in other NERC Reliability Standards for IBR.***

a) This Model Library will be developed and maintained by NERC. Updates on the Model Library development will be coordinated with the Drafting Team. The Drafting Team may solicit feedback comments of the NERC process from industry as needed.

b) The Model Library will be accessible to the general public. NERC will develop an open and transparent process for maintaining the library.

c) The Model Library will be consistent with NERC's published Dynamic Modeling Recommendations, primarily:

i) Industry-approved library models are sufficient for use in Interconnection-wide base case creation and interconnection-wide studies;

For local reliability studies (e.g. performance during the interconnection process, model quality validation), equipment-specific models should be used if generic models from the Model Library cannot accurately represent the IBR.)

Item 2 Comments: EEI suggests removing the reference to NERC's Dynamic Modeling Requirements. While we do not object to using that document as a guide, such language potentially limits the DT from developing requirements that they believe better align with the directive contained in Order 901. EEI also does not agree with mixing the modeling data requirements associated with MOD-032 with the data collection requirements of TOP-003 and IRO-010. The SAR will be clearer separating these DT tasks. To address these concerns, we offer the following edits to Item 2 below:

2a) Modify (*remove:* ***applicable***) Reliability Standard (*remove:* ***s (e.g.***) MOD-032 (*remove:* ***, TOP-003, and IRO-010)***) **or develop a new Reliability Standard that to** require**s** Planning Coordinators, Transmission Planners, Reliability Coordinators, Transmission Operators, and Balancing Authorities to (*remove:* ***ensure usage of***) **use** a uniform framework **with modeling criteria for each interconnection.** (*remove:* ***that includes modeling criteria consistent with***) **The DT should consider integrating appropriate element of** NERC's Dynamic Modeling Recommendations (*remove:* ***, a***) **as a guide.** (*remove:* ***registered modeling designee, and necessary data exchange requirements.***) The (*remove:* ***framework must require***) **revised or new Reliability Standard should contain**:

d) Data specification (*remove:* ***and notifications***) for the data necessary to develop interconnection-wide models and models for other reliability studies;

i) Specifications must include provisions for new, modified, or changed equipment,

ii) Specifications must include provisions for changes to an approved equipment-specific models,

iii) Specifications must include provisions and a periodicity for exchanging estimated aggregated unregistered IBR and DER data.

e) Data exchange of generic models from the Model Library for interconnection-wide model creation that most accurately reflect the behavior of each IBR during steady state, short- circuit, and dynamic conditions;

(remove: **f)** ***A review and approval process for additional model types from the Model Library (other than generic model types) for other reliability studies;)***)

g) Data exchange of aggregated data, estimation methods, and documented limitations of the availability of accurate data for unregistered IBR and DER as developed by Transmission Owners and Distribution Providers in Item 4.

2b: **Modify TOP-003 and IRO-010 or develop new Reliability Standards for the collection of IBR specific models and data that align with the defined specifications as developed within the modified MOD-032 Reliability Standard or new Reliability Standard.**

Item 3 Comments: EEI does not agree that MOD-032 is the proper Reliability Standard to require GOs to provide IBR models and data. And while TOs and DPs will be responsible for providing IBR models and data for unregistered IBRs and IBR-DERs in aggregate, TOs should have no part in providing IBR models or data for registered IBRs. To address our concern, we offer the following edits to Item 3:

3. Modify (*remove:* ***MOD-032***) **TOP-003 and IRO-010** to require Generator Owners (GO) to **provide** (*remove:* ***follow the uniform framework developed in)*** **IBR models and data that conform to the specification for contained in MOD-032, or the new IBR Reliability Standard that meets the requirements identified in** Item 2 **above**, specifically;

a. GO (*remove:* ***and TO***) of **registered** IBR must provide generic models from the Model Library for interconnection- wide model creation that most accurately reflect the behavior of each IBR during steady state, short-circuit, and dynamic conditions;

b. GO (*remove:* ***and TO***) of **registered** IBR must provide sufficient documentation regarding technical limitations and any inaccuracies as justification for the use of additional equipment-specific models.

i. For instance, a Corrective Action Plan created by a planner or operator to address model quality due to exceeded performance criteria (reference Milestone 3 Part 2 SAR), may necessitate usage of an equipment-specific model instead of a generic model from the Model Library.

ii. For instance, studied discrepancies between generic model and performance or IBR demonstrated during the interconnection process may necessitate usage of an equipment-specific model instead of a generic model from the Model Library.

iii. For instance, discrepancies between the generic model and performance of the IBR during a disturbance (i.e. from a post-event analysis) may necessitate usage of an equipment-specific model instead of a generic model from the Model Library.

c. **TOs who have unregistered IBRs and DPs who have IBR-DERs that have a material impact on the BPS must provide aggregated dynamic models that adequately represent the dynamic performance of those resources;**

d. **TOs who have unregistered IBR and DPs who have IBR-DERs that have a material impact on the BPS must provide sufficient documentation regarding technical limitations and any inaccuracies as justification for the use of additional equipment-specific models if unable to gather data from the affected aggregated resources that have a material impact on the Bulk-Power System, providing to the responsible planners and operators a dynamic model using estimated data for those resources.**

Item 4 Comments: EEI does not agree that TOP-003 and IRO-010 are appropriate Reliability Standards to develop aggregation processes for TOs and DPs that have been notified by Transmission Planners that they have unregistered IBRs that materially impact, in aggregate, the reliability of the BPS. To address the Order 901 directives associated with identifying aggregated unregistered IBRs and IBR-DERs that have a material impacts on the BPS, the establishment and implementation of aggregation methods for unregistered IBRs and IBR-DERs that have been defined as having material impacts, and processes for developing and providing estimated data and identifying models for aggregated unregistered IBRs and IBR-DERs that adequately represent the dynamic performance of those resources we suggest the development of a new Reliability Standard. To address these concerns, we offer the following edits for consideration.

4. *(remove:* ***Modify TOP-003 and IRO-010 to***) **Develop a new Reliability Standard that:**

a. **Requires Transmission Planners to identify and notify responsible TOs and DPs when they have unregistered IBRs and IBR-DERs that are having a material impact on BPS reliability.**

b. **R**equire**s** Transmission Owners and Distribution Providers to establish and implement data aggregation methods for unregistered IBR**s** and **IBR-**DER**s**, **when they have been notified by their Transmission Planner that these resources are having a material impact on BPS reliability**. These (*remove: **standards***) **processes** must address:

• An estimate of the modeling data and parameters of IBR-DERs and unregistered IBRs **in aggregate that account for the material impacts on the BPS**,

• **Selection of dynamic models that they determine to adequately represent the dynamic performance of the unregistered IBRs and IBR-DERs that are materially impacting the BPS,**

• An explanation of the limitations of the availability of accurate data, and

• The method used for all estimations.

Item 5 Comments: EEI does not agree that this drafting team should be overseeing work done by other drafting teams. It is sufficient for this drafting team to coordinate with other drafting teams to ensure their work does not duplicate or otherwise overlap the work of other drafting teams. To address our concerns. We offer the following edits:

The drafting team shall **coordinate with other drafting teams that have overlapping work, particularly those working on Order 901 directives in order to ensure that** (*remove: **ensure that implementation plans for***) new or modified Reliability Standards related to Milestone 3 of the Work Plan are aligned and do not create a reliability gap (*remove: **during implementation***.)

Comment

This SAR contains excessive language that creates confusion as to what the scope and goal of this SAR encompasses.

This SAR is attempting to perform several different functions. Project management and Standards development.

Is this a FERC Order 901 standard development coordination project, ie. Project Management, or a standards development project to address a specific risk? The coordination (project management) of the 901 projects should be separated from the specifics of Modeling and Data sharing requirements.

From the NERC Work Plan, Milestone 3 – Part 1, Data Sharing

Overall Strategy: Collaborate between NERC Standards Development, Engineering, and the RSTC. The scope of this collaboration is to cross check active projects, draft SARs, and pending SARs from RSTC-associated work plans and identify which of those will address aspects of this milestone. Some revisions to draft SARs or active projects will be necessary to focus development on directives in Order No. 901.

This is project management. Multiple projects, standards, and objectives. This can be accomplished outside of a SAR.

1. This project shall coordinate among other projects (i.e., act as a clearing house to tie directive language to standard revisions), develop standard language (i.e., perform the normal duties of a standard development Project), and build upon other Milestones from FERC Order No. 901 Standards Projects to meet regulatory deadlines (i.e., maintain agility based on how FERC Order No. 901 related Projects proceed to meet the directive deadlines).

2. This project is intended to serve as a data sharing center point for many of the revisions being established within all of the 901-related projects. Performance of IBR during an event (grid disturbance) are identified and corrected within the Standards Development projects pertaining to Milestone 2 of the Work Plan. However, any requisite changes to model data as a result of correcting IBR performance, must be communicated through a uniform model framework to assure all impacted entities and users of the approved models are adequately informed and provided updated models (as developed within this project). Similarly, revisions to model validation being drafted by the drafting team assigned the Milestone 3 Part 2 SAR, must also assure entities follow the uniform model framework established here.

3. {C}NERC Modeling Guidance states that additional model types, namely manufacturer-specific user-written models, must be used for local reliability studies, during the interconnection process and following commissioning to validate as-built performance – as well as through ongoing validation of performance. The deficiencies within the current state of model quality are well documented. As required by FERC Order No. 901, the development of positive sequence models based on an approved (standard) library of model types must be built into Interconnection-wide cases.

4. The creation of a “NERC Approved Model Library” that allows the use of manufacturer-specific models in addition to standard library (generic) models in instances.

Additionally, MRO NSRF requests coordination of this SAR and Project across all IBR/Order 901 Projects to ensure that all the projects collectively address the directives in FERC Order 901 without introducing duplication, overlap or contradictions between projects.

MRO NSRF is concerned that the SAR does not appear to align with what’s in NERC’s Dynamic Modeling Recommendations whitepaper (see Figure 1).[1]

Example #1

{C}· While the SAR (bottom of page 2) states that: “*NERC Modeling Guidance 1 states that additional model types, namely manufacturer-specific user-written models, must be used for local reliability studies, during the interconnection process and following commissioning to validate as-built performance – as well as through ongoing validation of performance.”*

{C}· {C}NERC's Dynamic Modeling Recommendations whitepaper, Figure 1 illustrates that both "**Recommended User Defined Models**" and "**Benchmarked (against UDM or EMT) Library Models Recommended**" can be used for "**Local Reliability Studies**" and "**Plant Interconnection Studies.**"

{C}· The SAR also appears to contain conflicts within itself as with the first bullet above (SAR, bottom of page 2) and this bullet (SAR, page 4, section 1.c.ii.):

"For local reliability studies (e.g. performance during the interconnection process, model quality validation), equipment-specific models should be used if generic models from the Model Library cannot accurately represent the IBR."

Example #2

Likewise, there appears to be another conflict between NERC's Dynamic Modeling Recommendations whitepaper and the SAR (page 2): "*As required by FERC Order No. 901, the development of positive sequence models based on an approved (standard) library of model types must be built into Interconnection-wide cases." Here again, the whitepaper illustrates that "Recommended User-Defined Models" are also acceptable.*"

Christy Thompson - PPL - Louisville Gas and Electric Co. - 3,5,6 - SERC

Answer	No
Document Name	

Comment

Louisville Gas and Electric Co. agrees generally with the EEI comments but would like to provide additional specific comments.

The section addressing potential BES risk incorrectly states that "NERC Modeling Guidance states that additional model types, namely manufacturer-specific user-written models, **must** be used for local reliability studies, during the interconnection process and following commissioning …" This is an overstatement at best, as the referenced Modeling Guidance is 1) guidance, and 2) clearly says the suggested practice is "strongly recommended". Further, the same document plainly says that with multiple models available, "GOs, TPs, and PCs should have enough information to use engineering judgement to determine which model is most appropriate for each study."

Regarding item (1), FERC Order 901 states:

"Accordingly, we direct NERC to develop new or modified Reliability Standards that require the sole use of nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build interconnection-wide models. One example of a way NERC could meet this directive would be to require an equivalent generic library model along with all submissions of user defined models so that the generic library model can be used when combining neighboring transmission system models and in interconnection-wide models."

The suggestion in item 1 of the SAR to utilize a “NERC-Approved Model Library” goes beyond the directive. The current practice of maintaining a list of unapproved models or models that have identified issues could be sufficient if paired with a requirement such as, “dynamic models utilized in interconnection-wide models must be compatible with the simulation software employed in the processes used to build such models.” Establishing a “NERC-Approved Model Library” (as opposed to the list of unapproved/problematic models) will only serve to slow industry adoption of updated or improved models. Once major software vendors have introduced such models into their standard model libraries, entities should be able to utilize those models without this additional hurdle.

Additionally, entities are likely to move very slowly in supporting the approval of new models into a “NERC-Approved Model Library” since new models typically require software updates, code/script changes, etc. Thus, this additional step will slow the adoption of improved generic models and decrease the incentive for entities to maintain automation and processes that is compatible with the latest version of industry standard analysis software.

Regarding item (1)(c)(ii), the SAR should be modified to align with the actual language of the Dynamic Modeling Recommendations, which is that 1) user-written models are recommended for this type of study, and 2) the TP/PC/GO should use engineering judgment to determine which model is appropriate.

Regarding item (2), the only modification necessary is the addition of explicit requirements that entities submitting data for interconnection-wide models utilize models that are compatible with the simulation software utilized to build such models. For example, if Siemens PTI PSS®E were to introduce a new IBR model type that was not supported by GE PSLF, entities should not utilize it for interconnection-wide cases as it would preclude GE PSLF users from using the models. However, if the model has been adopted by the major software vendors, no additional approval should be necessary (beyond the model verification that will already take place via MOD-026/027, etc.)

Regarding item (3)(a), the SAR should remove the requirement to “provide generic models from the Model Library” and instead reference only “generic models”. This comment is consistent with the comments above. The SAR must be modified to allow for an option other than the creation and maintenance of a “NERC-Approved Model Library”.

Diana Aguas - CenterPoint Energy Houston Electric, LLC - 1 - Texas RE

Answer	No
Document Name	

Comment

CenterPoint Energy Houston Electric, LLC (CEHE) does not support this project’s scope, particularly objective three of the SAR. CEHE supports the comments as submitted by the Edison Electric Institute (EEI), in particular, the issue around the statements requiring the TOs to provide the generic models, specifications, parameter information for these unregistered/registered IBRs and DERs. CEHE is a TO and does not own IBRs/DERs, therefore, does not have this data. CEHE believes GOs of IBRs should provide the documented information and equipment-specific models since the owner should be aware of the registered/unregistered IBR limitations, parameters, and performance information for their IBR equipment. In addition, unregistered/registered DERs are not modeled at transmission level in dynamic studies.

CEHE has additional concerns with scope objective four of the SAR. Even when unregistered DERs are modeled, it is not clear how a TP will be able to create a dynamic model for these unregistered IBRs/DERs.

Bobbi Welch - Midcontinent ISO, Inc. - 2, Group Name ISO/RTO Council Standards Review Committee (SRC) Project 2022-02 IBR SAR	
Answer	No
Document Name	2022-02_SAR_Unofficial_Comment_Form_IRC SRC_06-24-24_FINAL.docx
Comment	

The **ISO/RTO Council (IRC) Standards Review Committee (SRC)[1]** is concerned that the SAR does not appear to align with NERC's Dynamic Modeling Recommendations whitepaper (see Figure 1).[2]

Example #1

· While the SAR (bottom of page 2) states that: "*NERC Modeling Guidance states that additional model types, namely manufacturer-specific user-written models, must be used for local reliability studies, during the interconnection process and following commissioning to validate as-built performance – as well as through ongoing validation of performance."*

· NERC's Dynamic Modeling Recommendations whitepaper, Figure 1 illustrates that both "**Recommended User Defined Models**" *and* "**Benchmarked (against UDM or EMT) Library Models Recommended**" can be used for "**Local Reliability Studies**" and "**Plant Interconnection Studies.**"

· The SAR also appears to contain conflicts within itself. As noted above, the SAR (bottom of page 2) and the below bullet (from page 4, section 1.c.ii.) are contradictory. Page 2 of the SAR indicates only one type of model "*manufacturer-specific user-written models must be used*" whereas page 4 of the SAR indicates that equipment-specific models should be used if generic models are inaccurate. This would seem to indicate that more than one type of model (as indicated by the dark blue and light blue shading) is acceptable.

o SAR (page 4, section 1.c.ii.) states that: *"For local reliability studies (e.g. performance during the interconnection process, model quality validation), equipment-specific models should be used if generic models from the Model Library cannot accurately represent the IBR."*

The SRC requests the SDT align the SAR with the Dynamic Modeling Recommendations whitepaper.

Example #2

Likewise, there appears to be another conflict between NERC's Dynamic Modeling Recommendations whitepaper and the SAR (page 2): "*As required by FERC Order No. 901, the development of positive sequence models based on an approved (standard) library of model types must be built into Interconnection-wide cases."* Here again, the whitepaper allows for more flexibility in that Figure 1 illustrates "Recommended User-Defined Models" are also acceptable.

Recommendation:

The SRC recommends the SDT review the language in FERC Order 901, the SAR and NERC's Dynamic Modeling Recommendations whitepaper to ensure alignment across all three (3).

The SRC also has the following comments and concerns regarding the scope of the SAR:

§ Regarding Scope #2.a.iii, the SRC is concerned with the current language as it assumes a relationship among different industry entities that may not actually exist. More specifically, it is unclear how data collection and data validation can be audited and enforced for entities not registered with NERC. If this scope remains, the SRC requests that it be revised to give the PC flexibility in determining unregistered IBR and DER collection based on location and penetration thresholds.

§ Regarding Scope #3, based on the scope assumptions, it is not clear how an inaccurate model would be found and when a CAP would be needed. The SRC recommends revising the scope to include the TO in developing this framework.

§ Regarding Scope #4, the SRC agrees with the scope as written and requests the addition of an additional step: 4d. the transfer of data collected by the DPs and TOs to the PAs, PCs, and TOPs.

The SRC also requests coordination of this SAR and Project across the multiple IBR/Order 901 Projects. Specifically, the SRC requests assurance that SDTs will coordinate among each other.

Additionally, while the SRC agrees that there are benefits to having a standard modeling framework, the SAR is too restrictive in specifying the Model Library. Failure to utilize common models was not a significant factor in the unexpected performance events cited in the SAR. Inaccurate model performance was mostly associated with model parameterization rather than model selection (and in the cases where model selection was the primary issue, it was because a generic model was used instead of an equipment-specific model that may have been better able to reflect the actual performance of the unit). If the Model Library concept is maintained, it needs to include equipment-specific models and/or provide usability specifications for the development of equipment-specific models. Note that two of the cited FERC directives (items 13 and 14 in the SAR) refer to "approved industry" IBR models:

from item 13 "…Reliability Standards that require the use of approved industry IBR models that **accurately** reflect the behavior of all IBRs…" (emphasis added), and

from item 14 "…Reliability Standards that require the use of approved industry generic library IBR models that **accurately** reflect the behavior of IBRs…" (emphasis added).

Both items mention the need for accurate models, but only one mentions generic models. It seems that FERC would prioritize model accuracy over the use of generic models. The SAR should be clear on which path the SDT should pursue. If necessary, NERC should seek clarification from FERC before heading down a path of mandating the use of generic models and creating unnecessary barriers (red tape and documentation requirements) to the use of equipment-specific models.

Finally, the SAR should include a requirement for the drafting team to assign appropriate compliance obligations between model builders and model suppliers (Model Library). Because of the dual paths there could be uncertainty of compliance obligations if an Interconnection-wide case includes a model that is not in the Model Library. The SAR should clarify whether the responsibility rests with the case builders (PC/TP/RC/designee) or the model supplier (TO/GO). A very restrictive requirement as contemplated in the SAR would be difficult for the case builders to comply with because, as a practical matter, base cases need to get created/finalized with the data that is available, and case builders sometimes need to fill in gaps and make assumptions. Sometimes models, including generic models, and parameterization that look reasonable don't initialize properly (despite troubleshooting efforts) and the best and most accurate option to meet a deadline may be to utilize a model that may not be on the approved list.

Document Name	

Comment

Regarding 1.c.i and 1.c.ii as shown below, Generator Owners should standardize equipment and configuration so that PCs and TPs can use industry-approved library models. User models might be used initially but should be migrated over time into standardized models.

c. The Model Library will be consistent with NERC's published Dynamic Modeling Recommendations, primarily:

i. Industry-approved library models are sufficient for use in Interconnection-wide base case creation and interconnection-wide studies;

ii. For local reliability studies (e.g. performance during the interconnection process, model quality validation), equipment-specific models should be used if generic models from the Model Library cannot accurately represent the IBR.

Suggested replacement language is

{C}i. "For interconnection studies, equipment-specific models should be used if generic models from the Model Library cannot accurately represent the IBR. As the interconnection studies are completed, generator manufacturers should work with power system software vendors to develop industry-approved library models for the equipment.

The existing wording will require obtaining two sets of models and then maintaining cases with two sets of models, potentially indefinitely.

Regarding 3.b.ii and 3.b.iii as shown below, where there are discrepancies between the provided models and equipment performance, Generator Owners should be expected to correct the discrepancy so that the performance matches the models that were provided.

c. Modify MOD-032 to require Generator Owners (GO) and Transmission Owners (TO) to follow the uniform framework developed in Item 2, specifically;

ii. For instance, studied discrepancies between the generic model and performance or the IBR demonstrated during the interconnection process may necessitate usage of an equipment-specific model instead of a generic model from the Model Library.

iii. For instance, discrepancies between the generic model and performance of the IBR during a disturbance (i.e. from a post-event analysis) may necessitate usage of an equipment-specific model instead of a generic model from the Model Library.

Suggested replacement language is:

{C}*i. For instance, discrepancies between the generic model and performance of the IBR during a disturbance (i.e. from a post-event analysis) may necessitate the Generator Owner correcting the performance of the facility so that it matches the model provided.*

Authors should also modify the scope to address another FERC Order 901 Directive Assigned to this SAR. For bullet 19,

"Further, we direct NERC to require distribution providers to provide to the planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities aggregated dynamic models that adequately represent the dynamic performance of IBR-DERs on their systems that in the aggregate have a material impact on the Bulk-Power System, including momentary cessation and/or tripping, and all ride through behavior (e.g., IBR-DERs in the aggregate modeled by interconnection requirements performance to represent different steady-state and dynamic behavior)." (P141)

Scope should include defining what it means to "*in the aggregate have a material impact on the Bulk-Power System"* and defining all *"momentary cessation and/or tripping, and all ride through behavior"* or limits thereof.

NERC plans to set up a “NERC-Approved Model Library” and have PCs/TPs/RCs/TOs/BAs use a “uniform modeling framework”, both huge tasks, it may be difficult if not possible to complete by the 901 deadline

Paragraph 4 of the project scope (see page 5) calls out for TO’s and DP’s to have methods to aggregate unregistered IBR’s. The standards will need to be very clear on how the TOs and DPs can do this or else demonstrating compliance might be difficult.

Paragraph 17 on page 8 also references TO’s needing to provide dynamic data for unregistered IBR’s. This might be even more difficult, An unregistered IBR cannot be compelled to provide data. While such requirements can be added into future interconnection agreeements, TOs will not have the ability to compel currently connected unregistered IBRs to provide data.

Paragraph 24 on page 9 states that NERC will have to determine the appropriate registered entity to provide the data where a registered DP is not involved. Registered Entities will limited in the ability to collect data by the language of existing interconnection agreements.

As explicitly stated, the intent of the uniform framework for data sharing and model development is to ensure all directive of FERC order 901 can be effectively met and all impacted parties/users of the approved models are informed and provided approved models as a result of any requisite changes due to correcting IBR performance. While Constellation agrees with the intent, we are not sure a new standard added is going to be effective in informing and guiding the industry. This will only be burdensome and likely drive confusions as too many processes are being created/revised in short amount of time.

Southern Company would like to offer the following comments: • Additional scope should be limited to model acceptability, not anything to do with exchange of data among entities. There are sufficient requirements to allow TPs, PCs, RCs, BAs, TOPs to obtain/exchange all data that is necessary through MOD-032, TOP-003, IRO-10 data spec requirements. • Only MOD-032 should be modified to require TPs/PCs to incorporate acceptable models (since it is a data spec and modeling standard) • Any additional modification should incorporate significant flexibility in the operational planning models vs. planning models as they are very different and used for different purposes. • Clarify intent of using registered modeling designee.

From BPA's perspective, it appears that Project 2024-01's objective is to align the definitions of GO/GOP so they are required to provide models for "registered IBR" down to the 20MW threshold. Similarly, for unregistered-IBR and IBR-DER, the best practice to collect 'good' modeling data is if the entity that has knowledge of the generation is submitting the data. The DP/TO are the frontline entities that would have this data. Going up the NERC Compliance Registry Criteria hierarchy (DP->TO->TP->PC, etc.) will not hold much value as the TP and PC won't have the knowledge needed to produce good models.

BPA believes DPs and TOs will need to register under NERC's Compliance Registry so the PC can obtain accurate models. BPA suggests that a minimum threshold for the cumulative individual or DER inverter-based resources within an area be established that possibly determines DP (and/or TO) registration. BPA believes this would define a baseline and would also require those DP/TO entities to register when their managed areas exceed that baseline. Accurate models will be dependent on what is required of the DP/TO. If the DP/TO entities are registered, potential future modifications to MOD-032, TPL-001, or others, would be more effective.

The SAR appears open-ended in terms of proposed revisions, detailed descriptions, and overlap with the other two modeling SARs (Project 2020-06 and Project 2021-01) – which are primarily text extracted from FERC Order 901. NERC, the NERC RSTC, the NERC Standards Committee, and industry have tended to avoid creating new standards projects with open-ended SARs as this shows insufficient supporting evidence and background to help a small SDT accomplish its mission. This seems particularly relevant given the massive scale, depth, and breadth of these proposed changes and do not believe this is the most effective/efficient SAR definition to address the directives and reliability risks, as it is unclear what the SARs are actually addressing from a reliability perspective. It also appears there are some FERC directives that are linked to a reliability risk that needs to be mitigated, but between this SAR and the other two it is unclear if they are being addressed or not – these risks should be mitigated between these SARs.

In the Purpose or Goal section, this SAR and the Project 2020-06 SAR both state the projects and SDTs will be a clearing house for the modeling work. It seems having two SARs act as a clearing house for modeling work is not necessary and should be clarified.

In the Project Scope, it is unclear which NERC entities have what roles for each of the IBR categories (registered IBRs, non-registered IBRs, and DERs) applicable to this SAR and the other two modeling related SARs.

In the Detailed Description section, repeating all FERC Order 901 directives in full and then only bolding the specific directives that this SAR addresses is confusing and inefficient. Recommend deleting all unrelated language and only keep the specific directives that this SAR is addressing to add clarity to this SAR.

It seems there has been insufficient attention given to the cost-benefit analysis for this SAR. NERC has simply stated "currently unknown" and "vary based on SDT outcome" and did not provide any additional analysis or consideration for costs and how to minimize such costs across all registered entities involved. The vast proposed revisions will significantly increase costs to registered entities, affecting business operations and costs to consumers. Therefore, more due diligence and consideration should be given to cost across all the proposed standards projects.

In addition to the current SAR, the following issues should be addressed:

a) For Scope Item 2d: Generally, the DPs (and perhaps some TOs performing more of an operations function) do not use PSLF or PSSE as their tool for modeling/aggregating unregistered IBR and DER. There may be data collection and aggregation issues if the specifications for the required data is not platform neutral.

b) Consider as to whether non-compliance with proposed model data requirements should be required to be reported to the Regional Entity, instead of relying on the “complaint” process.

c) For Scope Item 4: A large count (although smaller in size) of entities that serve load fall below the criteria to be registered as a DP. There may be gaps in the existing (or potentially modified) including, but not limited to TOP-003 and IRO-010 standards when trying to collect non-BPS data from un-registered entities, or when asking TOs to pass along data relating to non-jurisdictional entities, although these could be enforced via interconnection agreements.

d) The SDT should consider how DER installed at voltages below 60kV (outside of proposed jurisdiction) will be modeled (ie large amounts of aggregated rooftop solar, etc.) to understand if this will just be included in load forecasting or via another method. Alternatively, the generic residential or commercial load models may need modification as well.

The developers of the SAR did not answer the question: Are there alternatives (e.g. guidelines, white papers, alerts, etc.) that have been considered or could meet the objectives? The question should be answered. The answer should paraphrase the following:

Since the directives of FERC Order 901 instruct NERC to develop new or modified standards, there were no other alternatives considered.

We noted in our comments on an earlier SAR, which appears to remain unresolved, that a Distribution Provider may not always be the most practical source for the DER modeling data needed by the PC and TP. We recognize that the SDT has allowed for the flexibility of a Transmission Owner to also be a source for DER modeling data in Draft 1. However if the DP or TO is not directly affiliated with the DER owner, would their need to collect the DER model data from the entities that possess it not essentially mirror the PC and TP's need under R1? The DP and TO might need their own requirement(s) to develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures to obtain DER modeling data (potentially from unregistered entities that don't have an obligation to comply with NERC's Reliability Standards) that would subsequently be passed on to the PC and TP. A "DER data entity" could also be added to the applicability section (reference PRC-006-5 for precedent) with a broader range of registered entity options to fulfil that role (e.g., DP, UFLS-Only DP, TO, RP, GO).

We recommend that the SAR drafting team extend the comment period on this SAR and the other two modeling related SARs until after the July 10 NERC Webinar that will inform the industry further about these three SARs and have a question-and-answer period for attendees. This webinar seems like it will be very informative and helpful to the industry in understanding these three SARs, which would further support the comment period and balloting process for getting the SARs approved. There should be a much clearer linkage to the EMT-related NERC projects and EMT modeling requirements in general, which are the best models and studies to evaluated IBR ride-through and other technical performance criteria. While FERC did not call out EMT requirements in Order 901, it did recommend continuing to pursue efforts and those efforts should be closely aligned with this SAR. This SAR and the other two modeling related SARs should also: 1) acknowledge and work towards getting verified and validated modeling throughout the interconnection process from beginning to commissioning and energization. 2) acknowledge and supporting improvements in the dynamic model estimation and aggregation of unregistered IBRs and DERs, which requires significant assumptions to be made. Guidance and technical background should be part of this SAR to support the industry on the assumptions and modeling work that should go into this modeling estimation and aggregation of unregistered IBRs and DERs.

Bobbi Welch - Midcontinent ISO, Inc. - 2, Group Name ISO/RTO Council Standards Review Committee (SRC) Project 2022-02 IBR SAR

Answer	
Document Name	2022-02_SAR_Unofficial_Comment_Form_IRC SRC_06-24-24_FINAL.docx

Comment

The SAR states that “[t]he deficiencies within the current state of model quality are well documented,” but then goes on to require only the use of “an approved (standard) library of model types” or models included in a “NERC Approved Model Library.”

With evolving modeling practices, the SRC is concerned that a requirement to only use models that have gone through a NERC approval process would create a bottleneck by potentially delaying the use of more accurate models that are newly developed (perhaps reflecting new technologies) or would result in the use of less accurate models in the name of standardization. The result may very well be less accurate simulation results, which is the opposite of the intent of this SAR. To avoid this result, the SAR should direct the SDT to ensure that the standard clearly provides that any model deemed acceptable by a PC or TP is presumed to be included in the “NERC Approved Model Library” in advance of any formal process.

The SAR states that “[t]his Model Library will be developed and maintained by NERC. Updates on the Model Library development will be coordinated with the Drafting Team.”

This implies that the SDT has an ongoing obligation regarding updates to the model library. The SAR should be revised to clarify whether NERC intends to propose a process for updating the model library that the SDT will evaluate, potentially by soliciting industry comments.

The SAR states “industry-approved library models are sufficient for use in Interconnection-wide base case creation and interconnection-wide studies; ii. For local reliability studies (e.g. performance during the interconnection process, model quality validation), equipment-specific models should be used if generic models from the Model Library cannot accurately represent the IBR.”

It is unclear whether “industry approved library models” is synonymous with the “Model library,” and the SRC recommends that the SAR be revised to clarify this point.

Additionally, these statements imply that only generic models will be included in the Model Library and that these are (by default) sufficient for use in Interconnection-wide cases (even if they cannot accurately represent the IBR). In other words, the SAR appears to intentionally allow the use of inaccurate (or even less accurate) models in Interconnection-wide cases. **The SRC recommends that the SAR be revised to require that models accurately represent the IBR. This would allow for the use of a generic model that can accurately represent the IBR for both local studies and Interconnection-wide cases, while ensuring that entities are required to use an equipment-specific model for both local studies and Interconnection-wide cases if that is the only model that can accurately represent the IBR.**

Otherwise, the purpose of creating Interconnection-wide cases, namely, having a common dataset that is used for nearly all local studies, is defeated. Having to replace all of the inaccurate generic models in the local study area for every local study is like re-inventing the wheel for every local study. Further, this creates uncertainties and complications in every local study regarding the determination of the extent to which inaccurate generic

models allowed in the Interconnection-wide cases need to be replaced (recall that in the Odessa event, ride-through failures occurred hundreds of miles away from the fault location).

To help address this, section 3.a of the SAR scope should be revised to read: "GO and TO of IBR must provide models that accurately represent IBR performance (either generic models from the Model Library or equipment-specific models as needed) for interconnection-wide model creation…."

The Model Library (and Interconnection-wide cases) must be open for the inclusion of equipment-specific models (and not just generic models). Otherwise, this SAR is a step backward for modeling accuracy. The Model Library could include usability specifications or requirements for the acceptance of equipment-specific models.

The SAR states that "GO and TO of IBR must provide sufficient documentation regarding technical limitations and any inaccuracies as justification for the use of additional equipment-specific models."

This statement is backwards, as it prioritizes standardization over modeling accuracy. Instead of requiring a justification for the use of an equipment-specific model, the SAR should require a demonstration that a generic model can accurately represent IBR performance before its use is allowed (though equipment-specific models, too, should be subject to a requirement for a demonstration that they accurately represent IBR performance).

SPP has concerns about language mentioned in the Standards Authorization Request (SAR) pertaining to the Compliance Registry Criteria. The language suggests that FERC Order 901 should properly align with the revised Compliance Registry Criteria when it comes to the registering of the Inverter Based Resources (IBRs) and Distributed Energy Resources (DERs). However, it is not clear where this alignment takes place. From our perspective, the current posting of the Rules of Procedures (RoP-Appendix 5B Version 7) does not mention the registration and/or definition of the IBR or DER as well as the appropriate entities to register them.

In addition, SPP has a concern about the clarity of the rooftop IBRs being included in the FERC Order 901 efforts. At this point, it is not clear if rooftop IBR will be included in the FERC Order 901 alignment with the revised Compliance Registry Criteria.

Moreover, the SAR mentions modeling efforts and the use of the MOD-032 Standard in reference to data collection. From our perspective, there will be a need to include that data in the modeling process to ensure accuracy for the various analyses results that NERC is requiring applicable entities to conduct.

SPP recommends that NERC staff provide clarity on this topic by including language in the SAR discussing their expectations for all IBRs. Furthermore, it is important for NERC staff to understand that none of the resource issues can be addressed until the MOD-032 data collection project has resolved.

Finally, SPP has concerns about FERC Order directive number seventeen (17) and their expectations of the Generator Owner (GO) and Transmission Owner (TO) sharing dynamic model information for registered and unregistered IBRs. We feel that it will be a difficult task to have appropriate representation in the dynamic models when it comes to unregistered IBRs. Furthermore, the directive mentions addressing momentary cessation and

ride through behavior. At this point, NERC has not resolved their issues with the PRC-024 Standard from a performance perspective. From our observation, it will be difficult to align any FERC Order 901 effort with this directive.

SPP recommends that NERC staff provide clarity on the expectations for the unregistered IBRs as well as coordinating with Project 2020-02 drafting team from a ride through and momentary cessation point of view.

The DT should keep in mind that most entities already use and effectively share generic models for IBRs. While user-written models may be prevalent in interconnection-wide models, correcting this issue does not require the establishment of an entire new process or library. Rather, the DT should consider how to shape careful adjustments to existing standards to achieve the relevant directives of FERC Order 901.

Julie Hall - Entergy - 1,3,6, Group Name Entergy

Answer	
Document Name	

Comment

1. Will the subsequent SARs on model validation include consideration of comparison of simulation results among generic models used for interconnection-wide base cases and equipment-specific models used for interconnection studies? If so, a process is needed to rectify differences observed in the simulation results among generic vs. equipment-specific models.
2. It is unclear if the recommendation to use equipment-specific models in interconnection studies for all IBRs shall apply to existing IBRs as well as the new IBRs under study. It seems under this scenario PCs and TPs would have to continuously maintain two sets of dynamic modeling files --- one using generic models and one using equipment-specific models. Maintaining and troubleshooting an equipment-specific model dynamic file may become challenging as the number of user-defined models increases given that much of the code is concealed behind a DLL.
3. Item #2 describes the provisions that are associated with new, modified, or changed equipment. This should consider and/or reference provisions already developed regarding the FAC-002 Qualified Change.
4. Related to data exchange of models associated with steady-state, short-circuit, and dynamic conditions, EMT models should be included as well or a reference to the standards that are being considered relating to submission of EMT models for IBRs. However, EMT models for IBR-DER (particularly unregistered) should be precluded. Estimating parameters associated with a DER EMT model would be quite challenging and there are limited references with regards to estimated EMT models, particularly for DER facilities, for which a TO or TP could reference.
5. Item #3.b.i provides an example related to a TP identifying a CAP related to planning criteria violations which may have been triggered by the generic IBR model inaccuracies. A process should be developed which allows the TP/PC to request equipment-specific models and/or updates

to generic models if the TP/PC believes there may be an issue with the model (e.g. protection system settings in the VTGTPA model contradict settings in the REEC high voltage logic Vup/Vdip) and for the GO to provide a response in a timely manner such that the TP/PC can incorporate the updates in their reliability assessments and evaluate the necessity of the CAP.

6. Paragraph 3 of the SAR becomes confusing when noting that unregistered IBRs be considered as a registered IBR (is this the intent?) when identifying assets for the Compliance Registry. If they're unregistered, who, then, would take that ownership (either GO or GOP)? This seems problematic. Several items in the "Requested Information" section discuss this.
7. Subsequently, does #4 then put the onus for any reporting failures (of the data aggregation) of an unregistered IBR on the TO/DP?
8. Entergy has concerns related to obtaining detailed information as specified in item #3 given that the manufacturers treat this information as proprietary in nature.
9. Item 24 in the requested information discusses "materially impact the reliable operations of the BPS". It's unclear what "materially impact" means.

Comment

The Risk, Purpose and Detailed Description should be evaluated to provide concise descriptions without the additional Order 901 language. (see below for example)

In the Project Scope, Item 1a/b/c, the NSRF understands that NERC will be responsible for developing and maintaining the Model Library. However, it is unclear what work activities, if any, the Drafting Team will perform regarding the Model Library. Coordinating Model Library development with the DT is an administrative function that does not require specific DT work activities. Therefore, we recommend removing Items 1a/b/c from the SAR Project Scope section.

Also, we recommend that the NERC-Approved Model Library contain only the acceptable models. Including unacceptable models does not provide value.

In the Project Scope, Item 3, the NSRF recommends using a process similar to that currently used for synchronous generation.

The NSRF does not agree with mixing the modeling data requirements associated with MOD-032 with the data collection requirements of TOP-003 and IRO-010. Data requirements are best handled in a single place, MOD-032. Eliminate references to IRO-010 and TOP-003. Otherwise there is the potential to review many neighboring entity data specs for differing data requirements.

Items 11, 17, 21 and 24 of the Detailed Description are NERC directed tasks and the NSRF believes those activities should be removed from this of this SAR and addressed separately by NERC.

Example:

1. What is the risk to the Bulk Electric System (What Bulk Electric System (BES) reliability benefit does the proposed project provide?):

FERC Order No. 901 – Milestone 3, Part 1: Modeling and Data Sharing Requirements addresses regulatory directives from the NERC Standards Development Work Plan to respond to FERC Order No. 901.

The current paradigm of modeling and data sharing leaves the bulk power system (BPS) at a higher than necessary risk for unexpected and undesired inverter-based resource (IBR) performance. Since 2016, approximately 15,000 MW of IBR have unexpectedly reduced output during NERC categorized disturbance events. None of the IBR facilities involved in these disturbances utilized models that could accurately represent the facility's performance during the disturbance event. These discrepancies between modeled and studied performance when compared to real-world performance are driven by current industry modeling practices and a dependence on generic IBR modeling throughout the lifecycle of the IBR facility.

The current Reliability Standards may not account for the material technological differences between the response of synchronous generation resources and the response of IBRs to the same disturbances on the Bulk-Power System.

2. Purpose or Goal (What are the reliability gap(s) or risk(s) to the Bulk Electric System being addressed, and how does this proposed project provide the reliability-related benefit described above?):

This project is intended to establish new or revised Reliability Standards to ensure the usage of a uniform framework for data sharing and model development. This uniform framework is to ensure the directives of Order No. 901 can be effectively met to ensure usage of generic model types for IBR in the Interconnection-wide models.

Current Reliability Standards do not ensure that Bulk-Power System planners and operators have the necessary tools to plan for and reliably integrate IBRs into the Bulk-Power System or to plan for IBRs connected to the distribution system that in the aggregate have a material impact on the Bulk-Power System (IBR-DER). IBRs, individually and in the aggregate, and IBR-DERs in the aggregate can have a material impact on the reliable operation of the Bulk-Power System.

Additionally, the Reliability Standards do not contain performance requirements that are unique to IBRs and are necessary to ensure that IBRs operate in a predictable and reliable manner.

Revisions to data sharing expectations and the creation of a “NERC Approved Model Library” that allows the use of manufacturer-specific models in addition to standard library (generic) models in instances where generic modeling cannot represent the performance of the IBR are necessary to ensure BPS reliability through improvements to the inputs of current study practices.

3. Project Scope (Define the parameters of the proposed project):

The scope is seeking to modify MOD-032, IRO-010 and TOP-003 – I do not have additional comments.

4. Detailed Description (Describe the proposed deliverable(s) with sufficient detail for a drafting team to execute the project. If you propose a new or substantially revised Reliability Standard or definition, provide: (1) a technical justification[1]. of developing a new or revised Reliability Standard or definition, which includes a discussion of the risk and impact to reliability-of the BES, and (2) a technical foundation document (e.g., research paper) to guide development of the Standard or definition):

As of April 1, 2024, this SAR will address the following FERC Order No. 901 directives, with the scope for this SAR emphasized in **bold** as appropriate:

However, the Project Scope states: “901 directives assigned to this SAR are outlined in the Detailed Description section below. The project scope shall address all those directives…”

There are 26 bulleted FERC directives listed in the Detailed Description. Is the intent of this SAR to address all 26 directives or just directives **17, 24** & **25**?

[1]The NERC Rules of Procedure require a technical justification for new or substantially revised Reliability Standards. Please attach pertinent information to this form before submittal to NERC.

The NAGF provides the following additional comments for consideration: a. IBR manufacturer-specific user written models are unique to each facility. These models require a significant investment of time and money to develop/test/validate and therefore sharing of such OEM proprietary models is unlikely. The NAGF proposes that NERC consider developing model specifications as a method for determining the most appropriate models for industry to use. b. The NAGF notes that current IBR models do not accurately represent momentary cessation/tripping and ride through behavior.

Manufacturer-specific models, if allowed or required by any portion of the revised NERC standards, must be provided by OEMs for industry use without restrictions on sharing of these models with TPs, TOs, PCs, and GOs.	

Also, how will the Model Library be developed and maintained by NERC? Will the models be freely shared with software tool developers (GE, Siemens/PTI, Manitoba Hydro, PGSTech, ASPEN, Powertech, etc.)? How will NERC require inverter manufacturers provide the necessary information to implement models in the industry software tools before such inverters are connected to the grid going forward?

Some effort should be made to require automated model benchmark validation testing with a GO's specified parameters for their particular facility be provided within the industry software tools. This benchmark validation testing could be provided by the software tool vendors or by the NERC group responsible for the Model Library.

o This SAR process is likely missing a Requirements Definition phase that captures all the specifications that are needed to run analysis (i.e. TPL-001), and then work backwards to determine how to model the DER. For example, certain needed studies may need different data:

a) To run a study where you want to see system performance when solar drops off and EV charging increases due to consumer behavior, it is likely that a time-of-day case is needed for hour-ending 19:00 vice peak hour.

b) To run a study showing the dynamic performance of IBR solar generation at system peak conditions, it is likely needed to have a case with increased dispatch of solar generation with either corresponding DER_A or Composite Load Models that include DER included in the dynamic data sets such as DYD in PSLF or DYR in PSSE.

The concept of modeling IBRs is to have extremely accurate data/models. There is no guidance for how to “make-up” an aggregate IBR model. Even in EMT studies, accuracy suffers when you try to “aggregate” modeling data from several different equipment manufacturers into one “blended” model. How can the framework account for the need to aggregate and/or blend data and still meet the accuracy needs of the modeling/analysis process? Are changes to the standard load model needed to allow for percentages of rooftop solar to be added on a substation level?

3.b.ii: Clarify whether interconnection process refers to the Interconnection System Impact Study, Commissioning Phase, or other? Consider in the implementation of effective dates the requirement of dependency between requirements. For example, if GO needs to provide models and the TP and TOP need to use the models, then the GO requirement should become effective prior to the TP/TOP requirements, allowing the TP/TOP time to incorporate models in their process. Or, if the RC needs to build a methodology and the TOP needs to implement the methodology, the RC requirement should be effective prior to the TOP requirement, allowing the TOP time to implement the updated methodology.

The Risk, Purpose and Detailed Description should be evaluated to provide concise descriptions without the additional Order 901 language.

Example:

1. What is the risk to the Bulk Electric System (What Bulk Electric System (BES) reliability benefit does the proposed project provide?):

FERC Order No. 901 – Milestone 3, Part 1: Modeling and Data Sharing Requirements addresses regulatory directives from the NERC Standards Development Work Plan to respond to FERC Order No. 901.

The current paradigm of modeling and data sharing leaves the bulk power system (BPS) at a higher than necessary risk for unexpected and undesired inverter-based resource (IBR) performance. Since 2016, approximately 15,000 MW of IBR have unexpectedly reduced output during NERC categorized disturbance events. None of the IBR facilities involved in these disturbances utilized models that could accurately represent the facility's performance during the disturbance event. These discrepancies between modeled and studied performance when compared to real-world performance are driven by current industry modeling practices and a dependence on generic IBR modeling throughout the lifecycle of the IBR facility.

The current Reliability Standards may not account for the material technological differences between the response of synchronous generation resources and the response of IBRs to the same disturbances on the Bulk-Power System.

2. Purpose or Goal (What are the reliability gap(s) or risk(s) to the Bulk Electric System being addressed, and how does this proposed project provide the reliability-related benefit described above?):

This project is intended to establish new or revised Reliability Standards to ensure the usage of a uniform framework for data sharing and model development. This uniform framework is to ensure the directives of Order No. 901 can be effectively met to ensure usage of generic model types for IBR in the Interconnection-wide models.

Current Reliability Standards do not ensure that Bulk-Power System planners and operators have the necessary tools to plan for and reliably integrate IBRs into the Bulk-Power System or to plan for IBRs connected to the distribution system that in the aggregate have a material impact on the Bulk-Power System (IBR-DER). IBRs, individually and in the aggregate, and IBR-DERs in the aggregate can have a material impact on the reliable operation of the Bulk-Power System.

Additionally, , the Reliability Standards do not contain performance requirements that are unique to IBRs and are necessary to ensure that IBRs operate in a predictable and reliable manner.

Revisions to data sharing expectations and the creation of a "NERC Approved Model Library" that allows the use of manufacturer-specific models in addition to standard library (generic) models in instances where generic modeling cannot represent the performance of the IBR are necessary to ensure BPS reliability through improvements to the inputs of current study practices.

*3. Detailed Description (Describe the proposed deliverable(s) with sufficient detail for a drafting team to execute the project. If you propose a new or substantially revised Reliability Standard or definition, provide: (1) a technical justification{C}**[1]**{C} of developing a new or revised Reliability Standard or definition, which includes a discussion of the risk and impact to reliability-of the BES, and (2) a technical foundation document (e.g., research paper) to guide development of the Standard or definition):*

As of April 1, 2024, this SAR will address the following FERC Order No. 901 directives, with the scope for this SAR emphasized in **bold** as appropriate:

However, the Project Scope states: "901 directives assigned to this SAR are outlined in the Detailed Description section below. The project scope shall address all those directives…"

There are 26 bulleted FERC directives listed in the Detailed Description. Is the intent of this SAR to address all 26 directives or just directives **17, 24** & **25**?

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the third draft of the proposed standard for a formal 45-day additional comment period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	01/19/2022
SAR posted for comment	2/1/2022 – 3/02/2022
45-day formal comment period with ballot	5/31/2023 – 7/14/2023
45-day formal additional comment period with ballot	6/1/2023 – 7/17/2023
45-day formal comment period with additional ballot	10/6/2023 – 11/20/2023

Anticipated Actions	Date
45-day formal comment period with additional ballot	8/27/2024 – 10/10/2024
10-day final ballot	TBD
Board adoption	TBD

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resource (DER)

Generators and energy storage technologies connected to the Distribution Provider's system, including those connected behind the meter of an end use customer, that are capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System.

- Distribution Provider refers to the NERC glossary definition, rather than an entity meeting the NERC registration criteria.

A. Introduction

1. **Title: Data for Power System Modeling and Analysis**

2. **Number: MOD-032-2**

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Balancing Authority

   4.1.2 Distribution Provider

   4.1.3 Generator Owner

   4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

   4.1.5 Resource Planner

   4.1.6 Transmission Owner

   4.1.7 Transmission Planner

   4.1.8 Transmission Service Provider

5. **Effective Date: See Implementation Plan.**

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M2. Each registered entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data;

3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each registered entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance with Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

NERC Reliability Standard MOD-032-2 Implementation Plan

NERC Reliability Standard MOD-032-2 Technical Rationale

Version History

Version	Date	Action	Change Tracking
1	February 6, 2014	Adopted by the NERC Board of Trustees.	Developed to consolidate and replace MOD-010-0, MOD -011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1
1	May 1, 2014	FERC Order issued approving MOD-032-1.	See Implementation Plan posted on the Reliability Standards web page for details on enforcement dates for Requirements.
2	TBD	TBD	Revised under Project 2022-02

MOD-032-2 – ATTACHMENT 1:

Data Reporting Requirements

The table below indicates the information that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in the Interconnection-wide cases. A Planning Coordinator may specify additional information that includes specific information required for each item in the table below. Each functional entity[1] responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The data reported shall be as identified by the bus number, name, and/or identifier that is assigned in conjunction with the PC, TO, or TP.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
1. Each bus [TO] a. nominal voltage b. area, zone and owner 2. Aggregate Demand[2] [DP] a. real and reactive power* b. in-service status* 3. Generating Units[3] [GO, RP (for future planned resources only)] a. real power capabilities - gross maximum and minimum values b. reactive power capabilities - maximum and minimum values at real power capabilities in 3a above	1. Generator [GO, RP (for future planned resources only)] 2. Excitation System [GO, RP (for future planned resources only)] 3. Governor [GO, RP (for future planned resources only)] 4. Power System Stabilizer [GO, RP (for future planned resources only)] 5. Aggregate Demand[2] [DP] 6. Wind Turbine Data [GO] 7. Photovoltaic systems [GO] 8. Static Var Systems and FACTS [GO, TO, DP]	1. Provide for all applicable elements in column "steady-state" [GO, RP, TO] a. Positive Sequence Data b. Negative Sequence Data

[1] For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Generator Owner (GO), Distribution Provider (DP), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).

[2] For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. A Distribution Provider is responsible for providing this information, generally through coordination with the Transmission Owner or as specified in the joint PC/TP modeling data requirements and reporting procedures developed per R1.

[3] Including synchronous condensers and pumped storage.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
c. station service auxiliary load for normal plant configuration (provide data in the same manner as that required for aggregate Demand under item 2, above). d. regulated bus* and voltage set point* (as typically provided by the TOP) e. machine MVA base f. generator step up transformer data (provide same data as that required for transformer under item 6, below) g. generator type (hydro, wind, fossil, solar, nuclear, etc.) h. in-service status* 4. AC Transmission Line or Circuit [TO] a. impedance parameters (positive sequence) b. susceptance (line charging) c. ratings (normal and emergency)* d. in-service status* 5. DC Transmission systems [TO] 6. Transformer (voltage and phase-shifting) [TO] a. nominal voltages of windings b. impedance(s) c. tap ratios (voltage or phase angle)* d. minimum and maximum tap position limits e. number of tap positions (for both the ULTC and NLTC) f. regulated bus (for voltage regulating transformers)* g. ratings (normal and emergency)* h. in-service status* 7. Reactive compensation (shunt capacitors and reactors) [TO] a. admittances (MVars) of each capacitor and reactor b. regulated voltage band limits* (if mode of operation not fixed) c. mode of operation (fixed, discrete, continuous, etc.) d. regulated bus* (if mode of operation not fixed) e. in-service status* 8. Static Var Systems [TO] a. reactive limits b. voltage set point* c. fixed/switched shunt, if applicable d. in-service status*	9. DC system models [TO] 10. Aggregate Distributed Energy Resource (DER) data including whether DER is subject to tripping in conjunction with UFLS and/or UVLS[4] [DP] 11. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]	c. Zero Sequence Data 2. Mutual Line Impedance Data [TO] 3. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
9. Aggregate Distributed Energy Resource (DER) data[4] [DP] a. Location (bus from item 1) b. Real power capability c. DER type (solar, battery, diesel generator, etc.) d. DER capabilities related to ride-through, voltage control and/or frequency control or information that can be used to infer those capabilities for modeling purposes. 10. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]		

[4] For purposes of this item, the Distribution Provider to which DER is connected is responsible for reporting DER data, generally through coordination with the Transmission Owner, in accordance with PC/TP modeling data requirements and data reporting procedures developed under Requirement R1. The PC or TP may need to coordinate with the DP or TO to determine appropriate equivalent distribution system impedance.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the third~~first~~ draft of the proposed standard for a formal 45-day additional comment period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	01/19/2022
SAR posted for comment	2/1/2022 – 3/02/2022
45-day formal ~~or informal~~ comment period with ballot	~~6~~5/31/2023 – 7/~~17~~14/2023
45-day formal additional comment period with ballot	6/1/2023 – 7/17/2023
45-day formal comment period with additional ballot	10/6/2023 – 11/20/2023

Anticipated Actions	Date
~~45-day formal or informal comment period with ballot~~	~~6/1/2023 – 7/17/2023~~
~~45-day formal or informal comment period with additional ballot~~	~~10/6/2023 – 11/20/2023~~
45-day formal comment period with additional ballot~~XX-day final ballot~~	8/27/2024 – 10/10/2024
10-day final ballot	TBD
Board adoption	~~12/12/2023~~TBD

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resource (DER)

Generators and energy storage technologies connected to the Distribution Provider's system, including those connected behind the meter of an end use customer, that are capable of providing Real Power in non-isolated parallel operation with the Bulk ~~Electric~~ Power System.

- Distribution Provider refers to the NERC glossary definition, rather than an entity meeting the NERC registration criteria~~not the NERC registered entity~~.

A. Introduction

1. **Title: Data for Power System Modeling and Analysis**

2. **Number: MOD-032-2**

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Balancing Authority

   4.1.2 Distribution Provider

   ~~**4.1.2**~~**4.1.3** Generator Owner

   ~~**4.1.3 Distribution Provider**~~

   4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

   4.1.5 Resource Planner

   4.1.6 Transmission Owner

   4.1.7 Transmission Planner

   4.1.8 Transmission Service Provider

5. **Effective Date: See Implementation Plan.**

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M2. Each registered entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Generator Owner, Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data;

3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each registered entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance with Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Time Horizon	VRF	Violation Severity Levels			
			Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	**Long-term Planning**	**Lower**	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include less than or equal to 25% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 25% but less than or equal to 50% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 50% but less than or equal to 75% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) did not develop any steady-state, dynamics, and short circuit modeling data requirements and reporting procedures required by Requirement R1; OR The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 75% of the required components specified in Requirement R1.

NERC Reliability Standard MOD-032-2 Implementation Plan

NERC Reliability Standard MOD-032-2 Technical Rationale

Version History

Version	Date	Action	Change Tracking
1	February 6, 2014	Adopted by the NERC Board of Trustees.	Developed to consolidate and replace MOD-010-0, MOD -011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1
1	May 1, 2014	FERC Order issued approving MOD-032-1.	See Implementation Plan posted on the Reliability Standards web page for details on enforcement dates for Requirements.
2	TBD	TBD	Revised under Project 2022-02

MOD-032-2 – ATTACHMENT 1:

Data Reporting Requirements

The table below~~,~~ indicates the information that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. ~~-~~Data must be shareable on an interconnection-wide basis to support use in the Interconnection-wide cases.~~–~~ A Planning Coordinator may specify additional information that includes specific information required for each item in the table below. Each functional entity[1] responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The data reported shall be as identified by the bus number, name, and/or identifier that is assigned in conjunction with the PC, TO, or TP.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions.~~-~~ Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
1. Each bus [TO] a. nominal voltage b. area, zone and owner 2. Aggregate Demand[2] [DP] a. real and reactive power* b. in-service status* 3. Generating Units[3] [GO, RP (for future planned resources only)] a. real power capabilities - gross maximum and minimum values b. reactive power capabilities - maximum and minimum values at real power capabilities in 3a above	1. Generator [GO, RP (for future planned resources only)] 2. Excitation System [GO, RP (for future planned resources only)] 3. Governor [GO, RP (for future planned resources only)] 4. Power System Stabilizer [GO, RP (for future planned resources only)] 5. Aggregate Demand~~2~~ [DP] 6. Wind Turbine Data [GO] 7. Photovoltaic systems [GO] 8. Static Var Systems and FACTS [GO, TO, DP]	1. Provide for all applicable elements in column "steady-state" [GO, RP, TO] a. Positive Sequence Data b. Negative Sequence Data

[1] For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Generator Owner (GO), Distribution Provider (DP), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).

[2] For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. ~~-~~A Distribution Provider is responsible for providing this information, generally through coordination with the Transmission Owner or as specified in the joint PC/TP modeling data requirements and reporting procedures developed per R1.

[3] Including synchronous condensers and pumped storage.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions.~~-~~ Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
c. station service auxiliary load for normal plant configuration (provide data in the same manner as that required for aggregate Demand under item 2, above). d. regulated bus* and voltage set point* (as typically provided by the TOP) e. machine MVA base f. generator step up transformer data (provide same data as that required for transformer under item 6, below) g. generator type (hydro, wind, fossil, solar, nuclear, etc.) h. in-service status* 4. AC Transmission Line or Circuit [TO] a. impedance parameters (positive sequence) b. susceptance (line charging) c. ratings (normal and emergency)* d. in-service status* 5. DC Transmission systems [TO] 6. Transformer (voltage and phase-shifting) [TO] a. nominal voltages of windings b. impedance(s) c. tap ratios (voltage or phase angle)* d. minimum and maximum tap position limits e. number of tap positions (for both the ULTC and NLTC) f. regulated bus (for voltage regulating transformers)* g. ratings (normal and emergency)* h. in-service status* 7. Reactive compensation (shunt capacitors and reactors) [TO] a. admittances (MVars) of each capacitor and reactor b. regulated voltage band limits* (if mode of operation not fixed) c. mode of operation (fixed, discrete, continuous, etc.) d. regulated bus* (if mode of operation not fixed) e. in-service status* 8. Static Var Systems [TO] a. reactive limits b. voltage set point* c. fixed/switched shunt, if applicable d. in-service status*	9. DC system models [TO] 10. Aggregate- Distributed Energy Resource (DER) data including whether DER is subject to tripping in conjunction with UFLS and/or UVLS[4] [DP~~, TO where DER is directly connected to the TO system and not through a DP~~] 11. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]	c. Zero Sequence Data 2. Mutual Line Impedance Data [TO] 3. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions.~~-~~ Those items may have different data provided for different modeling scenarios)*	dynamics *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	short circuit
9. Aggregate Distributed Energy Resource (DER) data[4] [DP~~, TO where DER is directly connected to the TO system and not through a DP~~].[5] a. Location (bus from item 1) b. Real power capability c. ~~Generator~~ DER type (solar, battery, diesel generator, etc.) d. DER capabilities related to ride-through, voltage control and/or frequency control or information that can be used to infer those capabilities for modeling purposes. 10. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]		

[4] ~~The joint PC/TP modeling data requirements and reporting procedures developed per R1 will specify data flow processes and the required level of aggregation. The PC or TP may need to coordinate with the DP or TO to determine appropriate equivalent distribution system impedance.~~For purposes of this item, the Distribution Provider to which DER is connected is responsible for reporting DER data, generally through coordination with the Transmission Owner, in accordance with PC/TP modeling data requirements and data reporting procedures developed under Requirement R1.~~-~~ The PC or TP may need to coordinate with the DP or TO to determine appropriate equivalent distribution system impedance.

[5] ~~Where DER is connected to an unregistered Distribution Provider, the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information. An unregistered Distribution Provider is an unregistered entity meeting the NERC Glossary of Terms definition of Distribution Provider. This footnote is also applicable to item 10 under the "dynamics" column.~~

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the ~~first~~ third draft of the proposed standard for a formal 45-day additional comment period.

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resource (DER)

Generators and energy storage technologies connected to the Distribution Provider's system, including those connected behind the meter of an end use customer, that are capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System.

- Distribution Provider refers to the NERC glossary definition, rather than an entity meeting the NERC registration criteria.

A. Introduction

1. **Title: Data for Power System Modeling and Analysis**

2. **Number: MOD-032-~~1~~2**

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Balancing Authority

   4.1.2 Distribution Provider

   ~~4.1.2~~4.1.3 Generator Owner

   ~~4.1.3~~4.1.4 ~~Load Serving Entity~~

   ~~4.1.4~~4.1.5 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

   ~~This proposed standard combines "Planning Authority" with "Planning Coordinator" in the list of applicable functional entities. The NERC Functional Model lists "Planning Coordinator" while the registration criteria list "Planning Authority," and they are not yet synchronized. Until that occurs, the proposed standard applies to both Planning Authority and Planning Coordinator.~~

   ~~4.1.5~~4.1.6 Resource Planner

   ~~4.1.6~~4.1.7 Transmission Owner

   ~~4.1.7~~4.1.8 Transmission Planner

   ~~4.1.8~~4.1.9 Transmission Service Provider

5. **Effective Date: See Implementation Plan.**

   ~~MOD-032-21, Requirement R1 shall become effective on the first day of the first calendar quarter that is 12 24 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, MOD-032-21, Requirement R1 shall become effective on the first day of the first calendar quarter that is 12 24 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.~~

   ~~MOD-032-21, Requirements R2, R3, and R4 shall become effective on the first day of the first calendar quarter that is 24 36 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a~~

jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, MOD-032-21, Requirements R2, R3, and R4 shall become effective on the first day of the first calendar quarter that is 24 36 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

6. Background:

MOD-032-1 exists in conjunction with MOD-033-1, both of which are related to system-level modeling and validation. Reliability Standard MOD-032-1 is a consolidation and replacement of existing MOD-010-0, MOD-011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1, and it requires data submission by applicable data owners to their respective Transmission Planners and Planning Coordinators to support the Interconnection-wide case building process in their Interconnection. Reliability Standard MOD-033-1 is a new standard, and it requires each Planning Coordinator to implement a documented process to perform model validation within its planning area.

The transition and focus of responsibility upon the Planning Coordinator function in both standards are driven by several recommendations and FERC directives from FERC Order No. 693, which are discussed in greater detail in the rationale sections of the standards. One of the most recent and significant set of recommendations came from the NERC Planning Committee's System Analysis and Modeling Subcommittee (SAMS). SAMS proposed several improvements to the modeling data standards, to include consolidation of the standards (the SAMS whitepaper is available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here: http://www.nerc.com/comm/PC/Agendas%20Highlights%20and%20Minutes%20DL/2012/2012_Dec_PC%20Agenda.pdf).

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Generator Owner, ~~Load Serving Entity~~Distribution Provider, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. ~~-~~For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M2. Each registered entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Generator Owner, ~~Load Serving Entity~~Distribution Provider, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data;

3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each registered entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying

Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

~~"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions. "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.~~

1.2. Evidence Retention: The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance with Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and ~~Assessment~~ Enforcement Program~~Processes~~: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

~~Refer to the NERC Rules of Procedure for a list of compliance monitoring and assessment processes.~~

~~**1.4. Additional Compliance Information**~~

NERC Reliability Standard MOD-032-2 Implementation Plan

NERC Reliability Standard MOD-032-2 Technical Rationale

~~None.~~

Guidelines and Technical Basis

For purposes of jointly developing steady-state, dynamics, and short circuit modeling data requirements and reporting procedures under Requirement R1, if a Transmission Planner (TP) and Planning Coordinator (PC) mutually agree, a TP may collect and aggregate some or all data from providing entities, and the TP may then provide that data directly to the PC(s) on behalf of the providing entities. The submitting entities are responsible for getting the data to both the TP and the PC, but nothing precludes them from arriving at mutual agreements for them to provide it to the TP, who then provides it to the PC. Such agreement does not relieve the submitting entity from responsibility under the standard, nor does it make the consolidating entity liable for the submitting entities' compliance under the standard (in essence, nothing precludes parties from agreeing to consolidate or act as a conduit to pass the data, and it is in fact encouraged in certain circumstances, but the requirement is aimed at the act of submitting the data). Notably, there is no requirement for the TP to provide data to the PC. The intent, in part, is to address potential concerns from entities that they would otherwise be responsible for the quality, nature, and sufficiency of the data provided by other entities.

The requirement in Part 1.3 to include specifications for distribution or posting of the data requirements and reporting procedures could be accomplished in many ways, to include posting on a Web site, distributing directly, or through other methods that the Planning Coordinator and each of its Transmission Planners develop.

An entity submitting data per the requirements of this standard who needs to determine the PC for the area, as a starting point, should contact the local Transmission Owner (TO) for information on the TO's PC. Typically, the PC will be the same for both the local TO and those entities connected to the TO's system. If this is not the case, the local TO's PC can typically provide contact information on other PCs in the area. If the entity (e.g., a Generator Owner [GO]) is requesting connection of a new generator, the entity can determine who the PC is for that area at the time a generator connection request is submitted. Often the TO and PC are the same entity, or the TO can provide information on contacting the PC. The entity should specify as the reason for the request to the TO that the entity needs to provide data to the PC according to this standard. Nothing in the proposed requirement language of this standard is intended to preclude coordination between entities such that one entity, serving only as a conduit, provides the other entity's data to the PC. This can be accomplished if it is mutually agreeable by, for example, the GO (or other entity), TP, and the PC. This does not, however, relieve the original entity from its obligations under the standard to provide data, nor does it pass on the compliance obligation of the entity. The original entity is still accountable for making sure that the data has been provided to the PC according to the requirements of this standard.

The standard language recognizes that differences exist among the Interconnections. Presently, the Eastern/Quebec and Texas Interconnections build seasonal cases on an annual basis, while the Western Interconnection builds cases on a continuous basis throughout the year. The intent of the standard is not to change established processes and procedures in each of the Interconnections, but to create a framework to support both what is already in place or

what it may transition into in the future, and to provide further guidance in a common platform for the collection of data that is necessary for the building of the Interconnection-wide case(s).

The construct that these standards replace did not specifically list which Functional Entities were required to provide specific data. Attachment 1 specifically identifies the entities responsible for the data required for the building of the Interconnection-wide case(s).

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:

This requirement consolidates the concepts from the original data requirements from MOD-011-0, Requirement R1, and MOD-013-0, Requirement R1. The original requirements specified types of steady-state and dynamics data necessary to model and analyze the steady state conditions and dynamic behavior or response within each Interconnection. The original requirements, however, did not account for the collection of short circuit data also required to perform short circuit studies. The addition of short circuit data also addresses the outstanding directive from FERC Order No. 890, paragraph 290.

In developing a performance-based standard that would address the data requirements and reporting procedures for model data, it was prohibitively difficult to account for all of the detailed technical concerns associated with the preparation and submittal of model data given that many of these concerns are dependent upon evolving industry modeling needs and software vendor terminology and product capabilities.

This requirement establishes the Planning Coordinator jointly with its Transmission Planners as the developers of technical model data requirements and reporting procedures to be followed by the data owners in the Planning Coordinator's planning area. FERC Order No. 693, paragraphs 1155 and 1162, also direct that the standard apply to Planning Coordinators. The inclusion of Transmission Planners in the applicability section is intended to ensure that the Transmission Planners are able to participate jointly in the development of the data requirements and reporting procedures.

This requirement is also consistent with the recommendations from the NERC System Analysis and Modeling Subcommittee (SAMS) White Paper titled "Proposed Improvements for NERC MOD Standards", available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here:

Aside from recommendations in support of strengthening and improving MOD-010 through MOD-015, the SAMS paper included the following suggested improvements:

reduce the quantity of MOD standards;

add short circuit data as a requirement to the MOD standards; and

supply data and models:

add requirement identifying who provides and who receives data;

identify acceptability;

standard format;

how to deal with new technologies (user written models if no standard model exists); and

a. shareability.
b. These suggested improvements are addressed by combining the existing standards into two new standards, one standard for the submission and collection of data, and one for the validation of the planning models. Adding the requirement for the submittal of short circuit data is also an improvement from the existing standards, consistent with FERC Order No. 890, paragraph 290. In supplying data, the approach clearly identifies what data is required and which Functional Entity is required to provide the data.
c. The requirement uses an attachment approach to support data collection. The attachment specifically lists the entities that are required to provide each type of data and the steady-state, dynamics, and short circuit data that is required.
d. Finally, the decision to combine steady-state, dynamics, and short circuit data requirements into one requirement rather than three reflects that they all support the requirement of submission of data in general.
e. Rationale for R2:
f. This requirement satisfies the directive from FERC Order No. 693, paragraph 1155, which directs that "the planning authority should be included in this Reliability Standard because the planning authority is the entity responsible for the coordination and integration of transmission facilities and resource plans, as well as one of the entities responsible for the integrity and consistency of the data."
g. **Rationale for R3:**
h. In order to maintain a certain level of accuracy in the representation of a power system, the data that is submitted must be correct, periodically checked, and updated. Data used to perform steady state, dynamics, and short circuit studies can change, for example, as a result of new planned transmission construction (in comparison to as-built information) or changes performed during the restoration of the transmission network due to weather related events. One set of data that changes on a more frequent basis is load data, and updates to load data are needed when new improved forecasts are created.
i. This requirement provides a mechanism for the Planning Coordinator and Transmission Planner (that does not exist in the current standards) to collect corrected data from the entities that have the data. It provides a feedback loop to address technical concerns related to the data when the Planning Coordinator or Transmission Planner identifies technical concerns, such as concerns about the usability of data or simply that the data is not in the correct format and

cannot be used. The requirement also establishes a time-frame for response to address timeliness.

Rationale for R4:

This requirement will replace MOD-014 and MOD-015.

This requirement recognizes the differences among Interconnections in model building processes, and it creates an obligation for Planning Coordinators to make available data for its planning area.

The requirement creates a clear expectation that Planning Coordinators will make available data that they collect under Requirement R2 in support of their respective Interconnection-wide case(s). While different entities in each Interconnection create the Interconnection-wide case(s), the requirement to submit the data to the "ERO or its designee" supports a framework whereby NERC, in collaboration and agreement with those other organizations, can designate the appropriate organizations in each Interconnection to build the specific Interconnection-wide case(s). It does not prescribe a specific group or process to build the larger Interconnection-wide case(s), but only requires the Planning Coordinators to make available data in support of their creation, consistent with the SAMS Proposed Improvements to NERC MOD Standards (at page 3) that, "industry best practices and existing processes should be considered in the development of requirements, *as many entities are successfully coordinating their efforts."* (Emphasis added).

This requirement is about the Planning Coordinator's obligation to make information available for use in the Interconnection-wide case(s); it is not a requirement to build the Interconnection-wide case(s).

For example, under current practice, the Eastern Interconnection Reliability Assessment Group (ERAG) builds the Eastern Interconnection and Quebec Interconnection-wide cases, the Western Electricity Coordinating Council (WECC) builds the Western Interconnection-wide cases, and the Electric Reliability Council of Texas (ERCOT) builds the Texas Interconnection-wide cases. This requirement does not require a change to that construct, and, assuming continued agreement by those organizations, ERAG, WECC, and ERCOT could be the "designee" for each Interconnection contemplated by this requirement. Similarly, the requirement does not prohibit transition, and the requirement remains for the Planning Coordinators to make available the information to the ERO or to whomever the ERO has coordinated with and designated as the recipient of such information for purposes of creation of each of the Interconnection-wide cases.

- Transmission Service Provider

NERC Glossary of Terms

This section includes a newly defined term used in the NERC Reliability Standard. The new definition listed below becomes approved when the proposed standard is approved. When the standard becomes effective, the defined term will be removed from the individual standard and added to the Glossary.

Proposed New Definition:
Distributed Energy Resource (DER):

Generators and energy storage technologies connected to the Distribution Provider's system, including those connected behind the meter of an end use customer, that are capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System.

- Distribution Provider refers to the NERC glossary definition, rather than an entity meeting the NERC registration criteria.

Background

As the penetration of distributed energy resources (DERs) continues to increase across the many distribution systems connected both directly and indirectly to the North American Bulk Power System (BPS), it is necessary to account for the potential impacts of DERs on reliability in the planning, operation, and design of the Bulk Electric System. The NERC System Planning Impacts of Distributed Energy Resources Working Group (SPIDERWG) has identified the need for improved modeling of aggregate DER for planning studies (including both utility-scale and retail-scale DER) conducted by Transmission Planners (TPs) and Planning Coordinators (PCs), including updated modeling data requirements specific to DER.

Proposed Reliability Standard MOD-032-2 replaces the Load-Serving Entity as an applicable entity with the Distribution Provider and updates Attachment 1: Data Reporting Requirements with data specific to DERs.

General Considerations

In developing this implementation plan, the drafting team (DT) considered the time that would be necessary to develop data requirements and reporting procedures for data related to DERs, including identifying the proper reporting entity. The DT also considered that the standard would become applicable to the Distribution Provider (DP) for the first time. Transmission Owners (TOs) and DPs would be expected to participate in PC/TP processes to change data reporting requirements related to DER developed during the 24 months prior to the effective date of Requirement R1 and should be able to start working on data collection processes and methods more than 12 months prior to the effective dates of Requirements R2, R3, and R4. In summary, this would give a full 36 months from FERC approval until data is required to be reported.

Effective Date and Phased-In Compliance Dates

The effective date for the proposed Reliability Standard and NERC Glossary term Distributed Energy Resource is provided below. Where the standard drafting team identified the need for a longer implementation period for compliance with a particular section of a proposed Reliability Standard (i.e., an entire Requirement or a portion thereof), the additional time for compliance with that section is specified below. The phased-in compliance date for those particular sections represents the date that entities must begin to comply with that particular section of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

Reliability Standard MOD-032-2

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date

the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for Reliability Standard MOD-032-2 Requirements R2, R3, and R4
Entities shall not be required to comply with Requirements R2, R3, and R4 relating to revised PC/TP data requirements and reporting procedures developed under MOD-032-2 Requirement R1 and Attachment 1 until 12 months after the effective date of Reliability Standard MOD-032-2.

Definition – Distributed Energy Resource (DER)
Where approval by an applicable governmental authority is required, the definition of DER shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving Reliability Standard MOD-032-2, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the definition shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date that Reliability Standard MOD-032-2 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Retirement Date

Reliability Standard MOD-032-1
Reliability Standard MOD-032-1 shall be retired immediately prior to the effective date of Reliability Standard MOD-032-2 in the particular jurisdiction in which the revised standard is becoming effective.

Initial Performance Dates

Entities shall not be required to comply with Requirements R2, R3, and R4 relating to revised PC/TP data requirements and reporting procedures developed under MOD-032-2 Requirement R1 and Attachment 1 until 12 months after the effective date of Reliability Standard MOD-032-2.

Entities shall continue to comply with Requirements R2, R3, and R4 related to PC/TP data requirements and reporting procedures developed under MOD-032-1 Requirement R1 and Attachment 1 during the phased-in compliance period for MOD-032-2.

NERC Glossary of Terms

This section includes a newly defined term used in the NERC Reliability Standard. The new definition listed below becomes approved when the proposed standard is approved. When the standard becomes effective, the~~se~~ defined term~~s~~ will be removed from the individual standard and added to the Glossary.

Proposed New Definition~~(s)~~:
Distributed Energy Resource (DER):

Generators and energy storage technologies connected to the Distribution Provider's system, including those connected behind the meter of an end use customer, that are capable of providing Real Power in non-isolated parallel operation with the Bulk -Power System.

- Distribution Provider refers to the NERC glossary definition, rather than an entity meeting the NERC registration criteria ~~not the NERC registered entity~~.

Background

As the penetration of distributed energy resources (DERs) continues to increase across the many distribution systems connected both directly and indirectly to the North American Bulk Power System (BPS), it is necessary to account for the potential impacts of DERs on reliability in the planning, operation, and design of the Bulk Electric System. The NERC System Planning Impacts of Distributed Energy Resources Working Group (SPIDERWG) has identified the need for improved modeling of aggregate DER for planning studies (including both utility-scale and retail-scale DER) conducted by Transmission Planners (TPs) and Planning Coordinators (PCs), including updated modeling data requirements specific to DER.

Proposed Reliability Standard MOD-032-2 replaces the Load-Serving Entity as an applicable entity with the Distribution Provider and updates Attachment 1: Data Reporting Requirements with data specific to DERs.

General Considerations

In developing this implementation plan, the ~~standard~~ drafting team (DT) considered the time that would be necessary to develop data requirements and reporting procedures for data related to DERs, including identifying the proper reporting entity. The ~~standard drafting team~~DT also considered that the standard would become applicable to the Distribution Provider (DP) for the first time. -Transmission Owners (TOs)~~s~~ and DPs would be expected to participate in PC/TP processes to change data reporting requirements related to DER developed during the 24 months prior to the effective date of Requirement R1 and should be able to start working on data collection processes and methods more than 12 months prior to the effective dates of Requirements R2, R3, and R4. -In summary, this would give a full 36 months from FERC approval until data is required to be reported.

Effective Date and Phased-In Compliance Dates

The effective date for the proposed Reliability Standard and NERC Glossary term Distributed Energy Resource is provided below. Where the standard drafting team identified the need for a longer implementation period for compliance with a particular section of a proposed Reliability Standard (i.e., an entire Requirement or a portion thereof), the additional time for compliance with that section is specified below. The phased-in compliance date for those particular sections represents the date that entities must begin to comply with that particular section of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

Reliability Standard MOD-032-2

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date

the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for Reliability Standard MOD-032-2 Requirements R2, R3, and R4
Entities shall not be required to comply with Requirements R2, R3, and R4 relating to revised ~~Planning Coordinator~~PC/~~Transmission Planner~~TP data requirements and reporting procedures developed under MOD-032-2 Requirement R1 and Attachment 1 until 12 months after the effective date of Reliability Standard MOD-032-2.

Definition – Distributed Energy Resource (DER)
Where approval by an applicable governmental authority is required, the definition of ~~Distributed Energy Resource (~~DER~~)~~ shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving Reliability Standard MOD-032-2, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the definition shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date that Reliability Standard MOD-032-2 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Retirement Date

Reliability Standard MOD-032-1
Reliability Standard MOD-032-1 shall be retired immediately prior to the effective date of Reliability Standard MOD-032-2 in the particular jurisdiction in which the revised standard is becoming effective.

Initial Performance Dates

Entities shall not be required to comply with Requirements R2, R3, and R4 relating to revised ~~Planning Coordinator~~PC/~~Transmission Planner~~TP data requirements and reporting procedures developed under MOD-032-2 Requirement R1 and Attachment 1 until 12 months after the effective date of Reliability Standard MOD-032-2.

Entities shall continue to comply with Requirements R2, R3, and R4 related to ~~Planning Coordinator~~PC/~~Transmission Planner~~TP data requirements and reporting procedures developed under MOD-032-1 Requirement R1 and Attachment 1 during the phased-in compliance period for MOD-032-2.

Unofficial Comment Form

Project 2022-02 Uniform Modeling Framework for IBR

Do not use this form for submitting comments. Use the Standards Balloting and Commenting System (SBS) to submit comments on **Project 2022-02 Uniform Modeling Framework for IBR** by **8 p.m. Eastern, Thursday, October 10, 2024.**

Additional information is available on the project page. If you have questions, contact Senior Standards Developer, Laura Anderson (via email), or at 404-782-1870.

Background Information

Prior to FERC Order No. 901, Project 2022-02 was intended to address multiple Standard Authorization Requests (SARs) related to transmission planning and modeling data and analysis (MOD-032-1 Data for Power System Modeling and Analysis SAR from the NERC System Planning Impacts by the Distributed Energy Resources Working Group (SPIDERWG); TPL-001-5.1 Transmission System Planning Performance Requirements SAR from NERC Inverter-Based Resource Performance Working Group (IRPWG); and TPL-001-5.1 Transmission System Planning Performance Requirements SAR from the SPIDERWG).

The Project 2022-02 Drafting Team (DT) decided to break this project into two phases since there are two Reliability Standards involved and the project scopes are quite different. Phase I addresses MOD-032-1 in data collection and Phase II was intended to address TPL-001-5.1 in the accuracy of transmission system planning assessments. **This posting affects Phase I of the project for proposed Reliability Standard MOD-032-2 and does not contemplate the SAR related to FERC Order No. 901; the Milestone 3, Part 1 posted for industry comments May 17 – June 24, 2024.**

Draft 3 relationship to FERC Order No. 901

Around the time that Draft 3 of proposed Reliability Standard MOD-032-2 was prepared, NERC incorporated FERC Order No. 901, Milestone 3, Part 1 into the current Project 2022-02, expanding the scope of this project to include a uniform modeling framework for IBR and elevating the project to high priority. Given that the DT already modified Draft 3 of proposed Reliability Standard MOD-032-2 in response to Industry comments, and that industry need for DER data exchange continues to exist, this Draft 3 of proposed Reliability Standard MOD-032-2 is being posted for a 45-day comment period with 10-day ballot.

Additional changes to MOD-032 may be needed based on the proposed SAR resulting from FERC Order No. 901, Milestone 3, Part 1 and will be considered as part of the Project 2022-02 workplan once the SAR and workplan have been finalized.

Proposed Distributed Energy Resources (DER) definition changes

As included in the SAR, a DER definition is proposed that is suitable for application across NERC standards (i.e., definition is not specific to MOD-032). Based on industry comment, the DT suggested redlines to clarify that DER includes behind-the-meter resources. Further, the DT proposed a clarification to the term

"Distribution Provider" (DP) to point to the NERC Glossary of Terms definition more clearly, rather than the NERC registration criteria. The Technical Rationale has additional information on the proposed DER definition.

"Pass through" requirement removed

The previous Footnotes 4 and 5 were consolidated to remove any “pass through” requirement and to clarify that the DP is the responsible entity for reporting DER data under currently available entity registration, while recognizing that DER data collection efforts may generally involve DP and Transmission Owner (TO) coordination.

Questions

1. Given the explanation in the Technical Rationale and responses to industry comments, do you agree with the proposed definition for DER? If you do not agree, please suggest modifications to improve the definition.

   ☐ Yes
   ☐ No

   Comments:

2. Do you agree that the modifications for the proposed reliability standard address the scope of the SAR, modifications to MOD-032-1, in a cost-effective manner? If you do not agree, please provide alternatives that would address the SAR scope in a more cost-effective manner.

   ☐ Yes
   ☐ No

   Comments:

3. Given the explanation added in the Implementation Plan and in response to industry comments, do you agree with the Implementation Plan for proposed Reliability Standard MOD-032-2?

   ☐ Yes
   ☐ No

4. Provide any additional comments for the standard drafting team to consider, if desired.

Violation Risk Factor and Violation Severity Level Justifications

Project 2022-02 Modifications to MOD-032-2

This document provides the drafting team's (DT's) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in MOD-032-2. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The DT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

MOD-032-2

VRF Justification for MOD-032-2, Requirement R1

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R1

The VSL did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VRF Justification for MOD-032-2, Requirement R2

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R2

"Load Serving Entity" was replaced with "Distribution Provider" from Requirement R2 in MOD-032-2.

VRF Justification for MOD-032-2, Requirement R3

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R3

"Load Serving Entity" was replaced with "Distribution Provider" from Requirement R2 in MOD-032-2.

VRF Justification for MOD-032-2, Requirement R4

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R4

The VSL did not change from the previously FERC approved MOD-032-1 Reliability Standard.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Violation Risk Factor and Violation Severity Level Justifications

Project 2022-02 Modifications to MOD-032-2

This document provides the ~~standard~~ drafting team's (~~S~~DT's) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in MOD-032-2. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The ~~S~~DT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

MOD-032-2

VRF Justification for MOD-032-2, Requirement R1

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R1

The VSL did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VRF Justification for MOD-032-2, Requirement R2

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R2

"Load Serving Entity" was replaced with "Distribution Provider" from Requirement R2 in MOD-032-2.

VRF Justification for MOD-032-2, Requirement R3

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R3

"Load Serving Entity" was replaced with "Distribution Provider" from Requirement R2 in MOD-032-2.

VRF Justification for MOD-032-2, Requirement R4

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R4

The VSL did not change from the previously FERC approved MOD-032-1 Reliability Standard.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Technical Rationale for Reliability Standard MOD-032-2

August 2024

MOD-032-2 – Data for Power System Modeling and Analysis

Rationale for Applicability Section

For MOD-032-2, Load-Serving Entity (LSE) was replaced with Distribution Provider (DP) because of the removal of LSEs from the NERC registry criteria. Items in Attachment 1 that were previously required to be provided by the LSE are now required to be provided by the DP. It is recognized that some distribution facilities do not have an associated DP that meets the NERC registration criteria, but it should be clear that compliance obligations can only be imposed on NERC-registered entities listed in the Applicability Section; use of the DP term within proposed Reliability Standard MOD-032-2 should be understood to refer to an entity meeting the NERC registration criteria, unless otherwise specified.

The Drafting Team (DT) has concerns that there may be challenges in collecting data for distributed energy resources (DER) connected to unregistered entities. Draft 1 of proposed Reliability Standard MOD-032-2 proposed to assign this data obligation to the Transmission Owner (TO) or DP, but based on industry comments, this may place an unreasonable compliance risk on the TO/DP because any unregistered entities that connect DER to their systems have no compliance obligation to provide data to the TO/DP. As such, the DT recommends that NERC consider a range of options that could include expanding DP registration criteria or registering DER-only DPs to reduce or eliminate this potential DER data collection gap. However, the process to modify NERC registry criteria and register new entities is beyond the scope of Project 2022-02 and would unnecessarily delay the implementation of DER data requirements. The DT believes there is value in moving forward with MOD-032-2, as it does provide substantial improvement with respect to ensuring DER data is available for inclusion in Planning Coordinator (PC) and Transmission Planner (TP) studies. The DT considered adding “UFLS-Only Distribution Provider” to MOD-032-2 applicability to reduce (but not necessarily eliminate) the potential gaps associated with DER connected to unregistered entities with no compliance obligation. However, adding UFLS-Only Distribution Provider to the applicability would not be appropriate at this time.

Additionally, the DT reviewed the dual applicability to PA and PC and determined that it was most appropriate to reference both terms in the applicability section until NERC registration criteria is updated to use only a single term. The posted “Appendix 5B: Statement of Compliance Registry Criteria,” dated January 19, 2021, still uses both terms and, arguably, the PA term is used more prominently. However, the explanation included in MOD-032-1 refers to synchronization between registration criteria and the NERC functional model which is not maintained, was never formally approved, and is only posted as a historical document. Therefore, the DT excluded the explanatory language from MOD-032-2 Applicability Section.

Rationale for Distributed Energy Resource (DER) Definition

The DT considered various DER definitions utilized in the industry and discussed in the SPIDERWG Terms and Definitions Working Document, including the six other definitions described in Appendix D which were not adopted by SPIDERWG. Through this review, the DT determined each of these seven definitions required or would benefit from refinement to be most suitable for application in MOD-032 and future reliability standards more broadly.

The DT consensus is that the proposed definition aligns with the intent of the SPIDERWG working definition for DER (which explicitly excludes demand response) and clarifies what is in scope and out of scope with respect to where DER is connected (rather than the technology type). Utilizing the existing NERC definition for DP and the associated area of responsibility aligns with the scope of DER data collection and modeling activities and provides clarity for the industry to aid in gathering this information. It should be clear that MOD-032-2 applicability and compliance obligations refer to NERC-registered DPs; the use of the DP term in the DER definition does not in itself imply any compliance obligation.

Below is a summary of the rationale for the DT departing from each of the seven definitions when proposing a new DER definition.

SPIDERWG definition

After considering the SPIDERWG definition, the DT determined it provided a useful foundation, but needed refinement to be suitable for the intended use. Specifically, the SPIDERWG term 1) included transient types of DER power beyond generation and storage; 2) pointed to a SPIDERWG-specific defined term for “distribution systems”; and 3) included sources of back-up power that would have no potential grid impacts.

The DT chose to refer to generator and storage technologies specifically, rather than use the SPIDERWG language of “source,” to exclude devices or resources that only transiently inject real power (e.g., regenerative elevators, transition switches, etc.) DER can use various technologies including synchronous machines, induction machines, and power inverters/converters (i.e., IBR). Different types of DER can utilize a wide range of energy sources including, but not limited to, natural gas, diesel, hydro, storage, wind, and solar. Further, the DT proposed definition uses “connected to the Distribution Provider’s system” to avoid ambiguities associated with a unique definition of “distribution system” as was required by the SPIDERWG term. The NERC Glossary of Terms definition for DP[1] notes that the DP is defined by providing the distribution function (this includes entities that may not satisfy the NERC registration criteria). Additionally, the DT intention was to ensure that the scope included facilities “connected behind the meter of an end use customer” that may export Real Power to the power system or offset Real Power load (e.g., residential solar or commercial rooftop solar). This would exclude technologies such as charging-only electric vehicle (EV) installations and controllable load.

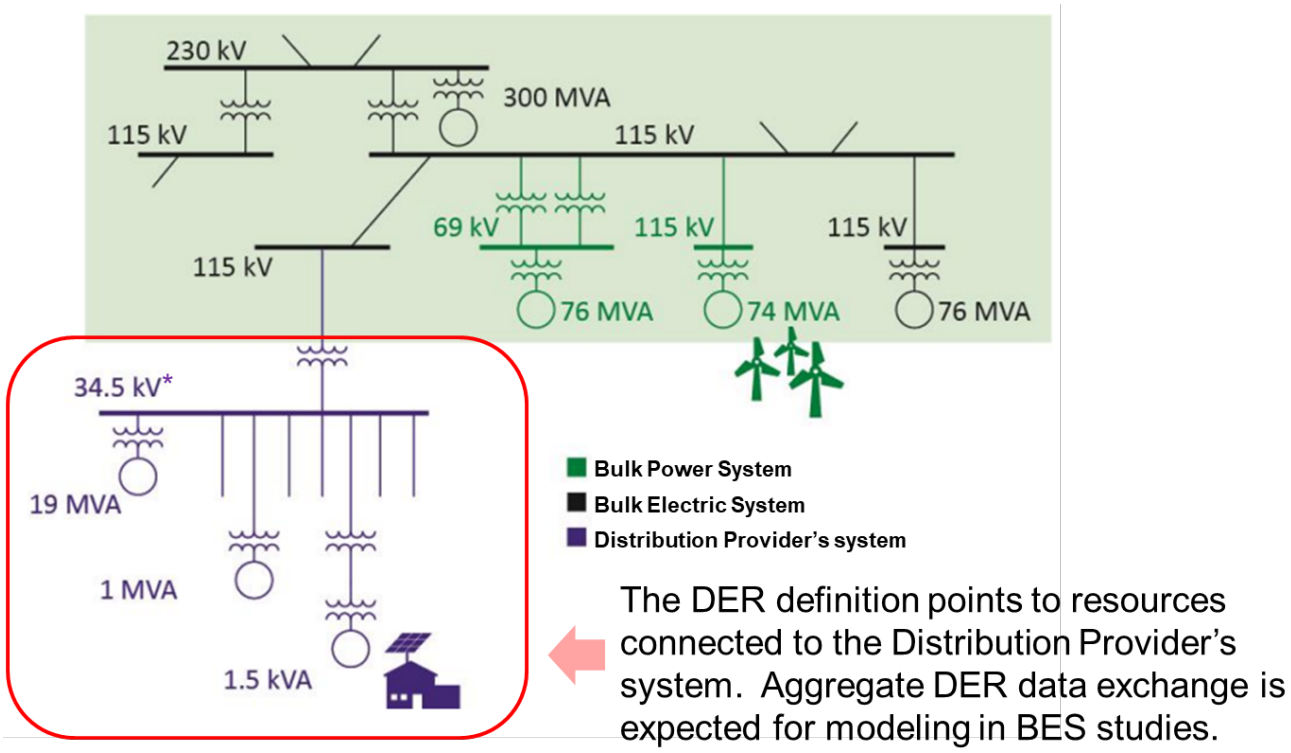
[1] NERC Glossary of Terms, Updated March 2023. Distribution Provider definition is: “Provides and operates the “wires” between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage.”

The DT included the language "in non-isolated parallel operation with the Bulk Electric System" to indicate that DER with potential Bulk Electric System (BES) reliability impacts are those that have electrical connectivity to the BES. The DT intentionally avoided the term “directly connected” to differentiate electrical connectivity from an electrical connection point. Resources that are only operated in islanded or isolated mode (e.g., back-up generation that only operates when a facility is disconnected from the grid), will not have an impact to the BES and, therefore, are not of interest from a BES-reliability perspective. The DT understands the concepts of non-isolated parallel operation versus isolated parallel operation to be commonly understood within the industry.

IEEE 1547-2018
The DT reviewed the IEEE 1547-2018 definition and found that it contained elements that could supplement the SPIDERWG definition to address the three issues identified above. The DT incorporated the explicit reference to “generation and storage” aspect of the IEEE definition. Further, the IEEE concept of “capable of exporting active power to an EPS” was used to inform the need for capturing non-isolated, long-term paralleling and the sourcing of Real Power (i.e., active power) within the DT definition.

At the same time, the DT did not view the IEEE definition as suitable for the DT’s intended use as written. The IEEE term qualifies the DER connection point as “not directly connected to a bulk power system” which the DT viewed as potentially ambiguous. Instead, the DT opted for the “connected to the DP’s system” language to point to a NERC defined term and concept. The DT considered if it was necessary to define “supplemental DER devices” as part of the DER definition and determined this nuance is not needed for a DER definition for inclusion in the NERC Glossary of Terms.

Federal Energy Regulatory Commission (FERC) Energy Primer
The DT identified the FERC Energy Primer definition as being inclusive of load resources (e.g., energy efficiency, demand response) which is not aligned with the SPIDERWG definition. Given the reliability planning use cases, the DT and SPIDERWG definitions target sources of electric power, with the DT narrowing this definition to be only sources “capable of providing Real Rower.” After considering the FERC definition, the DT determined it was not suitable for the intended use.



National Association of Regulatory Utility Commissions (NARUC)
NARUC’s definition is also inclusive of load resources (e.g., energy efficiency, demand response) and therefore, the DT concluded it is too broad. After considering the NARUC definition, the DT determined it was not suitable for the intended use.

NERC DERTF
The NERC DERTF definition uses the language “resource on the distribution system that produces electricity” which appears to exclude distributed energy storage, a technology necessary for inclusion in the DT definition. Further, the NERC DERTF definition defines DER as anything “not otherwise included in the formal NERC definition of the Bulk Electric system” which the DT views as ambiguous and overly broad. After considering the NERC DERTF definition, the DT determined it was not suitable for the intended application.

California Public Utilities Commission (CPUC)
The CPUC definition appears to be based on California legislation and includes energy efficiency, EVs, and demand response, renewable generation resources, and energy storage. As is the case for FERC and NARUC definitions above, the inclusion of load resources is overly broad for the DT's use. After considering the CPUC definition, the DT determined it was not suitable for the intended application.

New York Independent System Operator (NYISO)
The NYISO definition only considers market-qualifying resources as DER. This definition to exclude a large portion of DER (i.e. retail participation) is too narrow for the reliability planning needs identified by the SPIDERWG DER Modeling Study. After considering the NYISO definition, the DT determined it was not suitable for the intended application.

Figure 1 below provides a graphic illustration of the DER definition and the intended scope of facilities that would fall under the proposed definition. Figure 2 below shows that the proposed DER and IBR definitions are compatible, but distinct. Some resources may be classified as DER, but not IBR; some resources may be classified as IBR, but not DER; some resources may be classified as both DER and IBR. Note that in Figure 2, "distribution-connected" is shorthand for connected to the DP's system and "bulk system-connected" refers to resources connected to the transmission system.

*Note: The Distribution Provider's system is not defined by voltage level but rather by function.

Figure 1: DER Definition Illustration

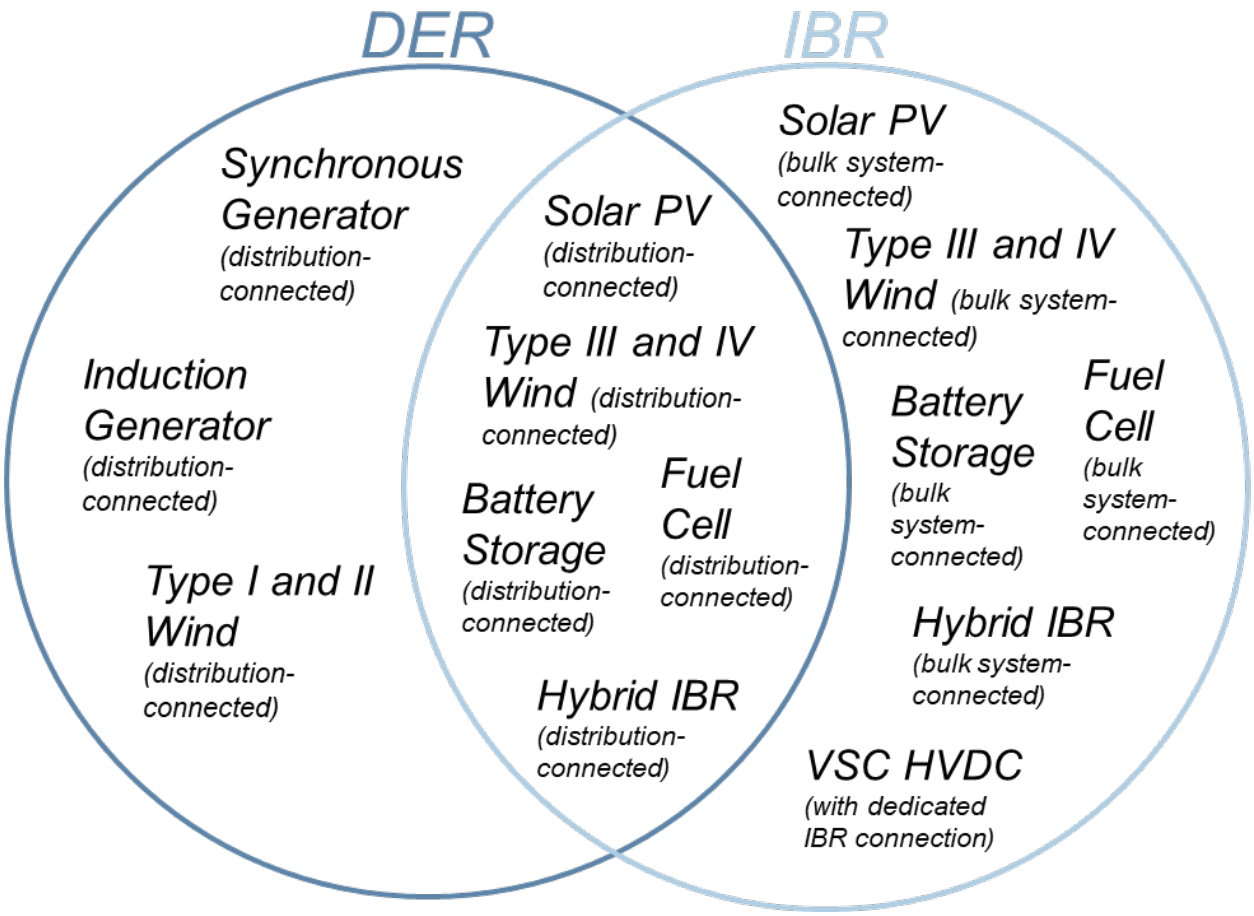


Figure 2: DER and IBR Definition Compatibility

Rationale for Modifications to Attachment 1

MOD-032-2 Attachment 1: Data Reporting Requirements was updated with data specific to DERs. The intent is that all relevant DER data including both utility scale facilities (commonly referred to as U-DER) and smaller behind-the-meter facilities (commonly referred to as R-DER) be available and represented in models of the interconnected transmission system consistent with the approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies. Specific data items listed for DER reflect the minimum amount of information expected to be needed to reasonably represent DER in transmission system models. It is expected that aggregate DER (rather than individual DER facilities) would be represented in most PC/TP study models. In Draft 3, the word "aggregate" was specifically added to Attachment 1 to clarify this point based on industry comments. However, Requirement R1 provides the PC/TP great flexibility in developing data requirements and reporting procedures that align with local practices and needs, so long as they include the items listed in the Requirement R1 Parts.

The PC/TP may have access to sufficient data for modeling certain DER through alternative means (e.g., direct registration of DER in certain markets). In such cases, the DP (or TO) should not be obligated to provide duplicate DER modeling data, but care will be needed to ensure DER is not double counted. The PC/TP modeling data requirements and reporting procedures should clearly identify if there are certain classifications of DER that are excluded from the DP/TO obligation for providing DER modeling data. This

in no way absolves a DP/TO from an obligation to provide DER data according to the data requirements and reporting procedures developed by its PC and TP in Requirement R1.

The DT intentionally maintained flexible language as to whether the underlying DER data originates from interconnection documentation, measured quantities, estimated quantities, or other sources. Data availability or sufficiency issues, among other factors, may lead to the DP/TO applying a combination of approaches to source the data. The PC/TP modeling data requirements and reporting procedures should identify acceptable methods and their application.

The DT decided to maintain an approach similar to MOD-032-1 where more detailed sub-bullets associated with the required DER data are only presented in the "steady state" column (though arguably such data is also relevant to "dynamics" and/or "short circuit"). The DT concluded that this was appropriate and consistent with other "dynamics" line items such as "Wind Turbine Data" and "Photovoltaic systems" that are listed without detailed sub-bullets. Drastically altering the structure of Attachment 1 or explicitly adding DER data to the "short circuit" column was beyond the scope of the Project 2022-02 SAR. However, the PC or TP is not restricted from requiring any needed short circuit data in their joint modeling data requirements and reporting procedures developed per Requirement R1.

It should be noted that the modifications do not make DER a BES facility subject to NERC reliability standards. Instead, the modifications place a compliance obligation on NERC registered DPs (or TOs) to provide basic information about DER that are connected to their systems so that DER can be properly represented in Interconnection-wide cases. There are already existing requirements for DPs (or TOs) to provide information about load connected to their systems. Like load, DER is not generally considered to be a BES facility. However, BES reliability assessments require an accurate representation of both aggregate load and aggregate DER behavior. The modifications proposed in MOD-032-2 are intended to ensure sufficient DER data is available to the PC/TP so that appropriate DER representations can be included in their BES reliability assessments.

- **Inferring DER Capabilities**

As suggested in the approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies, the in-service date for DER may be used as a proxy for the PC/TP to make reasonable assumptions about DER capabilities. For example, in a certain jurisdiction DER installed after a specified date may be required to have a certain ride-through characteristic. Thus, the appropriate ride-through characteristic representation for DER in that area could be inferred by the in-service date of the DER. However, the PC/TP modeling data requirements and reporting procedures may require the provision of alternative information to achieve the same purpose. PC/TP modeling data requirements and reporting procedures may also require more detail and/or additional information. In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, it is expected that the proportion of aggregate DER amount with in-service dates before and after certain threshold dates would be needed (and specified in the PC/TP requirements) to make inferences regarding the overall aggregate DER response characteristics.

- **Inclusion of Data Related to DER Subject to Trip by UFLS and/or UVLS**

There is a reliability need for the DP/TO to convey this information to the PC/TP. As described in the approved Reliability Guideline: Recommended Approaches for UFLS Program Design with Increasing Penetrations of DERs, accurately representing DER tripping as part of UFLS operation is vital for designing and evaluating UFLS programs. Similarly, accurately representing DER tripping as part of UVLS operation is vital for designing and evaluating UVLS programs as described in the approved White Paper: DER Impact to Under Voltage Load Shedding Program Design. In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, the proportion of aggregate DER subject to each UVLS/UFLS tripping stage should be identified.

- **Inclusion of Aggregate Demand Clarification**

Footnote 2 was modified to clarify that the gross demand is needed at each load serving bus. Collecting and modeling a net demand that incorporates offsets due to output from DER is not consistent with a modeling framework that explicitly represents DER.

- **Footnote 4**

Footnote 4 was clarified and Footnote 5 from the previous draft was removed from Attachment 1 to make it clear that the functional entity that is responsible for reporting DER data under the currently available registered entities is the DP. Previous references to the TO as a responsible DER entity were removed, but the clarified footnote still states and recognizes that DER data collection efforts may generally involve DP and TO coordination. The DT continues to recognize that there are situations where DER is connected to an "unregistered Distribution Provider," instead of a DP or TO, and that it is still an appropriate aim to collect this data. However, in agreement with industry comments, references to data collection efforts or passing through data by the DP/TO from these unregistered entities was removed from the standard language as it could add compliance risk on the DP/TO without any compliance obligation on the unregistered entities. The DT believes that there is great value in moving forward with the standard with the registered DP as the responsible entity for DER data as this will vastly improve the amount of data that is available to the TP/PC.

Where an unregistered DP (an entity not meeting the NERC registration criteria) is interconnected to the system of a registered entity (DP or TO), the DP/TO should coordinate with the unregistered DP to ensure the availability of information associated with DER that may be connected to the unregistered DP's system. This effort would be considered as a best practice, even if not specifically required by the MOD-032 Reliability Standard. FERC Order No. 901 addresses this issue of data collection for DERs that do not have an associated registered entity and directs future efforts to determine appropriate responsible registered entities, but the DT believes that this currently falls outside of the scope of this SAR and will be addressed in the new SAR related to FERC Order No. 901, Milestone 3, Part 1. In the interim, FERC Order No. 901 also describes a process where this data is unavailable and should instead be estimated and the limitations of data availability should be documented.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Technical Rationale for Reliability Standard MOD-032-2

~~October 2023~~August 2024

MOD-032-2 – Data for Power System Modeling and Analysis

Rationale for Applicability Section

For MOD-032-2, Load-Serving Entity (LSE) was replaced with Distribution Provider (DP) because of the removal of LSEs from the NERC registry criteria. ~~-~~Items in Attachment 1 that were previously required to be provided by the LSE are now required to be provided by the DP. ~~-~~It is recognized that some distribution facilities do not have an associated DP that meets the NERC registration criteria~~. It is expected that TOs (or registered DPs) will need to coordinate with the owners of distribution facilities that do not have an associated NERC registered DP to ensure the availability of the necessary data, either through interconnection agreements or other binding contracts~~, but it should be clear that compliance obligations can only be imposed on NERC-registered entities listed in the Applicability Section; use of the DP term within proposed Reliability Standard MOD-032-2 should be understood to refer to an entity meeting the NERC registration criteria, unless otherwise specified.

The ~~Standard~~ Drafting Team (~~S~~DT) has concerns that there may be challenges in collecting data for distributed energy resources (DER) connected to unregistered entities. ~~-~~Draft 1 of proposed Reliability Standard MOD-032-2 proposed to assign this data obligation ~~on~~to the Transmission Owner (TO~~/~~) or DP, but based on industry comments, this may place an unreasonable compliance risk on the TO/DP because any unregistered entities that connect DER to their systems have no compliance obligation to provide data to the TO/DP. ~~-~~As such, the ~~S~~DT recommends that NERC consider a range of options that could include expanding DP registration criteria or registering DER-only DPs to reduce or eliminate this potential DER data collection gap. ~~-~~However, the process to modify NERC registry criteria and register new entities is beyond the scope of Project 2022-02 and would unnecessarily delay the implementation of DER data requirements. ~~-~~The ~~S~~DT believes there is value in moving forward with MOD-032-2, as it does provide substantial improvement with respect to ensuring ~~-~~DER data is available for inclusion in Planning Coordinator (PC) and Transmission Planner (TP) studies. The DT considered adding "UFLS-Only Distribution Provider" to MOD-032-2 applicability to reduce (but not necessarily eliminate) the potential gaps associated with DER connected to unregistered entities with no compliance obligation. However, adding UFLS-Only Distribution Provider to the applicability would not be appropriate at this time.

Additionally, the ~~S~~DT reviewed the dual applicability to ~~Planning Authority~~PA and ~~Planning Coordinator~~PC and determined that it was most appropriate to reference both terms in the applicability section until NERC registration criteria is updated to use only a single term. ~~-~~The posted "Appendix 5B: Statement of Compliance Registry Criteria~~",~~," dated January 19, 2021, still uses both terms and, arguably, the ~~Planning Authority~~PA term is used more prominently.~~-~~ However, the explanation included in MOD-032-1 refers to synchronization between registration criteria and the NERC functional model which is not maintained,

was never formally approved, and is only posted as a historical document. ~~-~~Therefore, the ~~S~~SDT excluded the explanatory language from MOD-032-2 ~~applicability section~~Applicability Section.

Rationale for Distributed Energy Resource (DER) Definition

The ~~S~~SDT considered various DER definitions utilized in the industry and discussed in the SPIDERWG Terms and Definitions Working Document, including the six other definitions described in Appendix D which were not adopted by SPIDERWG. Through this review, the ~~S~~SDT determined each of these seven definitions required or would benefit from refinement to be most suitable for ~~the~~ application in MOD-032 and future reliability standards more broadly.

The ~~S~~SDT consensus is that the proposed definition aligns with the intent of the SPIDERWG working definition for DER (which explicitly excludes demand response) and clarifies what is in scope and out of scope with respect to where DER is connected (rather than the technology type~~.~~). Utilizing the existing NERC definition for DP and the associated area of responsibility aligns with the scope of DER data collection and modeling activities and provides clarity for the industry to aid in gathering this information. It should be clear that MOD-032-2 applicability and compliance obligations refer to NERC-registered DPs; the use of the DP term in the DER definition does not in itself imply any compliance obligation.

Below is a summary of the rationale for the ~~S~~SDT departing from each of the seven definitions when proposing a new DER definition.

SPIDERWG definition

After considering the SPIDERWG definition, the ~~S~~SDT determined it provided a useful foundation, but needed refinement to be suitable for the intended use. Specifically, the SPIDERWG term 1) included transient types of DER power beyond generation and storage; 2) pointed to a SPIDERWG-specific defined term for “distribution systems”; and 3) included sources of back-up power that would have no potential grid impacts.

The ~~S~~SDT chose to refer to generator and storage technologies specifically, rather than use the SPIDERWG language of “source~~”,~~,” to exclude devices or resources that only transiently inject real power (e.g., regenerative elevators, transition switches, etc.) ~~Additionally, by specifying facilities that produce Real Power, the scope is focused on only those facilities that may be exporting Real Power to the power system or offsetting~~DER can use various technologies including synchronous machines, induction machines, and power inverters/converters (i.e., IBR). Different types of DER can utilize a wide range of energy sources including, but not limited to, natural gas, diesel, hydro, storage, wind, and solar. Further, the DT proposed definition ~~Real Power load (e.g., residential solar or commercial rooftop solar). This would exclude technologies such as charging only electric vehicle (EV) installations and controllable load.~~

~~Further, the SDT term~~ uses “connected to the Distribution Provider’s system” to avoid ambiguities associated with a unique definition of “distribution system” as was required by the SPIDERWG term. ~~-~~The

NERC ~~glossary~~Glossary of Terms definition for DP[1] notes that the DP is defined by providing the distribution function (this includes entities that may not satisfy the NERC registration criteria). Additionally, the DT intention was to ensure that the scope included facilities "connected behind the meter of an end use customer" that may export Real Power to the power system or offset Real Power load (e.g., residential solar or commercial rooftop solar). This would exclude technologies such as charging-only electric vehicle (EV) installations and controllable load.~~be NERC-registered DPs).~~

The ~~S~~DT included the language "in non-isolated parallel operation with the Bulk ~~Power~~Electric System" to indicate that ~~distributed energy resources~~DER with potential Bulk Electric System (BES) reliability impacts are those that have electrical connectivity to the BES. The ~~S~~DT intentionally avoided the term "directly connected" to differentiate electrical connectivity from an electrical connection point. ~~-~~Resources that are only operated in islanded or isolated mode (e.g., back-up generation that only operates when a facility is disconnected from the grid), will not have an impact to the BES and, therefore, are not of interest from a BES-reliability perspective. ~~-~~The ~~S~~DT understands the concepts of non-isolated parallel operation versus isolated parallel operation to be commonly understood within the industry.

IEEE 1547-2018

The ~~S~~DT reviewed the IEEE 1547-2018 definition and found that it contained elements that could supplement the SPIDERWG definition to address the three issues identified above. The ~~S~~DT incorporated the explicit reference to "generation and storage" aspect of the IEEE definition. Further, the IEEE concept of "capable of exporting active power to an EPS" was used to inform the need for capturing non-isolated, long-term paralleling and the sourcing of Real Power (i.e., active power) within the ~~S~~DT definition.

At the same time, the ~~S~~DT did not view the IEEE definition as suitable for the ~~S~~DT's intended use as written. The IEEE term qualifies the DER connection point as "not directly connected to a bulk power system" which the ~~S~~DT viewed as potentially ambiguous. Instead, the ~~S~~DT opted for the "connected to the DP's system" language to point to a NERC defined term and concept. ~~-~~The ~~S~~DT considered if it was necessary to define "supplemental DER devices" as part of the DER definition and determined this nuance is not needed for a DER definition for inclusion in the NERC Glossary of Terms.

Federal Energy Regulatory Commission (FERC) Energy Primer

The ~~S~~DT identified the FERC Energy Primer definition as being inclusive of load resources (e.g., energy efficiency, demand response) which is not aligned with the SPIDERWG definition. Given the reliability planning use cases, the ~~S~~DT and SPIDERWG definitions target sources of electric power, with the ~~S~~DT narrowing this definition to be only sources "capable of providing Real Rower~~.~~." After considering the FERC definition, the ~~S~~DT determined it was not suitable for the intended use.

National Association of Regulatory Utility Commissions (NARUC)

[1] NERC Glossary of Terms, Updated March 2023. ~~DP is~~Distribution Provider definition is: "Provides and operates the "wires" between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage."

NARUC's definition is also inclusive of load resources (e.g., energy efficiency, demand response) and therefore, the ~~S~~DT concluded it is too broad. After considering the NARUC definition, the ~~S~~DT determined it was not suitable for the intended use.

NERC DERTF

The NERC DERTF definition uses the language "resource on the distribution system that produces electricity" which appears to exclude distributed energy storage, a technology necessary for inclusion in the ~~S~~DT definition. Further, the NERC DERTF definition defines DER as anything "not otherwise included in the formal NERC definition of the Bulk Electric system" which the ~~S~~DT views as ambiguous and overly broad. After considering the NERC DERTF definition, the ~~S~~DT determined it was not suitable for the intended application.

California Public Utilities Commission (CPUC)

The CPUC definition appears to be based on California legislation and includes energy efficiency, ~~electric vehicles~~EVs, and demand response, renewable generation resources, and energy storage. As is the case for FERC and NARUC definitions above, the inclusion of load resources is overly broad for the ~~S~~DT's use. After considering the CPUC definition, the ~~S~~DT determined it was not suitable for the intended application.

New York Independent System Operator (NYISO)

The NYISO definition only considers market-qualifying resources as DER. This definition to exclude a large portion of DER (i.e. retail participation) is too narrow for the reliability planning needs identified by the SPIDERWG DER Modeling Study. After considering the NYISO definition, the ~~S~~DT determined it was not suitable for the intended application.

Figure 1 below provides a graphic illustration of the DER definition and the intended scope of facilities that would fall under the proposed definition. Figure 2 below shows that the proposed DER and IBR definitions are compatible, but distinct. Some resources may be classified as DER, but not IBR; some resources may be classified as IBR, but not DER; some resources may be classified as both DER and IBR. Note that in Figure 2, "distribution-connected" is shorthand for connected to the DP's system and "bulk system-connected" refers to resources connected to the transmission system.

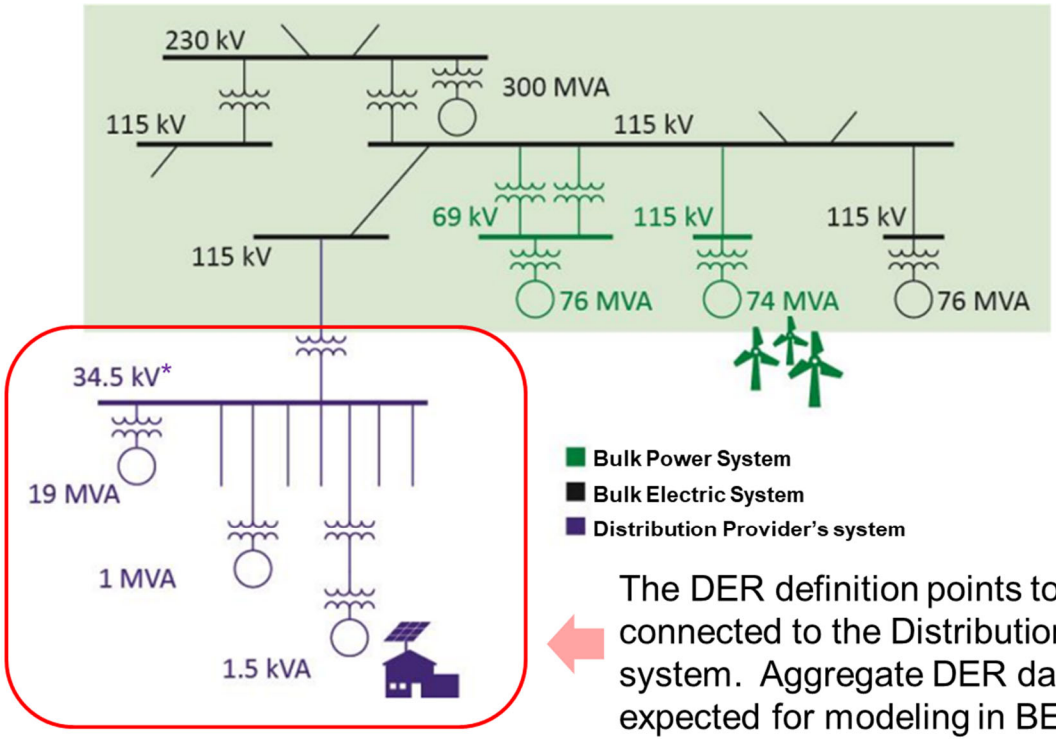

Figure 1: DER Definition Illustration

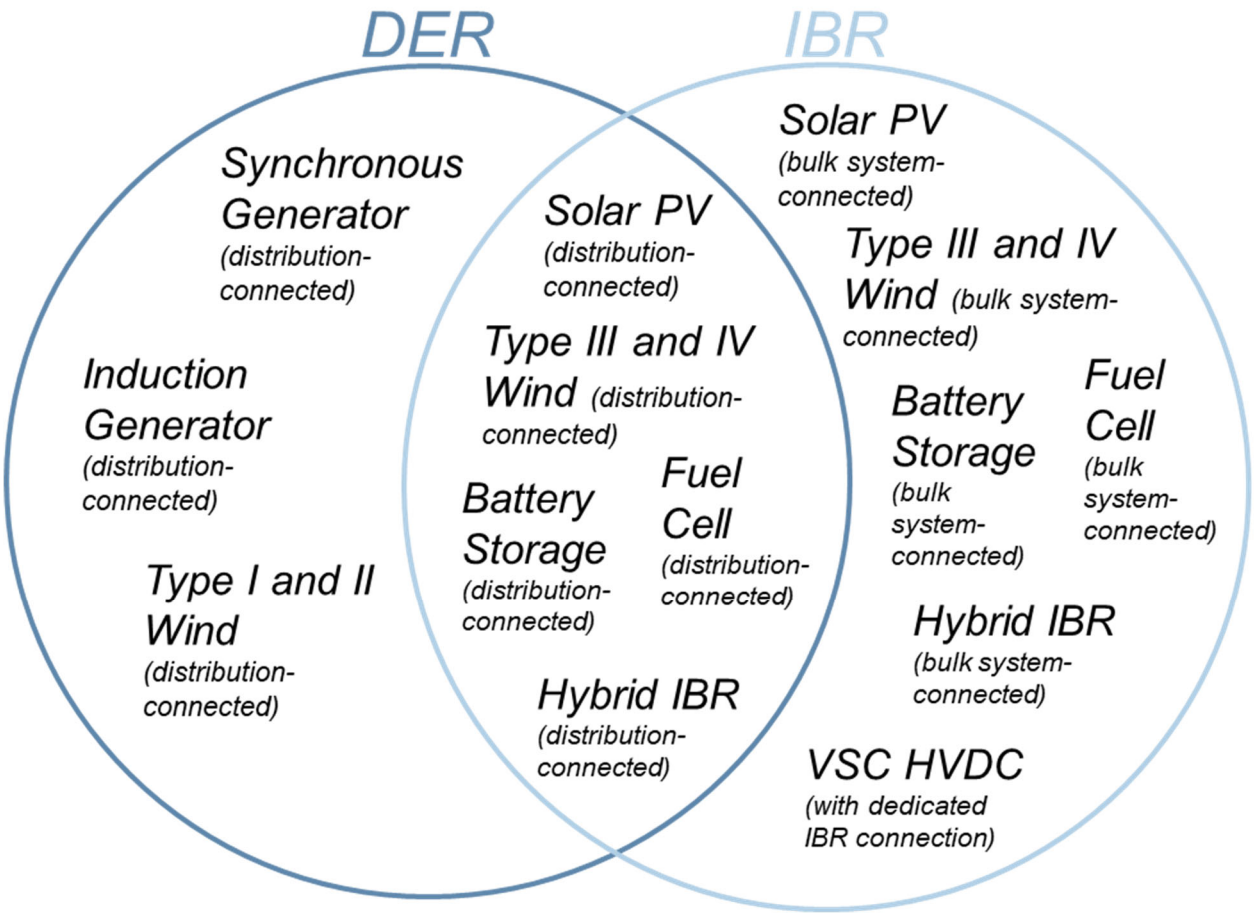

Figure 2: DER and IBR Definition Compatibility

Rationale for Modifications to Attachment 1

MOD-032-2 Attachment 1: Data Reporting Requirements was updated with data specific to DERs. ~~-~~The intent is that all relevant DER data including both utility scale facilities (commonly referred to as U-DER) and smaller behind-the~~-~~-meter facilities (commonly referred to as R-DER) be available and represented in models of the interconnected transmission system consistent with the approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies. ~~-~~Specific data items listed for DER reflect the minimum amount of information expected to be needed to reasonably represent DER in transmission system models. ~~-~~It is expected that aggregate DER (rather than individual DER facilities) would be represented in most ~~Planning Coordinator/Transmission Planner (~~PC/TP~~)~~ study models. In Draft 3, the word "aggregate" was specifically added to Attachment 1 to clarify this point based on industry comments. However, ~~footnote 4 explicitly allows the PC/TP to specify the level of DER data aggregation. This~~Requirement R1 provides the PC/TP great flexibility ~~for~~in developing data requirements and reporting procedures that align with local practices ~~wherein~~and needs, so long as they include the ~~PC/TP may elect to apply DER aggregation assumptions rather than depend on~~ items listed in the ~~DP/TO to apply aggregation assumptions.~~Requirement R1 Parts.

The PC/TP may have access to sufficient data for modeling certain DER through alternative means (e.g., direct registration of DER in certain markets). ~~-~~In such cases, the DP (or TO) should not be obligated to provide duplicate DER modeling data, but care will be needed to ensure DER is not double counted. The PC/TP modeling data requirements and reporting procedures should clearly identify if there are certain classifications of DER that are excluded from the DP/TO obligation for providing DER modeling data. ~~-~~This in no way absolves a DP/TO from an obligation to provide DER data according to the data requirements and reporting procedures developed by its ~~Planning Coordinator and Transmission Planner~~PC and TP in Requirement R1.

The ~~S~~SDT intentionally maintained flexible language as to whether the underlying DER data originates from interconnection documentation, measured quantities, estimated quantities, or other sources. Data availability or sufficiency issues, among other factors, may lead to the DP/TO applying a combination of approaches to source the data. The PC/TP modeling data requirements and reporting procedures should identify acceptable methods and their application.

The ~~S~~SDT decided to maintain an approach similar to MOD-032-1 where more detailed sub-bullets associated with the required DER data are only presented in the "steady state" column (though arguably such data is also relevant to "dynamics" and/or "short circuit"). The ~~S~~SDT concluded that this was appropriate and consistent with other "dynamics" line items such as "Wind Turbine Data" and "Photovoltaic systems" that are listed without detailed sub-bullets. ~~-~~Drastically altering the structure of Attachment 1 or explicitly adding DER data to the "short circuit" column was beyond the scope of the Project 2022-02 SAR. ~~-~~However, the PC or TP is not restricted from requiring any needed short circuit data in their joint modeling data requirements and reporting procedures developed per Requirement R1.

It should be noted that the modifications do not make DER a BES facility subject to NERC reliability standards. ~~-~~Instead, the modifications place a compliance obligation on NERC registered DPs (or TOs) to provide basic information about DER that are connected to their systems so that DER can be properly represented in ~~i~~Interconnection-wide cases.~~-~~ There are already existing requirements for DPs (or TOs) to provide information about load connected to their systems. ~~-Similar to~~Like load, DER is not generally considered to be a BES facility.~~-~~ However, BES reliability assessments require an accurate representation of both aggregate load and aggregate DER behavior. ~~-~~The modifications proposed in MOD-032-2 are intended to ensure sufficient DER data is available to the PC/TP so that appropriate DER representations can be included in their BES reliability assessments.

- **Inferring DER Capabilities**

As suggested in the approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies, the in-service date for DER may be used as a proxy for the PC/TP to make reasonable assumptions about DER capabilities. ~~-~~For example, in a certain jurisdiction DER installed after a specified date may be required to have a certain ride-through characteristic. ~~-~~Thus, the appropriate ride-through characteristic representation for DER in that area could be inferred by the in-service date of the DER. However, the PC/TP modeling data requirements and reporting procedures may require the provision of alternative information to achieve the same purpose. ~~-~~PC/TP modeling data requirements and reporting procedures may also require more detail and/or additional information. ~~-~~In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, it is expected that

the proportion of aggregate DER amount with in-service dates before and after certain threshold dates would be needed (and specified in the PC/TP requirements) to make inferences regarding the overall aggregate DER response characteristics.

- **Inclusion of Data Related to DER Subject to Trip by UFLS and/or UVLS**

There is a reliability need for the DP/TO to convey this information to the PC/TP. ~~-~~As described in the approved Reliability Guideline: Recommended Approaches for UFLS Program Design with Increasing Penetrations of DERs, accurately representing DER tripping as part of UFLS operation is vital for designing and evaluating UFLS programs. ~~-~~Similarly, accurately representing DER tripping as part of UVLS operation is vital for designing and evaluating UVLS programs as described in the approved White Paper: DER Impact to Under Voltage Load Shedding Program Design. ~~-~~In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, the proportion of aggregate DER subject to each UVLS/UFLS tripping stage should be identified.

- **Inclusion of Aggregate Demand Clarification**

Footnote 2 was modified to clarify that the gross demand is needed at each load serving bus. ~~-~~Collecting and modeling a net demand that incorporates offsets due to output from DER is not consistent with a modeling framework that explicitly represents DER. ~~In situations where DER is not separately metered, a comparison to historical load levels can be used to approximate the addition of DER on the distribution feeder. A consistent reduction in load on the feeder may be indicative of DER interconnections.~~

- ~~**Examples for** **Footnote** **54**~~

~~Footnote 5 was added to Attachment 1, item 9, after the bracketed statement, indicating the functional entity responsible for data reporting requirements is the "DP, TO where DER is directly connected to the TO system and not through a DP", to cover situations where the DER is not connected to a registered DP or directly to a registered TO. In these situations, DER is connecting to an "unregistered Distribution Provider", that is responsible for DER interconnection processes and data management but does not have NERC compliance obligations. The SDT viewed the collection of all DER data as the appropriate aim, but recognized practical constraints associated with unregistered entity compliance obligations. For that reason, the SDT added a footnote that in part states, "the next closest electrically connected registered entity (DP or TO) shall request DER data and pass through available information" to request data that cannot be required.~~

~~The SDT offers two examples to illustrate the SDT's intended application of Footnote 5:~~

- ~~If the DER is directly connecting to an unregistered Distribution Provider that is immediately electrically adjacent to a registered TO (i.e., "next closest electrically connected registered entity"), the TO is responsible for requesting data from the unregistered DP and incorporating it in the MOD-032 data to the Planning Coordinator.~~
- ~~If the DER is directly connected to an unregistered Distribution Provider that is served by a registered DP (i.e., "next closest electrically connected registered entity"), then the registered DP is required to request data from the unregistered Distribution Provider and include this data in the MOD-032 data submission.~~

Footnote 4 was clarified and Footnote 5 from the previous draft was removed from Attachment 1 to make it clear that the functional entity that is responsible for reporting DER data under the currently available registered entities is the DP. Previous references to the TO as a responsible DER entity were removed, but the clarified footnote still states and recognizes that DER data collection efforts may generally involve DP and TO coordination. The DT continues to recognize that there are situations where DER is connected to an "unregistered Distribution Provider," instead of a DP or TO, and that it is still an appropriate aim to collect this data. However, in agreement with industry comments, references to data collection efforts or passing through data by the DP/TO from these unregistered entities was removed from the standard language as it could add compliance risk on the DP/TO without any compliance obligation on the unregistered entities. The DT believes that there is great value in moving forward with the standard with the registered DP as the responsible entity for DER data as this will vastly improve the amount of data that is available to the TP/PC.

Where an unregistered DP (an entity not meeting the NERC registration criteria) is interconnected to the system of a registered entity (DP or TO), the DP/TO should coordinate with the unregistered DP to ensure the availability of information associated with DER that may be connected to the unregistered DP's system. This effort would be considered as a best practice, even if not specifically required by the MOD-032 Reliability Standard. FERC Order No. 901 addresses this issue of data collection for DERs that do not have an associated registered entity and directs future efforts to determine appropriate responsible registered entities, but the DT believes that this currently falls outside of the scope of this SAR and will be addressed in the new SAR related to FERC Order No. 901, Milestone 3, Part 1. In the interim, FERC Order No. 901 also describes a process where this data is unavailable and should instead be estimated and the limitations of data availability should be documented.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2022-02 Uniform Modeling Framework for IBR

Formal Comment Period Open through October 10, 2024

Now Available

A 45-day formal comment period for **Project 2022-02 Uniform Modeling Framework for IBR** is open through **8 p.m. Eastern, Thursday, October 10, 2024** for the following standard and implementation plan:

- MOD-032-2 – Data for Power System Modeling and Analysis
- Implementation Plan

The standard drafting team's considerations of the responses received from the previous comment period are reflected in this draft of the standard.

This posting affects Phase I of the project for proposed Reliability Standard MOD-032-2 and does not contemplate the SAR related to FERC Order No. 901; the Milestone 3, Part 1.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Additional ballots for the standard and implementation plan, as well as the non-binding polls of the associated Violation Risk Factors and Violation Severity Levels will be conducted **October 1-10, 2024.**

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Laura Anderson (via email) or at 404-782-1870. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project Uniform Modeling Framework for IBR observer list” in the Description Box.

Comment Report

Project Name:	2022-02 Modifications to TPL-001 and MOD-032 | Draft 3 - MOD-032-2
Comment Period Start Date:	8/27/2024
Comment Period End Date:	10/10/2024
Associated Ballots:	2022-02 Modifications to TPL-001 and MOD-032 | Draft 1 Implementation Plan AB 3 OT 2022-02 Modifications to TPL-001 and MOD-032 | Draft 1 MOD-032-2 AB 3 ST 2022-02 Modifications to TPL-001 and MOD-032 | Non-Binding Poll MOD-032-2 AB 3 NB

There were 55 sets of responses, including comments from approximately 140 different people from approximately 87 companies representing 7 of the Industry Segments as shown in the table on the following pages.

Questions

1. Given the explanation in the Technical Rationale and responses to industry comments, do you agree with the proposed definition for DER? If you do not agree, please suggest modifications to improve the definition.

2. Do you agree that the modifications for the proposed reliability standard address the scope of the SAR, modifications to MOD-032-1, in a cost-effective manner? If you do not agree, please provide alternatives that would address the SAR scope in a more cost-effective manner.

3. Given the explanation added in the Implementation Plan and in response to industry comments, do you agree with the Implementation Plan for proposed Reliability Standard MOD-032-2?

4. Provide any additional comments for the standard drafting team to consider, if desired.

Comment

The standard as written places an untenable compliance burden on NERC registered entities. It does not note or address in any way the challenges in collecting DER data from behind the meter facilities connected to DPs or TOs. These unregistered DER owners have no obligation or requirement under NERC standards to provide data for modeling. Requiring that DPs provide modeling data for equipment they do not own and have no means to acquire data on leaves them in a position where they fail to comply with the standard through no fault of their own and despite their best efforts.

Comment

1. The standard does not address responsibilities where legacy DER connected to TP or DP may not have the modeling data to provide.

2. The range of options to expand DP registration criteria mentioned in the technical rationale should be discussed in detail in the standard

3. Constellation recommends that references to “behind the meter” devices be removed. A distributed energy resource’s location relative to the meter does not define it.

Did the SDT perhaps intend to strike the phrase “not the NERC registered entity” from the bullet which states “Distribution Provider refers to the NERC glossary definition, rather than an entity meeting the NERC registration criteria not the NERC registered entity?”

The proposed definition has no boundaries and, as such, would apply to all generators and energy storage systems, no matter the size, e.g. a 1 kW solar panel mounted on a homeowner’s garage. This is unworkable due the sheer number of these that exist. Suggest including boundaries such as those proposed by NERC, i.e. “resources that have an aggregate nameplate capacity of greater than or equal to 20 MVA, delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV.” Remove the sub bullet related to the Distribution Provider.	

Adding the reference to Distribution Provider's system but saying it's not referring to the registered DP, which is applicable to this standard, adds unnecessary confusion. Striking the words "connected to the Distribution Provider's system" doesn't affect the definition and removes the confusion. If you are trying to use this to say it includes sub-transmission voltages, just say that; including DP language makes it difficult to figure out the intent.

Reclamation supports NAGF's comment "The NAGF recommends that references to "behind the meter" devices be removed. A distributed energy resource's location relative to the meter does not define it. The NAGF recommends that the bulleted phrase stating that the term Distribution Provider is referencing NERC Glossary of Terms be removed. It is implicitly understood, unnecessary, and not in line with any other definition. NAGF recommends removal of the phrase "in non-isolated parallel operation." This phrase adds no value and potentially adds unnecessary ambiguity. A potential alternative is to use language similar to that in IEEE 1547 ("not directly connected to the Bulk Power System"). If this phrase is intended to include or exclude any particular type of resource, instead any exclusions or inclusions should be explicitly listed in subparts, as done in the BES definition". Reclamation recommends the DER definition should be added to the Glossary of Terms.

Black Hills Corporation agrees with the following concerns from EEI’s comments.

- There is no need to specify that DERs include DERs behind the meter.

- It is not necessary to state that Distribution Provider (DP) are to be understood through the definition provided within the NERC Glossary of Terms. This is true of any term defined in the NERC Glossary of Terms and contained in a NERC Reliability Standard.
- It is preferable to state a DER is designed to export Real Power to the DP's system, rather than "provides Real Power in non-isolated parallel operation with the Bulk Power System".

Definition of "Distribution Provider"

As used in the revised draft MOD-32-2, the term "Distribution Provider" ("DP") is ambiguous and should be clarified.

- Earlier comments from industry participants and numerous responses from the drafting team to industry comments on previous drafts clearly show that there is some confusion around the definition of DP as used in this revised MOD-032-2. In one instance, the text points to how "Distribution Provider" is defined in the NERC Glossary of Terms. In another instance, however, the text appears to consider a "Distribution Provider" to meet NERC's registration criteria (as defined in NERC Rules of Procedure, Appendix 5B). To address this persistent confusion, the

drafting team added a note at the beginning of the standard that reads: “Distribution Provider refers to the NERC glossary definition, rather than an entity meeting the NERC registration criteria.”

- Considering the revised draft MOD-032-2 in isolation, one would reasonably assume that the definition of “Distribution Provider” provided at the beginning of the document to apply to the entire document. The technical rationale included in the document, however, explicitly states this is not the case - the alternative interpretation of “Distribution Provider” is apparently to be used for the rest of the document. This seems needlessly confusing at best and at worst, could cause problems during the implementation of MOD-032-2.

Definition of “Distributed Energy Resource”

- Oncor Electric Delivery Company LLC (“Oncor”) considers the “Distributed Energy Resource” (“DER”) definition used in the Technical Rationale for Reliability Standard MOD-032-2 too vague because it does not contain a voltage class threshold for an energy resource to be considered a DER.
- Oncor’s view of DER is consistent with ERCOT’s definition of DER, which is: “An electrical generating facility consisting of one or more on-site distributed generation units connected at a voltage less than or equal to 60 kilovolts (kV), which may be connected in parallel operation to the utility system.” This definition can be found here: https://www.ercot.com/files/docs/2017/03/24/DER_OnePager_FINAL.pdf
- From Oncor’s experience, the total capacity of the installation’s on-site distributed generation units may exceed ten megawatts (MW); however, no more than ten MW of the installation’s capacity will be allowed to export into the grid at any point in time at the point of common coupling.
- Is there any MW size threshold for Generator and energy storage technologies to be taken into account when the end-use customer is served at transmission voltage? We would prefer a MW size threshold be specified in the definition.

The definition of distributed energy resources lacks sufficient specificity by not including solar resources. Even though the definition of distributed energy includes “energy storage technologies”, it might not be sufficient to imply it includes solar resources. MRO recommends, for example, using “energy resources and energy storage technologies connected to…..” in the definition to ensure it includes all types of energy resources.

WECC suggests the Drafting Team use “end-use” in the definition for consistency with Glossary of Terms (i.e., hyphenate the term). Is there any concern that the Distribution Provider’s system, by definition, stops at the end-use customer but the DER definition goes beyond that interface (or appears to)? While the Technical Rationale provides a good description of the inter-relatedness of IBR and DER definitions but the DER definition itself is not clear.

Tim Kelley - Tim Kelley On Behalf of: Charles Norton, Sacramento Municipal Utility District, 3, 6, 4, 1, 5; Foung Mua, Sacramento Municipal Utility District, 3, 6, 4, 1, 5; Kevin Smith, Balancing Authority of Northern California, 1; Nicole Looney, Sacramento Municipal Utility District, 3, 6, 4, 1, 5; Ryder Couch, Sacramento Municipal Utility District, 3, 6, 4, 1, 5; Wei Shao, Sacramento Municipal Utility District, 3, 6, 4, 1, 5; - Tim Kelley, Group Name SMUD and BANC

Answer	No
Document Name	

Comment

SMUD supports the following comments provided by the North American Generator Forum (NAGF) to improve the definition:

(1) The NAGF recommends that references to “behind the meter” devices be removed. A distributed energy resource’s location relative to the meter does not define it.

(2) The NAGF recommends that the bulleted phrase stating that the term Distribution Provider is referencing NERC Glossary of Terms be removed. It is implicitly understood, unnecessary, and not in line with any other definition.

In addition, the DER definition needs some threshold limits for what DER data must be reported so that entities are solely focused on the aggregate DERs of significant size that may impact the Bulk Power System. The registration criteria for Category 2 Generator Owners and Generator Operators uses an aggregate capacity of 20 MVA or more, connected to a common point of connection at 60 kV and above. This criteria is comparable to other generation resources applicable to NERC reliability standards and would eliminate the need for Distribution Providers to consider every residential solar PV installation.

Comment	

It is the opinion of ACES that the currently proposed definition of DER is inherently flawed and rife with ambiguity.

Firstly, we take great issue with the phrase “Distribution Provider refers to the NERC glossary definition, rather than an entity meeting the NERC registration criteria.” We believe that the term Distribution Provider (DP) is a well-defined term in widespread use throughout the industry and is universally understood to refer to a NERC registered entity. Using this term in such a unique manner as is done in the proposed DER definition will only create confusion and cause consternation for registered entities. This is further compounded by the stark contrast between the currently proposed draft 3 of MOD-032-2 and the updated Technical Rationale. The 1st paragraph on page 1 of the Technical Rationale states (emphasis added):

“It is recognized that some distribution facilities do not have an associated DP that meets the NERC registration criteria, but it should be clear that compliance obligations can only be imposed on NERC-registered entities listed in the Applicability Section; use of the DP term within proposed Reliability Standard MOD-032-2 should be understood to refer to an entity meeting the NERC registration criteria, unless otherwise specified.”

It is our understanding that the intent of the Technical Rationale is to support and provide additional clarification and context for the enumerated requirements within a given Reliability Standard. If the Technical Rationale blatantly contradicts rather than bolsters the Reliability Standard that is intended to support, then in our opinion, the Technical Rationale fails to fulfill its intended purpose.

Moreover, the term DP is used throughout the NERC Rules of Procedure for describing an entity that meets NERC registration criteria.

Page 1 of Appendix 2 to the Rules of Procedure states:

“For purposes of the NERC Rules of Procedure, including all Appendices, the terms defined in this Appendix shall have the meanings set forth herein.”

Page 2 of Appendix 2 states:

““Distribution Provider” means the entity that provides and operates the “wires” between the transmission system and the end-use customer. For those end-use customers who are served at transmission voltages, the Transmission Owner also serves as the Distribution Provider. Thus, the Distribution Provider is not defined by a specific voltage, but rather as performing the distribution function at any voltage.**”

As evidenced above, the NERC Rules of Procedure clearly uses the same definition to refer to a DP as is used in the Glossary of Terms. In fact, this explicitly stated within Appendix 2.

Page 1 of Appendix 2 states:

“Definitions of terms in this Appendix that are marked with asterisks (**) are taken from the NERC Glossary of Terms Used in Reliability Standards.”

Furthermore, page 1 of Appendix 5A to the NERC Rules of Procedure contains a chart identifying entities that must register. Please see the screenshot included as an attachment for reference (emphasis added):

Secondly, ACES and its Members have additional concerns with the proposed DER definition surrounding the phrase “including those connected behind the meter of an end use customer”. It is the opinion of ACES that by including the aforementioned phrase, the DT has created a situation wherein both Registered Entities and unregistered entities will now have compliance obligations under the purview of MOD-032-1. If our interpretation is correct then, in our opinion, this represents a gross overreach of NERC’s statutory authority. We believe this concern is best expressed in the 2nd paragraph on page 1 of the Technical Rationale which states (emphasis added):

“The Drafting Team (DT) has concerns that there may be challenges in collecting data for distributed energy resources (DER) connected to unregistered entities.”

Conversely, if the intent of this phrase is to require the NERC Registered Entity to collect data from non-registered entities, then doing so creates an insurmountable compliance burden and immeasurably increases the compliance risk for said NERC Registered Entity. In short, by what mechanism is the NERC Registered Entity able to require unregistered entities to provide data?

Additionally, what recourse does the NERC Registered Entity have if the unregistered entity is either unable or unwilling to provide said data at all or is unable or unwilling to do so in a timely manner to meet compliance deadlines? It is apparent that the DT shares our concerns as these very issues are enumerated within paragraph 2 on page 1 of the Technical Rationale which states:

“…this may place an unreasonable compliance risk on the TO/DP because any unregistered entities that connect DER to their systems have no compliance obligation to provide data to the TO/DP. As such, the DT recommends that NERC consider a range of options that could include expanding DP registration criteria or registering DER-only DPs to reduce or eliminate this potential DER data collection gap.”

Thus, we recommend modifying the DER definition as follows:

Distributed Energy Resource (DER)

Generators and energy storage technologies connected to the Distribution Provider’s system that are capable of providing Real Power and/or Reactive Power in non-isolated parallel operation with the Bulk-Power System.

Providing the DP/TO/TP the authority to determine the appropriate levels of DER that would be impactful, or material, would ensure the needed flexibility and agility for systems with either large or small populations where one size does not fit all. • It is preferable to state a DER is designed to export Real Power to the DP's system, rather than "provides Real Power in non-isolated parallel operation with the Bulk Power System". Many DER installations are designed to provide power to a specific end-user with the ability to provide any excess power to the DP system. • The models provided to the PC/TP may be either specific to a DER unit (for larger installations) or utilize the NERC generic DER model, when small DER units are aggregated.

We recommend that a separate definition for Aggregate DER be developed. A distinction between individual units with compliance requirements and the representation of multiple units into an aggregate with differing compliance requirements will add clarity to what is expected in MOD-032 and TPL-001.

Concepts needed to improve the standard:

Providing the DP with the authority to determine what DERs are impactful will ensure flexibility and agility for large population standards where one size does not fit all.

Example Footnote 4 Revisions: For purposes of this item, the Distribution Provider to which **aggregated** DERs **is are** connected **is shall be for reporting responsible for providing aggregated DER composite model[s] using its sole engineering judgement based on criteria determined by the DP in conjunction with the TO/TP that contains generalized characteristics of the type of DERs identified by DER type under 9c DERs data, generally through coordination with to** the Transmission Owner**,**. **in accordance with PC/TP modeling data requirements and data reporting procedures developed under Requirement R1. The PC or TP may need to coordinate with the DP or TO to determine appropriate equivalent distribution system impedance.**

Clarify behind the meter DERs aren't may not necessary (and may not be feasible to monitor) unless in continuous parallel and designed to export power to the BPS.

Consider replacing "non-isolated parallel" with "continuous parallel" that can export real power to the BPS.

Consider modifying the DER definition with:

Generators and energy storage technologies connected to **the a** Distribution Provider's system **and designed to export Real Power in continuous parallel to the BPS.**

, including those connected behind the meter of an end use customer, that are capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System.

Distribution Provider refers to the NERC glossary definition, rather than an entity meeting the NERC registration criteria.

Clarify unregistered entities are not included in MOD-032 DERs.

Comment	

The potential size of the TO and DP data collection processes and methods could be immense and costly. Without clear boundaries DERs are potentially unbounded and could reach well into the distribution. NERC has suggested that data collection for residential rooftop systems down to 1.5 kVA are potentially within scope. Mandating data collection of such systems transfers the compliance burden to the DP versus NERC which is costly and inappropriate.

Providing the DP, in conjunction the TO/TP, have the latitude to set the criteria as necessary to ensure impactful DERs are properly captured.

The expansion of the generation data collection requirements to include small-scale generation adds a burden to the utilities and is in conflict with the Michigan State policy. The current interconnection process for generation connected to the distribution system is well-established, and the collection of UFLS/ULVS load-shedding and dynamic data from these generators will require a significant change for future interconnections – information that is generally not available to homeowners from their installers. For those who already have connection agreements, some dating back over 50 years, there is no means to re-collect this data. This solution is not likely to be cost effective given the uncertainty around the tools and information gathering necessary to collect the data on legacy generators in order to maintain compliance, and whether compliance is truly possible even with heavy investment. The standard would be better written to define parameters around the size of the unit, its connection, and its anticipated substantial impact on the BES as to whether such data collection is necessary.

If the aggregating of generation data to a single unit within the model data is acceptable, then that should be explicitly stated in a footnote along with what NERC accepted dynamic models may be used. In order to implement the DER definition within the scope of the implementation plan, Distribution Providers absolutely must have clarity on the technical scope of what modeling data will be required prior to implementation. If left to the Balancing Authority/TPs/etc. to discuss and determine the acceptable scope of model data and software requirements, data collection for the Distribution Providers and others responsible for compiling this data will not be left with enough time to meet the standard requirements.

Some DER entities connected to the DP system over 30 years ago and are still operating today. The data for these units may not be readily available and could be very costly to obtain. Additionally, even with good intentions, some DER may be missed when trying to identify and aggregate all DER. Since no provision has been provided to not be held liable if either of these is true, an allowance should be provided if the DP made a good faith effort to obtain all of the records.

The MOD-032 Standard should include the language from the Technical Rationale recognizing that there are situations where this data is unavailable and should instead be estimated and the limitations of data availability should be documented. In order to emphasize that a PC does not need to perform unreasonable effort to obtain data that is unavailable, Tacoma Power recommends adding this sentence from the Technical Rationale into the	

Measure for R4: “If this data is unavailable, then Planning Coordinator will work with DP and be able to use either estimated or default data and should provide evidence documenting the limitations of the data availability and the justification for the estimations used in the model”.

Comment

We at ACES have an ongoing concern regarding the burden this will place upon the DP by requiring DPs to collect data for any DER connected to the DP’s system. The proposed draft establishes a zero MVA threshold for the collection of DER data for all resources "in non-isolated parallel operation with the Bulk Power System”. Per the Technical Rationale, this includes every residential solar and commercial rooftop solar customer on the DP’s systems.

Furthermore, as written, the proposed MOD-032-1 standard would include every electric vehicle (EV) that is capable of providing power to the BPS. Is the DP now expected to collect information from residential customers whenever said customer buys an EV? This is further compounded by the fact that every manufacturer of EVs has the freedom and flexibility to design their vehicles to meet their own independent specifications. Please consider the following hypothetical scenario:

An end-use residential customer buys a Tesla and has it connected to the grid. In an effort to reduce their electric bill, the customer connects their EV and enables it to discharge the battery during periods of high electrical demand. The end-use residential customer then decides to upgrade their vehicle and now buys a Ford F-150 Lightening. The F-150 potentially has a vastly different power output and battery discharge curve from the Tesla the customer previously owned. How is the DP expected to be able to provide accurate modeling data in such a scenario? Is the DP expected to require the end-use customer to get approval prior to buying a new vehicle?

In short, the lack of an MVA threshold for these resources goes beyond **any** previous precedent for a NERC Reliability Standard and places an unreasonable compliance burden on the DP.

Additionally, we are concerned that attempting to collect DER data at such a low level will place a huge strain on the already limited resources of our Members. This is especially compounded by the fact that, at present, DERs owned by end-use residential customers have not been clearly demonstrated to have a material impact on the reliability of the BPS.

In summary, we fear that by not establishing a non-zero MVA threshold, the currently proposed draft of MOD-032-2 may exhaust all available resources to the point that some entities may be forced to choose between compliance with this Reliability Standard or providing reliable electricity to end-use customers.

Therefore, ACES recommends modifying Section 4 Applicability as follows:

4. Applicability:

4.1. Functional Entities:

4.1.1. Balancing Authority

4.1.2. Distribution Provider

4.1.3. Generator Owner

4.1.4. Planning Authority/Planning Coordinator (hereafter referred to as “Planning Coordinator”)

4.1.5. Resource Planner

4.1.6. Transmission Owner

4.1.7. Transmission Planner

4.1.8. Transmission Service Provider

4.2. Facilities

4.2.1. Bulk Electric System (BES) Facilities; and

4.2.2. Non-BES Distributed Energy Resources connected at a voltage of 20 kV or above with:

4.2.2.1. Gross individual nameplate rating greater than 10 MVA. Or,

4.2.2.2. Gross facility aggregate nameplate rating greater than 10 MVA.

CEHE does not support the changes made to MOD-032-1 because we believe that the cost to gather and report the level of data being proposed will far exceed the reliability benefit that will be provided through these modeling enhancements. Also, the addition of behind the meter generation to the DER Definition will add cost and burden on us due to the scope of data that is required to be collected from individual households within the DPs footprint.

AES Clean Energy agrees with and supports MRO NSRF comments that the DER definition should have thresholds that havebased on material impact to the reliability of the BPS. The aggregate 20 MVA of real power generation and aggregated to a Point of Interconnection of 60 kV and greater should be used for DER to align with the newly introduced Category 2 definition by NERC.. DER definitions without bounds could result in unintended consequences.

{C} {C}{C}These unintended consequences will include size and cost of data collection process and methods which cannot be cannot be fully comprehended without clear boundaries and thresholds for the DER definition. DPs that are required to submit this datamodeling data for DER resources could potentially have to spend a lot of time and resources in gathering the data from the DER owners.

Comment

A large point of concern in previous draft comments has been related to the draft MOD-032-2's inappropriately placing reporting obligations and compliance responsibility on the Transmission Owner ("TO"). In the original draft of MOD-032-2, the standard was explicit that DER data is the responsibility of the TO when a DER is not associated with a NERC registered DP. Because unregistered entities have no obligation to provide this data to the TO, the current draft MOD-032-2 is essentially setting the TO up for non-compliance because the TO will have no ability to force the unregistered entities to provide the needed data.

- In the current draft, the drafting team has acknowledged this issue and clarified in its comments, the technical justification, and the standard to try to alleviate industry concerns.
- While the current draft of MOD-032-2 now explicitly states that the responsibility for reporting DER data is with the DP connected to the DER, there is also a note that this reporting will be accomplished "generally through coordination with the Transmission Owner."
    - Oncor's concern is whether a "failure of coordination" between the DP and TO could result in a shared violation of data reporting requirements?
    - If the answer is "yes," then Oncor has the following question: What constitutes a "failure of coordination"?
        - This concern further reinforces the need to clarify the definition of DP used throughout the standard, as it stands to reason that a "failure of coordination" is more likely with an unregistered DP that is not compelled to coordinate to supply DER data.
    - If the answer is "no," then the phrase "generally through coordination with the Transmission Owner" should be removed to alleviate this concern. The updated phrasing is still accurate but more concise: "For purposes of this item, the Distribution Provider to which DER is connected is responsible for reporting DER data in accordance with PC/TP modeling data requirements and data reporting procedures developed under Requirement R1."

As written, we feel unclear on the Dynamic Aggregate Distributed Energy Resource date criteria #10. FirstEnergy suggest that the word “including” be replaced with “limited to” - to clarify definition of Dynamic Aggregation DER data requested. Criteria #10 would read: Aggregate Distributed Energy Resource (DER) data **limited to** whether DER is subject to tripping in conjunction with UFLS and/or UVLS4.

SMECO agrees with ACES comments: We are not clear on what the SDT is trying to say in the following: From Section 4 of Attachment 2: Section 3.1.4: documentation showing the ability to protect user authentication information for user-initiated electronic access applicable to Section 3.1.3 while in transit between the Cyber System outside the asset containing low impact BCS or SCI that supports a low impact BCS and • The asset containing low impact BCS or SCI that supports a low impact BCS, It seems that the bullet is an exact duplicate of the body of the explanation above the bullet? Is the SDT trying to cover communications between two (2) different LIBCS with this statement?

The addition of behind the meter generation to the DER Definition prevents this standard from being complied with in a cost-effective manner due to the scope of data that is required to be collected from individual households within the DPs footprint. Removing behind the meter generation from DER definition would reduce the scope of work required to comply with standard to something that is more cost effective.

[Response is neither Yes nor No]	

It is recognized that Requirement R1 and the revised Attachment 1 are intended to provide the PC/TP flexibility in developing data requirements and reporting procedures that align with local practices and needs, so long as they include the items listed in the Requirement R1 Parts. However, the cost effectiveness of the proposed standard modifications cannot be determined until the steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the new DER requirements are actually developed. It is anticipated that significant changes to certain load forecasting practices will be required, as well as development of new/expanded processes to be able to forecast DER and translate DER data into power flow, dynamics and short circuit models. There may be significant costs / uplift borne by PCs, TPs and TOs/DPs to accomplish all of this.

3. Given the explanation added in the Implementation Plan and in response to industry comments, do you agree with the Implementation Plan for proposed Reliability Standard MOD-032-2?

Srikanth Chennupati - Entergy - 1,3,5,6 - SERC

Answer	No
Document Name	

Comment

Due to the scope of work created by the requirement to include behind the meter generation in the data submittal it would not be possible for many DPs to complete this work in12 months as required for R2, R3, R4.

No, we do not feel that it is ample time to be able to comply with MOD-032-2 within 12 months of the approval of the Standard due to the TP and PC may not have the new data requirements indentified by the effective date of the Standard, therefore DPs may not have ample time to gather all the data for the DERs that are connected to their systems.

The added text (indented below) under the section titled “General Considerations” is unenforceable.

Transmission Owners (TOs)s and DPs would be expected to participate in PC/TP processes to change data reporting requirements related to DER developed during the 24 months prior to the effective date of Requirement R1 and should be able to start working on data collection processes and methods more than 12 months prior to the effective dates of Requirements R2, R3, and R4. In summary, this would give a full 36 months from FERC approval until data is required to be reported.

In reference to the first part of the first sentence - while the TOs and DPs COULD participate in the PC/TP process, they cannot be “expected to” as there is no requirement for them to do so until the standard is enforceable. Similarly, in the second part of the first sentence, they COULD be able to start working on data collection, but they are not required to do so. As such, the 36-month timeframe referred to in the second sentence is not truly correct and gives the perception of more time for implementation than is real.

As such, the implementation timeframe of 12 months after the effective date is too short and should be extended to at least 24 calendar months.

The MRO NSRF remains concerned the expectations contained in MOD-032-2 (Attachment 1) regarding what Distribution Providers (DPs) can provide goes beyond what is currently possible for most DPs. Specifically, the language in Attachment 1 (Item 9) does not align with what DPs can provide regarding the DER resources connected to their system. In most cases, DPs do not monitor those resources in real-time and most would need to deploy extensive upgrades to their system before they could provide the detailed information, even in aggregate, for DER performance (i.e., ride-through, voltage control and frequency control). While this will be possible in the future once Advanced Distribution Management Systems (ADMS) and Distributed Energy Resource Management Systems (DERMS) are more broadly deployed, such details may be impossible to provide for most DPs at this time.

The proposed implementation plan may not be sufficient for the DP to provide all of the items identified in Attachment 1. Additionally, the information required in Attachment 1 Item 9d may not be available to the DPs based on the DPs/States requirements for data from DER entities to connect to the DP system. This item should include either a footnote or provision of - if available.	

Additionally, the requirement for DPs to determine and provide the appropriate equivalent distribution system impedance should be removed from Footnote 4. The method for locating the DER data should be left to the TO/DP so that the addition of DER data does not cause solution issues for the model.

Tacoma Power concurs with the Implementation Plan change to allow 24-months for implementation of MOD-032-2. However, Tacoma Power is concerned that 24-months will not be sufficient to collect the data necessary for all DER resources. Specifically, with the change in the DER definition to include behind-the-meter data and the additional clarification from the SDT that the threshold for data collection is zero (essentially all DER), Tacoma Power recommends that additional time is needed for entities to determine how to collect this data. As other commenters have noted, data will need to be collected from entities which may or may not have the monitoring capabilities installed in their systems to capture this data. Coordination with these entities to determine responsibility for the monitoring equipment and then purchasing/installation of this equipment will take longer than 24 months.

To address this concern, Tacoma Power recommends developing a phased-in implementation plan based on modeling thresholds. For example, within 24-months of the effective date of the Standard, provide DER data for aggregate 1 MW generation, and then a 36 month phased-in implementation plan for no threshold / all DER data. This longer phased-in implementation for all DER data would allow entities to sufficiently revise procedures for coordination with other entities while also expanding the modeling and monitoring capabilities.

Proposed revisions to Implementation Plan:

Entities shall not be required to comply with Requirements R2, R3, and R4 relating to revised PC/TP data requirements and reporting procedures developed under MOD-032-2 Requirement R1 and Attachment 1 based on the following thresholds:

- until 12 months after the effective date of Reliability Standard MOD-032-2 for aggregate DERs at bus greater than or equal to 1 MW real power generation,
- until 36 months after the effective date of Reliability Standard MOD-032-2 for the remaining DERs connected to the BPS, regardless of real power generation.

Comment	

Tacoma Power supports adequate modeling of DER. However, we are concerned the current proposal could actually result in less detailed transient study. Detailed dynamic models such as the composite load model for aggregate load are only used when the aggregate load exceeds 1-5 MW. Below this threshold, a static rather than a dynamic model is used.

Typically the level of aggregation for load and distribution generation is different than the point at which UFLS relays are placed on the actual power grid. For example, inside the WECC base case load/gen is typically listed at the high voltage side of a substation transformer. The substation transformer and distribution circuits are included by turning on composite load model. However, UFLS relays are often physically placed on individual distribution circuits and modeled as tripping a certain percentage of overall substation load. Under the proposed revisions, the highest level of load/gen aggregation that could occur would be at the location where the UFLS relay is physically installed. At a typical substation this could result in numerous loads that are too small to use the composite load model.

An additional concern with numerical simulations is many load buses in the WECC system are likely to have at least 6 different DER characteristics (e.g. IEEE-1547 2003, IEEE 1547a-2014, IEEE 1547-2018, IEEE 1547-2018 with Utility specific settings, distributed Hydro, other). Even when the aggregate DER at a bus exceeds 1.0 MW, many of the categories will have much less than 1 MW of each DER characteristic. For many of Tacoma Power's substation load models, there will be a single residential customer with less than 0.010 MW of solar generation with pre-2014 vintage inverters. We question whether attempting to include such small values into a transient simulation will actually provide a more realistic result.

Additionally, we should consider how this requirement may influence where utilities choose to place UFLS relays. In general, placing UFLS relays on distribution circuits rather than substation or transmission lines provides greater flexibility for avoiding undesired tripping of distributed generation or of equipment serving critical natural gas infrastructure. Rather than focusing on including both UFLS and DER into the MOD-032 data template, Tacoma

Power would prefer modifications to PRC-006 directing UFLS entities to consider the impacts of DER on UFLS locations. This would be similar to the requirement in EOP-011-4 to manage overlap between operator controlled load shedding and automatic load shedding.

· At the moment, it is not entirely clear what performance related requirements are intended to be addressed under the “Dynamics” column for Aggregated DER resources. If all that is sought is what is specifically listed (i.e. whether DER is subject to tripping in conjunction with UFLS and/or UVLS), then we can accept. However the inclusion of the word “including” in the preceding phrase leaves the requirement wide open to interpretation, potentially seeking more details that could pose undue challenges to manage. It would be helpful to clarify this further, in particular to identify what performance measures or operational needs the “Dynamics” data is intended to address. · In addition to the above, consideration may be appropriate for exclusions, allowing grandfathering of existing projects and establishing capacity thresholds for DERs to exempt less impactful smaller projects (e.g. exempt < 100 kW?).

Answer	
Document Name	
Comment	

MOD-032 provides adequate clarity regarding DER modeling thresholds – Members of the SRC are aware of industry concerns that the currently proposed MOD-032 language could be construed to require modeling of individual DERs, regardless of size or impact to the BES. However, the SRC's understanding is that MOD-032 allows PCs and TPs to determine what degree of modeling granularity is needed as part of the modeling data requirements and reporting procedures that they jointly develop under Requirement R1.

The SRC's understanding is based on the language in Requirement R1 and on the structure of Attachment 1. More specifically, the drafting team's proposed structure for **Attachment 1, column 1, "steady state" item 9 Aggregate DER data** is similar to the existing structure used for **Attachment 1, column 1, "steady state" item 2 Aggregate Demand** (both items list a type of aggregate data, with subitems specifying more particular types of data). In addition, footnote 4 in Attachment 1 clarifies that the modeling data requirements and reporting procedures that are jointly developed under Requirement R1 will specify the required level of aggregation. To help alleviate industry concerns, the SRC requests that the drafting team clarify whether the SRC's understanding of this topic is correct.

Need to reinstate the Transmission Owner (TO) function – The TO has been removed from the modeling equation, yet there are times when there is no registered Distribution Provider (DP) and the Transmission Planner (TP) will still need to coordinate with the TO to obtain DER information. From a compliance perspective, there is a need to balance the responsibilities on both parties by requiring the TO to provide accurate and comprehensive DER data to the TP when there is no registered DP as illustrated below:

steady-state 2. Aggregate Demand [DP, TO]

steady-state 9. Aggregate Distributed Energy Resource (DER) data [DP, TO]

dynamics 5. Aggregate Demand [DP, TO]

In addition to supporting the IRC SRC comments, PJM understands and agrees with the proposed definition of a DER. However, we have concerns with the applicability of MOD-032 and DERs being defined (requesting additional clarification). For example, it would be beneficial to specify whether MOD-032 applies only to DER aggregations that are ≥20 MW with export capability to the Bulk Electric System (BES) or those that are 20 MW connected to 69 kV or above.

Comment
The proposed changes require entities to model aggregate DERs at substation buses. There needs to be a guideline or clarification on how to select a dynamic model for the aggregate DERs. Due to variety of devices on the system, the aggregate DERs would require entities to make assumptions on dynamic model parameters. Additionally, dynamic data may not be available for all equipment. What level of assumptions are reasonable and ensure the requirements of the standards are not violated? One entity’s assumptions may be different than other.

Recommend this project be delayed and work in tandem with Project 2024-01 ROP changes and / or put on hold until the ROP changes are made. Otherwise, industry is being asked to approve unbounded definitions with impacts that cannot be quantified.

The MRO NSRF does not agree with the language contained in Item 9 of Attachment 1 because most DPs do not have detailed information on the aggregated output of DERs on their systems. While it is possible to supply information on the aggregated capability of those resources and the aggregated types (i.e., solar, battery, diesel generator, etc.) they do not have real time monitoring of those facilities or have the ability to provide aggregated models that might approximate what is possible to supply for BPS connected IBRs. To address our concerns, we offer the following changes to Item 9 and Footnotes 2 and 4 under Attachment 1.

9. Aggregate Distributed Energy Resource (DER) data [DP]

a. Location (bus from item 1)

b. Cumulative Real power capability name plate capacity

c. Percentage of DER by type (solar, battery, diesel generator, etc.)

d. DER capabilities related to ridethrough, voltage control and/or frequency control or information that can be used to infer those capabilities for modeling purposes.

Footnote 2:

2. Aggregate Demand [DP]

a. Cumulative real and reactive power

b. Percentage of in-service status

The MRO NSRF supports the use of generic, aggregate DER models for analyzing the impact of “small” DERs as we believe this is adequate to reliably approximate and model the impact of “small” DERs. Even if the DP was able to provide discrete information concerning every DER on its system, it is unlikely their PC or TP would be able to use it in its planning model.

Therefore, the need for individual DER models should be reserved for “large” DERs as specified in the Planning Coordinator’s jointly developed (with its TPs) steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for their area.

Requirement R1 allows each TP to define what level of granularity is needed to reliably model DERs in its TP area. To obtain industry consensus, it would be helpful for the SDT to clarify and emphasize this as industry remains concerned that the language is open to interpretation.

To that end, the MRO NSRF recommends NERC host a Technical Conference like the one recently held in Washington DC to advance PRC-029 (generator ride-through for IBRs). More conversation is needed to obtain a meeting of industry minds. Once there is agreement as to what data is

needed to adequately model DERs, it will be easier for the SDT to propose draft language that reflects that common vision. In the absence of that, industry may continue to talk past each other and make little progress.

An existing framework that may serve as a model is that used for low impact BES Cyber Assets. While BES Cyber Assets are defined as assets that "would affect the reliable operation of the Bulk Electric System," they are not part of the BES itself. If "small (low impact) DERs are intended to be viewed the same way, it may be worthwhile to look at the compliance framework for "low impact" BES Cyber Assets and see whether and how some of these principles may be applied in designing a compliance framework for low impact DERs, particularly the absence of a requirement to maintain a discrete list of low impact cyber assets.

Attachment 1: Data Reporting Requirements

While Attachment 1, column 1, "steady-state," items 9b, 9c and 9d clearly fall under "Aggregate DER data," the proposed language could be interpreted as requiring explicit information for each individual DER. Therefore, the SRC requests the SDT clarify that the information being requested is to be provided at the aggregate level to avoid alternate interpretations. Sample language below:

b. Cumulative Real power capability

c. Percentage of DERs by type (solar, battery, diesel generator, etc.)

d. Cumulative DER capabilities related to ride-through, voltage control and/or frequency control or information that can be used to infer those capabilities for modeling purposes.

Likewise, while Attachment 1, footnote #2 clearly states that, "For purposes of this item [i.e., item 2], aggregate Demand is the gross Demand aggregated at each bus," the proposed language could be interpreted as requiring explicit information for each individual DER. Therefore, the SRC requests the SDT clarify that the information being requested is to be provided at the aggregate level to avoid alternate interpretations. Sample language below:

2. Aggregate Demand [DP]

a. Cumulative real and cumulative reactive power*

b. Percentage of in-service status*

Comment
WECC suggests changes to Requirement R4 to be consistent with other Standards (and Projects currently underway) by replacing “Electric Reliability Organization or its designee” with “Compliance Enforcement Authority (CEA)”. M4 and the VSLs would need adjustments as well if adopted. In Attachment 1- WECC suggests capitalizing “interconnection-wide” in first use in second sentence. Is there a “bus number, name, and/or identifier” for DER? If so, does the DP and TO “assign” or are they assigned by the TP and PC? There are several instances of terms being capitalized in the Attachment 1 listing of data reporting requirements that should not be capitalized as they are not defined. And other terms that are defined need capitalized (e.g. Real Power). “Ride-through” was recently defined in Order 901 efforts. Is the intent of the DT to use that definition? If not, what does term that mean? What does Aggregate DER mean versus DER? How would one define the bus number/name or aggregate?

Comment

EEI appreciates the changes made to Attachment 1 since the prior draft of this standard, however, what is contained in Attachment 1 still does not reflect what most DPs can provide at this time. We further note that even the Reliability Guideline titled DER Data Collection and Model Verification of Aggregate DER notes that DER interconnections generally do not contain requirements that include “high and low time-resolution data collection”, the guideline further notes that such change will take considerable time to implement and will require state regulator directives to accomplish given these resources fall outside of NERC’s jurisdiction. It is also important to recognize that existing resources, already interconnected to the distribution system, may never be able or otherwise obligated to provide the level of data and modeling envisioned.

EEI further notes that the above referenced guideline additionally recommends that TOs and DPs install expanded monitoring equipment that currently doesn’t exist; making compliance at the level envisioned not possible at this time. Moreover, DPs do not monitor these resources in real-time and most would need to deploy extensive upgrades to their system before they could provide the detailed information envisioned under MOD-032-2 Draft 3. Expectations that DPs will be capable of providing aggregate DER models that yield accurate disturbance ride through (i.e., ride-through, voltage control and frequency control) is impractical and goes beyond what is contained in FERC Order 901. Nevertheless, in the future after DPs have installed Advanced Distribution Management Systems (ADMS) and Distributed Energy Resource Management Systems (DERMS) broadly, such details will be possible to provide but such requirements are impractical at this time.

To address our concerns, we suggest the following edits in boldface below:

Attachment 1; Item 1

EEI does not agree with the language contained in Item 9 of Attachment 1 because most DPs do not have detailed information on the aggregated output of DERs in line with the requirements in the subparts of this item. While it is possible to supply information on the reported aggregated Name Plate Capacity of the DER resources and identify those aggregated resources by type (i.e., solar, battery, diesel generator, etc.), DPs do not have real time monitoring of those facilities or have the ability to provide aggregated models that will accurately define performance during BPS system disturbances. Moreover, DPs are not DER owners, and therefore do not have models for DER resources. It is also important to note that DPs generally do not conduct EMT studies on DER interconnections or require such models be provided as a condition of interconnection. To address our concerns, we offer the following changes (in boldface) to Item 9 of Attachment 1 below to better define what DP can provide:

9. Aggregate Distributed Energy Resource (DER) data [DP]

a. Location (bus from item 1)

b. Reported Aggregate Name Plate Capacity as provided to the Distribution Provider during the Interconnection Process. Note: *Resources that are not in continuous parallel operation are not included in the aggregate models provided. (e.g.: EVs (vehicle to grid operation), backup generation for non-grid purposes, etc.)*

c. Reported Aggregate Name Plate Capacity by DER type (solar, battery, diesel generator, etc.)

d. Aggregated composite DER models that approximate the performance of aggregated DERs on their system.

Footnote 4:

For purposes of this item, the Distribution Provider to which **aggregated** DERs **are** connected **shall be responsible for providing aggregated DER composite model[s] using engineering judgement that contains generalized characteristics of the type of DERs identified by DER type under 9c to** the Transmission Owner.

Proposed New Footnote 5 to address the limitation TOs and DPs often have regarding detailed data for IBR and DER resources they do not own or have the regulatory authority to collect (for Item 10 Steady State column and Item 11 Dynamics column and Item 3 Short Circuit column)

For purposes of this item, Transmission Owners and Distribution Providers are limited in the information that they can provide to Planning Coordinators and Transmission Planners for modeling purposes. This includes but is not limited to models of individual unregistered IBR and DER resources they do not own or have the regulatory authority to collect.

Comment

The standard as written **places an unsustainable compliance burden** on TPs, TOs, TOPs and DPs. The standard does not address the challenges a NERC registered entity (TP/TO/DP) will experience with collecting DER data from behind the meter facilities connected to us as DPs or TOs. CEHE supports EEI's comments that the modifications made to MOD-32-1 continue to obligate DPs to provide detailed data that exceeds their ability to obtain. Unregistered DER owners have no obligation or requirement under NERC standards to provide data for modeling. Requiring DPs to provide modeling data for equipment TPs/DPs do not own and have no means of acquiring data will leave TP/DPs in a position where we may fail to comply with the standard through no fault of our own despite our best efforts. CEHE supports EEI's comments concerning DPs not having the capability to monitor DER performance such as voltage ride through, voltage control, and/or frequency control information that can be used to infer those capabilities for modeling purposes. CEHE also supports EEI's proposed changes to item 9 and footnote 4 modifications under Attachment 1.

It is recognized that Requirement R1 and the revised Attachment 1 are intended to provide the PC/TP flexibility in developing data requirements and reporting procedures that align with local practices and needs, so long as they include the items listed in the Requirement R1 Parts. However, from a compliance perspective, how to satisfy the modeling requirements identified in MOD-032-2 Attachment 1, Steady State column item #9, part “C” (DER type (solar, battery, diesel generator, etc.)) is not entirely clear. This requirement needs be more clearly defined (either in the standard or in the Technical Rationale) so that entities can have confidence that their data requirements established to meet Requirement #1 are sufficient. Question for the SDT: is the expectation that compliance with Attachment 1, Steady State column item #9, part C could be satisfied with specific / discrete modeling or itemization of DER types within simulation models (i.e., several DER generator types added to each bus), an aggregate “composite of DER types” at each bus, or would documentation outside of the simulation models be acceptable? Or, would any of the above alternatives be acceptable from a compliance perspective? We did not identify any additional clarity offered on MOD-032-2 Attachment 1, Steady State column item #9, part C in the Technical Rationale document. One recommendation would be to expand on this item within the Technical Rationale to ensure clarity for compliance purposes. We identify the same concern above for MOD-032-2 Attachment 1, Dynamics column item #10 (Aggregate Distributed Energy Resource (DER) data including whether DER is subject to tripping in conjunction with UFLS and/or UVLS). This requirement needs be more clearly defined (either in the standard or in the Technical Rationale) so that entities can have confidence that their data requirements established to meet Requirement #1 are sufficient. For example, would documentation outside of the simulation models be sufficient to demonstrate “whether DER is subject to tripping in conjunction with UFLS and/or UVLS”?

Comment
The various requirements in Table 1 all give the applicable functions for the requirements, e.g. TO, RP, GO, etc. However, all the designations have been removed for the new requirement 10 under the “dynamics” column in the “redline” version. Note that the DP designation shows up in the “clean” version but is shown as deleted in the “redline” version. In the Technical Rationale document in the section titled “Rationale for Applicability Section,” we appreciate the DT’s recognition of the industry’s concerns over unregistered entities having no compliance obligation to provide data to the TO/DP. However, the requirements are being left in place and the concern is basically being ignored because “the process to modify NERC registry criteria and register new entities is beyond the scope of Project 2022-02 and would unnecessarily delay the implementation of DER data requirements.” This is basically a cop-out by the DT. While it is understood, and agreed, that modifying NERC registry criteria and registering new entities is beyond the scope of Project 2022-02, the DT should not be moving forward with attempting to place requirements on the industry that may not be implementable. If modifying NERC registry criteria and registering new entities is required to implement the new requirements, then the DT should notify NERC that they cannot move forward until this is done. Otherwise, the industry is being placed in a “no-win” situation in that they have requirements being enforced that they cannot meet. Remove the sub bullet related to the Distribution Provider. Like the response for question 1, removing the words “connected to the Distribution Provider’s system” doesn’t affect the definition and removes the confusion. If you are trying to use this to say it includes sub-transmission voltages, just say that; including DP language makes it difficult to figure out the intent.

Referencing Footnote 4, the SDT's newly added content in the Technical Rationale states "previous references to data collection efforts or passing through data by the DP/TO from these unregistered entities was removed from the standard language as it could add compliance risk on the DP/TO without any compliance obligation on the unregistered entities." Despite this acknowledgement, the SDT goes on to state "there is great value in moving forward with the standard with the registered DP as the responsible entity for DER data as this will vastly improve the amount of data that is available to the TP/PC." The Technical Rationale further states "where an unregistered DP (an entity not meeting the NERC registration criteria) is interconnected to the system of a registered entity (DP or TO), the DP/TO should coordinate with the unregistered DP to ensure the availability of information associated with DER that may be connected to the unregistered DP's system" and that "this effort would be considered as a best practice, even if not specifically required by the MOD-032." By taking these passages in their entirety, the Technical Rationale not only considers these efforts as a best practice, but also expects that they be executed, which is essentially an obligation of inference. Simply put, there are expectations set in the Technical Rationale which are not established within the obligations, and that is type of compliance risk that goes beyond the acknowledgement made within the Technical Rationale. In addition, AEP does not believe that "best practices", well-meaning as they may be, should be included in a Technical Rationale. Rather, they should be provided in Reliability Guidelines as "recommended practices."

AEP continues to believe that the best path forward for this proposed standard would be for those entities providing DER data to be registered as Functional Entities. As is the case in existing standards where Generator Owners are obligated to provide similar data, entities who possess the needed DER data noted in the Attachment One revisions should likewise be registered and explicitly obligated to provide this data as well. While we are unsure if the existing Functional Entities classes are themselves sufficient, or if instead, a new class of Functional Entities might need to be considered and developed, the need nonetheless exists. NERC may wish to also consider the potential that such obligations could potentially cross Federal and State jurisdictional lines of responsibility, further illustrating the complexity-of and challenges-in developing obligations to obtain the DER data in the revised Attachment One.

FE supports EEI comments and edits made to Attachment 1 Criteria #9 steady-state entry which states: 9. Aggregate Distributed Energy Resource (DER) data [DP] a. Location (bus from item 1) b. Reported Aggregate Name Plate Capacity as provided to the Distribution Provider during the Interconnection Process. Note: Resources that are not in continuous parallel operation are not included in the aggregate models provided. (e.g.: EVs (vehicle to grid operation), backup generation for non-grid purposes, etc.) c. Reported Aggregate Name Plate Capacity by DER type (solar, battery, diesel generator, etc.) d. Aggregated composite DER models that approximate the performance of aggregated DERs on their system.

BPA would like to remind NERC that there is currently a data collection gap for entities that are not registered, as they are not required to submit data to their Distribution Provider or Transmission Owner. BPA suggests that NERC create a new registration type or other means to address the gap.

1) For MOD-032-2, the “Aggregate Distributed Energy Resource (DER) data, including whether DER is subject to tripping in conjunction with UFLS and/or UVLS” in #10 of the “Dynamics” column of attachment 1 should probably be more clearly defined, as to what data is exactly required here? 2) For #1 of the “Short Circuit” column in MOD-032-2 attachment 1, should it also designate the responsibility of this to [DP] in addition to GO, RP, and TO and refer to foot note-4?

Standards Announcement
Project 2022-02 Uniform Modeling Framework for IBR

Additional Ballots and Non-binding Poll Open through October 10, 2024

Now Available

Additional ballots for **Project 2022-02 Uniform Modeling Framework for IBR** and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels are open through **8 p.m. Eastern, Thursday, October 10, 2024** for the following standard and implementation plan:

- MOD-032-2 – Data for Power System Modeling and Analysis
- Implementation Plan

The standard drafting team's considerations of the responses received from the last comment period are reflected in this draft of the standard.

This posting affects Phase I of the project for proposed Reliability Standard MOD-032-2 and does not contemplate the SAR related to FERC Order No. 901; the Milestone 3, Part 1.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Balloting

Members of the ballot pools associated with this project can log in and submit their votes by accessing the Standards Balloting and Commenting System (SBS) here.

Note: Votes cast in previous ballots, will not carry over to additional ballots. It is the responsibility of the registered voter in the ballot pools to place votes again. To ensure a quorum is reached, if you do not want to vote affirmative or negative, cast an abstention.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*

- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will review all responses received during the comment period and determine the next steps of the project.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Laura Anderson (via email) or at 404-782-1870. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project Uniform Modeling Framework for IBR observer list” in the Description Box.

Standards Announcement

Project 2022-02 Uniform Modeling Framework for IBR

Formal Comment Period Open through October 10, 2024

Now Available

A 45-day formal comment period for **Project 2022-02 Uniform Modeling Framework for IBR** is open through **8 p.m. Eastern, Thursday, October 10, 2024** for the following standard and implementation plan:

- MOD-032-2 – Data for Power System Modeling and Analysis
- Implementation Plan

The standard drafting team's considerations of the responses received from the previous comment period are reflected in this draft of the standard.

This posting affects Phase I of the project for proposed Reliability Standard MOD-032-2 and does not contemplate the SAR related to FERC Order No. 901; the Milestone 3, Part 1.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Additional ballots for the standard and implementation plan, as well as the non-binding polls of the associated Violation Risk Factors and Violation Severity Levels will be conducted **October 1-10, 2024.**

For information on the Standards Development Process, refer to the Standard Processes Manual.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standard Authorization Request (SAR)

Complete and submit this form, with attachment(s) to the NERC Help Desk. Upon entering the Captcha, please type in your contact information, and attach the SAR to your ticket. Once submitted, you will receive a confirmation number which you can use to track your request.

The North American Electric Reliability Corporation (NERC) welcomes suggestions to improve the reliability of the bulk power system through improved Reliability Standards.

Requested information			
SAR Title:	Federal Energy Regulatory Commission (FERC) Order No. 901 – Milestone 3, Part 1: Modeling and Data Sharing Requirements		
Date Submitted:	4/29/24 (Revised on October 15, 2024)		
SAR Requester			
Name:	Alex Shattuck, Jamie Calderon, JP Skeath (Revised by 2022-02 DT)		
Organization:	North American Electric Reliability Corporation (NERC)

☒ New Standard	☐ Imminent Action/ Confidential Issue (SPM Section 10)
☒ Revision to Existing Standard	☐ Variance development or revision
☒ Add, Modify or Retire a Glossary Term	☐ Other (Please specify)
☒ Withdraw/retire an Existing Standard	

Justification for this proposed standard development project (Check all that apply to help NERC prioritize development)	
☒ Regulatory Initiation	☒ NERC Standing Committee Identified
☒ Emerging Risk (Reliability Issues Steering Committee) Identified	☐ Enhanced Periodic Review Initiated
☒ Reliability Standard Development Plan	☐ Industry Stakeholder Identified

What is the risk to the Bulk Electric System (What Bulk Electric System (BES) reliability benefit does the proposed project provide?):

This Standards Authorization Request (SAR) is initiated by the North American Electric Reliability Corporation (NERC), with consultation of the Reliability Security Technical Committee, to address directives issued by the Federal Energy Regulatory Commission (FERC) in Order No. 901. FERC issued Order No. 901 on October 19, 2023, which includes directives on new or modified NERC Reliability Standard projects. FERC Order No. 901 addresses a wide spectrum of reliability risks to the grid from the application of inverter-based resources (IBRs), including both utility scale and behind-the-meter or distributed energy resources (DERs).

Within the Order are four milestones that include sets of directives to NERC. In the Order, FERC has directed NERC to propose new or modified standards to mitigate reliability gaps in the current NERC

Requested information

Reliability Standards related to IBRs. Specifically, FERC directed NERC to develop new or modified Reliability Standards to address the following four broad topic areas related to IBRs: (1) data sharing; (2) data and model validation; (3) planning and operational studies; and (4) performance.

In January 2024, NERC filed the initial **Standards Development Work Plan in Response to FERC Order No. 901** (hereafter referred to as the "Work Plan"). A current version of the Work Plan will be maintained here. The Work Plan discusses how NERC will develop Reliability Standards within (Milestones 2-4) to meet FERC's filing deadlines. This SAR addresses Milestone 3 of the Work Plan related to Reliability Standards for modeling and data sharing requirements to establish sufficient IBR model data and parameters to assure accurate representation of IBR performance within the models. Further, collaborative sharing of this information and the utilization of this information throughout the lifecycle of IBRs will also be established.

Milestone 3 of the Work Plan covers the development of data provisioning, parameters, and estimation requirements for IBRs. FERC Order No. 901 directives address three categories of IBR: (1) registered IBR, including sub-Bulk Electric System IBRs to be registered under NERC's revised Compliance Registry criteria; (2) unregistered IBR; and (3) IBR-DER, to distinguish registered bulk connected IBRs from unregistered bulk connected IBRs as well as the transmission connected IBRs from distribution-connected IBRs. To be clear, assets to be included as part of revisions to the Compliance Registry criteria ("category 2 type assets") are considered herein as "registered IBR." NERC must file the Reliability Standards or definitions developed under Milestone 3 by November 4, 2025.

As often discussed within NERC recommendations and publications, the current paradigm of modeling and data sharing leaves the bulk power system (BPS) at a higher than necessary risk for unexpected and undesired IBR performance. Since 2016, approximately 15,000 MW of IBR have unexpectedly reduced output during NERC categorized disturbance events. None of the IBR facilities involved in these disturbances utilized models that could accurately represent the facility's performance during the disturbance event. These discrepancies between modeled and studied performance when compared to real-world performance are driven by current industry modeling practices and a dependence on generic IBR modeling throughout the lifecycle of the IBR facility.

NERC Modeling Guidance [1] states that additional model types, namely manufacturer-specific user-written models, should be used for local reliability studies, during the interconnection process and following commissioning to validate as-built performance – as well as through ongoing validation of performance. The deficiencies within the current state of model quality are well documented. As required by FERC Order No. 901, the development of positive sequence models based on an approved (standard) library of model types must be built into Interconnection-wide cases.

Revisions to data sharing expectations and the creation of a "NERC Approved Model Library" that allows the use of manufacturer-specific models in instances where generic modeling cannot represent the

Requested information
performance of the IBR are necessary to ensure BPS reliability through improvements to the inputs of current study practices.
Purpose or Goal (What are the reliability gap(s) or risk(s) to the Bulk Electric System (BES) being addressed, and how does this proposed project provide the reliability-related benefit described above?):
This SAR addresses specific pieces of the NERC filed Work Plan related to Milestone 3 and addresses the various industry comments to meet the regulatory directives of FERC Order No. 901. This project shall coordinate with other relevant projects in developing standard language and meeting the FERC Order No. 901 directives. This Project will address FERC Order No. 901 directives related to aggregation of data, parameters, and estimation methods to provide the Transmission Planner (TP) and Transmission Operator (TOP) with the estimate values, explanation for limitations on data availability, and the method used for all estimations. This project is intended to serve as a data sharing center point for many of the revisions being established within all of the 901-related projects. Performance of IBR during an event (grid disturbance) are identified and corrected within the Standards Development projects pertaining to Milestone 2 of the Work Plan. However, any requisite changes to model data as a result of correcting IBR performance, must be communicated through a uniform model framework to assure all impacted entities and users of the approved models are adequately informed and provided updated models (as developed within this project). Similarly, revisions to model validation being drafted by the drafting team assigned the Milestone 3 Part 2 SAR, must also assure entities follow the uniform model framework established here.
Project Scope (Define the parameters of the proposed project):
The FERC Order No. 901 directives assigned to this SAR are outlined in the Detailed Description section below. The project scope shall address all those directives, and should consider the following objectives during the standards development process: 1. Modify applicable Reliability Standards (e.g. MOD-032, TOP-003, and IRO-010) to ensure the usage of a uniform framework for each Interconnection that includes a minimum modeling criteria consistent with NERC's Dynamic Modeling Recommendations, a registered modeling designee, and necessary data exchange requirements. The framework must require: a. The usage of a "NERC-Approved Model Library" (hereafter: "Model Library"). i. The Model Library will be developed and maintained by NERC and will be consistent with NERC's published Dynamic Modeling Recommendations. The Model Library will not prohibit the use of equipment-specific models in Interconnection-wide base cases. ii. The Model Library will be accessible to the general public. NERC will develop an open and transparent process for maintaining the library. iii. The Model Library will include recommendations to facilitate the exchange of neighboring entities' respective planning and operation models to be used in Interconnection-wide case creation and in other NERC Reliability Standards for IBR.

Requested information
iv. The Model Library will include recommendations regarding model usage depending on study type. v. The DT may consider documenting additional guidance for NERC related to maintaining a model library. b. Data specification and notifications for the data necessary to develop Interconnection-wide models and models for other reliability studies. Specifications must include: i. Provisions and a periodicity for new, modified, or changed equipment for any changes that alter the performance of the IBR, and ii. Provisions and a periodicity for unregistered IBRs and DERs that include estimation, aggregation, or other data submittal. c. Data exchange of models from the Model Library for Interconnection-wide model creation (i.e., system models in the language of FERC Order No. 901 (157, 161)) that most accurately reflects, according to manufacturer documentation, the behavior of each IBR during steady state, short-circuit, and dynamic conditions; d. Data exchange of estimated modeling data and parameters, estimation methods, and documented limitations of the availability of accurate data for unregistered IBR and DER as developed by Transmission Owners and Distribution Providers. 2. The drafting team shall ensure that implementation plans for new or modified Reliability Standards related to Milestone 3 of the Work Plan are aligned and do not create a reliability gap during implementation.
Detailed Description (Describe the proposed deliverable(s) with sufficient detail for a drafting team to execute the project. If you propose a new or substantially revised Reliability Standard or definition, provide: (1) a technical justification[2] of developing a new or revised Reliability Standard or definition, which includes a discussion of the risk and impact to reliability-of the BES, and (2) a technical foundation document (*e.g.,* research paper) to guide development of the Standard or definition):
The project scope above will need to account for the specific directive text in FERC Order No. 901 to be successful. The drafting team should consider the specific language in the FERC directives, as well as any comments in the underlying FERC Order No. 901 proceeding that FERC directed NERC to consider as part of the standard development process. **FERC Order 901 Directives Assigned to this SAR:** NERC will maintain a current version of NERC Standards Development's Work Plan to Address FERC Order No. 901 on the NERC website under Reliability Standards Under Development. Included in this Work Plan is a list of the directives in FERC Order No. 901 and their associated mapping of each SAR

[2] The NERC Rules of Procedure require a technical justification for new or substantially revised Reliability Standards. Please attach pertinent information to this form before submittal to NERC.

Requested information

submitted by NERC. The Work Plan will be updated should any mapping of FERC directives be reassigned due to ongoing work in the various Standards Development Projects. As of April 1, 2024, this SAR will address the following FERC Order No. 901 directives, with the scope of this SAR emphasized in **bold** where the Paragraph language is separated[3] across multiple projects:

1. **"Second, by November 4, 2025, NERC must submit new or modified Reliability Standards addressing the interrelated directives concerning: (1) data sharing for registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate**; and (2) data and model validation for registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate." (P 7)
2. **"Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require registered IBR generator owners and operators to provide IBR-specific modeling data and parameters (e.g., steady-state, dynamic, and short circuit modeling information ,and control settings for momentary cessation and ramp rates)** that accurately represent the registered IBRs **to their planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities that are responsible for planning and operating the Bulk-Power System."** (P 76)
3. "Nevertheless, to support accurate modeling and performance, we direct NERC to consider during its standards development process AEU and ACP/SEIA's suggested data sharing requirements when developing the framework, criteria, and necessary data exchange requirements to meet the registered IBR data sharing directive." (P 77)
4. **"As discussed in more detail in section IV.C of this final rule, we are also directing NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models** that accurately reflect the behavior of all IBRs during steady state, short-circuit, and dynamic conditions." (P78)
5. "Likewise, regarding CAISO's request that the Commission direct NERC to consider requiring registered IBRs to provide additional data, we agree that such data collections may be warranted, and direct NERC to consider through its standards development process whether additional IBR data points (e.g., telemetry collections or other automated platform integrations) are needed to further enhance real-time visibility of Bulk-Power System operations." (P 86)
6. "Specifically, as proposed in the NOPR, we direct NERC to submit to the Commission for approval one or more new or modified Reliability Standards that require: (1) transmission owners to provide to Bulk-Power System planners and operators modeling data and parameters for unregistered IBRs in their transmission owner areas that, individually or in the aggregate, materially affect the reliable operation of the Bulk-Power System and (2) distribution providers to provide to Bulk-Power System planners and operators modeling data and parameters for IBR-DERs in the aggregate in their distribution provider areas where the IBR-DERs in the aggregate materially affect the reliable operation of the Bulk-Power System." (P 102)

[3] Other Projects will cover the non-bolded sections of the same Order Paragraph containing the directive.

Requested information

7. "Recognizing that there may be instances in which transmission owners are unable to gather adequate unregistered IBR modeling data and parameters to create and maintain unregistered IBR models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation." (P 104)
8. "To support this data collection, we further direct NERC to consider commenters suggestions to implement a process or mechanism by which transmission owners would receive modeling data and parameters." (P 104)
9. "Accordingly, to account for instances in which distribution providers are unable to gather adequate modeling data and parameters of IBR-DERs to create and maintain IBR-DER models, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require that each distribution provider, if unable to gather accurate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation." (P 105)
10. "In support of above, we further direct NERC to consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters." (P 105)
11. "For those areas with IBR-DERs that in the aggregate materially affect the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we direct NERC to determine the appropriate registered entity responsible for providing data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, or, when unable to gather such accurate IBR-DERs data, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation." (P 106)
12. "Regarding CAISO's concern regarding the potential "compliance trap" where planners and operators rely on third-party data and IRC's request that the final rule specify the data to be submitted by all IBRs (i.e., registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate) and transmission devices using similar technologies, we direct NERC to determine through its standards development process the minimum categories or types of data that must be provided

Requested information

to transmission planners, transmission operators, transmission owners, and distribution providers necessary to predict the behavior of all IBRs and to ensure that compliance obligations are clear." (P 108)

13. **"As discussed in more detail in section IV.C of this final rule, we are also directing NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models** that accurately reflect the behavior of all IBRs during steady state, short-circuit, and dynamic conditions." (P 108)
14. **"Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require the use of approved industry generic library IBR models** that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions when developing planning, operations, and interconnection-wide models." (P 122)
15. "We direct NERC to determine through its standards development process which nation-wide approved component models are needed to build IBR plant models for steady state, short-circuit, and dynamics studies." (P 124)
16. "Accordingly, we direct NERC to develop new or modified Reliability Standards that require the sole use of nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build interconnection-wide models." (P 125)
17. "**We also direct NERC to require** the generator owners of registered IBRs and **the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g., planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of** registered and **unregistered IBRs, including momentary cessation and/or tripping, and all ride through behavior**." (P 141)
18. "Recognizing that there may be instances in which transmission owners are unable to gather accurate unregistered IBR modeling data and parameters to create and maintain accurate unregistered IBR dynamic models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas, dynamic models of unregistered IBRs using estimated data in accordance with this final rule's section IV.B.3 data sharing directives." (P 141)
19. "Further, we direct NERC to require distribution providers to provide to the planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities aggregated dynamic models that adequately represent the dynamic performance of IBR-DERs on their systems that in the aggregate have a material impact on the Bulk-Power System, including momentary cessation and/or tripping, and all ride through behavior (e.g., IBR-DERs in the

Requested information

aggregate modeled by interconnection requirements performance to represent different steady-state and dynamic behavior)." (P141)

20. "Recognizing that there may be instances in which distribution providers are unable to gather data that accurately represents IBR-DERs in the aggregate, we modify the NOPR proposal and direct NERC to include in the proposed new or modified Reliability Standards a requirement that the distribution provider, if unable to gather data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, provide to the Bulk-Power System planners and operators (i.e., the data recipients) a dynamic model using estimated data for IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, in accordance with this final rule's section IV.B.3 data sharing directives." (P 141)
21. "Furthermore, we acknowledge that there may be areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider. Therefore, we modify the NOPR proposal and direct NERC to determine the appropriate registered entity responsible for providing adequate data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and to identify the registered entities for coordinating, verifying, and keeping up to date the respective dynamic models." (P 141)
22. "Finally, NERC must ensure that the proposed new or modified Reliability Standards account for the dynamic performance of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System." (P 141)
23. "Accordingly, we direct NERC to develop new or modified Reliability Standards that require the use of the DER_A model or successor models to represent the behaviors of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System at a sufficient level of fidelity for Bulk-Power System planners and operators to create valid planning and operations and interconnection-wide models and to be able to perform respective system studies." (P 146)
24. "**Furthermore, for those areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we modify the NOPR proposal to direct NERC to determine the appropriate registered entity responsible for the data and parameters of IBR-DERs in the aggregate** and to establish a process that requires identified registered entities to coordinate, validate, and keep up to date the system models." (P 157)
25. "**Specifically, we direct NERC to develop new or modified Reliability Standards that require planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities to establish for each interconnection a uniform framework with modeling criteria, a registered modeling designee, and necessary data exchange requirements both between themselves and with the generator owners, transmission owners, and distribution providers to coordinate the creation of transmission planning, operations, and interconnection-wide models (i.e., system models)** and the validation of each respective system model." (P 161)

Requested information
26. "Further, we believe that there is a need to have all of the directed Reliability Standards effective and enforceable well in advance of 2030 and direct NERC to ensure that the associated implementation plans sequentially stagger the effective and enforceable dates to ensure an orderly industry transition for complying with the IBR directives in this final rule prior to that date." (P 226)
Cost Impact Assessment, if known (Provide a paragraph describing the potential cost impacts associated with the proposed project):
The associated cost with implementation of a new standard is currently unknown, and the modifications necessary for each specific directive are also unknown though they are expected to vary based on DT outcome.
Please describe any unique characteristics of the BES facilities that may be impacted by this proposed standard development project (*e.g.*, Dispersed Generation Resources):
IBRs connected to the transmission system.
To assist the NERC Standards Committee in appointing a drafting team with the appropriate members, please indicate to which Functional Entities the proposed standard(s) should apply (*e.g.*, Transmission Operator, Reliability Coordinator, etc. See the NERC Rules of Procedure Appendix 5A:
This Project should contain appropriate members representing the following Functional Entities: Balancing Authority Distribution Provider Generator Owner Generator Operator Planning Coordinator Reliability Coordinator Transmission Owner Transmission Operator Transmission Planner
Do you know of any consensus building activities[4] in connection with this SAR? If so, please provide any recommendations or findings resulting from the consensus building activity.
FERC Order No. 901 NERC Standards Development Work Plan in Response to FERC Order No. 901 Inverter-Based Resource Activities, Quick Reference Guide Distributed Energy Resource Activities, Quick Reference Guide IBR Registration Initiative, Quick Reference Guide
Are there any related standards or SARs that should be assessed for impact as a result of this proposed project? If so, which standard(s) or project number(s)?
1. SARs:

[4] Consensus building activities are occasionally conducted by NERC and/or project review teams. They typically are conducted to obtain industry inputs prior to proposing any standard development project to revise, or develop a standard or definition.

Requested information
a. SAR titled: Federal Energy Regulatory Commission (FERC) Order No. 901 – Milestone 3, Part 2: IBR Model Validation b. SAR titled: Federal Energy Regulatory Commission (FERC) Order No. 901 – Milestone 3, Part 3: IBR Modeling Revision 2. Active Reliability Standards Projects: a. 2020-06 Verifications of Models and Data for Generators b. 2021-01 Modifications to MOD-025 and PRC-019 c. 2022-02 Modifications to TPL-001-5.1 and MOD-032-1 (NERC Standards Development recommends assigning the SAR to this active project) d. 2022-04 EMT Modeling e. 2023-05 Modifications to FAC-001 and FAC-002 f. 2023-08 Modifications of MOD-031 Demand and Energy Data
Are there alternatives (e.g., guidelines, white paper, alerts, etc.) that have been considered or could meet the objectives? If so, please list the alternatives with the benefits of using them. Since the directives of FERC Order 901 instruct NERC to develop new or modified standards, there were no other alternatives considered.

Reliability Principles	
Does this proposed standard development project support at least one of the following Reliability Principles (Reliability Interface Principles)? Please check all those that apply.	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Market Interface Principles	
Does the proposed standard development project comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

What is the risk to the Bulk Electric System (What Bulk Electric System (BES) reliability benefit does the proposed project provide?):

This Standards Authorization Request (SAR) is initiated by the North American Electric Reliability Corporation (NERC), with consultation of the Reliability Security Technical Committee, to address directives issued by the Federal Energy Regulatory Commission (FERC) in Order No. 901. FERC issued Order No. 901 on October 19, 2023, which includes directives on new or modified NERC Reliability Standard projects. FERC Order No. 901 addresses a wide spectrum of reliability risks to the grid from the application of inverter-based resources (IBRs~~);~~), including both utility scale and behind-the-meter or distributed energy resources (DERs).

Within the Order are four milestones that include sets of directives to NERC. In the Order, FERC has directed NERC to propose new or modified standards to mitigate reliability gaps in the current NERC

Requested information

Reliability Standards related to IBRs. Specifically, FERC directed NERC to develop new or modified Reliability Standards to address the following four broad topic areas related to IBRs: (1) data sharing; (2) data and model validation; (3) planning and operational studies; and (4) performance.

In January 2024, NERC filed the initial **Standards Development Work Plan in Response to FERC Order No. 901** (hereafter referred to as the "Work Plan"). A current version of the Work Plan will be maintained here. The Work Plan discusses how NERC will develop Reliability Standards within (Milestones 2-4) to meet FERC's filing deadlines. This ~~Standard Authorization Request~~SAR addresses Milestone 3 of the Work Plan~~,~~ related to Reliability Standards for modeling and data sharing requirements to establish sufficient IBR model data and parameters to assure accurate representation of IBR performance within the models. Further, collaborative sharing of this information~~,~~ and the utilization of this information throughout the lifecycle of IBRs will also be established.

Milestone 3 of the Work Plan covers the development of data provisioning, parameters, and estimation requirements for IBRs. FERC Order No. 901 directives address three categories of IBR: (1) registered IBR, including sub-Bulk Electric System IBRs to be registered under NERC's revised Compliance Registry criteria; (2) unregistered IBR; and (3) IBR-DER, to distinguish registered bulk connected IBRs from unregistered bulk connected IBRs as well as the transmission connected IBRs from distribution-connected IBRs. To be clear, assets to be included as part of revisions to the Compliance Registry criteria ("category 2 type assets") are considered herein as ~~"~~"registered IBR."~~.~~ NERC must file the Reliability Standards or definitions developed under Milestone 3 by November 4, 2025.

As often discussed within NERC recommendations and publications, the current paradigm of modeling and data sharing leaves the bulk power system (BPS) at a higher than necessary risk for unexpected and undesired ~~inverter-based resource (~~IBR~~)~~ performance. Since 2016, approximately 15,000 MW of IBR have unexpectedly reduced output during NERC categorized disturbance events. None of the IBR facilities involved in these disturbances utilized models that could accurately represent the facility's performance during the disturbance event. These discrepancies between modeled and studied performance when compared to real-world performance are driven by current industry modeling practices and a dependence on generic IBR modeling throughout the lifecycle of the IBR facility.

NERC Modeling Guidance [1] states that additional model types, namely manufacturer-specific user-written models, ~~must~~ should be used for local reliability studies, during the interconnection process and following commissioning to validate as-built performance – as well as through ongoing validation of performance. The deficiencies within the current state of model quality are well documented. As required by FERC Order No. 901, the development of positive sequence models based on an approved (standard) library of model types must be built into Interconnection-wide cases.

Revisions to data sharing expectations and the creation of a "NERC Approved Model Library" that allows the use of manufacturer-specific models ~~in addition to standard library (generic) models~~ in instances

[1] https://www.nerc.com/pa/RAPA/ModelAssessment/Documents/Dynamic%20Modeling%20Recommendations.pdf

Requested information
where generic modeling cannot represent the performance of the IBR are necessary to ensure BPS reliability through improvements to the inputs of current study practices.
Purpose or Goal (What are the reliability gap(s) or risk(s) to the Bulk Electric System (BES) being addressed, and how does this proposed project provide the reliability-related benefit described above?):
This SAR addresses specific pieces of the NERC filed Work Plan related to Milestone 3 and addresses the various industry comments to meet the regulatory directives of FERC Order No. 901. This project shall coordinate with other relevant projects in developing standard language and meeting the FERC Order No. 901 directives~~among other projects (i.e., act as a clearing house to tie directive language to standard revisions), develop standard language (i.e., perform the normal duties of a standard development Project), and build upon other Milestones from FERC Order No. 901 Standards Projects to meet regulatory deadlines (i.e., maintain agility based on how FERC Order No. 901 related Projects proceed to meet the directive deadlines)~~. This Project will ~~also~~ address FERC Order No. 901 directives related to aggregation of data, parameters, and estimation methods to provide the Transmission Planner (TP) and Transmission Operator (TOP) with the estimate values, explanation for limitations on data availability, and the method used for all estimations. This project is intended to serve as a data sharing center point for many of the revisions being established within all of the 901-related projects. Performance of IBR during an event (grid disturbance) are identified and corrected within the Standards Development projects pertaining to Milestone 2 of the Work Plan. However, any requisite changes to model data as a result of correcting IBR performance, must be communicated through a uniform model framework to assure all impacted entities and users of the approved models are adequately informed and provided updated models (as developed within this project). Similarly, revisions to model validation being drafted by the drafting team assigned the Milestone 3 Part 2 SAR, must also assure entities follow the uniform model framework established here.
Project Scope (Define the parameters of the proposed project):
The FERC Order No. 901 directives assigned to this SAR are outlined in the Detailed Description section below. The project scope shall address all those directives, and should consider the following objectives during the standards development process: ~~Modify MOD-032 to require the usage of a "NERC-Approved Model Library" (Hereafter: "The Model Library") that shall identify contains acceptable (and unacceptable) models, recommendations on which models should be used for each study, and include recommendations to facilitate the exchange of neighboring entities' respective planning and operation models and to be used in Interconnection-wide case creation and in other NERC Reliability Standards for IBR.~~ ~~This Model Library will be developed and maintained by NERC and include recommendations regarding model usage depending on study type. Updates on the Model Library development will be coordinated with the Drafting Team. The Drafting Team may solicit feedback comments of the NERC process from industry as needed.~~ ~~The Model Library will be accessible to the general public. NERC will develop an open and transparent process for maintaining the library.~~

Requested information

~~The Model Library will be consistent with NERC's published Dynamic Modeling Recommendations. The Model Library will not prohibit the use of equipment-specific models in Interconnection-wide base cases.~~
~~, primarily: Placeholder for DT guidance.~~

~~i. Industry-approved library models are sufficient for use in Interconnection-wide base case creation and interconnection-wide studies;~~

~~ii. For local reliability studies (e.g. performance during the interconnection process, model quality validation), equipment specific models should be used if standard library models (i.e. WECC Generic) cannot accurately represent the performance of the IBR. if generic models from the Model Library cannot accurately represent the IBR.~~

~~2.~~1. Modify applicable Reliability Standards (e.g. MOD-032, TOP-003, and IRO-010) to ~~require Planning Coordinators (PC), Transmission PlannersTPs, Reliability Coordinators (RC), Transmission OperatorsTOPs, and Balancing Authorities (BA) to~~ ensure the usage of a uniform framework for each Interconnection ~~that includes the usage of a "NERC-Approved Model Library" (hereafter:the Model Library"). which The uniform framework will~~that includes a minimum modeling criteria consistent with NERC's Dynamic Modeling Recommendations, a registered modeling designee, and necessary data exchange requirements. The framework must require:

a. The usage of a "NERC-Approved Model Library~~-~~" (hereafter: "Model Library").

i. The~~is~~ Model Library will be developed and maintained by NERC and will be consistent with NERC's published Dynamic Modeling Recommendations. The Model Library will not prohibit the use of equipment-specific models in Interconnection-wide base cases.

ii. The Model Library will be accessible to the general public. NERC will develop an open and transparent process for maintaining the library.

iii. The Model Library will include recommendations to facilitate the exchange of neighboring entities' respective planning and operation models to be used in Interconnection-wide case creation and in other NERC Reliability Standards for IBR.

iv. The~~is~~ Model Library will include recommendations regarding model usage depending on study type.

v. The DT may consider documenting additional guidance for NERC related to maintaining a model library~~Placeholder for DT guidance~~.

~~a.~~b. Data specification and notifications for the data necessary to develop ~~i~~Interconnection-wide models and models for other reliability studies. Specifications must include:~~;~~

i. ~~Specifications must include p~~Provisions and a periodicity for new, modified, or changed equipment for any changes that alter the performance of the IBR, and

Requested information

ii. ~~Specifications must include provisions for changes to an approved equipment-specific models for any changes that alter the performance of the IBR,~~

iii.ii. ~~Specifications must include p~~Provisions and a periodicity for unregistered IBRs and DERs that include estimation, aggregation, or other data submittal. ~~exchanging estimated aggregated unregistered IBR and DER data.~~

~~b.~~c. Data exchange of ~~generic~~ models from the Model Library for ~~i~~Interconnection-wide model creation (i.e., system models in the language of FERC Order No. 901 (157, 161)) that most accurately reflects, according to manufacturer documentation, the behavior of each IBR during steady state, short-circuit, and dynamic conditions; ~~;~~

~~c. A review and approval process for additional model types from the Model Library (other than generic model types) for other reliability studies;~~

d. Data exchange of estimated modeling data and parameters~~aggregated data~~, estimation methods, and documented limitations of the availability of accurate data for unregistered IBR and DER as developed by Transmission Owners and Distribution Providers ~~in Item 4~~.

~~3. Modify MOD-032 to require Generator Owners (GO) and Transmission Owners (TO) to follow the uniform framework developed in Item 2, specifically;~~

~~a. GO and TO of IBR must provide generic models from the Model Library for interconnection-wide model creation that most accurately reflect the behavior of each IBR during steady state, short-circuit, and dynamic conditions;~~

~~b. GO and TO of IBR must provide sufficient documentation regarding technical limitations and any inaccuracies as justification for the use of additional equipment-specific models.~~

~~i. For instance, a Corrective Action Plan created by a planner or operator to address model quality due to exceeded performance criteria (reference Milestone 3 Part 2 SAR), may should necessitate usage of an equipment-specific model, if available, instead of a generic model from the Model Library. .~~

~~ii. For instance, studied discrepancies between the generic model and performance or of the IBR or equipment-specific model demonstrated during the interconnection process may should necessitate usage of an equipment-specific model, if available, instead of a generic model. from the Model Library.~~

~~iii. For instance, discrepancies between the generic model and performance of the IBR during a disturbance (i.e. from a post-event analysis) may should necessitate usage of an equipment-specific model, if available. instead of a generic model from the Model Library. .~~

~~4. Modify TOP-003 and IRO-010 to require Transmission Owners and Distribution Providers to establish and implement data aggregation methods for unregistered IBR and DER. The SDT~~

Requested information
~~should consider including these methods in the TOP, BA, and RC data specifications these entities maintain. These standards must address:~~ ~~a. An estimate of the modeling data and parameters of IBR-DERs and unregistered IBRs,~~ ~~b. An explanation of the limitations of the availability of accurate data, and~~ ~~c. The method used for all estimations.~~ ~~5.~~2. The drafting team shall ensure that implementation plans for new or modified Reliability Standards related to Milestone 3 of the Work Plan are aligned and do not create a reliability gap during implementation.
Detailed Description (Describe the proposed deliverable(s) with sufficient detail for a drafting team to execute the project. If you propose a new or substantially revised Reliability Standard or definition, provide: (1) a technical justification[2] of developing a new or revised Reliability Standard or definition, which includes a discussion of the risk and impact to reliability-of the BES, and (2) a technical foundation document (*e.g.,* research paper) to guide development of the Standard or definition):
The project scope above will need to account for the specific directive text in FERC Order No. 901 to be successful. The drafting team should consider the specific language in the FERC directives, as well as any comments in the underlying FERC Order No. 901 proceeding that FERC directed NERC to consider as part of the standard development process. **FERC Order 901 Directives Assigned to this SAR:** NERC will maintain a current version of NERC Standards Development's Work Plan to Address FERC Order No. 901 on the NERC website under Reliability Standards Under Development. Included in this Work Plan is a list of the directives in FERC Order No. 901 and their associated mapping of each SAR submitted by NERC. The Work Plan will be updated should any mapping of FERC directives be reassigned due to ongoing work in the various Standards Development Projects. As of April 1, 2024, this SAR will address the following FERC Order No. 901 directives, with the scope ~~for~~ of this SAR emphasized in **bold** where the Paragraph language is separated[3] across multiple projects: ~~this SAR emphasized in **bold** as appropriate:~~ 1. **"Second, by November 4, 2025, NERC must submit new or modified Reliability Standards addressing the interrelated directives concerning: (1) data sharing for registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate**; and (2) data and model validation for registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate." (P 7) 2. **"Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require registered IBR generator owners and operators to provide IBR-specific modeling data and parameters (e.g., steady-state,**

[2] The NERC Rules of Procedure require a technical justification for new or substantially revised Reliability Standards. Please attach pertinent information to this form before submittal to NERC.
[3] Other Projects will cover the non-bolded sections of the same Order Paragraph containing the directive.

Requested information

dynamic, and short circuit modeling information ,and control settings for momentary cessation and ramp rates) that accurately represent the registered IBRs **to their planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities that are responsible for planning and operating the Bulk-Power System."** (P 76)

3. "Nevertheless, to support accurate modeling and performance, we direct NERC to consider during its standards development process AEU and ACP/SEIA's suggested data sharing requirements when developing the framework, criteria, and necessary data exchange requirements to meet the registered IBR data sharing directive." (P 77)
4. **"As discussed in more detail in section IV.C of this final rule, we are also directing NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models** that accurately reflect the behavior of all IBRs during steady state, short-circuit, and dynamic conditions." (P78)
5. "Likewise, regarding CAISO's request that the Commission direct NERC to consider requiring registered IBRs to provide additional data, we agree that such data collections may be warranted, and direct NERC to consider through its standards development process whether additional IBR data points (e.g., telemetry collections or other automated platform integrations) are needed to further enhance real-time visibility of Bulk-Power System operations." (P 86)
6. "Specifically, as proposed in the NOPR, we direct NERC to submit to the Commission for approval one or more new or modified Reliability Standards that require: (1) transmission owners to provide to Bulk-Power System planners and operators modeling data and parameters for unregistered IBRs in their transmission owner areas that, individually or in the aggregate, materially affect the reliable operation of the Bulk-Power System and (2) distribution providers to provide to Bulk-Power System planners and operators modeling data and parameters for IBR-DERs in the aggregate in their distribution provider areas where the IBR-DERs in the aggregate materially affect the reliable operation of the Bulk-Power System." (P 102)
7. "Recognizing that there may be instances in which transmission owners are unable to gather adequate unregistered IBR modeling data and parameters to create and maintain unregistered IBR models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation." (P 104)
8. "To support this data collection, we further direct NERC to consider commenters suggestions to implement a process or mechanism by which transmission owners would receive modeling data and parameters." (P 104)

Requested information

9. "Accordingly, to account for instances in which distribution providers are unable to gather adequate modeling data and parameters of IBR-DERs to create and maintain IBR-DER models, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require that each distribution provider, if unable to gather accurate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation." (P 105)
10. "In support of above, we further direct NERC to consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters." (P 105)
11. "For those areas with IBR-DERs that in the aggregate materially affect the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we direct NERC to determine the appropriate registered entity responsible for providing data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, or, when unable to gather such accurate IBR-DERs data, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation." (P 106)
12. "Regarding CAISO's concern regarding the potential "compliance trap" where planners and operators rely on third-party data and IRC's request that the final rule specify the data to be submitted by all IBRs (i.e., registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate) and transmission devices using similar technologies, we direct NERC to determine through its standards development process the minimum categories or types of data that must be provided to transmission planners, transmission operators, transmission owners, and distribution providers necessary to predict the behavior of all IBRs and to ensure that compliance obligations are clear." (P 108)
13. **"As discussed in more detail in section IV.C of this final rule, we are also directing NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models** that accurately reflect the behavior of all IBRs during steady state, short-circuit, and dynamic conditions." (P 108)
14. **"Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require the use of approved industry generic library IBR models** that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions when developing planning, operations, and interconnection-wide models." (P 122)

Requested information

15. "We direct NERC to determine through its standards development process which nation-wide approved component models are needed to build IBR plant models for steady state, short-circuit, and dynamics studies." (P 124)
16. "Accordingly, we direct NERC to develop new or modified Reliability Standards that require the sole use of nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build interconnection-wide models." (P 125)
17. "**We also direct NERC to require** the generator owners of registered IBRs and **the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g., planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of** registered and **unregistered IBRs, including momentary cessation and/or tripping, and all ride through behavior**." (P 141)
18. "Recognizing that there may be instances in which transmission owners are unable to gather accurate unregistered IBR modeling data and parameters to create and maintain accurate unregistered IBR dynamic models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas, dynamic models of unregistered IBRs using estimated data in accordance with this final rule's section IV.B.3 data sharing directives." (P 141)
19. "Further, we direct NERC to require distribution providers to provide to the planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities aggregated dynamic models that adequately represent the dynamic performance of IBR-DERs on their systems that in the aggregate have a material impact on the Bulk-Power System, including momentary cessation and/or tripping, and all ride through behavior (e.g., IBR-DERs in the aggregate modeled by interconnection requirements performance to represent different steady-state and dynamic behavior)." (P141)
20. "Recognizing that there may be instances in which distribution providers are unable to gather data that accurately represents IBR-DERs in the aggregate, we modify the NOPR proposal and direct NERC to include in the proposed new or modified Reliability Standards a requirement that the distribution provider, if unable to gather data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, provide to the Bulk-Power System planners and operators (i.e., the data recipients) a dynamic model using estimated data for IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, in accordance with this final rule's section IV.B.3 data sharing directives." (P 141)
21. "Furthermore, we acknowledge that there may be areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider. Therefore, we modify the NOPR proposal and direct NERC to

Requested information
determine the appropriate registered entity responsible for providing adequate data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and to identify the registered entities for coordinating, verifying, and keeping up to date the respective dynamic models." (P 141) 22. "Finally, NERC must ensure that the proposed new or modified Reliability Standards account for the dynamic performance of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System." (P 141) 23. "Accordingly, we direct NERC to develop new or modified Reliability Standards that require the use of the DER_A model or successor models to represent the behaviors of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System at a sufficient level of fidelity for Bulk-Power System planners and operators to create valid planning and operations and interconnection-wide models and to be able to perform respective system studies." (P 146) 24. "**Furthermore, for those areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we modify the NOPR proposal to direct NERC to determine the appropriate registered entity responsible for the data and parameters of IBR-DERs in the aggregate** and to establish a process that requires identified registered entities to coordinate, validate, and keep up to date the system models." (P 157) 25. "**Specifically, we direct NERC to develop new or modified Reliability Standards that require planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities to establish for each interconnection a uniform framework with modeling criteria, a registered modeling designee, and necessary data exchange requirements both between themselves and with the generator owners, transmission owners, and distribution providers to coordinate the creation of transmission planning, operations, and interconnection-wide models (i.e., system models)** and the validation of each respective system model." (P 161) 26. "Further, we believe that there is a need to have all of the directed Reliability Standards effective and enforceable well in advance of 2030 and direct NERC to ensure that the associated implementation plans sequentially stagger the effective and enforceable dates to ensure an orderly industry transition for complying with the IBR directives in this final rule prior to that date." (P 226)
Cost Impact Assessment, if known (Provide a paragraph describing the potential cost impacts associated with the proposed project):
The associated cost with implementation of a new standard is currently unknown, and the modifications necessary for each specific directive are also unknown though they are expected to vary based on DT outcome.
Please describe any unique characteristics of the BES facilities that may be impacted by this proposed standard development project (*e.g.*, Dispersed Generation Resources):
IBRs connected to the transmission system.

Requested information
To assist the NERC Standards Committee in appointing a drafting team with the appropriate members, please indicate to which Functional Entities the proposed standard(s) should apply (*e.g.*, Transmission Operator, Reliability Coordinator, etc. See the NERC Rules of Procedure Appendix 5A:
This Project should contain appropriate members representing the following Functional Entities: Balancing Authority Distribution Provider Generator Owner Generator Operator Planning Coordinator Reliability Coordinator Transmission Owner Transmission Operator Transmission Planner ~~Reliability Coordinator~~
Do you know of any consensus building activities[4] in connection with this SAR? If so, please provide any recommendations or findings resulting from the consensus building activity.
FERC Order No. 901 NERC Standards Development Work Plan in Response to FERC Order No. 901 Inverter-Based Resource Activities, Quick Reference Guide Distributed Energy Resource Activities, Quick Reference Guide IBR Registration Initiative, Quick Reference Guide
Are there any related standards or SARs that should be assessed for impact as a result of this proposed project? If so, which standard(s) or project number(s)?
1. SARs: a. SAR titled: Federal Energy Regulatory Commission (FERC) Order No. 901 – Milestone 3, Part 2: IBR Model Validation b. SAR titled: Federal Energy Regulatory Commission (FERC) Order No. 901 – Milestone 3, Part 3: IBR Modeling Revision 2. Active Reliability Standards Projects: a. 2020-06 Verifications of Models and Data for Generators b. 2021-01 Modifications to MOD-025 and PRC-019 c. 2022-02 Modifications to TPL-001-5.1 and MOD-032-1 (NERC Standards Development recommends assigning the SAR to this active project) d. 2022-04 EMT Modeling e. 2023-05 Modifications to FAC-001 and FAC-002 f. 2023-08 Modifications of MOD-031 Demand and Energy Data

[4] Consensus building activities are occasionally conducted by NERC and/or project review teams. They typically are conducted to obtain industry inputs prior to proposing any standard development project to revise, or develop a standard or definition.

Requested information
Are there alternatives (e.g., guidelines, white paper, alerts, etc.) that have been considered or could meet the objectives? If so, please list the alternatives with the benefits of using them. Since the directives of FERC Order 901 instruct NERC to develop new or modified standards, there were no other alternatives considered.

Reliability Principles	
Does this proposed standard development project support at least one of the following Reliability Principles (Reliability Interface Principles)? Please check all those that apply.	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Market Interface Principles	
Does the proposed standard development project comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

Project 2022-02 Uniform Modeling Framework for IBR

Action

- Approve the following waiver of provisions of the Standard Processes Manual (SPM) for Project 2022-02 Uniform Modeling Framework for IBR:
  - Initial formal comment and ballot period reduced from 45 calendar days to as few as 30 calendar days, with ballot pools formed in the first 10 calendar days and initial ballot and non-binding poll of Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) conducted during the last 10 calendar days of the comment period. (Sections 4.7, 4.9)
  - Additional formal comment and ballot period (s) reduced from 45 calendar days to as few as 15 calendar days, with ballot(s) conducted during the last 10 calendar days of the comment period. (Section 4.12)
  - Final ballot period reduced from 10 calendar days to 5 calendar days. (Section 4.9)
- Authorize posting Project 2022-02 Uniform Modeling Framework for IBR proposed Reliability Standards MOD-032-2, IRO-010-5, TOP-003-8, and the associated Implementation Plan for an initial 30 calendar day formal comment and ballot period, with ballot pools formed in the first 10 calendar days, and initial ballots conducted during the last 10 calendar days of the comment period.

Background

The Federal Energy Regulatory Commission (FERC) issued Order No. 901 on October 19, 2023, which included directives on new or modified NERC Reliability Standard projects.[1] FERC Order No. 901 addresses a wide spectrum of reliability risks to the grid from the application of Inverter-Based Resources (IBRs), including both utility scale and behind-the-meter or distributed energy resources. Within Order No. 901, there are four milestones that include sets of directives to NERC. NERC Standards Development has identified three active projects (2020-06, 2021-01, and 2022-02) that are directly impacted by the associated FERC directives in Order No. 901.

In addition, to assist readers, please see the following additional documents drafted to help keep the NERC Milestone 3 projects organized.

- FERC Order No. 901 - Summary Information of Milestone 3
- FERC Order No. 901 - Summary Graphic of Milestone 3
- Standards Development Mapping of FERC Order 901 Directives and Other Guidance to Standards Development Projects

This one pager addresses Milestone 3 Project 2022-02 and the FERC directive covering the development of Reliability Standards to address concerns "related to IBRs at all stages of interconnection, planning, and operations.[2]" Among other things, FERC directed NERC to develop

[1] *Reliability Standards to Address Inverter-Based Resources,* Order No. 901, 185 FERC ¶ 61,042 (2023), available at eLibrary | File List.

[2] FERC Order No. 901 at P 25.

requirements addressing the provision of IBR and Distributed Energy Resource (DER) data to the entities responsible for the planning and operation of the Bulk-Power System.

All new or modified Reliability Standards and associated Implementation Plans addressing Milestone 3 of Order No. 901 must be filed with FERC by November 4, 2025. NERC Project 2022-02 addresses 24 FERC directives through modifications to MOD-032-2, IRO-010-5, and TOP-003-8 in addition to the development of the Implementation Plan.

At its November 13, 2024, meeting, the Standards Committee (SC) accepted the FERC Order No. 901 – Milestone 3, Part 1: Modeling and Data Sharing Requirements Standards Authorization Request and appointed this SAR to the 2022-02 Uniform Modeling Framework for IBR DT, as recommended by NERC staff.

NERC staff hosted a joint workshop from January 15-17, 2025, in Pheonix, AZ. During the workshop NERC staff and drafting team (DT) members reviewed the FERC directives associated with Milestone 3 and talked through concerns of industry prior to the development or modification of each standard(s) with its associated project.

A quality review for MOD-032-2, IRO-010-5, and TOP-003-8 and the associated Implementation Plan was conducted from March 14 to March 24, 2025, by NERC legal and engineering (Alain Rigaud, Lauren Perotti, Sarah Crawford, and JP Skeath), members of the DT (Hari Singh, CORE Electric Cooperative), PMOS Representatives (Donovan Crane, WECC), and industry members (Sarah Habriga, AEP; Todd Bennett, AECI; Ruth Kloecker, ITC Holdings; and Sean Bodkin, Dominion Energy).

NERC Standard Processes Manual Section 16.0 Waiver provides as follows:

- The SC may waive any of the provisions contained in this manual for good cause shown, but limited to the following circumstances:
    - In response to a national emergency declared by the United States or Canadian governments that involves the reliability of the BES or cyber-attack on the BES;
    - Where necessary to meet regulatory deadlines;
    - Where necessary to meet deadlines imposed by the NERC Board of Trustees; or
    - Where the SC determines that a modification to a proposed Reliability Standard or its requirement(s), a modification to a defined term, a modification to an interpretation, or a modification to a variance has already been vetted by the industry through the standards development process or is so insubstantial that developing the modification through the processes contained in this manual will add significant time delay.

Summary

Project 2022-02 DT leadership and NERC staff request that the SC approve a waiver under section 16.0 of the SPM regarding the length of comment periods and ballots in order to meet the November 2025 regulatory deadline for Project 2022-02 as established by FERC.

Project 2022-02 DT leadership and NERC staff recommend that the SC shorten the initial formal comment and ballot period for all standards and definitions developed under Project 2022-02 from 45 calendar days to as few as 30 calendar days and any additional formal comment and

ballot period(s) from 45 calendar days to as few as 15 calendar days. In addition, Project 2022-02 DT leadership and NERC staff recommend shortening the final ballot of all standards and definitions from 10 calendar days to as few as five (5) calendar days.

NERC staff recommends the SC authorize initial formal comment and ballot period for Project 2022-02 Uniform Modeling Framework for IBR for a 30-calendar day formal initial ballot, with ballot pools formed in the first 10 calendar days, and initial ballots conducted during the last 10 calendar days of the comment period.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Minutes
Standards Committee Meeting

T. Bennett, chair, called to order the meeting of the Standards Committee (SC or the Committee) on April 16, 2025, at 1:02 p.m. Eastern. D. Love determined the meeting had a quorum. The SC member attendance and proxy sheets are attached as Attachment 1.

NERC Antitrust Compliance Guidelines and Public Announcement
K. Boyd called attention to the NERC Antitrust Compliance Guidelines and the public meeting notice and directed questions to NERC's General Counsel, Sonia C. Rocha.

Introduction and Chair's Remarks
T. Bennett welcomed the Committee, guests, and proxies to the meeting.

Review January 22, 2025 Agenda (agenda item 1)
T. Bennett mentioned that agenda item 7 be removed due to the Standard Authorization Request (SAR) in response to comments not being posted for the Committee to review. The Committee approved the April 16, 2025, meeting agenda.

Consent Agenda (agenda item 2)
The Committee approved March 19, 2025 Standards Committee Meeting Minutes.

Project 2020-06 Verifications of Models and Data for Generators (agenda item 3)
S. Madan provided an overview and highlighted that this project is one of three active projects that have assigned directives from Federal Energy Regulatory Commission (FERC) Order No. 901. V. O'Leary recommended that the Milestone 3 posting be staggered to not overwhelm the subject-matter experts (SMEs) reviewing and providing comments to the formal ballots. J. Calderon agreed with the recommendation. M. Brytowski commented that the Milestone 3 projects are in a time crunch to meet their deadline of submittal to FERC by November 4, 2025. J. Calderon responded that more development time was needed due to the robust amount of information and extensive effort of coordination amongst the Milestone 3 projects. J. Johnson made a motion to:

- Approve the following waiver of provisions of the Standard Processes Manual (SPM) for Project 2020-06 Verifications of Models and Data for Generators:
  - Initial formal comment and ballot period reduced from 45 calendar days to as few as 25 calendar days, with ballot pools formed in the first 10 calendar days and initial ballot and non-binding poll of Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) conducted during the last 10 calendar days of the comment period. (Sections 4.7, 4.9)
  - Additional formal comment and ballot period(s) reduced from 45 calendar days to as few as 15 calendar days, with ballot(s) conducted during the last 10 calendar days of the comment period. (Sections 4.9 and 4.12)

  - Final ballot period reduced from 10 calendar days to 5 calendar days. (Section 4.9)
- Authorize posting Project 2020-06 Verifications Model and Data for Generators Modeling definitions for an initial 25-calendar day formal comment and ballot period, with ballot pools formed in the first 10 calendar days, and initial ballots conducted during the last 10 calendar days of the comment period.

S. Bodkin seconded the motion.

The committee approved the motion with no oppositions and no abstentions.

Project 2021-01 System Model Validation with IBRs (agenda item 4)
S. Madan provided an overview and highlighted that this project is one of three active projects that have assigned directives from FERC Order No. 901. J. Johnson recommended that this project posting should be increased to 40 days. S. Bodkin commented that the next agenda item may require more posting time. J. Wike mentioned that original equipment manufacturers (OEMs) may need more time to conduct their feedback for the formal posting. J. Calderon responded that the three Milestone 3 projects leverage the same SMEs with tight deadlines, and it would be imperative for Project Management and Oversight Subcommittee (PMOS) liaisons, drafting team (DT), and developers communicate as projects work in parallel and in tandem. S. Bodkin made a motion to:

- Approve the following waiver of provisions of the Standard Processes Manual (SPM) for Project 2021-01 System Model Validation with IBRs:
  - Initial formal comment and ballot period reduced from 45 calendar days to as few as 35 calendar days, with ballot pools formed in the first 10 calendar days and initial ballot and non-binding poll of Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) conducted during the last 10 calendar days of the comment period. (Sections 4.7, 4.9)
  - Additional formal comment and ballot period(s) reduced from 45 calendar days to as few as 15 calendar days, with ballot(s) conducted during the last 10 calendar days of the comment period. (Section 4.12)
  - Final ballot period was reduced from 10 calendar days to 5 calendar days. (Section 4.9)
- Authorize posting proposed Project 2021-01 System Model Validation with IBRs proposed Reliability Standard MOD-033-3, and its associated Implementation Plan for an initial 35-calendar day formal comment and ballot period, with ballot pools formed in the first 10 calendar days, and initial ballots conducted during the last 10 calendar days of the comment period.

V. O'Leary seconded the motion.

The committee approved the motion with no oppositions. P. MacDonald abstained.

Project 2022-02 Uniform Modeling Framework for IBR (agenda item 5)
S. Madan provided an overview and highlighted that this project is one of three active projects that have assigned directives from FERC Order No. 901. S. Bodkin asked if changing the posting date to 40 days would

conflict with the upcoming workshop. J. Calderon responded that the DT would not have enough time to review comments. S. Bodkin made a motion to:

- Approve the following waiver of provisions of the Standard Processes Manual (SPM) for Project 2022-02 Uniform Modeling Framework for IBR:
  - Initial formal comment and ballot period reduced from 45 calendar days to as few as 30 calendar days, with ballot pools formed in the first 10 calendar days and initial ballot and non-binding poll of Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) conducted during the last 10 calendar days of the comment period. (Sections 4.7, 4.9)
  - Additional formal comment and ballot period (s) reduced from 45 calendar days to as few as 15 calendar days, with ballot(s) conducted during the last 10 calendar days of the comment period. (Section 4.12)
  - Final ballot period reduced from 10 calendar days to 5 calendar days. (Section 4.9)
- Authorize posting Project 2022-02 Uniform Modeling Framework for IBR proposed Reliability Standards MOD-032-2, IRO-010-5, TOP-003-8, and the associated Implementation Plan for an initial 30-calendar day formal comment and ballot period, with ballot pools formed in the first 10 calendar days, and initial ballots conducted during the last 10 calendar days of the comment period.

T. Pyle seconded the motion.

The committee approved the motion with no oppositions and no abstentions.

Errata to Reliability Standards CIP-006-7, CIP-007-7, CIP-008-7, CIP-009-7, and CIP-001-4 (agenda item 6)
A. Oswald provided an overview and highlighted that the correction is necessary to align with the defined term. Errata to be filed with FERC as they are still reviewing the submittal of the virtualization project. S. Bodkin made a motion to approve the errata changes to Reliability Standards CIP-006-7, CIP-007-7, CIP-008-7, CIP-009-7 and CIP-011-4 to correct the spelled-out term "Electronic Access Control or Monitoring System." T. Pyle seconded the motion.

The committee approved the motion with no oppositions and no abstentions.

Canadian-specific Revisions to EOP-012-3 – Extreme Cold Weather Preparedness and Operations (agenda item 8)
A. Oswald provided an overview. An observer provided an additional overview of the SAR and highlighted the key differences in the Canadian provinces. S. Bodkin asked if only Canadians are going to be solicited for the DT. A. Oswald confirmed that the makeup of the DT will be Canadian only. S. Bodkin questioned why a variance is only being requested for Canada and not also for the states that experience temperatures similar to Canada such as Wisconsin. S. Rueckert asked if the variance would result in a new version of the standard. L. Perotti responded that it would require a new version of the standard and an informational filing to FERC. P. MacDonald mentioned that not having FERC approval of the version may be an issue as his province follows only FERC approved standards. A. Oswald acknowledged P. MacDonald's comment and will address his comment offline. T. Bennett commented that the technical justification in the SAR is similar to the SAR comments. S. Bodkin commented that the technical justification is for jurisdictional issues. J.

Wike asked if the SAR undermines the comments from version 3 of the standard. An observer responded that the SAR does not undermine version 3 of the standard and their jurisdictional concerns were submitted throughout the entire balloting process for version 3. P. MacDonald made a motion to:

- Accept the Canadian-specific Revisions to EOP-012-3 – Extreme Cold Weather Preparedness and Operations SAR;
- Authorize posting of the SAR for 30-day formal comment period; and
- Authorize solicitation of drafting team (DT) members.

S. Rueckert seconded the motion.

The committee approved the motion. M. Brytowski (proxy for P. Metro) opposed and J. Wike abstained.

EOP-012-3 Cold Weather Update (agenda item 9)
J. Calderon provided an overview and highlighted that the FERC filing was made for the standard.

Projects Under Review (agenda item 10)
M. Brytowski reviewed the Project Tracking Spreadsheet. N. Santos reviewed the Project Posting Schedule and three-month outlook. A potential special call for Project 2020-06 was mentioned. S. Bodkin asked about the urgency of a special call. N. Santos responded that due to timing, the initial posting for the standard would not be able to wait until the May SC meeting. S. Bodkin commented that the waiver requested in agenda item 4 would only apply to the posting of the definitions. Applying the waiver would be a violation of the Rules of Procedure if used for the posting of standards. L. Perotti responded that there were two distinct items of action for agenda item 3. There would not be a violation of the Rules of Procedure in regard to the use of the waiver across the project, but the Committee could reconsider the earlier actions for agenda item 3.

Update Legal Update and Upcoming Standards Filings (agenda item 11)
A. Rigaud provided an update.

Adjournment
The meeting adjourned at 2:00 p.m. Eastern.

Standards Committee
2024 Segment Representatives

Segment and Terms	Representative	Organization	Proxy	Present (Member or Proxy)
Chair 2024-25	Todd Bennett* Managing Director, Reliability Compliance & Audit Services	Associated Electric Cooperative, Inc.		y
Vice Chair 2024-25	Troy Brumfield* Regulatory Compliance Manager	American Transmission Company		y

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the initial draft of the proposed standard for a formal 30-day comment period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024

Anticipated Actions	Date
30-day formal comment period with initial ballot	April 17 – May 16, 2025
20-day formal comment period with additional ballot	July – August 2025
10-day final ballot	September 2025
Board adoption	October 2025

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resources (DER): Generators and energy storage technologies connected to a distribution system that are capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including those connected behind the meter of an end-use customer that is supplied from a distribution system.

A. Introduction

1. **Title:** **Data for Power System Modeling and Analysis**

2. **Number:** **MOD-032-2**

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Balancing Authority

   4.1.2 Distribution Provider

   4.1.3 Generator Owner

   4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as “Planning Coordinator”)

   4.1.5 Resource Planner

   4.1.6 Transmission Owner

   4.1.7 Transmission Planner

   4.1.8 Transmission Service Provider

5. **Effective Date:** See Implementation Plan for Project 2022-02.

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1, including the responsible entity for each required item.

1.2. Requirements for model submissions in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization (ERO).

1.3. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.3.1. Data format;

1.3.2. Level of detail to which equipment shall be modeled;

1.3.3. Case types or scenarios to be modeled; and

1.3.4. A schedule for submission of data at least once every 13 calendar months.

1.4. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. If the responsible entity, as identified in Requirement R1 Part 1.1, is unable to gather unregistered Inverter-based Resource (IBR)[1] data or aggregate Distributed data and parameters and include an explanation of the limitations of

[1] As used in this standard, the phrase "unregistered IBR" refers to a Bulk-Power System connected IBR that does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.

the availability of data, an explanation of the limitations of any data provided, and the method used for estimation.

M2. Each registered entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data;

3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each registered entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. **Compliance Monitoring Process**

   1.1. **Compliance Enforcement Authority:** "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

   1.2. **Evidence Retention:** The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

   The applicable entity shall keep data or evidence to show compliance as identified below unless directive by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

   - Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

   If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

   The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

2. **Compliance Monitoring and Enforcement Program:** Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include less than or equal to 25% of the required components specified in Requirement R1. MOD-032-2 – ATTACHMENT 1
Data Reporting Requirements

The table below indicates the information[1] that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in Interconnection-wide cases. A Planning Coordinator may specify additional information that includes specific information required for each item in the table below. Each functional entity[2] typically responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The joint Planning Coordinator /Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1 will specify the functional entity responsibility and data flow processes. The data reported shall be identified by the bus number, name, and/or identifier that is assigned in conjunction with the Planning Coordinator, Transmission Owner, or Transmission Planner.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics**	**short circuit**
1. Each bus [TO] a. nominal voltage b. area, zone and owner 2. Aggregate Demand[3] [DP] a. real and reactive power* b. in-service status* 3. Generating and storage units[4] [GO, TO[5], RP (for future planned resources only)] a. real power capabilities - gross maximum and minimum values b. reactive power capabilities - maximum and minimum values at real power capabilities in 3a above c. station service auxiliary load for normal plant configuration (provide data in the same manner as that required for aggregate Demand under item 2, above).	1. Generator [GO, RP (for future planned resources only)] 2. Excitation System [GO, RP (for future planned resources only)] 3. Governor [GO, RP (for future planned resources only)] 4. Power System Stabilizer [GO, RP (for future planned resources only)] 5. Aggregate Demand[3] [DP] 6. Wind plant model (for plants with type 1 and type 2 wind turbines) [GO] 7. Inverter-Based Resource [GO, TO[5]] a. IBR capabilities related to momentary cessation, tripping, Ride-through, and frequency control 8. Static Var Systems and FACTS [GO, TO, DP] 9. DC system models [TO]	1. Provide for all applicable elements in column "steady-state" [GO, RP, TO, DP] a. Positive Sequence Data b. Negative Sequence Data c. Zero Sequence Data 2. Mutual Line Impedance Data [TO] 3. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics**	**short circuit**
d. regulated bus* and voltage set point* (as typically provided by the TOP) e. machine MVA base f. generator step up transformer data (provide same data as that required for transformer under item 6, below) g. generator type (hydro, wind, fossil, solar, nuclear, etc.) h. in-service status* 4. AC Transmission Line or Circuit [TO] a. impedance parameters (positive sequence) b. susceptance (line charging) c. ratings (normal and emergency)* d. in-service status* 5. DC Transmission systems [TO] 6. Transformer (voltage and phase-shifting) [TO] a. nominal voltages of windings b. impedance(s) c. tap ratios (voltage or phase angle)* d. minimum and maximum tap position limits e. number of tap positions (for both the ULTC and NLTC) f. regulated bus (for voltage regulating transformers)* g. ratings (normal and emergency)* h. in-service status* 7. Reactive compensation (shunt capacitors and reactors) [TO] a. admittances (MVars) of each capacitor and reactor b. regulated voltage band limits* (if mode of operation not fixed) c. mode of operation (fixed, discrete, continuous, etc.) d. regulated bus* (if mode of operation not fixed) e. in-service status* 8. Static Var Systems [TO] a. reactive limits b. voltage set point* c. fixed/switched shunt, if applicable	10. Aggregate Distributed Energy Resource (DER) data [DP, TO][6] a. DER capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control or information that can be used to infer those capabilities for modeling purposes. b. indication whether DER is subject to tripping in conjunction with UFLS or UVLS. 11. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]	

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics**	**short circuit**
d. in-service status* 9. Aggregate Distributed Energy Resource (DER) data [DP, TO][6] a. Location (bus from item 1) b. Real power capability c. DER type (solar, battery, diesel generator, etc.) 10. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]		

Attachment 1 Data Reporting Requirements Footnotes

1. Data specified in the sub-bullets of each column that are required for both steady-state and dynamics are not duplicated in the table.
2. For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Distribution Provider (DP), Generator Owner (GO), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).
3. For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 under Steady State Column that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. A Distribution Provider is the typical responsible entity for providing this information, generally through coordination with the Transmission Owner.
4. This includes IBR, synchronous condensers, and pumped storage.
5. The Transmission Owner is the typical responsible entity for collecting and providing data for unregistered IBRs that are not DERs.
6. The Distribution Provider is the typical responsible entity for collecting and providing data for DER connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider’s system. The Transmission Owner is the typical responsible entity for collecting and providing data for DER where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner’s system.

Version History

Version	Date	Action	Change Tracking
1	February 6, 2014	Adopted by the NERC Board of Trustees.	Developed to consolidate and replace MOD-010-0, MOD -011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1
1	May 1, 2014	FERC Order issued approving MOD-032-1.	See Implementation Plan posted on the Reliability Standards web page for details on enforcement dates for Requirements.
2	TBD	Adopted by the NERC Board of Trustees.	FERC Order No. 901 Revisions by Project 2022-02.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the initial draft of the proposed standard for a formal 30-day comment period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024

Anticipated Actions	Date
30-day formal comment period with initial ballot	April 17 – May 16, 2025
20-day formal comment period with additional ballot	July – August 2025
10-day final ballot	September 2025
Board adoption	October 2025

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resources (DER): Generators and energy storage technologies connected to a distribution system that are capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including those connected behind the meter of an end-use customer that is supplied from a distribution system.

A. Introduction

1. **Title:** **Data for Power System Modeling and Analysis**

2. **Number:** **MOD-032-12**

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Balancing Authority

   4.1.2 Distribution Provider

   4.1.24.1.3 Generator Owner

   4.1.3 Load Serving Entity

   4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as "Planning Coordinator")

   This proposed standard combines "Planning Authority" with "Planning Coordinator" in the list of applicable functional entities. The NERC Functional Model lists "Planning Coordinator" while the registration criteria list "Planning Authority," and they are not yet synchronized. Until that occurs, the proposed standard applies to both Planning Authority and Planning Coordinator.

   4.1.5 Resource Planner

   4.1.6 Transmission Owner

   4.1.7 Transmission Planner

   4.1.8 Transmission Service Provider

5. **Effective Date:** See Implementation Plan for Project 2022-02.

   MOD-032-1, Requirement R1 shall become effective on the first day of the first calendar quarter that is 12 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, MOD-032-1, Requirement R1 shall become effective on the first day of the first calendar quarter that is 12 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

   MOD-032-1, Requirements R2, R3, and R4 shall become effective on the first day of the first calendar quarter that is 24 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a

jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, MOD-032-1, Requirements R2, R3, and R4 shall become effective on the first day of the first calendar quarter that is 24 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.

6. Background:

MOD-032-1 exists in conjunction with MOD-033-1, both of which are related to system-level modeling and validation. Reliability Standard MOD-032-1 is a consolidation and replacement of existing MOD-010-0, MOD-011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1, and it requires data submission by applicable data owners to their respective Transmission Planners and Planning Coordinators to support the Interconnection-wide case building process in their Interconnection. Reliability Standard MOD-033-1 is a new standard, and it requires each Planning Coordinator to implement a documented process to perform model validation within its planning area.

The transition and focus of responsibility upon the Planning Coordinator function in both standards are driven by several recommendations and FERC directives from FERC Order No. 693, which are discussed in greater detail in the rationale sections of the standards. One of the most recent and significant set of recommendations came from the NERC Planning Committee's System Analysis and Modeling Subcommittee (SAMS). SAMS proposed several improvements to the modeling data standards, to include consolidation of the standards (the SAMS whitepaper is available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here: http://www.nerc.com/comm/PC/Agendas%20Highlights%20and%20Minutes%20DL/2012/2012_Dec_PC%20Agenda.pdf).

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1~~.~~, including the responsible entity for each required item.

1.2. Requirements for model submissions in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization (ERO).

~~**1.2.**~~**1.3.** Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

~~**1.2.1.**~~**1.3.1.** Data format;

~~**1.2.2.**~~**1.3.2.** Level of detail to which equipment shall be modeled;

~~**1.2.3.**~~**1.3.3.** Case types or scenarios to be modeled; and

~~**1.2.4.**~~**1.3.4.** A schedule for submission of data at least once every 13 calendar months.

~~**1.3.**~~**1.4.** Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Distribution Provider, Generator Owner~~, Load Serving Entity~~, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. If the responsible entity, as identified in Requirement R1 Part 1.1, is unable to gather unregistered Inverter-based Resource (IBR)[1] data or aggregate Distributed Energy Resource (DER) data, the responsible entity shall estimate the modeling data and parameters and include an explanation of the limitations of

[1] As used in this standard, the phrase "unregistered IBR" refers to a Bulk-Power System connected IBR that does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.

the availability of data, an explanation of the limitations of any data provided, and the method used for estimation.

M2. Each registered entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Distribution Provider, Generator Owner, Load Serving Entity, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data;

3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each registered entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. **Compliance Enforcement Authority**

   1.1. "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

   1.2. **Evidence Retention:** The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

   The applicable entity shall keep data or evidence to show compliance as identified below unless directive by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation. with

   - Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

   If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

   The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

2. **Compliance Monitoring and Assessment Processes:** Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards..

~~1.3.~~

MOD-032-012 – ATTACHMENT 1:

Data Reporting Requirements

The table, below, indicates the information[1] that is required to effectively model the interconnected transmission system for the Near-Term Transmission Planning Horizon and Long-Term Transmission Planning Horizon. Data must be shareable on an interconnection-wide basis to support use in *the* Interconnection-wide cases. A Planning Coordinator may specify additional information that includes specific information required for each item in the table below. Each functional *entity*[2] typically responsible for reporting the respective data in the table is identified by brackets "[functional entity]" adjacent to and following each data item. The joint Planning Coordinator /Transmission Planner modeling data requirements and reporting procedures developed under Requirement R1 will specify the functional entity responsibility and data flow processes. The data reported shall be *as* identified by the bus number, name, and/or identifier that is assigned in conjunction with the *PC, TO*Planning Coordinator, Transmission Owner, or Transmission Planner*TP*.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. Those items may have different data provided for different modeling scenarios)*	**dynamics** *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	**short circuit**
1. Each bus [TO] a. nominal voltage b. area, zone and owner 2. Aggregate Demand[2] [LSEDemand[3] [DP] a. real and reactive power*	1. Generator [GO, RP (for future planned resources only)] 2. Excitation System [GO, RP (for future planned resources only)]	1. Provide for all applicable elements in column "steady-state" [GO, RP, TO, DP] a. Positive Sequence Data b. Negative Sequence Data c. Zero Sequence Data

[2] For purposes of this item, aggregate Demand is the Demand aggregated at each bus under item 1 that is identified by a Transmission Owner as a load serving bus. A Load Serving Entity is responsible for providing this information, generally through coordination with the Transmission Owner.

steady-state *(Items marked with an asterisk indicate data that vary with system operating state or conditions. -Those items may have different data provided for different modeling scenarios)*	dynamics *(If a user-written model(s) is submitted in place of a generic or library model, it must include the characteristics of the model, including block diagrams, values and names for all model parameters, and a list of all state variables)*	short circuit
b. in-service status* 3. Generating Units[3]and storage units[4] [GO, TO[5], RP (for future planned resources only)] a. real power capabilities - gross maximum and minimum values b. reactive power capabilities - maximum and minimum values at real power capabilities in 3a above c. station service auxiliary load for normal plant configuration (provide data in the same manner as that required for aggregate Demand under item 2, above). d. regulated bus* and voltage set point* (as typically provided by the TOP) e. machine MVA base f. generator step up transformer data (provide same data as that required for transformer under item 6, below) g. generator type (hydro, wind, fossil, solar, nuclear, etc.) h. in-service status* h. 4. AC Transmission Line or Circuit [TO] a. impedance parameters (positive sequence) b. susceptance (line charging) c. ratings (normal and emergency)* d. in-service status*	3. Governor [GO, RP (for future planned resources only)] 4. Power System Stabilizer [GO, RP (for future planned resources only)] 5. Demand [LSE]Aggregate Demand[3] [DP] 6. Wind Turbine Dataplant model (for plants with type 1 and type 2 wind turbines) [GO] 7. Photovoltaic systems [GO] 7. Inverter-Based Resource [GO, TO[5]] a. IBR capabilities related to momentary cessation, tripping, Ride-through, and frequency control 8. Static Var Systems and FACTS [GO, TO, LSEDP] 9. DC system models [TO] 10. Aggregate Distributed Energy Resource (DER) data [DP, TO][6] a. DER capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control or information that can be used to infer those capabilities for modeling purposes. b. indication whether DER is subject to tripping in conjunction with UFLS or UVLS. 10.11. Other information requested by the Planning Coordinator or Transmission Planner	2. Mutual Line Impedance Data- [TO] 3. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, LSEDP, TO, TSP]

[3] Including synchronous condensers and pumped storage.

Static Var Systems -[TO] a. reactive limits b. voltage set point* c. fixed/switched shunt, if applicable d. in-service status* 9. Aggregate Distributed Energy Resource (DER) data [DP, TO][6] a. Location (bus from item 1) b. Real power capability c. DER type (solar, battery, diesel generator, etc.) ~~9.~~10. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, ~~LSE~~DP, TO, TSP]	necessary for modeling purposes. [BA, GO, ~~LSE~~DP, TO, TSP]	

Guidelines and Technical Basis

For purposes of jointly developing steady-state, dynamics, and short circuit modeling data requirements and reporting procedures under Requirement R1, if a Transmission Planner (TP) and Planning Coordinator (PC) mutually agree, a TP may collect and aggregate some or all data from providing entities, and the TP may then provide that data directly to the PC(s) on behalf of the providing entities. The submitting entities are responsible for getting the data to both the TP and the PC, but nothing precludes them from arriving at mutual agreements for them to provide it to the TP, who then provides it to the PC. Such agreement does not relieve the submitting entity from responsibility under the standard, nor does it make the consolidating entity liable for the submitting entities' compliance under the standard (in essence, nothing precludes parties from agreeing to consolidate or act as a conduit to pass the data, and it is in fact encouraged in certain circumstances, but the requirement is aimed at the act of submitting the data). Notably, there is no requirement for the TP to provide data to the PC. The intent, in part, is to address potential concerns from entities that they would otherwise be responsible for the quality, nature, and sufficiency of the data provided by other entities.

The requirement in Part 1.3 to include specifications for distribution or posting of the data requirements and reporting procedures could be accomplished in many ways, to include posting on a Web site, distributing directly, or through other methods that the Planning Coordinator and each of its Transmission Planners develop.

An entity submitting data per the requirements of this standard who needs to determine the PC for the area, as a starting point, should contact the local Transmission Owner (TO) for information on the TO's PC. Typically, the PC will be the same for both the local TO and those entities connected to the TO's system. If this is not the case, the local TO's PC can typically provide contact information on other PCs in the area. If the entity (e.g., a Generator Owner [GO]) is requesting connection of a new generator, the entity can determine who the PC is for that area at the time a generator connection request is submitted. Often the TO and PC are the same entity, or the TO can provide information on contacting the PC. The entity should specify as the reason for the request to the TO that the entity needs to provide data to the PC according to this standard. Nothing in the proposed requirement language of this standard is intended to preclude coordination between entities such that one entity, serving only as a conduit, provides the other entity's data to the PC. This can be accomplished if it is mutually agreeable by, for example, the GO (or other entity), TP, and the PC. This does not, however, relieve the original entity from its obligations under the standard to provide data, nor does it pass on the compliance obligation of the entity. The original entity is still accountable for making sure that the data has been provided to the PC according to the requirements of this standard.

The standard language recognizes that differences exist among the Interconnections. Presently, the Eastern/Quebec and Texas Interconnections build seasonal cases on an annual basis, while the Western Interconnection builds cases on a continuous basis throughout the year. The intent of the standard is not to change established processes and procedures in each of the Interconnections, but to create a framework to support both what is already in place or what it may transition into in the future, and

~~to provide further guidance in a common platform for the collection of data that is necessary for the building of the Interconnection-wide case(s).~~

~~The construct that these standards replace did not specifically list which Functional Entities were required to provide specific data. Attachment 1 specifically identifies the entities responsible for the data required for the building of the Interconnection-wide case(s).~~

~~Rationale:~~

~~During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.~~

~~Rationale for R1:~~

~~This requirement consolidates the concepts from the original data requirements from MOD-011-0, Requirement R1, and MOD-013-0, Requirement R1. The original requirements specified types of steady-state and dynamics data necessary to model and analyze the steady-state conditions and dynamic behavior or response within each Interconnection. The original requirements, however, did not account for the collection of short-circuit data also required to perform short-circuit studies. The addition of short-circuit data also addresses the outstanding directive from FERC Order No. 890, paragraph 290.~~

~~In developing a performance-based standard that would address the data requirements and reporting procedures for model data, it was prohibitively difficult to account for all of the detailed technical concerns associated with the preparation and submittal of model data given that many of these concerns are dependent upon evolving industry modeling needs and software vendor terminology and product capabilities.~~

~~This requirement establishes the Planning Coordinator jointly with its Transmission Planners as the developers of technical model data requirements and reporting procedures to be followed by the data owners in the Planning Coordinator's planning area. FERC Order No. 693, paragraphs 1155 and 1162, also direct that the standard apply to Planning Coordinators. The inclusion of Transmission Planners in the applicability section is intended to ensure that the Transmission Planners are able to participate jointly in the development of the data requirements and reporting procedures.~~

~~This requirement is also consistent with the recommendations from the NERC System Analysis and Modeling Subcommittee (SAMS) White Paper titled "Proposed Improvements for NERC MOD Standards", available from the December 2012 NERC Planning Committee's agenda package, item 3.4, beginning on page 99, here:~~

Aside from recommendations in support of strengthening and improving MOD-010 through MOD-015, the SAMS paper included the following suggested improvements:

1) reduce the quantity of MOD standards;
2) add short circuit data as a requirement to the MOD standards; and
3) supply data and models:
    a. add requirement identifying who provides and who receives data;
    b. identify acceptability;
    c. standard format;
    d. how to deal with new technologies (user written models if no standard model exists); and
    e. shareability.
4) These suggested improvements are addressed by combining the existing standards into two new standards, one standard for the submission and collection of data, and one for the validation of the planning models. Adding the requirement for the submittal of short circuit data is also an improvement from the existing standards, consistent with FERC Order No. 890, paragraph 290. In supplying data, the approach clearly identifies what data is required and which Functional Entity is required to provide the data.
5) The requirement uses an attachment approach to support data collection. The attachment specifically lists the entities that are required to provide each type of data and the steady-state, dynamics, and short circuit data that is required.
6) Finally, the decision to combine steady-state, dynamics, and short circuit data requirements into one requirement rather than three reflects that they all support the requirement of submission of data in general.

Rationale for R2:

This requirement satisfies the directive from FERC Order No. 693, paragraph 1155, which directs that "the planning authority should be included in this Reliability Standard because the planning authority is the entity responsible for the coordination and integration of transmission facilities and resource plans, as well as one of the entities responsible for the integrity and consistency of the data."

Rationale for R3:

In order to maintain a certain level of accuracy in the representation of a power system, the data that is submitted must be correct, periodically checked, and updated. Data used to perform steady-state, dynamics, and short circuit studies can change, for example, as a result of new planned transmission construction (in comparison to as-built information) or changes performed during the

~~restoration of the transmission network due to weather-related events. One set of data that changes on a more frequent basis is load data, and updates to load data are needed when new improved forecasts are created.~~

~~This requirement provides a mechanism for the Planning Coordinator and Transmission Planner (that does not exist in the current standards) to collect corrected data from the entities that have the data. It provides a feedback loop to address technical concerns related to the data when the Planning Coordinator or Transmission Planner identifies technical concerns, such as concerns about the usability of data or simply that the data is not in the correct format and cannot be used. The requirement also establishes a time-frame for response to address timeliness.~~

~~Rationale for R4:~~

~~This requirement will replace MOD-014 and MOD-015.~~

~~This requirement recognizes the differences among Interconnections in model building processes, and it creates an obligation for Planning Coordinators to make available data for its planning area.~~

~~The requirement creates a clear expectation that Planning Coordinators will make available data that they collect under Requirement R2 in support of their respective Interconnection-wide case(s). While different entities in each Interconnection create the Interconnection-wide case(s), the requirement to submit the data to the "ERO or its designee" supports a framework whereby NERC, in collaboration and agreement with those other organizations, can designate the appropriate organizations in each Interconnection to build the specific Interconnection-wide case(s). It does not prescribe a specific group or process to build the larger Interconnection-wide case(s), but only requires the Planning Coordinators to make available data in support of their creation, consistent with the SAMS Proposed Improvements to NERC MOD Standards (at page 3) that, "industry best practices and existing processes should be considered in the development of requirements, *as many entities are successfully coordinating their efforts.*" (Emphasis added).~~

~~This requirement is about the Planning Coordinator's obligation to make information available for use in the Interconnection-wide case(s); it is not a requirement to build the Interconnection-wide case(s).~~

~~For example, under current practice, the Eastern Interconnection Reliability Assessment Group (ERAG) builds the Eastern Interconnection and Quebec Interconnection-wide cases, the Western Electricity Coordinating Council (WECC) builds the Western Interconnection-wide cases, and the Electric Reliability Council of Texas (ERCOT) builds the Texas Interconnection-wide cases. This requirement does not require a change to that construct, and, assuming continued agreement by those organizations, ERAG, WECC, and ERCOT could be the "designee" for each Interconnection contemplated by this requirement. Similarly, the requirement does not prohibit transition, and the requirement remains for the Planning Coordinators to make available the information to the ERO or~~

~~to whomever the ERO has coordinated with and designated as the recipient of such information for purposes of creation of each of the Interconnection–wide cases.~~

Attachment 1 Data Reporting Requirements Footnotes

1. Data specified in the sub-bullets of each column that are required for both steady-state and dynamics are not duplicated in the table.
2. For purposes of this attachment, the functional entity references are represented by abbreviations as follows: Balancing Authority (BA), Distribution Provider (DP), Generator Owner (GO), Planning Coordinator (PC), Resource Planner (RP), Transmission Owner (TO), Transmission Planner (TP), and Transmission Service Provider (TSP).
3. For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 under Steady State Column that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. A Distribution Provider is the typical responsible entity for providing this information, generally through coordination with the Transmission Owner.
4. This includes IBR, synchronous condensers, and pumped storage.
5. The Transmission Owner is the typical responsible entity for collecting and providing data for unregistered IBRs that are not DERs.
6. The Distribution Provider is the typical responsible entity for collecting and providing data for DER connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the Distribution Provider's system. The Transmission Owner is the typical responsible entity for collecting and providing data for DER where there is no associated registered Distribution Provider between the DER connection point and the Transmission Owner's system.

Version History

Version	Date	Action	Change Tracking
1	February 6, 2014	Adopted by the NERC Board of Trustees.	Developed to consolidate and replace MOD-010-0, MOD -011-0, MOD-012-0, MOD-013-1, MOD-014-0, and MOD-015-0.1
1	May 1, 2014	FERC Order issued approving MOD-032-1.	See Implementation Plan posted on the Reliability Standards web page for details on enforcement dates for Requirements.
2	TBD	Adopted by the NERC Board of Trustees.	FERC Order No. 901 Revisions by Project 2022-02.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the initial draft of the proposed standard for a formal 30-day comment period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	November 13, 2024
SAR posted for comment	May 5 – June 6, 2024
45-day formal comment period with initial ballot	April 17 – May 2, 2025

Anticipated Actions	Date
30-day formal comment period with initial ballot	April 17 – May 16, 2025
20-day formal comment period with additional ballot	July – August 2025
10-day final ballot	September 2025
Board adoption	October 2025

A. Introduction

1. **Title:** Reliability Coordinator Data and information Specification and Collection

2. **Number:** IRO-010-6

3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact reliability, by ensuring each Reliability Coordinator has the data and information it needs to plan, monitor and assess the operation of its Reliability Coordinator Area.

4. **Applicability:**

   4.1. Reliability Coordinator

   4.2. Balancing Authority

   4.3. Generator Owner

   4.4. Generator Operator

   4.5. Transmission Operator

   4.6. Transmission Owner

   4.7. Distribution Provider

5. **Effective Date:** See Implementation Plan for Project 2022-02.

B. Requirements

R1. The Reliability Coordinator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include but not be limited to: *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification as deemed necessary by the Reliability Coordinator.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1 Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints.

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide data and information that includes, but is not limited to:

1.5.1 Specific deadlines or periodicity in which data and information is to be provided;

1.5.2 Performance criteria for the availability and accuracy of data and information, as applicable;

1.5.3 Requirements for model submissions in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization;

1.5.4 Provisions to update or correct data and information, as applicable or necessary;

1.5.5 A mutually agreeable format; and

1.5.6 A mutually agreeable method(s) for securely transferring data and information.

M1. The Reliability Coordinator shall make available its dated, current, in force documented specification(s) for data and information.

R2. The Reliability Coordinator shall distribute its data and information specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real- time monitoring, and Real-time Assessments. *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

M2. The Reliability Coordinator shall make available evidence that it has distributed its specification(s) to entities that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. This evidence could include, but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or email records.

R3. Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall satisfy the obligations of the documented specifications. *(Violation Risk Factor: Medium) (Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations)*

M3. The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Reliability Coordinator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall make available evidence that it satisfied the obligations of the documented specification using the specified criteria. Such evidence could include, but is not limited to electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain its dated, current, in force documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R1, Measure M1 as well as any documents in force since the last compliance audit.
- The Reliability Coordinator shall keep evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R2, Measure M2.
- Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R3 and Measurement M3.

1.3. Compliance Monitoring and Enforcement Program:
"Compliance Monitoring and Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Time Horizon	VRF	Violation Severity Levels			
			Lower	Moderate	High	Severe
R1	Operations Planning	Low	The Reliability Coordinator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Reliability Coordinator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
For the Requirement R2 VSLs only, the intent of the DT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.						

R#	Time Horizon	VRF	Violation Severity Levels			
			Lower	Moderate	High	Severe
R2	Operations Planning	Low	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, and Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to four or more entities, or more than 15% of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R3	Operations Planning, Same-Day Operations, Real-time Operations	Medium	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet one of the parts in Requirement Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet two of the parts in Requirement R1Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet any of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 did not satisfy the obligations of the documented specifications.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the initial draft of the proposed standard for a formal 30-day comment period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	November 13, 2024
SAR posted for comment	May 5 – June 6, 2024
45-day formal comment period with initial ballot	April 17 – May 2, 2025

Anticipated Actions	Date
30-day formal comment period with initial ballot	April 17 – May 16, 2025
20-day formal comment period with additional ballot	July – August 2025
10-day final ballot	September 2025
Board adoption	October 2025

A. Introduction

1. **Title:** Reliability Coordinator Data and information Specification and Collection

2. **Number:** IRO-010-~~5~~6

3. **Purpose:** To prevent instability, uncontrolled separation, or Cascading outages that adversely impact reliability, by ensuring each Reliability Coordinator has the data and information it needs to plan, monitor and assess the operation of its Reliability Coordinator Area.

4. **Applicability:**

   4.1. Reliability Coordinator

   4.2. Balancing Authority

   4.3. Generator Owner

   4.4. Generator Operator

   4.5. Transmission Operator

   4.6. Transmission Owner

   4.7. Distribution Provider

5. **Effective Date:** See Implementation Plan for Project ~~2021-06.~~2022-02.

B. Requirements

R1. The Reliability Coordinator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include but not be limited to: *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification as deemed necessary by the Reliability Coordinator.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1 Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints.

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide data and information that includes, but is not limited to~~.~~:

1.5.1 Specific deadlines or periodicity in which data and information is to be provided;

1.5.2 Performance criteria for the availability and accuracy of data and information, as applicable;

1.5.3 Requirements for model submissions in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization;

~~1.5.3~~1.5.4 Provisions to update or correct data and information, as applicable or necessary~~.~~;

~~1.5.4~~1.5.5 A mutually agreeable format~~.~~; and

~~1.5.5~~1.5.6 A mutually agreeable method(s) for securely transferring data and information.

M1. The Reliability Coordinator shall make available its dated, current, in force documented specification(s) for data and information.

R2. The Reliability Coordinator shall distribute its data and information specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real- time monitoring, and Real-time Assessments. *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

M2. The Reliability Coordinator shall make available evidence that it has distributed its specification(s) to entities that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. This evidence could include, but is not limited to web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or ~~e-mail~~email records.

R3. Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall satisfy the obligations of the documented specifications. *(Violation Risk Factor: Medium) (Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations)*

M3. The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Reliability Coordinator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R2 shall make available evidence that it satisfied the obligations of the documented specification using the specified criteria. Such evidence could include, but is not limited to electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" ~~(CEA)~~ means NERC or the Regional Entity~~, or any entity as otherwise designated by an Applicable Governmental Authority,~~ in their respective roles of monitoring and~~/or~~ enforcing compliance with the ~~mandatory and enforceable~~NERC Reliability Standards ~~in their respective jurisdictions~~.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the ~~CEA~~Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider shall each keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation:

- The Reliability Coordinator shall retain its dated, current, in force documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R1, Measure M1 as well as any documents in force since the last compliance audit.
- The Reliability Coordinator shall keep evidence for three calendar years that it has distributed its ~~-~~specification(s) to entities that have data required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R2, Measure M2.
- Each Reliability Coordinator, Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a ~~-~~specification(s) shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R3 and Measurement M3.

1.3. Compliance Monitoring and Enforcement Program:
~~As defined in the NERC Rules of Procedure,~~ "Compliance Monitoring and Enforcement Program" ~~refers~~or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the ~~identification~~NERC Rules of Procedure) or the Commission-approved program of ~~the processes~~a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that ~~will be used to evaluate data or information~~is responsible for ~~the purpose of assessing performance or~~

~~outcomes~~performing compliance monitoring and enforcement activities with ~~the associated reliability standard~~respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Time Horizon	VRF	Violation Severity Levels			
			Lower	Moderate	High	Severe
R1	Operations Planning	Low	The Reliability Coordinator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments.	The Reliability Coordinator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Reliability Coordinator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
For the Requirement R2 VSLs only, the intent of the ~~SDT~~DT is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.						

R#	Time Horizon	VRF	Violation Severity Levels			
			Lower	Moderate	High	Severe
R2	Operations Planning	Low	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, and Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Reliability Coordinator did not distribute its specification(s) as developed in Requirement R1 to four or more entities, or more than 15% of the entities, whichever is greater, that have data and information required by the Reliability Coordinator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R3	Operations Planning, Same-Day Operations, Real-time Operations	Medium	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet one of the parts in Requirement Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet two of the parts in Requirement R1Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 satisfied the obligations of the documented specifications but failed to meet any of the parts in Requirement R1 Part 1.5.	The responsible entity receiving a specification(s) in Requirement R2 did not satisfy the obligations of the documented specifications.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the initial draft of the proposed standard for a formal 30-day comment period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	November 13, 2024
SAR posted for comment	May 17 – June 24, 2024

Anticipated Actions	Date
30-day formal comment period with initial ballot	April 17 – May 16, 2025
20-day formal comment period with additional ballot	July – August 2025
10-day final ballot	September 2025
Board adoption	October 2025

A. Introduction

1. **Title:** Transmission Operator and Balancing Authority Data and Information Specification and Collection

2. **Number:** TOP-003-8

3. **Purpose:** To ensure that each Transmission Operator and Balancing Authority has the data and information it needs to plan, monitor, and assess the operation of its Transmission Operator Area or Balancing Authority Area.

4. **Applicability:**

   4.1 Functional Entities:

   4.1.1 Transmission Operator

   4.1.2 Balancing Authority

   4.1.3 Generator Owner

   4.1.4 Generator Operator

   4.1.5 Transmission Owner

   4.1.6 Distribution Provider

5. **Effective Date:** See Implementation Plan for Project 2022-02.

B. Requirements and Measures

R1. Each Transmission Operator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification as deemed necessary by the Transmission Operator.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1. Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide the data and information that includes, at a minimum, the following:

1.5.1. Specified deadlines or periodicity in which data and information is to be provided;

1.5.2. Performance criteria for the availability and accuracy of data and information as applicable;

1.5.3. Requirements for model submissions in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization ;

1.5.4. Provisions to update or correct data and information, as applicable or necessary;

1.5.5. A mutually agreeable format;

1.5.6. Mutually agreeable method(s) for securely transferring data and information.

M1. Each Transmission Operator shall make available its dated, current, in force documented specification(s) for data and information.

R2. Each Balancing Authority shall maintain documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. The data specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

2.1. A list of data and information needed by the Balancing Authority to support its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments, including non-Bulk Electric System data and information, IBR-specific data and parameters, and external network data and information, as deemed necessary by the Balancing Authority, and identification of the entity responsible for responding to the specification.

2.2. Provisions for notification of current Protection System and Remedial Action Scheme status or degradation that impacts System reliability.

2.3. Provisions for notification of BES generating unit(s) status during local forecasted cold weather to include:

2.3.1. Operating limitations based on:

2.3.1.1. capability and availability;

2.3.1.2. fuel supply and inventory concerns;

2.3.1.3. fuel switching capabilities; and

2.3.1.4. environmental constraints.

2.3.2. Generating unit(s) minimum:

2.3.2.1. design temperature; or

2.3.2.2. historical operating temperature; or

2.3.2.3. current cold weather performance temperature determined by an engineering analysis.

2.4. Identification of a mutually agreeable process in resolving conflicts;

2.5. Methods for the entity identified in Part 2.1 to provide data and information that includes at a minimum the following:

2.5.1. Specific deadlines or periodicity in which data and information is to be provided;

2.5.2. Performance criteria for the availability and accuracy of data and information, as applicable;

2.5.3. Requirements for model submissions in accordance with the Criteria for Acceptable Models maintained by the ERO;

2.5.4. Provisions to update or correct data and information, as applicable or necessary.

2.5.5. A mutually agreeable format.

2.5.6. A mutually agreeable method(s) for securely transferring data and information.

M2. Each Balancing Authority shall make available its dated, current, in force documented specification(s) for data and information.

R3. Each Transmission Operator shall distribute its data and information specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M3. Each Transmission Operator shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or email records.

R4. Each Balancing Authority shall distribute its data and information specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. Each Balancing Authority shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, or email records.

R5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a data and information specification(s) in Requirement R3 or R4 shall satisfy the obligations of the documented specifications. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall make available evidence that it has satisfied the obligations of the documented specification. Such evidence could include, but is not limited to, electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority (CEA) may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Transmission Operator shall retain its dated, current, in force, documented specification for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R1 and Measurement M1 as well as any documents in force since the last compliance audit.
- Each Balancing Authority shall retain its dated, current, in force, documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R2 and Measurement M2, as well as any documents in force since the last compliance audit.
- Each Transmission Operator shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R3 and Measurement M3.
- Each Balancing Authority shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R4 and Measurement M4.
- Each Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall retain evidence for the most recent 90-calendar days that it has satisfied the obligations of

the documented specifications in accordance with Requirement R5 and Measurement M5.

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Transmission Operator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Transmission Operator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R2	The Balancing Authority did not include two or fewer of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include three of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include four of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include any of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. OR, The Balancing Authority did not have a documented specification(s) for the data and information necessary for it to perform its analysis functions,

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				Real-time monitoring, and Near-Term Energy Reliability Assessments.
For the Requirement R3 and R4 VSLs only, the intent of the Drafting Team (DT) is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				
R3	The Transmission Operator did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R4	The Balancing Authority did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term	The Balancing Authority did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time	The Balancing Authority did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability	The Balancing Authority did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
	Energy Reliability Assessments.	monitoring, and Near-Term Energy Reliability Assessments.	Assessments.	
R5	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet one of the parts in Requirement R1 Part1.5 or Requirement R2 Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet two of the parts in Requirement R1 Part 1.5 or Requirement R2 Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet three or more of the parts in Requirement R1 Part 1.5 or Requirement R2 Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 did not satisfy the obligations of the documented specifications.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the initial draft of the proposed standard for a formal 30-day comment period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	November 13, 2024
SAR posted for comment	May 17 – June 24, 2024

Anticipated Actions	Date
30-day formal comment period with initial ballot	April 17 – May 16, 2025
20-day formal comment period with additional ballot	July – August 2025
10-day final ballot	September 2025
Board adoption	October 2025

A. Introduction

1. **Title:** Transmission Operator and Balancing Authority Data and Information Specification and Collection

2. **Number:** TOP-003-~~7~~8

3. **Purpose:** To ensure that each Transmission Operator and Balancing Authority has the data and information it needs to plan, monitor, and assess the operation of its Transmission Operator Area or Balancing Authority Area.

4. **Applicability:**

   4.1 Functional Entities:

   4.1.1 Transmission Operator

   4.1.2 Balancing Authority

   4.1.3 Generator Owner

   4.1.4 Generator Operator

   4.1.5 Transmission Owner

   4.1.6 Distribution Provider

5. **Effective Date:** See Implementation Plan for Project 2022-~~03~~02.

B. Requirements and Measures

R1. Each Transmission Operator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

1.1. A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification as deemed necessary by the Transmission Operator.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1. Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide the data and information that includes, at a minimum, the following:~~.~~

1.5.1. Specified deadlines or periodicity in which data and information is to be provided;

1.5.2. Performance criteria for the availability and accuracy of data and information as applicable;

1.5.3. Requirements for model submissions in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization;

~~**1.5.3.**~~**1.5.4.** Provisions to update or correct data and information, as applicable or necessary;

~~1.5.4.~~1.5.5. A mutually agreeable format;

~~1.5.5.~~1.5.6. Mutually agreeable method(s) for securely transferring data and information.

M1. Each Transmission Operator shall make available its dated, current, in force documented specification(s) for data and information.

R2. Each Balancing Authority shall maintain documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. The data specification shall include, but not be limited to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

2.1. A list of data and information needed by the Balancing Authority to support its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments, including non-Bulk Electric System data and information, IBR-specific data and parameters, and external network data and information, as deemed necessary by the Balancing Authority, and identification of the entity responsible for responding to the specification.

2.2. Provisions for notification of current Protection System and Remedial Action Scheme status or degradation that impacts System reliability.

2.3. Provisions for notification of BES generating unit(s) status during local forecasted cold weather to include:

2.3.1. Operating limitations based on:

2.3.1.1. capability and availability;

2.3.1.2. fuel supply and inventory concerns;

2.3.1.3. fuel switching capabilities; and

2.3.1.4. environmental constraints.

2.3.2. Generating unit(s) minimum:

2.3.2.1. design temperature; or

2.3.2.2. historical operating temperature; or

2.3.2.3. current cold weather performance temperature determined by an engineering analysis.

2.4. Identification of a mutually agreeable process in resolving conflicts;

2.5. Methods for the entity identified in Part 2.1 to provide data and information that includes at a minimum the following~~.~~:

2.5.1. Specific deadlines or periodicity in which data and information is to be provided;

2.5.2. Performance criteria for the availability and accuracy of data and

information, as applicable;

2.5.3. Requirements for model submissions in accordance with the Criteria for Acceptable Models maintained by the ERO;

~~2.5.3.~~2.5.4. Provisions to update or correct data and information, as applicable or necessary.

~~2.5.4.~~2.5.5. A mutually agreeable format.

~~2.5.5.~~2.5.6. A mutually agreeable method(s) for securely transferring data and information.

M2. Each Balancing Authority shall make available its dated, current, in force documented specification(s) for data and information.

R3. Each Transmission Operator shall distribute its data and information specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M3. Each Transmission Operator shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, date and contents, or ~~e-mail~~email records.

R4. Each Balancing Authority shall distribute its data and information specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M4. Each Balancing Authority shall make available evidence that it has distributed its data specification(s) to entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. Such evidence could include, but is not limited to, web postings with an electronic notice of the posting, dated operator logs, voice recordings, postal receipts showing the recipient, or ~~e-mail~~email records.

R5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a data and information specification(s) in Requirement R3 or R4 shall satisfy the obligations of the documented specifications. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]*

M5. Each Transmission Operator, Balancing Authority, Generator Owner, Generator Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall make available evidence that it has satisfied the obligations

of the documented specification. Such evidence could include, but is not limited to, electronic or hard copies of data transmittals or attestations of receiving entities.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority (CEA) may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

~~Each responsible~~The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its ~~CEA~~Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Transmission Operator shall retain its dated, current, in force, documented specification for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R1 and Measurement M1 as well as any documents in force since the last compliance audit.
- Each Balancing Authority shall retain its dated, current, in force, documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R2 and Measurement M2, as well as any documents in force since the last compliance audit.
- Each Transmission Operator shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments in accordance with Requirement R3 and Measurement M3.
- Each Balancing Authority shall retain evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments in accordance with Requirement R4 and Measurement M4.
- Each Balancing Authority, Generator Owner, Generator Operator, Transmission Operator, Transmission Owner, and Distribution Provider receiving a specification(s) in Requirement R3 or R4 shall retain evidence

for the most recent 90-calendar days that it has satisfied the obligations of the documented specifications in accordance with Requirement R5 and Measurement M5.

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Transmission Operator did not include one or two of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include three of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include four of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not include any of the parts (Part 1.1 through Part 1.5) of the documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. OR, The Transmission Operator did not have a documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R2	The Balancing Authority did not include two or fewer of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include three of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include four of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.	The Balancing Authority did not include any of the parts (Part 2.1 through Part 2.5) of the documented specification(s) for the data and information necessary for it to perform its analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments. OR, The Balancing Authority did not have a documented specification(s) for the data and information necessary for it to perform its analysis functions,

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
				Real-time monitoring, and Near-Term Energy Reliability Assessments.
For the Requirement R3 and R4 VSLs only, the intent of the ~~Standard~~ Drafting Team (~~S~~DT) is to start with the Severe VSL first and then to work your way to the left until you find the situation that fits. In this manner, the VSL will not be discriminatory by size of entity. If a small entity has just one affected reliability entity to inform, the intent is that that situation would be a Severe violation.				
R3	The Transmission Operator did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the reliability entities, whichever is greater, that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	The Transmission Operator did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.
R4	The Balancing Authority did not distribute its Specification(s) to one entity, or 5% or less of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term	The Balancing Authority did not distribute its Specification(s) to two entities, or more than 5% and less than or equal to 10% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time	The Balancing Authority did not distribute its Specification(s) to three entities, or more than 10% and less than or equal to 15% of the entities, whichever is greater, that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability	The Balancing Authority did not distribute its Specification(s) to four or more entities, or more than 15% of the entities that have data and information required by the Balancing Authority's analysis functions, Real-time monitoring, and Near-Term Energy Reliability Assessments.

R#	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
	Energy Reliability Assessments.	monitoring, and Near-Term Energy Reliability Assessments.	Assessments.	
R5	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet one of the parts in Requirement R1 Part1.5 or Requirement R2 Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet two of the parts in Requirement R1 Part 1.5 or Requirement R2 Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 satisfied the obligations in the specification, but failed to meet three or more of the parts in Requirement R1 Part 1.5 or Requirement R2 Part 2.5.	The responsible entity receiving a specification(s) in Requirement R3 or R4 did not satisfy the obligations of the documented specifications.

Implementation Plan

Project 2022-02 Uniform Modeling Framework for IBR

Applicable Standard(s)

- Reliability Standard MOD-032-2 Data for Power System Modeling and Analysis
- Reliability Standard IRO-010-6 Reliability Coordinator Data and information Specification and Collection
- Reliability Standard TOP-003-8 Transmission Operator and Balancing Authority Data and Information Specification and Collection

Requested Retirement(s)

- Reliability Standard MOD-032-1 Data for Power System Modeling and Analysis
- Reliability Standard IRO-010-5 Reliability Coordinator Data and information Specification and Collection
- Reliability Standard TOP-003-7 Transmission Operator and Balancing Authority Data and Information Specification and Collection

Prerequisite Standard(s)

These standard(s) or definitions must be approved before the Applicable Standard becomes effective:

- None

Applicable Entities

- Reliability Coordinator
- Balancing Authority
- Distribution Provider
- Generator Owner
- Generator Operator
- Planning Coordinator
- Resource Planner
- Transmission Owner
- Transmission Operator
- Transmission Planner
- Transmission Service Provider

NERC Glossary of Terms

This section includes a newly defined term used in the NERC Reliability Standards. The new definition listed below becomes approved when the proposed standard is approved. When the standard becomes effective, the defined term will be removed from the individual standard and added to the NERC Glossary of Terms.

Proposed New Definition:
Distributed Energy Resource (DER):
Generators and energy storage technologies connected to a distribution system that are capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including those connected behind the meter of an end-use customer that is supplied from a distribution system.

Background

As the penetration of DERs continues to increase across the many distribution systems connected both directly and indirectly to the North American Bulk-Power System (BPS), it is necessary to account for the potential impacts of DERs on reliability in the planning, operation, and design of the Bulk Electric System. The NERC System Planning Impacts of Distributed Energy Resources Working Group (SPIDERWG) has identified the need for improved modeling of aggregate DER for planning studies (including both utility-scale and retail-scale DER) conducted by Transmission Planners (TPs) and Planning Coordinators (PCs), including updated modeling data requirements specific to DER.

Further, in Order No. 901,[1] the U.S. Federal Energy Regulatory Commission ("FERC") found that it is imperative for NERC to develop new or modified Reliability Standards MOD-032, IRO-010, and TOP-003 to address reliability concerns "related to IBRs at all stages of interconnection, planning, and operations."[2]. Among other things, FERC directed NERC to develop requirements addressing the provision of IBR and DER data to the entities responsible for the planning and operation of the BPS. Detailed information on the specific FERC Order No. 901 directives addressed through this project is available in Project 2022-02 Consideration of Order No. 901 Directives.

Proposed Reliability Standard MOD-032-2 replaces the Load-Serving Entity as an applicable entity with the Distribution Provider and updates Attachment 1: Data Reporting Requirements with data specific to DERs and IBRs, consistent with addressing the FERC Order No. 901 directives. Proposed Reliability Standard MOD-032-2 also adds a new Part 1.2 in Requirement R1, which would require the Planning Coordinator and Transmission Planner to include in their data requirements and procedures requirements for model submissions in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization (ERO). New Requirement R2 Part 2.1 addresses estimation of unregistered IBR or DER data where actual data is not available, consistent with the directives in Order No. 901.
Revisions in the Reliability Standards TOP-003-8 and IRO-010-6 data specification standards specify that entities responsible for developing and distributing data specifications shall include requirements

[1] Reliability Standards to Address Inverter-Based Resources, Order No. 901, 185 FERC ¶ 61,042 (2023).
[2] Id. at P 25

for model submissions in accordance with the Criteria for Acceptable Models List maintained by the ERO.

General Considerations

In developing this implementation plan, the drafting team (DT) considered the time in MOD-032-2 that would be necessary to develop data requirements and reporting procedures, including identifying the proper reporting entity, for data related to IBRs, including unregistered IBRs and DERs. The DT also considered that the standard would become applicable to the Distribution Provider (DP) for the first time. Transmission Owners (TOs) and DPs would be expected to participate in PC/TP processes to change data reporting requirements related to DER and IBR developed during the 24 months prior to the effective date of Requirement R1 and should be able to start working on data collection processes and methods prior to the compliance dates of Requirements R2, R3, and R4. This timeline also allows for the development of new data estimation processes developed under MOD-032-2 Requirement R2 Part 2.1. Requirements adjusted in Reliability Standards IRO-010-5 and TOP-003-8 may not be practical to implement prior to full implementation of MOD-032-2, and therefore was set to the same timeline. One additional limitation the DT noted is the requirement for all FERC Order No. 901 directives to be fully implemented by January 1, 2030, including those covered by these standard revisions.

In summary, this implementation plan would provide a full 36 months for MOD-032 Requirements R2, R3, R4, IRO-010, and TOP-003 from FERC approval until data is required to be reported.

Effective Date and Phased-In Compliance Dates

The effective date for the proposed Reliability Standard and NERC Glossary term Distributed Energy Resource is provided below. Where the DT identified the need for a longer implementation period for compliance with a particular section of a proposed Reliability Standard (i.e., an entire Requirement or a portion thereof), the additional time for compliance with that section is specified below. The phased-in compliance date for those particular sections represents the date that entities must begin to comply with that particular section of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

Initial Performance Dates

Entities shall not be required to comply with Reliability Standard MOD-032-2 Requirements R2, R3, and R4 relating to revised Planning Coordinator/Transmission Planner data requirements and reporting procedures as developed under Requirement R1 and Attachment 1, until 12 months after the effective date of Reliability Standard MOD-032-2.

Entities shall continue to comply with Requirements R2, R3, and R4 related to Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under MOD-032-1 Requirement R1 and Attachment 1 during the phased-in compliance period for MOD-032-2 unless they are compliant with revised Planning Coordinator/Transmission Planner data requirements and reporting procedures under Reliability Standard MOD-032-2 Requirement R1.

Reliability Standard MOD-032-2

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is twenty-four (24) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Compliance Date for Reliability Standard MOD-032-2 Requirements R2, R3, and R4

Entities shall not be required to comply with Requirements R2, R3, and R4 relating to revised Planning Coordinator and Transmission Planner data requirements and reporting procedures developed under MOD-032-2 Requirement R1 and Attachment 1 until 12 months after the effective date of Reliability Standard MOD-032-2.

Definition – Distributed Energy Resource (DER)

Where approval by an applicable governmental authority is required, the definition of DER shall become effective on the first day of the first calendar quarter that is after the effective date of the applicable governmental authority's order approving Reliability Standard MOD-032-2, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the definition shall become effective on the first day of the first calendar quarter that is after the date that Reliability Standard MOD-032-2 is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Reliability Standard IRO-010-5

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Reliability Standard TOP-003-8

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is thirty-six (36) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Retirement Date

Reliability Standard MOD-032-1

Reliability Standard MOD-032-1 shall be retired immediately prior to the effective date of Reliability Standard MOD-032-2 in the particular jurisdiction in which the revised standard is becoming effective.

Reliability Standard IRO-010-4

Reliability Standard IRO-010-4 shall be retired immediately prior to the effective date of Reliability Standard IRO-010-5 in the particular jurisdiction in which the revised standard is becoming effective.

Reliability Standard TOP-003-7

Reliability Standard TOP-003-7 shall be retired immediately prior to the effective date of Reliability Standard TOP-003-8 in the particular jurisdiction in which the revised standard is becoming effective.

Project 2022-02 Uniform Modeling Framework for IBR

Do not use this form for submitting comments. Use the Standards Balloting and Commenting System (SBS) to submit comments on **Project 2022-02 Uniform Modeling Framework for IBR** by **8 p.m. Eastern, Friday, May 16, 2025.**

Additional information is available on the project page. If you have questions, contact Senior Standards Developer, Jordan Mallory (via email) or at 470-479-7538.

Background Information

As the penetration of distributed energy resources (DERs) continues to increase across the many distribution systems connected both directly and indirectly to the North American Bulk-Power System (BPS), it is necessary to account for the potential impacts of DERs on reliability in the planning, operation, and design of the Bulk Electric System (BES). The North American Electric Reliability Corporation (NERC) System Planning Impacts of Distributed Energy Resources Working Group (SPIDERWG) has identified the need for improved modeling of aggregate DER for planning studies (including both utility-scale and retail-scale DER) conducted by Transmission Planners (TPs) and Planning Coordinators (PCs), including updated modeling data requirements specific to DER.

Further, in Order No. 901 issued October 2023, The Federal Energy Regulatory Commission (FERC) directed the development of Reliability Standards to address concerns "related to Inverter-based Resources (IBRs) at all stages of Interconnection, planning, and operations." (Id. at P 25). Among other things, FERC directed NERC to develop requirements addressing the provision of IBR and DER data to the entities responsible for the planning and operation of the BPS. More information on the specific FERC Order No. 901 directives addressed through this project is available in the Project 2022-02 Consideration of Order No. 901 Directives.

Proposed Reliability Standard MOD-032-2 replaces the Load-Serving Entity (LSE) as an applicable entity with the Distribution Provider (DP) and updates Attachment 1: Data Reporting Requirements with data specific to DERs and IBRs, consistent with the FERC Order No. 901 directives. Proposed Reliability Standard MOD-032-2 also adds a new Part 1.2 in Requirement R1, which would require the PC and TP to include in their data requirements and procedures requirements for model submissions in accordance with the Criteria for Acceptable Models List maintained by the Electric Reliability Organization (ERO), which is NERC. New Requirement R2 Part 2.1 addresses estimation of unregistered IBR or DER data where actual data is not available, consistent with Order No. 901 directives.

Revisions in the TOP and IRO data specification standards specify that entities responsible for developing and distributing data specifications shall include requirements for model submissions in accordance with the Criteria for Acceptable Models List maintained by the ERO.

Questions

1. Do you agree with the proposed MOD-032-2 modifications to address the FERC Order 901 directives? Please reference the technical rationale and consideration of FERC directives. If you do not support the modifications made, please provide rationale and proposed language on how you would address the FERC Order 901 directives.

   ☐ Yes
   ☐ No

   Comments:

2. Do you agree that the Transmission Owner (TO) is typically the appropriate responsible entity for collecting and providing data for DER where there is no associated registered DP between the DER connection point and the TO's system? If not, what entity would be in a better position to provide that data and add justification?

   ☐ Yes
   ☐ No

   Comments:

3. Do you agree with the proposed IRO-010-5 and TOP-003-8 modifications to address the FERC Order 901 directives? Please reference the technical rationale and consideration of FERC directives. If you do not support the modifications made, please provide rationale and proposed language on how you would address the FERC Order 901 directives.

   ☐ Yes
   ☐ No

   Comments:

4. Do you agree with the proposed DER definition? Please refer to the technical rationale, which provides rationale behind the drafting team's intent and previous definitions proposed. If you do not support the definition as proposed, please explain the changes that, if made, would result in your support.

   ☐ Yes
   ☐ No

   Comments:

5. Do you agree that the modifications for the proposed reliability standards (MOD-032-2, IRO-010-5, and TOP-003-8) address the scope of the standard authorization request (SAR) in a cost-effective manner? If you do not agree, please provide alternatives that would address the SAR scope in a more cost-effective manner.

   ☐ Yes
   ☐ No

   Comments:

6. Do you agree with the proposed ERO Approved Criteria for Acceptable Models document? If you do not agree, please provide alternative language and explain the rationale that, if made, would result in your support.

   ☐ Yes
   ☐ No

   Comments:

7. Provide any additional comments for the drafting team to consider, if desired.

   Comments:

Violation Risk Factor and Violation Severity Level Justifications

Project 2022-02 Uniform Modeling Framework for IBR

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in Project 2022-02 Uniform Modeling Framework for Inverter-Based Resources (IBRs). Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in the Federal Energy Regulatory Commission (FERC)-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The drafting team applied the following North American Electric Reliability Corporation (NERC) criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on a Single Violation, not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

MOD-032-2

VRF Justification for MOD-032-2, Requirement R1

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard. The modifications made to Requirement R1 require model submission in accordance with the Criteria for Acceptable Models maintained by the ERO. This is similar to other sub-requirements in Requirements R1; therefore, the VRF remained a low.

VSL Justification for MOD-032-2, Requirement R1

Please refer to the VSL table below.

VRF Justification for MOD-032-2, Requirement R2

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard. "Load Serving Entity" was replaced with "Distribution Provider" from Requirement R2 in MOD-032-2. In addition, Requirement R2 added a sub-requirement requiring if entity is unable to gather unregistered IBR data or distributed energy resource(DER) data to complete an estimate. These modifications align with the medium risk requirement and therefore, the VRF remained medium.

VSL Justification for MOD-032-2, Requirement R2

Please refer to the VSL table located below**.**

VRF Justification for MOD-032-2, Requirement R3

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard. The modifications made to Requirement R3 were administrative in nature; therefore, the VRF remained a low.

VSL Justification for MOD-032-2, Requirement R3

Please refer to the VSL table located below**.**

VRF Justification for MOD-032-2, Requirement R4

The VRF did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSL Justification for MOD-032-2, Requirement R4

The VSL did not change from the previously FERC approved MOD-032-1 Reliability Standard.

VSLs for MOD-032-1, Requirement 1			
Lower	**Moderate**	**High**	**Severe**
The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include less than or equal to 25% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 25%, but less than or equal to 50% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 50%, but less than or equal to 75% of the required components specified in Requirement R1.	The Planning Coordinator and Transmission Planner(s) did not develop any steady-state, dynamics, and short circuit modeling data requirements and reporting procedures required by Requirement R1; OR The Planning Coordinator and Transmission Planner(s) developed steady-state, dynamics, and short circuit modeling data requirements and reporting procedures, but failed to include greater than 75% of the required components specified in Requirement R1.

VSL Justifications for MOD-032-1, Requirement 1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement was modified by adding an additional sub-requirement to Requirement R1. The proposed VSL was modified to reflect the additional sub-requirement. It does not have an unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The updated sub-requirement requires the responsible entity to follow the Criteria for Acceptable Models document maintained by the Electric Reliability Organization. The VSLs are not binary and do not contain ambiguous language.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL uses the same terminology as used in the associated requirement; therefore, it is consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

Technical Rationale

NERC Project 2022-02 | MOD-032-2, TOP-003-8, and IRO-010-5
April 2025

MOD-032-2 – Data for Power System Modeling and Analysis

Rationale for Applicability Section

For MOD-032-2, Load-Serving Entity (LSE) was replaced with Distribution Provider (DP) because of the removal of LSEs from the NERC registry criteria. It should be noted that Generator Owner (GO) applicability includes both Category 1 GO and Category 2 GO.

Additionally, the drafting team (DT) reviewed the dual applicability to Planning Authority (PA) and Planning Coordinator and determined that it was most appropriate to reference both terms in the applicability section until NERC registration criteria is updated to use only a single term. The posted "Appendix 5B: Statement of Compliance Registry Criteria," dated June 27, 2024, still uses both terms and, arguably, the PA term is used more prominently. However, the explanation included in MOD-032-1 refers to synchronization between registration criteria and the NERC functional model which is not maintained, was never formally approved, and is only posted as a historical document. Therefore, the DT excluded the explanatory language from MOD-032-2 Applicability Section.

Rationale for Distributed Energy Resource (DER) Definition

The approved standard authorization request (SAR) to revise MOD-032, submitted December 2021, noted that "it may be needed (based on the discretion of the DT) to add a definition for "Distributed Energy Resource (DER)" to the NERC Glossary of Terms" in conjunction with adding DER to Attachment 1, the main purpose of this SAR.[1] The DT found it necessary to draft a DER definition to clarify the usage of this term within the standard. Further, the DT recognized benefits of a Glossary of Terms definition to bring alignment and consistency of term usage across Reliability Standards. Inverter-Based Resources was recently defined in the Glossary of Terms under Project 2020-06 for a similar reason. Finally, the DT was comprised of team members with adequate experience to propose a definition, including members of the NERC SPIDERWG and IEEE 1547 working group.

The DT considered various DER definitions utilized in the industry and discussed in the NERC System Planning Impacts from Distributed Energy Resources Working Group (SPIDERWG) Terms and Definitions Working Document, including the six other definitions described in Appendix D which were not adopted by SPIDERWG. Through this review, the DT determined each of these seven definitions would benefit from refinement to be most suitable for application in MOD-032 and future reliability standards more broadly. It is expected that most reliability standard revision proposals related to DER would originate from the SPIDERWG. Thus, the DT intent was to propose a DER definition that aligned with the SPIDERWG working definition, which explicitly excludes demand response and clarifies what is in scope and out of scope with respect to where DER is connected, rather than the technology type).

[1] SAR title "MOD-032-1 Data for Power System Modeling and Analysis", submitted 12/15/2021. Available at: https://www.nerc.com/pa/Stand/Project202202ModificationstoTPL00151andMOD0321DL/2022-02_MOD-032%20SAR%20SPIDERWG_020122.pdf

The DT considered adopting a voltage threshold to define distribution. However, industry generally differentiates transmission from distribution based on the functional use of the system rather than technical specifications (e.g., voltage, active power, etc.). Setting aside the Bulk Electric System which has a clear NERC definition, defining electric facilities as either transmission or distribution is often based on State law or regulations, ISO/RTO tariff, and/or utility tariffs. The DT anticipates there are no conflicts in how applicable entities define distribution and transmission facilities for a given region, even if those definitions vary from region to region. Additionally, the DT considered an active power threshold to define DER and concluded that DER technologies can vary in size and a threshold might inappropriately exclude technologies that are DER[2]. At the same time, the DT understands that certain applications of DER data, for instance determining when or how a Transmission Planning (TP) or Planning Coordinator (PC) includes DER into planning processes (e.g., TPL-001), may include active power thresholds.

The DT considered defining DER based on the resource not being connected to the Bulk Power System (BPS), similar to the IEEE 1547-2018 definition that uses "not directly connected to the BPS" to describe DER. However, the NERC Glossary definition of BPS does not provide specificity that would enhance a definition of DER beyond an undefined term that is generally used in industry. The phrase "distribution system" was selected to expressly describe the type of electric facilities that would cause a resource to be defined as a DER, if interconnected to those facilities.

The DT recognizes that "distribution system" is not a NERC Glossary term and that the SPIDERWG proposed a definition.[3] The DT reviewed the SPIDERWG definition and concluded that it would not clarify the term DER. The SPIDERWG use of the term "transmission-distribution" interface within a definition of "distribution system" could be considered a circular reference that causes ambiguity. The DT is not proposing a definition of distribution system given any proposed definition could be of limited benefit for clarifying the proposed NERC Glossary term for DER.

Below is a summary of the rationale for the DT departing from each of the seven definitions when proposing a new DER definition.

SPIDERWG definition

After considering the SPIDERWG definition, the DT determined it provided a useful foundation but needed refinement to be suitable for the intended use. Specifically, the SPIDERWG term included transient types of DER power beyond generation and storage, and it included sources of back-up power that would have no potential grid impacts.

The DT chose to refer to generators and storage technologies specifically, rather than use the SPIDERWG language of "source", to exclude devices or resources that only transiently inject real power (e.g., regenerative elevators, transition switches, etc.). DER can use various technologies including synchronous machines, induction machines, and power inverters/converters (i.e., IBR). Different types of DER can

[2] NERC has published a study recommending that a zero MVA threshold be used when collecting DER information: https://www.nerc.com/comm/RSTC_Reliability_Guidelines/DERStudyReport.pdf

[3] SPIDERWG definition of "distribution system": The electrical facilities that are located behind a transmission-distribution transformer that serves multiple end-use customers. https://www.nerc.com/comm/RSTC/SPIDERWG/SPIDERWG%20Terms%20and%20Definitions%20Working%20Document.pdf

utilize a wide range of energy sources including, but not limited to, natural gas, diesel, hydro, storage, wind, and solar. Additionally, the DT intention was to ensure that the scope included facilities "connected behind the meter of an end use customer" that may export Real Power to the power system or offset Real Power load (e.g., residential solar or commercial rooftop solar). This would exclude technologies such as charging-only electric vehicle (EV) installations and controllable load. To exclude transmission connected load customers that have onsite generation or storage resources, the DER definition clarifies that the behind the meter customer "is supplied from a distribution system".

The DT included the language "in non-isolated parallel operation with the Bulk-Power System" to indicate that distributed energy resources with potential BPS reliability impacts are those that have electrical connectivity to the BPS. Resources that are only operated in islanded or isolated mode (e.g., back-up generation that only operates when a facility is disconnected from the grid), will not have an impact to the BPS and, therefore, are not of interest from a BPS-reliability perspective. The DT understands the concepts of non-isolated parallel operation versus isolated parallel operation to be commonly understood within the industry. The DT intentionally avoided the term "directly connected" to differentiate electrical connectivity from an electrical connection point. The phrase "connected to the distribution system" speaks to electrical connectivity and the subsequent phrase "including those connected behind the meter of an end use customer" clarifies this connectivity includes resources directly connected to a customer system (i.e., behind the meter).

IEEE 1547-2018

The DT reviewed the IEEE 1547-2018 definition and found that it contained elements that could supplement the SPIDERWG definition to address the issues identified above. The DT incorporated the explicit reference to generation and storage aspect of the IEEE definition. Further, the IEEE concept of "capable of exporting active power to an EPS" informed the need for capturing non-isolated, long-term paralleling and the sourcing of Real Power (i.e., active power) within the DT definition.

At the same time, the DT did not view the IEEE definition as suitable for the DT's intended use as written. The IEEE term qualifies the DER connection point as "not directly connected to a bulk power system" which the DT viewed as potentially ambiguous. Instead, the DT opted for the "connected to a distribution system" language to point to the electric system location, and how facilities at that location are classified, as a key concept in differentiating DER from other generators and energy storage technology. The DT considered if it was necessary to define "supplemental DER devices" as part of the DER definition and determined this nuance is not needed for a NERC Glossary of Terms DER definition.

Federal Energy Regulatory Commission (FERC) Energy Primer

The DT identified the FERC Energy Primer definition as being inclusive of load resources (e.g., energy efficiency, demand response) which is not aligned with the SPIDERWG definition. Given the reliability use cases, the DT and SPIDERWG definitions target sources of electric power, with the DT narrowing this definition to be only sources "capable of providing Real Rower." After considering the FERC definition, the DT determined it was not suitable for the intended use.

National Association of Regulatory Utility Commissions (NARUC)
NARUC's definition is also inclusive of load resources (e.g., energy efficiency, demand response) and therefore, the DT concluded it is too broad.

NERC DERTF
The NERC DERTF definition uses the language "resource on the distribution system that produces electricity" which appears to exclude distributed energy storage, a technology necessary for inclusion in the DT definition. Further, the NERC DERTF definition defines DER as anything "not otherwise included in the formal NERC definition of the Bulk Electric System" which the DT views as overly broad.

California Public Utilities Commission (CPUC)
The CPUC definition appears to be based on California legislation and includes energy efficiency, EVs, and demand response, renewable generation resources, and energy storage. As is the case for FERC and NARUC definitions above, the inclusion of load resources is overly broad for the NERC Glossary of Terms.

New York Independent System Operator (NYISO)
The NYISO definition only considers market-qualifying resources as DER. This definition's exclusion of a large portion of DER (i.e. retail participation) is too narrow for the reliability planning needs identified by the SPIDERWG DER Modeling Study.

Figure 1 below provides a graphic illustration of the DER definition and the intended scope of facilities that would fall under the proposed definition. Figure 2 below shows that the proposed DER and IBR definitions are compatible, but distinct. Some resources may be classified as DER, but not IBR; some resources may be classified as IBR, but not DER; some resources may be classified as both DER and IBR. Note that in Figure 2, "distribution-connected" is shorthand for connected to the distribution system and "bulk system-connected" refers to resources connected to the transmission system.

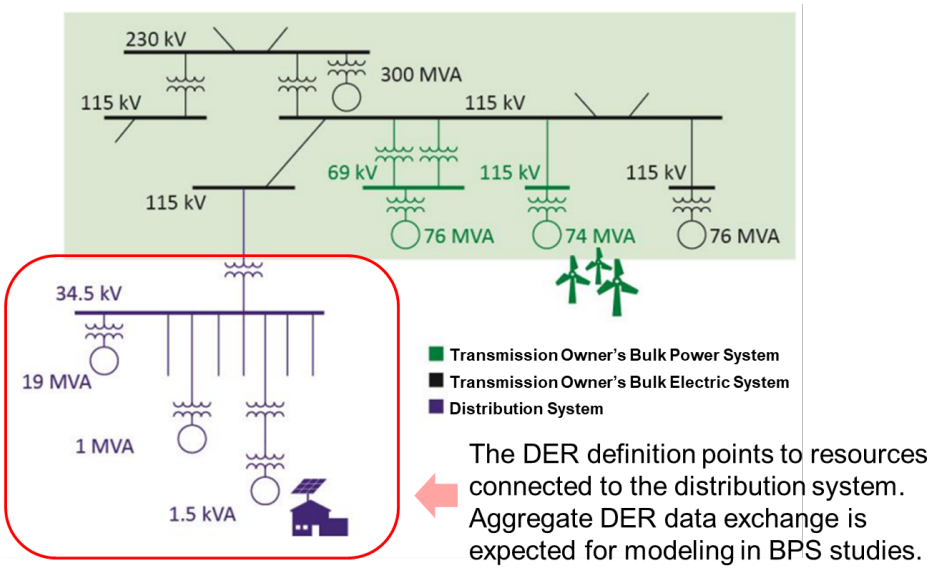

Figure 1: DER Definition Illustration

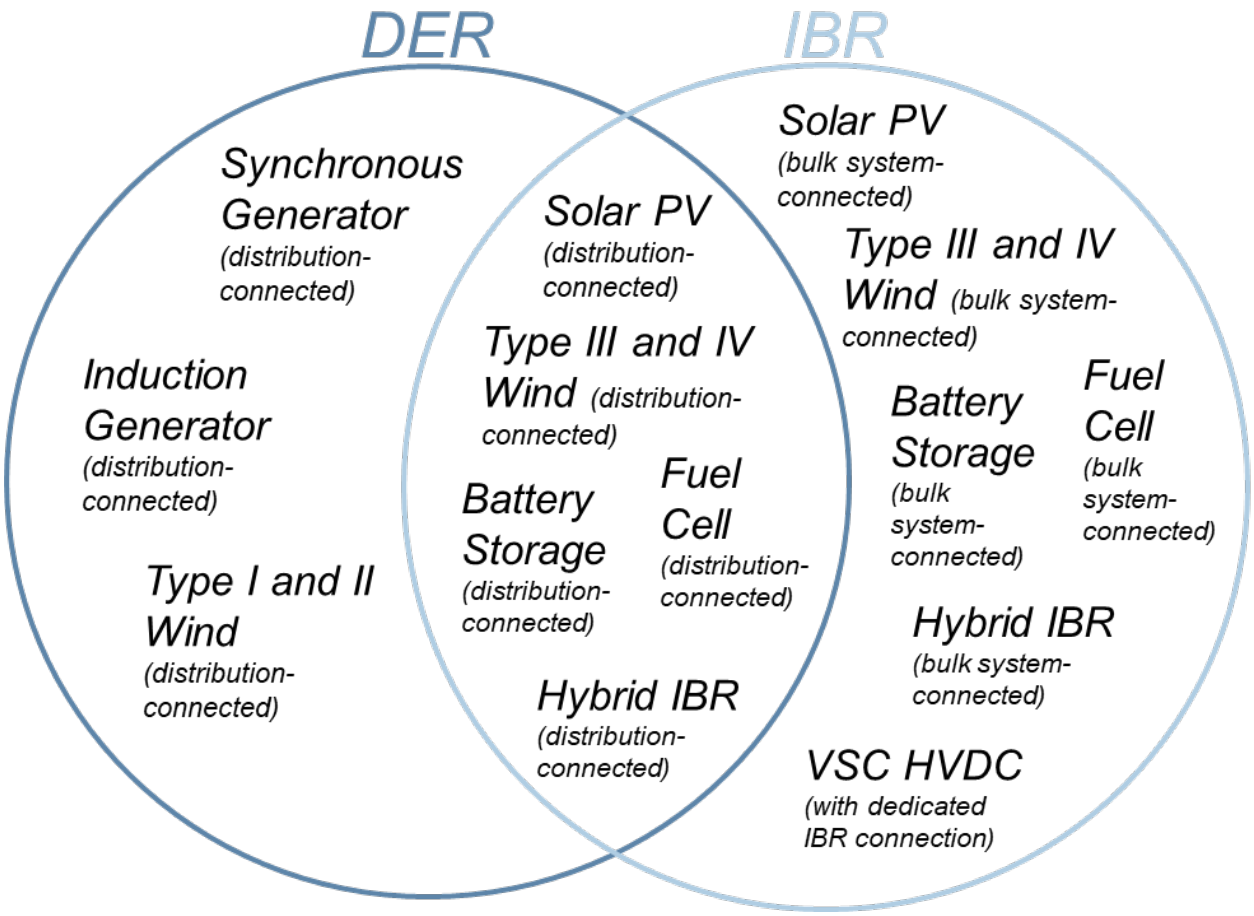

Figure 2: DER and IBR Definition Compatibility

Rationale for Modifications to Requirement R1

Requirement R1 was modified to require that PC and TP data requirements and reporting procedures include requirements for model submissions in accordance with a new ERO Approved Criteria for Acceptable Models document. The modifications are in response to FERC 901 directives.

The procedures resulting from Requirement R1 delineate data reporting responsibilities to avoid the potential for multiple submissions of the same data, which could lead to double counting of modeled elements.

FERC Order 901 directs NERC to develop reliability standards that require "the use of approved industry generic library IBR models".[4] However, pre-defining a limited set of models (i.e., a library of models) that could be used to represent generation and system components is potentially at odds with objectives to also have accurate models, especially as technology rapidly progresses. To align with industry practices while addressing the directives of the FERC Order, NERC staff incorporated elements from the NERC Dynamic Modeling Recommendations, including the proposed NERC Unacceptable Model List, into a newly developed ERO Approved Criteria for Acceptable Models document, rather than defining an

[4] FERC Order 901 at Paragraph 122.

inclusive model library. The DT supports the approach and views it as aligned with the FERC Order directives while addressing the practical limitations raised by industry at the January 15-16 NERC Industry Engagement Workshop.[5] For instance, Order 901 P125 requires "the sole use of nation-wide approved component generic library models" whereas workshop participants raised issues surrounding timelines for approving library models that reflect new IBR products, the accuracy of library models for certain products, timelines associated with updating library models, among other issues.

The ERO Approved Criteria for Acceptable Models document describes the required documentation and usability elements for planning and operational models. The ERO Approved Criteria for Acceptable Models document defines processes for modifying the criteria and the Unacceptable Models list. The DT views these processes as sufficient safeguards to prevent arbitrary or unvetted modifications being made to these documents referenced by the reliability standards.

The DT concluded that it would be most appropriate for NERC to maintain the ERO Approved Criteria for Acceptable Models as a separate document that could be referenced by reliability standards as needed rather than incorporate the criteria within reliability standards. This determination was based on the SAR language, time constraints for approval of FERC 901 Milestone 3 projects, and broader use of the new NERC document beyond MOD-032. For instance, while MOD-032 is an important application of the ERO Approved Criteria for Acceptable Models document, it will not be the only standard to reference the document. The DT considers maintenance as a separate document with NERC to be a better option for facilitating a unform modeling framework for both planning and operations in alignment with FERC Order 901 rather than incorporating concepts of the document into individualized Attachments for MOD-032 and other standards.

Rationale for Modifications to Requirement R2

Requirement R2 was modified to require estimation of modeling data if the Responsible entity (typically the Transmission Owner or Distribution Provider) is unable to gather required data. FERC Order 901 requires the provision of data related to unregistered-IBR and IBR-DER that in the aggregate have a material impact on the BPS.[6] If the data is estimated, Requirement R2.1 also requires the entity to provide an explanation of the limitations of the availability of data, an explanation of the limitations of any data provided by unregistered IBRs, and the method used for estimation.[7] The DT utilized the FERC Order language to broadly address the elements such an estimation must include, which was added as Requirement R2.1.[8] The requirement language intentionally uses the phrase "unable to gather" to mirror the FERC Order 901 language.

The DT views the introduction of these estimation methods as alleviating previous compliance obligation concerns around challenges in collecting data for DER connected to unregistered entities. The approach

[5] NERC_Industry_Engagement_Workshop–Reliable_IBR_Integration_and_Milestone_3_of_FERC_Order_901_Agenda
[6] FERC Order 901 at P104 and P105
[7] For instance, limitations on data gathering could result from legal or contractual prohibitions on requesting certain data.
[8] FERC Order 901 P104: "if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation."

directed by FERC is flexible as to whether the underlying unregistered IBR and DER data originates from interconnection documentation, measured quantities, estimated quantities, or other sources. Data availability or sufficiency issues, among other factors, may lead to the DP and TO applying a combination of approaches to source the data. The PC and TP modeling data requirements and reporting procedures should identify acceptable methods and their application.

While the FERC Order 901 directives only addressed IBR-DER, meaning that DER technologies based on induction generators or synchronous generators are not explicitly addressed, the DT found it practical to have a consistent estimation framework applicable for all DER technologies when DER data cannot be gathered. Therefore, R2 was intentionally written to have requirements for estimating DER data regardless of the technology type, when an applicable entity is unable to gather the data. The approach FERC directed NERC to use forms the basis for this uniform approach.

Given the challenges with collecting complete and accurate DER data, the DT would still recommend that NERC consider a range of options that could include expanding DP registration criteria or registering DER-only DPs to reduce or eliminate this potential DER data collection gap. However, the process to modify NERC registry criteria and register new entities is beyond the scope of Project 2022-02 and would delay the project beyond the FERC Order 901 Milestone 3 timeline. The DT considered adding “UFLS-Only Distribution Provider” to MOD-032-2 applicability to reduce (but not necessarily eliminate) the potential gaps associated with DER connected to unregistered entities with no compliance obligation. However, adding UFLS-Only Distribution Provider to the applicability would not be appropriate at this time based on consultation with NERC Legal staff.

Rationale for Modifications to Attachment 1

MOD-032-2 Attachment 1: Data Reporting Requirements was updated with data specific to IBR and DER.

The DT decided to maintain an approach similar to MOD-032-1 where more detailed sub-bullets associated with items are only presented in one column (i.e., some sub-bullets are only listed in the “steady state” column even though the data is also relevant to “dynamics” and/or “short circuit”). This long-standing approach was made explicit in footnote 1.

The format of Attachment 1 was modified to minimize replicating footnotes applicable to multiple items by adding a new footnotes section (Attachment 1 Data Reporting Requirements Footnotes) to the document. Along with the reformatting, language was added to the introductory paragraph to clarify that data obligations are established by the PC/TP modeling data requirements and reporting procedures rather than the listing of typical functional entities in Attachment 1.

Modifications for IBR

To incorporate IBR within Attachment 1, “and storage units” was added to generating units in the steady-state column under item 3. “Generating units” already incorporates IBR generators such as solar and wind. Storage is typically not classified as a generation resource because it has no primary energy source and consumes more energy than it injects when considering losses. Therefore, the DT found it necessary to include storage explicitly. Footnote 4, associated with “Generating units and storage”, was also updated to clarify IBR as an applicable technology for the item.

The dynamics column was updated to replace "photovoltaic systems" (PV) with "Inverter-Based Resources" under item 7. IBR encompasses PV, resulting in PV technology still being included under this new item.

The three following sub-items were added to dynamics item 7 based on specific language from the FERC Order 901, Paragraph 141.[9]

- IBR capabilities related to momentary cessation,
- Tripping, and
- Ride-through

"Frequency control" was added as a sub-item because frequency response of IBR is important for studying system reliability. For instance, a 2024 NERC Lessons Learned report shows how IBR frequency response can affect system performance.[10] Frequency control encompasses primary frequency response, fast frequency response (e.g., IEEE 2800-2022, Subclause 6.2), and potentially other frequency responsive controls (e.g., "grid-forming" virtual synchronous machine controls).

In order to clarify dynamics item 6, "wind plant model", to not overlap with the new IBR item 7, type 1 and type 2 wind turbines are specifically called out under item 6. These technologies are not IBR.

Footnote 5 was added to clarify that the TO will typically be responsible for unregistered IBR that are not captured in DER modeling data.

Modifications for DER

Item 9, "Aggregate Distributed Energy Resource (DER) data" was added to the steady state column with location, real power capability, and DER type (solar, battery, diesel generator, etc.) specified as required subitems. The DT selected these subitems as the minimum information needed to use data and make assumptions for power system modeling and analysis.

The intent is that relevant DER data be available and represented in models of the interconnected transmission system consistent with the NERC approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies. Specific data items listed for DER reflect the minimum information needed to reasonably represent DER in transmission system models. "Aggregate DER" is added as new item 9 to indicate aggregate DER, rather than individual DER facilities, would be represented in most PC/TP study models.[11] The word "aggregate" was specifically added to Attachment 1 to clarify this point based on industry comments and to align with FERC Order 901. However, Requirement R1 provides the PC and TP great flexibility in developing data requirements and reporting

[9] FERC Order 901, P141 states that IBR and IBR-DER data must include "momentary cessation and/or tripping, and all ride through behavior."
[10] NERC, Lessons learned, Incorrect IBR Primary Frequency Response Logic Caused Negative ACE. Available at: https://www.nerc.com/pa/rrm/ea/Lessons%20Learned%20Document%20Library/LL20240501_Incorrect_IBR_Primary_Frequency_Response_Logic_Caused_Negative_ACE.pdf
[11] In certain circumstances (e.g., very large DER), a TP or PC may decide to represent individual DER. However, the DT anticipates most DER information will be aggregated based on PC and PC planning criteria.

procedures that align with local practices and needs, in addition to the required items listed in the Requirement R1 Parts. Given industry comments on DER data availability, and FERC Order 901 directives, a process is needed for estimating DER data when an entity is unable to gather it. The process for estimating those values is referenced in Requirement R2 Part 2.1.

Footnote 3, associated with "aggregate demand", was modified to clarify that the gross demand is needed at each load serving bus. Collecting and modeling a net demand that incorporates offsets due to output from DER is not consistent with a modeling framework that explicitly represents DER.

Dynamics item 5, previously "demand", was updated to be "aggregate demand" to be consistent with the steady state column and general industry practices of modeling load dynamics for aggregate demand (e.g., composite load model).

Dynamics item 10 was updated to include "Aggregate Distributed Energy Resource (DER) data" along with the subitems: "DER capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control"; and "indication whether DER is subject to tripping in conjunction with UFLS or UVLS"

Momentary cessation, tripping, and ride-through of aggregate DER is needed for dynamics studies. For instance, NERC's Lessons Learned, LL20220401 "Distributed Energy Resource Performance Characteristics during a Disturbance" provided information following the loss of 300 MW of DER following a system fault. [12] The report indicated that, "There is a need to understand how distribution system connected generation, and loads will behave and how they can accurately be modeled under expected system contingencies. Entities should know the behavioral characteristics of DER inverters on their system (both new and old) as well as their number, capabilities, and locations and then report that information to their Balancing Authorities and Reliability Coordinators so their models can be accurate".

Voltage control of DER can alter the exchange of reactive power between distribution and transmission systems and may affect the results of reliability studies. Examples are described in the approved Reliability Guideline: Bulk Power System Planning under Increasing Penetration of Distributed Energy Resources.

Frequency control must be accounted for because DER interconnection under different standards (e.g., IEEE 1547-2003 versus IEEE 1547-2018) have different frequency response characteristics that may affect dynamics study results. Frequency control in this case typically refers to the frequency-droop characteristic outlined in IEEE 1547-2018, Subclause 6.5.2.7 and adopted in many jurisdictions. However, should other DER frequency controls become common in industry, those would also fall under this category.

As described in the approved Reliability Guideline: Recommended Approaches for UFLS Program Design with Increasing Penetrations of DERs, accurately representing DER tripping as part of UFLS operation is

[12] https://www.nerc.com/pa/rrm/ea/Lessons%20Learned%20Document%20Library/LL20220401_DER_Performance_During_a_Disturbance.pdf

vital for designing and evaluating UFLS programs. Similarly, accurately representing DER tripping as part of UVLS operation is vital for designing and evaluating UVLS programs as described in the approved White Paper: DER Impact to Under Voltage Load Shedding Program Design. In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, the proportion of aggregate DER subject to each UVLS/UFLS tripping stage should be identified.

Inferring DER Capabilities

Item 10 in the dynamics column indicates that aggregate DER dynamics modeling data may need to be inferred due to data availability and practical limitations. As suggested in the approved Reliability Guideline: DER Data Collection for Modeling in Transmission Planning Studies, the in-service date for DER may be used as a proxy for the PC/TP to make reasonable assumptions about DER capabilities. For example, in a certain jurisdiction DER installed after a specified date may be required to have a certain ride-through characteristic. Thus, the appropriate Ride-through characteristic representation for DER in that area could be inferred by the in-service date of the DER. However, the PC/TP modeling data requirements and reporting procedures may require the provision of alternative information to achieve the same purpose. PC/TP modeling data requirements and reporting procedures may also require more detail and/or additional information. In cases where the PC/TP data requirements and reporting procedures require aggregated DER data to be provided, it is expected that the proportion of aggregate DER amount with in-service dates before and after certain threshold dates would be needed (and specified in the PC/TP requirements) to make inferences regarding the overall aggregate DER response characteristics. Where applicable, similar assumption can be made for unregistered IBR.

Entity responsibilities and coordination

Footnote 6 provides additional distinctions that DER connected through a DP (directly connected to a registered DP, connected to an unregistered DP that is connected to a registered DP, or behind the meter of an end-use customer of either) should be reported by that DP. Further, the TO will be responsible if there is no system owned by a registered DP between the DER connection point and TO system. This clarification is necessary to reduce the possibility of DER on the system being unaccounted for by any entity. The DT was responsible for the FERC Order 901 directive requiring an entity to be identified when DER had no registered DP.

It should be noted that the MOD-032-2 modifications do not change the classification of unregistered IBR or DER to become BES facilities subject to NERC reliability standards. Instead, the modifications place a compliance obligation on NERC registered DPs (or TOs) to provide basic information about unregistered IBR or DER that are connected to their systems so they can be properly represented in Interconnection-wide cases. There are already existing requirements for DPs (or TOs) to provide information about load connected to their systems. Like load, unregistered IBR and DER are not generally considered to be BES facilities. However, BES reliability assessments require an accurate representation of aggregate load, unregistered IBR, and aggregate DER behavior. The modifications proposed in MOD-032-2 are intended to ensure sufficient data is available to the PC/TP so that appropriate unregistered IBR and DER representations can be included in their BES reliability assessments as required by FERC Order 901 and system planning needs.

IRO-010-6 – Reliability Coordinator Data Specification and Collection; and TOP-003-8 – Transmission Operator and Balancing Authority Data and Information Specification and Collection

The DT reviewed existing IRO-010 and TOP-003 versions and found that both standards had broad requirements language that encompassed generation and storage resources, including IBR. Nevertheless, to ensure no ambiguity that FERC Order 901 requirements are met, the DT included explicit references to IBR-specific data and parameters and pointed to the ERO Approved Criteria for Acceptable Models.

Rationale for Modifications to add "IBR-specific data and parameters"

The phrase "IBR-specific data and parameters" was added to the following requirements:

- IRO-010-6 Requirement R1 Part 1.1
- TOP-003-8 R1 Requirement Part 1.1
- TOP-003-8 Requirement R2 Part 2.1

These modifications were made in response to FERC Order 901 directives related to the inclusion of IBRs in operations models.[13] The phrase "IBR-specific data and parameters" in the revised IRO-010-06 and TOP-003-8 is intended to reflect what FERC describes in the order as "IBR models that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions".

Rationale for Modifications to add reference to ERO Approved Criteria for Acceptable Models

"Requirements for model submissions in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization" was added to the following requirements:

- IRO-010-6 Requirement R1 Part 1.5.3
- TOP-003-8 Requirement R1 Part 1.5.3
- TOP-003-8 Requirement R2 Part 2.5.3

These modifications were made in response to FERC Order 901 directives related to usage of a uniform framework in the development of operations models. The ERO Approved Criteria for Acceptable Models specifies further requirements as to what is needed for accurate models that are useful for the types of analysis specified by FERC in Order 901.

[13] FERC Order 901 Paragraph 122 and Paragraph 161

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of FERC Order 901 Directives

Milestone 3: Project 2022-02 Uniform Modeling Framework for IBR
April 2025

On October 23, 2023, FERC issued a Final Rule, Order No. 901, directing the North American Electric Reliability Corporation (NERC) to develop new or modified Reliability Standards that address aggregation of data, parameters, and estimation methods to provide the Transmission Planner (TP) and Transmission Operator (TOP) with the estimate values, explanation for limitations on data availability, and the method used for all estimations. This project has a FERC regulatory deadline of November 4, 2025. Below provides the directives from FERC Order 901 along with the drafting team's (DT's) consideration of the directives.

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
P7. "… Second, by November 4, 2025, NERC must submit new or modified Reliability Standards addressing the interrelated directives concerning: (1) data sharing for registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate…"	IRO-010 MOD-032 TOP-003	A timeline has been drafted to meet the regulatory deadline of November 4, 2025. Completed tasks listed below. • An industry workshop completed January 14-17, 2025. (outreach) • Many virtual drafting team meetings completed weekly from January – March 2025. (publicly posted) • In-person DT completed February 11-13, 2025. (publicly posted) • Industry Webinar March 6, 2025. (publicly posted) • DT outreach with trade groups and entities March 3 – 14, 2025 • Industry comment and ballot period April 17 – May 16, 2025. (publicly posted)

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		• A second industry workshop scheduled for June 3-5, 2025. (publicly posted)
P76. "Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require registered IBR generator owners and operators to provide IBR-specific modeling data and parameters (e.g., steady-state, dynamic, and short circuit modeling information, and control settings for momentary cessation and ramp rates) that accurately represent the registered IBRs to their planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities that are responsible for planning and operating the Bulk-Power System. As several commenters indicate, ensuring the sharing of appropriate IBR modeling data is critical to create and maintain the models used in reliability studies, and in turn to ensure that Bulk-Power System transmission planners or operators are able to plan for, operate, and reliably integrate IBRs onto the Bulk-Power System."	IRO-010 MOD-032 TOP-003	**Theme:** IBR/Generator Owner to provide specific modeling data. IRO-010 and TOP-003: • While TOP-003 and IRO-010 allow any data to be requested, the DT felt it was important to add "IBR-specific data and parameters" specifically to IRO-010-6 Requirements R1 subpart 1.1 and TOP-003-8 Requirement R1 subpart 1.1 and Requirement R2 subpart 2.1 to ensure it is clear what data may be specifically requested to address FERC Order 901. In addition, IBR encompasses IBR-DER, and this information could be requested. • The team considered adding a new subpart at the end of Requirement 1 (e.g., 1.6), but after reviewing Requirement language, the team determined the data and information lists within the existing subparts were the appropriate place to capture IBR-specific modeling data and parameters. MOD-032: • Generator Owner and Generator Operator – The DT decided to put the responsibility on just the Generator Owner and did not add Generator Operator as a functional entity to the applicability section. If data is needed from the Generator Operator, then the Generator Owner can reach out to the Generator Operator for necessary data via contractual obligations, etc. The team does

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
		not find it necessary to require two applicable entities when one oversees the other. • The team modified attachment 1 to include Generation and storage units, removed photovoltaic system (covered within IBR) and added Inverter-Based Resources. The wind turbine was updated for clarity that it is for Type 1 and Type 2.
P77. "With regard to AEU and ACP/SEIA's comments that the Commission direct NERC to specify data sharing requirements from transmission owners to generator owners and operators, we believe that this request may already be addressed through each transmission planner's existing processes. For example, the New York Independent System Operator (NYISO) and CAISO both have processes for obtaining such data after demonstrating a need for the specific information requested and that the required information protection and non-disclosure agreements are signed. Nevertheless, to support accurate modeling and performance, we direct NERC to consider during its standards development process AEU and ACP/SEIA's suggested data sharing requirements when developing the framework, criteria, and necessary data exchange requirements to meet the registered IBR data sharing directive." **P74.** "AEU and ACP/SEIA ask that, in addition to data provision requirements for generator owners and operators, the Commission direct NERC to specify data sharing requirements from transmission owners to generator owners. For example, AEU explains that	MOD-032	**Theme:** Information going from Transmission Owner to Generator Owner/Generator Operator (consider): MOD-032 • There is no specific requirement within MOD-032 that requires Transmission Owners to share data with the Generator Owners and Generator Operators. However, Transmission Planners and Planning coordinators have a framework where requests for data can be sent for inclusion for the interconnection-wide models. At this time, the team does not see a need for a requirement to be drafted requiring Transmission Owners to provide data to Generator Owners and Generator operators. The team believes this is most appropriately addressed through processes that exist outside of NERC reliability standards and concurs with the suggestion in P77 that these processes are already in place.

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
generator owners and operators also require data from transmission owners to support accurate modeling and performance, e.g., short circuit data, grid data for offshore wind, information on other power electronic devices around the IBR plant, and voltage harmonics. AEU adds that putting requirements on transmission owners would be consistent with revisions being developed for NERC's Modeling, Data, and Analysis (MOD) Reliability Standards."		
P78. "Commenters raised general concerns that mandating specific modeling and data submissions would reduce the flexibility and discretion of transmission planners and operators to identify the information they need. We find that, given the need for IBRs to operate in a predictable and reliable manner to ensure the reliable operation of the Bulk-Power System, it is necessary to establish uniform, minimum categories or types of data that must be provided so that Bulk-Power System planners and operators can predict the behavior of all IBRs. As discussed in more detail in section IV.C of this final rule, we are also directing NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models that accurately reflect the behavior of all IBRs during steady state, short-circuit, and dynamic conditions."	MOD-032 TOP-003 IRO-010	**Theme:** Individual use of approved IBR models. (ERO Approved Criteria for Acceptable Models) **Applicability:** Transmission Planner and Transmission Operator MOD-032 • An ERO Approved Criteria for Acceptable Models document has been developed. The Criteria for Acceptable Models defines the minimum criteria for model usability and quality for model submissions under the MOD-032, TOP-003, and IRO-010 Reliability Standards, as well as other Reliability Standards that may be revised from time to time to incorporate these Criteria. • IBR has been included in Attachment 1 of MOD-032 under steady state (item 3), dynamics (item 7), and short circuit ensuring that entities are clear that IBR needs to be addressed as required per FERC Order 901. • IBR was added to the TOP and IRO standards to clarify obligations when this specific data is requested.

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
P86. "As a general matter, we agree with ACP/SEIA regarding the need to balance the burden to generator owners of collecting and providing data collected by disturbance monitoring equipment with the benefit of that data to reliability. Thus, in developing the directed data collection requirements, we direct NERC to consider the burdens of generators collecting and providing data, while assuring that Bulk-Power System operators and planners have the data they need for accurate disturbance monitoring and analysis. Likewise, regarding CAISO's request that the Commission direct NERC to consider requiring registered IBRs to provide additional data, we agree that such data collections may be warranted, and direct **NERC to consider through its standards development process whether additional IBR data points (e.g., telemetry collections or other automated platform integrations) are needed to further enhance real-time visibility of Bulk-Power System operations."**	TOP-003 IRO-010	**Theme:** Disturbance and monitoring (Consider) (real-time operations) **Applicability:** Generator Owner TOP-003/IRO-010 • TOP-003 and IRO-010 Reliability Standards are already structured in an open way so that any type of data needed can be requested at any time. In addition, transmission of information from the plant level is generally dealt with via interconnection agreements and does not rise to the level of a requirement being needed at this time. Lastly, PRC-028 PMU devices must be installed for every IBR installation. These additional monitoring devices will allow additional data requests related to those devices if the applicable entities would find that useful.
P102. "Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal, with modification. Specifically, as proposed in the NOPR, we direct NERC to submit to the Commission for approval one or more new or modified Reliability Standards that require: (1) transmission owners to provide to Bulk-Power System planners and operators modeling data and parameters for unregistered IBRs in their transmission owner areas that, individually or in the aggregate, materially affect the reliable operation of the Bulk-Power System and (2) distribution providers to provide to Bulk-Power System	MOD-032 IRO-010 TOP-003	**Theme:** 1) TO provide data for unregistered IBR and 2) DPs provided data for IBR-DER **Applicability:** Transmission Owner and Distribution Provider • The DT added IBRs (including unregistered-IBRs) and DER (including IBR-DER) to Attachment 1. After a good bit of discussion, it was determined to add that the respective functional entity can estimate, should there be limitations of availability of data. In addition, the DT did not know how to interpret material affect and therefore, left it up to the Planning Coordinator and each of its Transmission Planners to review,

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
planners and operators modeling data and parameters for IBR-DERs in the aggregate in their distribution provider areas where the IBR-DERs in the aggregate materially affect the reliable operation of the Bulk-Power System."		consider, and determine all unregistered IBR that would be material impacted. • The IRO-010 and TOP-003 language already there to address the IBRs.
P104. "Recognizing that there may be instances in which transmission owners are unable to gather adequate unregistered IBR modeling data and parameters to create and maintain unregistered IBR models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation. We believe that this directive appropriately balances commenters' concerns about data accessibility and burden with the established need for transmission owners to provide unregistered IBR modeling data and parameters to Bulk-Power System planners and operators in their transmission owner area. We recognize that estimated modeling data and parameters are approximations of actual modeling data and parameters. We further acknowledge that there is some degree of error in	MOD-032 IRO-010 TOP-003	**Theme 1:** 1) Estimation, if not able to get data from unregistered IBRs, 2) an explanation of the limitations of the availability of data, 3) explanation of the limitations of any data provided by unregistered IBRs, and 4) method for estimation. (directive) **Theme 2:** Implement a process or mechanism by which Transmission Owners would receive modeling data and parameters. (consider) **Applicability:** TO • The DT added a Requirement R2 Part 2.1 allowing the functional entity to use the method of estimation should it find itself in a place unable to gather unregistered IBR data or DER data. However, it must include an explanation of the limitations of the availability of data, an explanation of the limitations of any data provided for unregistered IBRs or DERs, and the method used for estimation. • The DT discussed implementing a process or mechanism by which Transmission Owners would receive modeling data and parameters in depth. It was determined that if an entity is unable to gather data from unregistered IBRs, then it is better to leave open for Transmission Owner and Distribution Provider to acquire data how they see fit. This is something that entities can determine in the planning process.

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
estimated modeling data and parameters. However, on balance we believe that requiring such estimates with explanation of any limitations is an improvement from not having any data at all; and that even estimates will increase the overall adequacy of models and improve the reliability of the Bulk-Power System. To support this data collection, we further direct **NERC to consider commenters suggestions to implement a process or mechanism by which transmission owners would receive modeling data and parameters."**		• IRO-010 and TOP-003 language already there to address the IBRs.
P105. "We also recognize that there may be instances where distribution providers are similarly unable to gather adequate modeling data and parameters from IBR-DERs. Accordingly, to account for instances in which distribution providers are unable to gather adequate modeling data and parameters of IBR-DERs to create and maintain IBR-DER models, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require that each distribution provider, if unable to gather accurate IBR-DERs data in the aggregate or unable to gather IBR-DERs data in the aggregate at all, provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation. In support of above, we further direct NERC to consider commenters' suggestions to	MOD-032 IRO-010 TOP-003	**Theme 1:** 1) an estimate of the modeling data and parameters of IBR-DERs in the aggregate, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of the data provided by IBR-DERs, and (4) the method used for estimation. (Directive) **Theme 2:** consider commenters' suggestions to implement a process or mechanism by which distribution providers would receive modeling data and parameters. (Consider) **Applicability:** Distribution Provider The DT added a new Requirement R2 Part 2.1 that if the responsible entity is unable to gather unregistered IBR data or DER data and provide it to the Transmission Planner and Planning Coordinator, as specified in the data requirements and reporting procedures developed under Requirement R1, the responsible entity shall provide an estimate of the modeling data and parameters and include an explanation of the limitations of the availability of data, an explanation of the limitations of any data provided for unregistered IBRs or DERs, and the method used for estimation.

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
implement a process or mechanism by which distribution providers would receive modeling data and parameters."		The DT discussed the possible mechanism by which Distribution Providers would receive modeling data and parameters. The team did not feel this rose to the level of a requirement as the Distribution Provider can ask for the modeling data and parameters from the respective entity.
P106. "Finally, as noted by commenters, we recognize that there may be instances where IBR-DERs are connected to an entity that does not meet the criteria for registration with NERC as a distribution provider. For those areas with IBR-DERs that in the aggregate materially affect the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we direct NERC to determine the appropriate registered entity responsible for providing data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, or, when unable to gather such accurate IBR-DERs data, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation."	MOD-032 IRO-010 TOP-003	**Theme:** Who is the responsibility entity when no registered DP of IBR-DER (1) an estimate of the modeling data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by the IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and (4) the method used for estimation. • Upon a decent amount of conversation, the DT determined that if there is no registered Distribution Provider, then the next best entity would be a Transmission Owner. The DT created a footnote stating: "The DP is the typical responsible entity for collecting and providing data for DER connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the DP's system. The Transmission Owner is the typical responsible entity for collecting and providing data for DER where there is no associated registered Distribution Provider between the DER connection point and the TO's system."
P108. "Regarding CAISO's concern regarding the potential "compliance trap" where planners and operators rely on third-party data and IRC's request that the final rule specify the data to be submitted by	MOD-032 IRO-010 TOP-003	**Theme:** minimum categories or types of data that must be provided to transmission planners, transmission operators, transmission owners, and distribution providers that are necessary to predict the behavior of all

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
all IBRs (i.e., registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate) and transmission devices using similar technologies, we direct NERC to determine through its standards development process the minimum categories or types of data that must be provided to transmission planners, transmission operators, transmission owners, and distribution providers necessary to predict the behavior of all IBRs and to ensure that compliance obligations are clear. As discussed in more detail in section IV.C of this final rule, we are also directing NERC to develop new or modified Reliability Standards that require the use of approved industry IBR models that accurately reflect the behavior of all IBRs during steady state, short-circuit, and dynamic conditions. By contrast, we believe that a directive to task distribution providers as the appropriate registered entity to collect and share the modeling data and parameters of IBR-DERs in the aggregate is preferable to deferring to the stakeholder process as suggested by APS. The distribution provider, as the entity providing and operating the lines between the transmission and distribution systems, is the entity best situated to have access to the data necessary for accurate estimation and, other than Indicated Trade Associations that suggested the piecemeal approach already discussed above, no commenter identified other potential entities as an equally efficient option."		IBRs and to ensure that compliance obligations are clear (ERO Approved Acceptable Criteria for Models/IEEE1547 ref./modify req./Tech rationale) **Applicability:** Transmission Planners, Transmission Operators, Transmission Owners, and Distribution Providers • The ERO Approved Criteria for Acceptable Models ensures that acceptable behavior is being considered for all types of IBRs, and added Requirement R2 Part 2.1 ensures entities have a way to address unregistered IBR and IBR-DER data if it is not available. In addition, the ERO Approved Criteria section from the ERO Approved Criteria for Acceptable Models requires planning models, operational models, and usability requirements demonstrate disturbance behavior of all IBRs during steady state, short-circuit, and dynamic conditions.
P122. "Pursuant to section 215(d)(5) of the FPA, we adopt the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require the	MOD-032 IRO-010 TOP-003	**Theme**: require the use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady state, short-

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady state, short-circuit, and dynamic conditions when developing planning, operations, and interconnection-wide models. For example, the new or modified Reliability Standards could reference the NERC approved component model list, which defines the models that may be used, and those models that may not be used, for specific types of studies. This approved component model list includes WECC's IBR models. Without requiring the use of approved industry generic library models, Bulk-Power System planners and operators may not be able to create system models that adequately predict IBR behaviors and subsequent impacts on the Bulk-Power System."		circuit, and dynamic conditions when developing planning, operations, and interconnection-wide models. The Criteria for Acceptable Models defines the minimum criteria for model usability and quality for model submissions under the MOD-032, TOP-003, and IRO-010 Reliability Standards, as well as other Reliability Standards that may be revised from time to time to incorporate these Criteria. The applicable standards connect the ERO Approved Criteria for Acceptable Models via requirements language added in each standard. In addition, IBRs have been added to Attachment 1 ensuring this is captured in steady state, short-circuit, and dynamic conditions.
P124. "We direct NERC to determine through its standards development process which nation-wide approved component models are needed to build IBR plant models for steady state, short-circuit, and dynamics studies. We acknowledge NERC's comment that user-defined models may be helpful for specific local reliability studies; however, the user-defined model cannot be used in place of nation-wide approved component models for regional analysis or interconnection-wide analysis because the user-defined model may cause non-convergence and other issues. However, NERC may allow the submission of user-defined models alongside the approved industry generic IBR model. Various entities do not accept user-defined models or only accept them for limited		**Theme:** nation-wide approved component models are needed to build IBR plant models for steady state, short-circuit, and dynamics studies. (ERO Approved Criteria for Acceptable Models) The ERO Approved Criteria for Acceptable Models will focus on the use and representation of positive sequence phasor domain (PSPD) models in registered entity footprints and in Interconnection-wide models. Interconnection-wide modeling may be different from the models used in specialized studies dedicated to a particular technical objective. NERC's Criteria for Acceptable Models applies to the models where NERC Reliability Standards require its use (generally for planning and operation models where multiple entities share information beyond their portion of the electric system, which includes Interconnection-wide models). Further guidance for

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
instances along with the open-source code which then allows internal model components to be viewed and modified. For example, PJM does not accept user-defined models and requires generic models for model verification in accordance with currently effective Reliability Standards MOD-026-1 and MOD-027-1. NYISO accepts a user-defined model in limited instances but requires either the open-source code (allowing anyone to access the internal model) or dynamic link library data and code files (compiled code that must be decompiled to view the internal model) that must be supplied for existing power flow software and in perpetuity."		interconnection applications can be found in the *NERC Dynamic Model Recommendations*.
P125. "Accordingly, we direct NERC to develop new or modified Reliability Standards that require the sole use of nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build interconnection-wide models. One example of a way NERC could meet this directive would be to require an equivalent generic library model along with all submissions of user-defined models so that the generic library model can be used when combining neighboring transmission system models and in interconnection-wide models."	MDO-032 IRO-010 TOP-003	**Theme:** nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build interconnection-wide models. (ERO Approved Criteria for Acceptable Models/Req language) • Nation-wide approved components via generic library models are addressed via the development of the ERO Approved Criteria for Acceptable Models and the addition of a Requirement Part has been added to MOD-032, TOP-003, and IRO-010. • If an entity wants to provide a generic model library, they are allowed to do so, but if equipment-specific models satisfy usability criteria, they are not prohibited.
P141. "We also direct NERC to require the generator owners of registered IBRs and the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g.,	MOD-032 IRO-010 TOP-003	Repeat of above. **Applicability**: GO

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of registered and unregistered IBRs, including momentary cessation and/or tripping, and all ride through behavior. Recognizing that there may be instances in which transmission owners are unable to gather accurate unregistered IBR modeling data and parameters to create and maintain accurate unregistered IBR dynamic models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas, dynamic models of unregistered IBRs using estimated data in accordance with this final rule's section IV.B.3 data sharing directives. Further, we direct NERC to require distribution providers to provide to the planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities aggregated dynamic models that adequately represent the dynamic performance of IBR-DERs on their systems that in the aggregate have a material impact on the Bulk-Power System, including momentary cessation and/or tripping, and all ride through behavior (e.g., IBR-DERs in the aggregate modeled by interconnection requirements		• Nation-wide approved components via generic library models are addressed via the development of the ERO Approved Criteria for Acceptable Models and the addition of a Requirement Part has been added to MOD-032, TOP-003, and IRO-010. This approach is aligned with the FERC Order directives while addressing the practical limitations raised by industry at January 15-16 NERC Industry Engagement Workshop • MOD-032, Attachment 1 was modified to specifically add that capabilities related to momentary cessation, tripping, and Ride-through, be reflected in the required model data for IBR and DER.

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
performance to represent different steady-state and dynamic behavior). Recognizing that there may be instances in which distribution providers are unable to gather data that accurately represents IBR-DERs in the aggregate, we modify the NOPR proposal and direct NERC to include in the proposed new or modified Reliability Standards a requirement that the distribution provider, if unable to gather data of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, provide to the Bulk-Power System planners and operators (i.e., the data recipients) a dynamic model using estimated data for IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, in accordance with this final rule's section IV.B.3 data sharing directives. Furthermore, we acknowledge that there may be areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider. Therefore, we modify the NOPR proposal and direct NERC to determine the appropriate registered entity responsible for providing adequate data and parameters of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, and to identify the registered entities for coordinating, verifying, and keeping up to date the respective dynamic models. Finally, NERC must ensure that the proposed new or modified Reliability Standards account for the dynamic performance of IBR-DERs that		

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
in the aggregate have a material impact on the Bulk-Power System."		
P146. Accordingly, **we direct NERC to develop new or modified Reliability Standards that require the use of the DER_A model or successor models to represent the behaviors of IBR-DERs that in the aggregate have a material impact on the Bulk-Power System at a sufficient level of fidelity for Bulk-Power System planners and operators to create valid planning and operations and interconnection-wide models and to be able to perform respective system studies. For example, the new or modified Reliability Standards could require models of IBR-DERs (i.e., DER_A model) to adequately reflect the steady-state and dynamic aggregate** resource performance in both a transmission area and across the interconnection. Additionally, estimated modeling data and parameters of IBR-DERs that in the aggregate (i.e., DER_A model) have a material impact on the Bulk-Power System could be used where measured and collected data is not available. We believe requiring the DER_A model will address NERC's request for entities to work collaboratively with the state regulators to identify, implement, and perform an effective model validation approach for IBR-DERs in the aggregate as opposed to requiring validated models of IBR-DER in the aggregate that can have a material impact on the reliable operation of the Bulk-Power System.	MOD-032 IRO-010 TOP-003	**Theme**: IBR-DER Model • The ERO Approved Criteria for Acceptable Models document requires models that are appropriate for the intended use and meet usability criteria. The currently available DER_A model is sufficient only for positive sequence phasor domain simulations. With the variety of other simulation domains necessary to study IBRs, mandating this model could prevent TPs or PCs performing their studies. This further reinforces the team's election to not require the use of the DER_A model, but rather a model that achieves specific performance criteria and conforms with MOD-032 edits in Attachment 1 and R1. • The team considered referencing the DER_A model specifically, but refrained due to the rapidly evolving nature of models and concerns for the time required to update such a reference in a NERC Standard. Further, challenges with precisely defining and determining what a "successor model" is could potentially create more future reliability risks.
P157. We believe the development of new or modified Reliability Standards is an important corollary to NERC's	MOD-032 TOP-003	**Theme:** Who is the responsible entity when no registered DP of IBR-DER. Framework aspect.

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
ongoing effort to identify and register generator owners and operators of IBRs. Although NERC's registration changes will not at this time address IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, we believe APS's concerns regarding system-wide model validation is addressed in NERC's Reliability Guidelines and through the use of the EPRI DER Settings Database. We recognize that some distribution providers may not be able to provide a precise set of modeling data and parameters that accurately represent IBR-DERs in the aggregate. For these situations, NERC has provided a technical means to estimate in aggregating the needed IBR-DER modeling data and parameters (i.e., for the DER_A model) in the IBR-DER Data Collection Guideline. Further, NERC's 2021 Aggregate DER Model Verification Guideline provides transmission planners and planning coordinators with tools and techniques that can be adapted for their specific systems to verify that aggregate DER models (i.e., DER_A models) are a suitable representation of these resources in planning assessments. **Furthermore, for those areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we modify the NOPR proposal to direct NERC to determine the appropriate registered entity responsible for the data and parameters of IBR-DERs in the aggregate and to establish a process that**	IRO-010	Upon a decent amount of conversation, the DT determined that if there is no registered Distribution Provider, then the next best entity would be a Transmission Owner. The DT created a footnote stating: "The DP is the typical responsible entity for collecting and providing data for DER connected to its system either directly or through an unregistered Distribution Provider (i.e., not included on the NERC Compliance Registry) with no other registered entity systems between the DER connection point and the DP's system. The Transmission Owner is the typical responsible entity for collecting and providing data for DER where there is no associated registered Distribution Provider between the DER connection point and the TO's system."

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
requires identified registered entities to coordinate, validate, and keep up to date the system models.		
P161. "Pursuant to section 215(d)(5) of the FPA, we modify the NOPR proposal to provide additional specificity to explain coordination and keep up to date in a timely manner the verified data and models of registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate in the system models. **Specifically, we direct NERC to develop new or modified Reliability Standards that require planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities to establish for each interconnection a uniform framework with modeling criteria, a registered modeling designee, and necessary data exchange requirements both between themselves and with the generator owners, transmission owners, and distribution providers to coordinate the creation of transmission planning, operations, and interconnection-wide models (i.e., system models) and the validation of each respective system model.** Further, we direct NERC to include in the new or modified Reliability Standards a requirement for generator owners, transmission owners, and distribution providers to regularly update and communicate the verified data and models of registered IBRs, unregistered IBRs, and IBR-DERs by comparing their resulting models against actual operational behavior to achieve and maintain necessary modeling accuracy for inclusion of these	MOD-032 IRO-010 TOP-003	The DT modified MOD-032 to ensure it captures the uniform framework with modeling criteria, a registered modeling designee, and necessary data exchange has been modified via TOP-003 and IRO-010.

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
resources in the system models. For those areas with IBR-DERs in the aggregate that have a material impact on the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we modify the NOPR proposal to direct NERC to determine the appropriate registered entity responsible for the models of those IBR-DERs and to determine the registered entities responsible for updating, verifying, and coordinating models for IBR-DERs in the aggregate to meet the system models directives. NERC may implement this directive by modifying Reliability Standards MOD-032-1 and MOD-033-2 or by developing new Reliability Standards to establish requirements mandating an annual process to coordinate, validate, and keep up-to-date the transmission planning, operations, and interconnection-wide models."		
P226. "Although we are not directing NERC to include implementation dates in its informational filing and are leaving determination of the proposed effective dates to the standards development process, we are concerned that the lack of a time limit for implementation could allow identified issues to remain unresolved for a significant and indefinite period. Therefore, we emphasize that industry has been aware of and alerted to the need to address the impacts of IBRs on the Bulk-Power System since at least 2016. The number of events, NERC Alerts, reports, whitepapers, guidelines, and ongoing standards projects more than demonstrate the need for the expeditious	MOD-032 IRO-010 TOP-003	**Theme:** sufficient timeframe. The DT felt that four years was an appropriate timeframe for the MOD-032, IRO-010, and TOP-003 standards. However, taking into consideration an implementation plan completion of 2030 per FERC Order 901 required the team to go back to the table and re-think the timeframe knowing that milestone 4 still needs to be completed and allowed implementation plan time. It is understood that based on what is being required via MOD-032, industry would need at least one year to gather data, hold meetings with respective OEM or developers to gather models needed, and then an additional two years to update models based on the ERO Approved Criteria for Acceptable Models document, etc. The team settled on three years implementation plan for MOD-032 and then synced up TOP-003 and IRO-010 with three years

FERC Order 901 Directives		
Directive Language	**Standards Impacted**	**Consideration of Directives**
implementation of new or modified Reliability Standards addressing IBR data sharing, data and model validation, planning and operational studies, and performance requirements. Thus, in that light, the Commission will consider the justness and reasonableness of each new or modified Reliability Standard's implementation plan when it is submitted for Commission approval. Further, we believe that there is a need to have all of the directed Reliability Standards effective and enforceable well in advance of 2030 and direct NERC to ensure that the associated implementation plans sequentially stagger the effective and enforceable dates to ensure an orderly industry transition for complying with the IBR directives in this final rule prior to that date."		implementation plan for the respective functional entities to provide data upon requests.

Executive Summary

The Criteria for Acceptable Models defines criteria for model submissions under the MOD-032, TOP-003, and IRO-010 Reliability Standards. Models that are submitted for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system shall meet requirements in this document.

Disclaimers

Interconnection-wide modeling requirements may differ from the requirements of specialized studies dedicated to a particular technical objective. NERC's Criteria for Acceptable Models applies to the models where NERC Reliability Standards require its use (generally for planning and operation models where multiple entities share information beyond their portion of the electric System, which includes interconnection-wide models).

Operations models shall meet the requirements in this document, provided that models for operations shall not reduce the ability of a Registered Entity to perform their Operational Planning Analyses and Real-Time Assessments (RTAs) in a timely manner. Thus, models deemed acceptable for planning purposes may be deemed unacceptable by a receiving entity for certain operations applications.

Chapter 1: Process

Updates to the Criteria for Acceptable Models

This section describes the process by which changes may be made to the Criteria for Acceptable Models or the revision processes in this document, excluding changes to the Unacceptable Models List which will be addressed in the following section.

1) Any person or entity may submit a request to the ERO to revise the Criteria for Acceptable Models. This request shall include, at a minimum:
   a. Description of the suggested revision;
   b. Technical justification for the suggested revision;
   c. Supporting documentation; and
   d. Identification of any Confidential Information as defined in Section 1500 of the NERC Rules of Procedure.
2) ERO staff shall review and evaluate the Criteria for Acceptable Models revision request, along with any group or subcommittee of the NERC Reliability and Security Technical Committee (RSTC) or its successor charged with assisting in such reviews. If no such group or subcommittee has been identified, ERO staff may work with other industry subject matter experts as needed to review and evaluate the request.
3) As part of the review process, ERO staff shall conduct a 45-day public comment period on the proposed revision request.
4) The proposed revision request, along with the results of the review, the comments received, a summary consideration of comments, and the recommended action, shall be presented to the NERC RSTC or its successor in a duly noticed public meeting.
5) The NERC RSTC may recommend the NERC Board of Trustees approve the revision request, reject the revision request, or remand the revision request for further work. If the NERC RSTC recommends approving the revision request, the NERC RSTC shall also recommend an effective date for the revision.
6) The NERC Board of Trustees, considering the recommendation of the NERC RSTC, shall approve the revision request, reject the revision request, or approve the revision request with modifications. If approved, the NERC Board of Trustees shall also approve an effective date for the revision.
7) The ERO shall provide public notice of a revision to the Criteria for Acceptable Models along with the effective date of the revision. The revised Criteria for Acceptable Models shall be posted to the NERC website and filed with FERC for informational purposes.

Updates to the Unacceptable Models List

This section describes the process by which changes may be made to the Unacceptable Models List. The following steps shall be taken to add, remove, or modify a model to the Unacceptable Models List:

1) Any person or entity may submit a request to the ERO to add or remove a model from the Unacceptable Models List. This request shall include, at a minimum:
   a. The model name;

b. Alternative model name(s), if any;

c. Organization(s) the submitting entity represents;

d. Description of the model's stated intent;

e. Request to add model as an "unacceptable" model or remove model as an "unacceptable" model;

f. Technical supporting documentation that includes the ability of the model to meet or not meet small and large disturbance behavior;

g. Identification of any Confidential Information as defined in Section 1500 of the NERC Rules of Procedure; and

h. An explanation, if any of the above technical support items are unavailable to the supporting entity.

2) ERO staff shall review and evaluate the information in the Unacceptable Models List change request, along with any group or subcommittee of the NERC RSTC or its successor charged with assisting in such reviews. If no such group or subcommittee has been identified, ERO staff may work with other industry subject matter experts as needed to review and evaluate the request.

3) If the request is seeking to add a model to the Unacceptable Models List, ERO staff shall provide public notice that identifies the model being considered for addition to the list, includes a non-confidential summary of the rationale offered for its inclusion, and provides at least 30 days to submit comments.

4) The results of this review and the recommended action shall be presented to the NERC RSTC or its successor in a duly noticed public meeting.

5) The NERC RSTC may recommend the NERC Vice President of Engineering and Standards[1] approve the change request, reject the change request, or remand the application back to the ERO to work with the submitting entity. If the NERC RSTC recommends approving the change request, the NERC RSTC shall also recommend an effective date for the change.

6) The NERC Vice President of Engineering and Standards, considering the recommendation of the NERC RSTC, shall approve the change request, reject the change request, or remand the application back to ERO staff to work with the submitting entity. If approved, the NERC Vice President of Engineering and Standards shall also determine the effective date for the change.

7) The ERO shall provide public notice of a change to the Unacceptable Models List included in this Approved Criteria for Acceptable Models along with the effective date of the change. The revised document shall be posted to the NERC website and filed with FERC for informational purposes.

8) Technical Rationale for each model added to the Unacceptable Models List shall be retained by the ERO for as long as practicable, but no fewer than five (5) years from the date a model is added to the list.

[1] This may include an equivalent NERC officer if by a different title, or their designee.

Chapter 2: ERO Approved Criteria

Planning Models

Models that are submitted for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system shall qualify with the following:

1) All models shall be representative of expected or as-built facilities.
2) All models shall be usable (see usability requirements below).
3) All standard library models are deemed acceptable until demonstrated to not meet usability requirements and/or demonstrated to be unable to represent the expected or as-built facilities.[2]
4) Models listed on the Unacceptable Model List shall not be used unless it is demonstrated that such a model represents the expected or as-built facilities with negligible error(s) in both small signal and large disturbance behavior and does not introduce numerical instability in the software used by TPs or PCs. In these cases, the model submitting entity may submit a request to update the Unacceptable Model List. A model may be used pending the disposition of the request.

Operational Models

Models that are submitted for development of operation cases necessary to support analysis of the reliability of the interconnected transmission system shall qualify with the following:

1) All models shall be representative of expected or as-built facilities.
2) All models shall be usable (see usability requirements below).
3) All standard library models are deemed acceptable until demonstrated to not meet usability requirements and/or demonstrated to be unable to represent the expected or as-built facilities.[3]
4) Models listed on the Unacceptable Model List shall not be used unless it is demonstrated that such a model represents the expected or as-built facilities with negligible error(s) in both small signal and large disturbance behavior and does not introduce numerical instability in the software used by TPs or PCs. In these cases, the model submitting entity may submit a request to update the Unacceptable Model List. A model may be used pending the disposition of the request.
5) Models shall not reduce the viability of a Registered Entity's ability to perform their OPAs and RTAs in a timely manner.

Usability Requirements

Models that are used for representation of generation and system components shall have sufficient documentation for the user of the model to understand its parameters, states, and outputs into the simulation software. Usable models are those models that include, at a minimum, the following:

1) A model manual, or other documentation, with a description of all model parameters, variables, and states. The manual or other documentation shall also describe the range of validity of the model and valid use cases or studies for which the model has sufficient fidelity.
2) A procedure to use and initialize the model in dynamic simulations, including alterations to the steady-state representation.

[2] Poor model quality may stem from poor parameterization and/or poor implementation of a model from code. Poor parameterization or poor implementation of a particular model shall not be used to generalize a model's designation in the Unacceptable Model List.

[3] Poor model quality may stem from poor parameterization and/or poor implementation of a model from code. Poor parameterization or poor implementation of a particular model shall not be used to generalize a model's designation in the Unacceptable Model List.

3) Disclaimer(s) on the usability of the model for known model software or simulation domains.
4) An explanation of the model's adequacy to represent small and large disturbance behavior.
5) A list of commonly tuned parameters to align the model to site-specific settings as well as allowable tuning ranges for these parameters.

Chapter 3: Unacceptable Models List

Models that have been identified as unacceptable as list in Table 1 below. Revisions to this list may be made in accordance with the process described in "Updates to the Unacceptable Models List" above.

Table 1: Unacceptable Model List	
Known Unacceptable Model Name	**Model Description**
Renewable Energy Models	
WT3G1, WT3G2, wt3g	Generic Type 3 WTG Generator/Converter Model - Doubly-fed induction generator

Chapter 4: Form Revisions

This form is a sample to explain what is deemed a full application to change a model designation in the NERC Approved Model Criteria for Acceptable Models List.

Name of Person submitting			
Organization(s):			
Sector (if known)			
Telephone		Email	

Model Name	
Alternative Model Name(s) as implemented in software	
Equipment Model is stated to represent	
Indicate desired Action	☐ Add "model to the Unacceptable Models List, Section X of the Approved Model Criteria for Acceptable Models ☐ Remove model from the Unacceptable Models List, Section X of the Approved Model Criteria for Acceptable Models

Description of model ability to meet small signal Disturbances	
Description of model ability to meet large signal Disturbances	
Please cite and link any industry approved documentation regarding this model's small and large signal disturbances	
Describe the technical document attachments that support the above questions	
Please identify any information in this application that may meet the criteria for Confidential Information, as defined in Section 1500 of the NERC Rules of Procedure.	

Section 4: Process Tracking	
Date Submitted to ERO	
Model Status	☐ Submitted to the ERO ☐ Assigned ERO Review team ☐ Investigation and review by ERO and submitting entity ☐ Remanded by NERC RSTC (or its successor) ☐ Approved by the NERC RSTC (or its successor)
Date of Approval	
Date of Model Notice to Industry	

Attachments:

If available, please include at least one report that demonstrates the ability or inability of the model to meet its stated purpose using Hardware-in-the-Loop, Software-in-the-Loop, or actual System response (e.g., in a commissioning test) that demonstrates the ability or inability to meet the model's stated purpose. At least one attachment should detail the model's error boundaries to represent its stated equipment with the test description and procedure outlined in that report. Entities shall label any attachment that may meet the criteria for Confidential Information under NERC Rules of Procedure Section 1500, along with the basis for the designation (e.g., Confidential Business and Market Information, Critical Electric Infrastructure Information, etc.). If any of this information is not available to the supporting entity, please provide an explanation.

Chapter 5: Technical Rationale

FERC Order No. 901

This document addresses directives within Federal Energy Regulatory Commission (FERC) Order No. 901 outlining the need to use industry approved models. Pre-defining a limited set of models (i.e., a library of models) that could be used to represent generation and system components is potentially at odds with objectives to also have accurate models, especially as technology rapidly progresses. Thus, instead of specifying a limited model library, this document provides acceptability criteria for models representing generation and system components. This document is based on the *NERC Dynamic Modeling Recommendations*[4] but is standalone. Entities are encouraged to review the *NERC Dynamic Modeling Recommendations* for further consideration and technical background for this Criteria for Acceptable Models.

Operational Models

Transmission Operators (TOPs), Reliability Coordinators (RCs), and Balancing Authorities (BAs) are required to have a "documented specification for the data necessary" to perform Operational Planning Analysis (OPA), Real-Time Assessment (RTA), and Real-time Monitoring. This data specification is then distributed by the TOP, RC, and BA to entities to fulfil the data requirements and such entities provide the data in mutually agreeable format, security protocol, and process for resolving data conflicts. FERC Order No. 901 has identified that the transient dynamic performance of Inverter-based Resources (IBRs) is underrepresented in these models. However, many OPAs and RTAs do not perform a transient dynamic simulation for all credible Contingencies due to computational time constraints. As such, models for operations shall meet the same criteria for models for planning. Thus, models deemed acceptable for planning purposes may be deemed unacceptable by a receiving entity for certain operations applications.

Unacceptable Model List

As models have evolved and been implemented in software, some models have been proven to contain modeling errors, numerical issues, insufficient technical documentation, or have been phased out of use by the owners of the equipment due to the availability of better models. The unacceptable list of models shown in Table 1 below is categorized by the type of model, and as of publication, includes only PSPD models. Revisions to this list may be made in accordance with the process described in the "Updates to the Unacceptable Models List" above.

Usability Requirements

In current planning model software, most standard library models come with a list of parameters, their description, initial values, and the appropriate disclaimers. In these cases, references to the program's application manual suffices for usability requirements 1 through 3.

In addition to the content usability requirements above, any identified inability of a model to function properly within a System Model may cause a model to be deemed unacceptable until the issue is addressed and eliminated. Such software usability issues include, but are not limited to:

1) Models that restrict user selection of the machine unique identifiers (e.g., number, name, ID) beyond the inherent software limitations.
2) Models that fail to robustly initialize under reasonable initial conditions.
3) Models that cause simulation crashes or conflict with other models in a system simulation, including other instances of the same model.
4) Models that require unique folder structures that are incompatible with System Model development.
5) Models that cause numerical instability or simulation solution challenges.

[4] Available here: https://www.nerc.com/pa/RAPA/ModelAssessment/Documents/Dynamic%20Modeling%20Recommendations.pdf

Criteria Checklist Guideline

If all the checkboxes below can be attested to with evidence that the model meets these criteria, then the model at the date of delivery is deemed acceptable in accordance with this ERO Approved Criteria for Acceptable Models.

- ☐ The model name and description is not listed in the Unacceptable Model portion of the ERO Approved Criteria for Acceptable Models.
- ☐ The model is accompanied by a manual with descriptions of all model parameters, variables, and states.
- ☐ The model manual describes the range of validity of the model and valid use cases or studies for which the model has sufficient fidelity.
- ☐ The model is accompanied by a list of commonly tuned parameters for site-specific settings.
- ☐ The model is accompanied by a procedure to use and initialize the model in dynamic simulation.
- ☐ The model accompanied by an explanation of the model's adequacy to meet small and large disturbance behavior.
- ☐ The model does not place restrictions on unique identifiers (e.g., number, name, ID) used in simulation software.
- ☐ The model initializes robustly for all reasonable initial conditions and does not cause simulation crashes.
- ☐ The model does not require unique and burdensome folder structures that are incompatible with System Model development.
- ☐ The model does not cause numerical instability or simulation solution challenges.

Chapter 6: Version History

Version	Date	Action	Change Tracking
1	April 2025	Draft 1 Posting for Project 2022-02	Initial Draft

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2022-02 Uniform Modeling Framework for IBR

Formal Comment Period Open through May 16, 2025
Ballot Pools Forming April 17 – 28, 2025

Now Available

A formal comment period for **Project 2022-02 Uniform Modeling Framework for IBR**, is open through **8 p.m. Eastern, May 16, 2025** for the following standards and implementation plan:

- MOD-032-2 – Data for Power System Modeling and Analysis
- IRO-010-6 – Reliability Coordinator Data and information Specification and Collection
- TOP-003-8 – Transmission Operator and Balancing Authority Data and Information Specification and Collection
- Implementation Plan

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Ballot Pools

Ballot pools are being formed through **8 p.m. Eastern, Monday, April 28, 2025.** Registered Ballot Body members can join the ballot pools here.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*

- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Initial ballots for the standards and implementation plan, as well as the non-binding polls of the associated Violation Risk Factors and Violation Severity Levels will be conducted **May 7 – 16, 2025**.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Jordan Mallory (via email) or at 470-479-7538. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2022-02 Uniform Modeling Framework for IBR observer list” in the Description Box.

There were 82 sets of responses, including comments from approximately 174 different people from approximately 105 companies representing 8 of the Industry Segments as shown in the table on the following pages.

Questions

1. Do you agree with the proposed MOD-032-2 modifications to address the FERC Order 901 directives? Please reference the technical rationale and consideration of FERC directives. If you do not support the modifications made, please provide rationale and proposed language on how you would address the FERC Order 901 directives.

2. Do you agree that the Transmission Owner (TO) is typically the appropriate responsible entity for collecting and providing data for DER where there is no associated registered DP between the DER connection point and the TO's system? If not, what entity would be in a better position to provide that data and add justification?

3. Do you agree with the proposed IRO-010-5 and TOP-003-8 modifications to address the FERC Order 901 directives? Please reference the technical rationale and consideration of FERC directives. If you do not support the modifications made, please provide rationale and proposed language on how you would address the FERC Order 901 directives.

4. Do you agree with the proposed DER definition? Please refer to the technical rationale, which provides rationale behind the drafting team's intent and previous definitions proposed. If you do not support the definition as proposed, please explain the changes that, if made, would result in your support.

5. Do you agree that the modifications for the proposed reliability standards (MOD-032-2, IRO-010-5, and TOP-003-8) address the scope of the standard authorization request (SAR) in a cost-effective manner? If you do not agree, please provide alternatives that would address the SAR scope in a more cost-effective manner.

6. Do you agree with the proposed ERO Approved Criteria for Acceptable Models document? If you do not agree, please provide alternative language and explain the rationale that, if made, would result in your support.

7. Provide any additional comments for the drafting team to consider, if desired.

Answer	No
Document Name	

Comment

BPA does not support the proposed revisions in MOD-032-2, specifically, R2.1. BPA believes the TO is not the appropriate registered entity to be responsible for providing estimations of unregistered load. BPA has 133 load modeling entities within its footprint, with a combined winter peak load of 12.2 GW. 110 of these entities are unregistered, which accounts for 6.4 GW of the total load.

BPA, as a TO, does not have visibility into an unregistered entity's systems to provide an estimate of the data at any level of accuracy. BPA believes an uninformed estimate could negatively impact system reliability. BPA advocates that the best way to close the data gap is to close the registration gap. BPA recommends unregistered DPs become registered if only to supply IBR and DER data. BPA suggests a new compliance registry "DP-DER" registration.

Comment

FirstEnergy asks for clarification on the following:
Footnote 1 states:
As used in this standard, the phrase "unregistered IBR" refers to a Bulk-Power System connected IBR that does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.

Footnote 1 introduces the term "unregistered IBR" but does not adequately define it. Does the term "Unregistered IBR" only refer to IBRs that meet Category 2 criteria? This is not clear in the footnote as written.

Also, Project 2024-01 passed on May 7, 2025, which adds "Category 2" IBRs to the Generator Owner definition. Does that change the meaning of Footnote 1 since Generator Owner now includes both Categories 1 and 2? Would this change the meaning of the footnote 1 to include unregistered IBRs not already applicable under Categories 1 and 2?

In addition, FirstEnergy supports EEI's comments which state:

EEI does not agree that enforceable Reliability Standards should be reliant on external documents such as the document titled "ERO Approved Criteria for Acceptable Models" (FERC Order 901, P 125) for the establishment of enforceable and auditable compliance requirements. Moreover, the

Commission did not direct NERC to develop such a document but instead directed NERC "to develop new or modified Reliability Standards that require planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities to establish for each interconnection a uniform framework with modeling criteria" (emphasis added; FERC Order 901, P161).). To better align with FERC Order 901, we offer the following comments and suggested edits in boldface below:

Requirement R1

EEI does not support maintaining model criteria within ERO document titled ERO Approved Criteria for Acceptable Models for the reasons detailed in our response to Question 6 below. To address this concern, we offer the following modifications to requirement R1 below, which we believe would satisfy FERC Order 901 directives, place the criteria back within the requirements of the Reliability Standard, allow the use of user-defined models when needed and ensure sharing and coordination across the interconnection. These edits are limited to part 1.2 in boldface below:

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1 The data listed in Attachment 1, including the responsible entity for each required item.

1.2 Requirements for model submissions in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization (ERO) Specifications for the following items for dynamic models submitted in accordance with Attachment 1:

1.2.1 A list of unacceptable models1 which are not to be submitted unless there is no alternative model available;

1.2.2 Required submission of standard library model types provided with the software(s) utilized to create the interconnection-wide case(s), or a technical justification for the submission and use of user-written models if such models are permitted.

1.2.3 Criteria for any submitted user-written models including, at a minimum, documentation, and performance criteria to minimize the risk of non-convergence and other issues. The PC's user-written model criteria must be made available to all other TP/PC's within the Interconnection for review and comment, and approval where the usage of the user-written model represents a shared impact.

1.3 Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.3.1 Data format;

1.3.2 Level of detail to which equipment shall be modeled;

1.3.3 Case types or scenarios to be modeled; and

1.3.4 A schedule for submission of data at least once every 13 calendar months.

1.4 Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

Footnote 1: For example, the Unacceptable Model List included in NERC's Dynamic Modeling Recommendations and/or other lists maintained by the entities responsible for creating interconnection-wide base cases.

Requirement R2

EEI does not support Requirement R2, part 2.1 because this requirement places compliance obligations on the TO that they have no practical method of fulfilling without the support of the unregistered DPs. Moreover, the TOs played no part in interconnecting the DERs on unregistered DP systems, nor do they have any ability to compel those entities to provide the information needed. While it is unclear how DER data from unregistered entities might impact BPS reliability, TO will be limited in their ability to fulfill their compliance obligations without the direct assistance and participation for unregistered DPs. To address this concern, guidance could be developed to clarify exactly what must be provided by the TO, including the basis for DER estimates whenever an unregistered DPs does not provide the data requested by the TO. However, if unregistered DPs are having a material

impact on the Reliability of the BPS, consideration should be given to adjusting the registration criteria for DPs. We additionally offer some suggested boldface edits to Requirement R2 to add additional clarity:

R2. Each Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]

2.1 For unregistered Inverter-based Resource (IBR) data, the responsible TO, whose transmission system these resources are connected, shall develop estimates of the aggregated unregistered IBRs including estimated modeling data. The TO shall also include with the data an explanation of the limitations of the aggregated data, as provided, and the methods used to develop their estimations.

2.2 For Distributed Energy Resource (DER) data the responsible DP shall develop estimates of the aggregated DER connected to their distribution systems including aggregated modeling data. The DP shall also include an explanation of the limitations of the aggregated data as provided and the methods used for their estimations.

2.3 For distribution systems that are interconnected to a responsible TO system, where no registered DP exists, the TO shall document all attempts to gather aggregate estimates of DER capacity from the unregistered DP.

2.3.1 If the TO is success in gathering aggregate estimates of DER capacity from the unregistered DP, the data shall be forwarded to the responsible PC and TP so they can assess if the DER capacity on the unregistered DP's distribution system represents a material impact on the BPS.

2.3.1.1 If the PC & TP determines a material impact exists, their findings shall be reported to the ERO for further actions.

2.3.1.2 If the PC & TP determine there is not a material impact, no further actions are required by the responsible TO, unless further actions are requested by the PC & TP.

2.3.2 If the TO is unsuccessful in gathering aggregate estimates of DER capacity from the unregistered DP, they are to report their inability to collect the required data to both the responsible PC and TP, who will report the issue to NERC for further actions.

Attachment 1 Concerns: EEI offers the following comments and suggested edits (in boldface) to Attachment 1 below:

Item 2 – It is unclear where large loads connected to transmission systems are accounted for in planning studies. While we agree that DPs are responsible for demand data on distribution systems, it is unclear where other demand data that the LSE previously reported is reported and accounted for in various modeling scenarios.

Item 9 – TOs are entirely dependent on responsible **registered** DPs and should therefore be removed from having direct responsibility for Aggregate DER data. Additionally, 9c should be edited (see boldface edit below) to better align with what DP are capable of collecting (i.e., aggregate DER data by storage types).

Dynamics Concerns

Item 5 - It is unclear where large loads connected to transmission systems are accounted for in planning studies. While we agree that DPs are responsible for demand data on distribution systems, it is unclear where other demand data that the LSE previously reported is reported and accounted for various modeling scenarios.

Item 7 – Item 7 should be made clear that TOs are only responsible for supplying Aggregate data for Unregistered IBR. To address our concerns, we offer the following boldface edits to Item 7:

7. Inverter-Based Resource **[GO, TO]**

a. Registered IBR capabilities related to momentary cessation, tripping, Ride-through, and frequency control **[GO]**

b. **Aggregated capability of non-registered IBRs connect to the BPS including estimates related to momentary cessation, tripping, Ride-through, and frequency control [TOs]**

Item 10 – TOs should be removed from Item 10 because they are not the appropriate entity to collect DER data on distribution systems. EEI also notes that UFLS only DPs were not identified as having responsibilities for providing aggregated DER data on their systems or DER impacts to UFLS system they have installed. To address our concerns, we offer the following boldface edits:

10. Aggregate Distributed Energy Resource (DER) data

a. **Estimates of aggregated** DER capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control or information that can be used to infer those capabilities for modeling purposes. **[DP, UFLS only DPs]**

b. **I**ndication whether DER**s is subject to tripping in conjunction with are part of any** UFLS or UVLS **schemes and provide estimates of the affected aggregated capacity on those schemes**. **[DP, UFLS only DPs]**

Footnote concerns

Footnote 1: EEI does not agree with Footnote 1. Data requirement obligations should be clearly specified within each sub-bullet of each column for both steady-state and dynamics to ensure responsible entities understand their roles.

Footnote 2: EEI suggests the following clarifying edits to footnote 2 in boldface:

For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 under Steady State Column that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. **A The** Distribution Provider is the **typical** responsible entity for providing this information, **generally** through coordination with the Transmission Owner.

Footnote 4: EEI does not agree that IBRs should be generically identified as storage devices. Instead, Battery Energy Storage System (BESS) should replace IBR in footnote 4. Note the following boldface edits:

This includes **IBR battery energy storage systems**, synchronous condensers, and pumped storage.

Footnote 5: Ambiguous terms like typical should not be included in NERC Reliability Standard. We additionally feel that it should be made clear the limits of TO responsibilities regarding unregistered IBRs.

The transmission owner is the **typical** responsible entity for collecting and providing **aggregate** data for unregistered IBRs that are not DERs **and directly connected to their portion of the BPS.**

Footnote 6: TO and DP have no ability to collect or provide aggregate data for DERs that are not connected directly to their system. If DER data is needed from unregistered DP to preserve the reliability of the BPS, then those entities should be registered. The following boldface edits have been provided to clarify what registered DP are capable of providing under MOD-032:

The Distribution Provider is the responsible entity for collecting and providing **aggregate** data for DER connected to **their distribution** system.

Comment	
Attachment One's 7a and 10a are both concerning. While there are provisions for representing voltage and frequency protection settings in positive sequence simulations, "momentary cessation, tripping, and ride-through" are too open-ended, may not be able to be represented completely in positive sequence phasor domain simulations, and lack the clarity needed to be certain of compliance. AEP suggests the following be used instead: 7a. "In the absence of project specific data, include estimated, assumed, or typical voltage and frequency protection settings." 10a. "Include estimated, assumed, or typical aggregate voltage and frequency protection settings." AEP recommends that a MW threshold level be established for requiring unregistered IBRs. AEP suggests 10 MW and above or as otherwise determined by the PC and TP in R1. In addition, there should also be a threshold level for requiring aggregate DER (affecting steady-state items 2 and 9, dynamics items 5 and 10) so as not to be found non-compliant for trivial amounts. AEP suggests 5 percent or greater of a TO's or DP's peak load or as determined by the PC and TP in R1.

Julie Hall - Entergy - 6	
Answer	No
Document Name	
Comment	
Entergy has concerns about relying on "estimation of modeling data and parameters" required by R2.1 and introducing unverified DER model information into planning models and demonstrating compliance based on those estimations. **Footnote 3 in Attachment 1 – requires DPs make assumptions about generation output of behind the meter DER facilities to provide a gross demand number. Entergy proposes that R2.1 DER data be modeled as an aggregate MW generation as a percentage of the feeder, substation**	

transformer, or substation load. To optimize attaining meaningful results considering the proposed intense data demands set forth, Entergy recommends inclusion of a penetration threshold (ex: 20% of a substation gross load) for which these new modeling requirements become applicable.

TVA does not support the proposed revisions in MOD-032-2. Regarding R1.2, the ERO Criteria for Acceptable Models does not have industry consensus and was not established through the standards process. TVA does not believe it should be referenced in a compliance standard. In its place, TVA recommends specifications for standard models (where appropriate and available), user-written models (where appropriate and with adequate documentation), and other models (when no alternative is available and requiring justification for use). R2.1 asks entities that can't gather IBR/DER data to estimate the data. The model data that will be gathered with this provision is likely of low value and will potentially lead to more inaccurate models or models that have different issues. TVA does not believe the modeling responsibility for unregistered IBRs and aggregate DERs belongs with the TO and DP when that data, or lack there-of, must be estimated. Estimations of data without adequate information could negatively affect modeling. It is not uncommon for the TO and DP to lack visibility of unregistered IBRs and aggregate DERs. TVA recommends expanding the requirement to include “or justification on why unregistered IBR and/or aggregate DER was not modeled or estimated” to account for these circumstances. Regarding Attachment 1 Dynamics 10.b, this data could be difficult to accurately model for situations where the DP will often reconfigure their systems and move DERs between feeders. TVA recommends removing 10.b.

Adrian Andreoiu - BC Hydro and Power Authority - 1, Group Name BC Hydro	
Answer	No
Document Name	
Comment	

BC Hydro appreciates the drafting team's efforts and opportunity to review, and offers the following comments and suggestions.

Requirement R1 references the ERO-maintained Approved Criteria for Acceptable Models document. This document is not part of the Standard and may pose compliance challenges if updated outside of the Standard Development Process. The process to maintain the list of models (e.g. Unacceptable Model List) relies on NERC's determination on what would constitute an acceptable change implementation timeline, i.e. effective date.

For example, if the ERO added an existing data model to the List of Unacceptable Models in the ERO-maintained document without accounting for an adequate implementation timeline, entities may be in noncompliance on the effective date of the revised ERO document even though Standard had not been revised.

BC Hydro recommends that this document be included in the Standard, or otherwise provide for a change management process aligned with the Standard Development Procedures.

While the modifications are an improvement there are still areas that need to be addressed. For example, assigning the DP the burden to provide data on behalf of not registered DER's will add compliance obligations and will not provide the accurate data needed for an improved system model. A better approach is to provide a mechanism for the unregistered DER"s to become registered and therefore subjected to the same compliance obligations as registered DER's.

Black Hills Corporation agrees with EEI's comments regarding the modifications to MOD-032-2. The first issue of concern being the use of the external document "ERO Approved Criteria for Acceptable Models" to establish enforceable compliance requirements. We agree with EEI's suggestion that this be put back into the standard itself as part of Attachment 1. Black Hills Corporation also agrees with the EEI's conclusion that Section R2 places inappropriate burdens on the TO to gather information on installations they may have had no part in interconnecting and have no ability to compel those entities to provide information. We agree with their modifications to this section as well as attachment 1 that clarify which entities should typically be responsible for collecting data on these devices.

(1) The proposed MOD-032-2 modifications do not to address the FERC Order 901 directive on P78 and P161 regarding that the submitted model(s) should accurately reflect the IBR behaviors. The standard should explicitly require that submitted models be verified and validated to ensure they accurately reflect IBR behaviors, aligning with MOD-026 (ensuring that the approved industry IBR models that accurately reflect the behavior of all IBRs).

(2) The standard should also include a requirement to address data for DERs where there is no associated registered Distribution Provider (DP), rather than relying solely on a footnote. There is disagreement regarding the enforceability of footnotes, which may leave certain entities vulnerable.

(3) P141 direct NERC to require the generator owners of registered IBRs and the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g., planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of registered and unregistered IBRs. Models created in MOD-032-2 must be provided to Transmission Operators to be utilized for Operations Planning and Real-time Assessments.

AZPS supports the following comments submitted by EEI on behalf of its members:

Requirement 2

EEI does not support Requirement R2, Part 2.1 because this requirement places inappropriate compliance burdens on the TO that they have no practical method of fulfilling without the support of unregistered DPs. Moreover, the TOs played no part in interconnecting the DERs on unregistered DP systems, nor do they have any ability to compel those entities to provide the information needed. While EEI does not dispute that information from these unregistered entities may be needed and could impact BPS reliability, we do not agree that the answer is to place this compliance burden on TOs. Guidance could be developed to clarify exactly what must be provided by the TO, including the basis for DER estimates whenever an unregistered DPs does not provide the data requested by the TO. However, if unregistered DPs are having a material impact on the Reliability of the BPS, consideration should be given to adjusting the registration criteria for DPs. We additionally offer some suggested changes (clean version) to Requirement R2 to add additional clarity:

R2. Each Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1 For unregistered Inverter-based Resource (IBR) data, the responsible TO, whose transmission system these resources are connected, shall develop estimates of the aggregated unregistered IBRs including estimated modeling data. The TO shall also include with the data an explanation of the limitations of the aggregated data, as provided, and the methods used to develop their estimations.

2.2 For Distributed Energy Resource (DER) data the responsible DP shall develop estimates of the aggregated DER connected to their distribution systems including aggregated modeling data. The DP shall also include an explanation of the limitations of the aggregated data as provided and the methods used for their estimations.

2.3 For distribution systems that are interconnected to a responsible TO system, where no registered DP exists, the TO shall document all attempts to gather aggregate estimates of DER capacity from the unregistered DP.

2.3.1 If the TO is success in gathering aggregate estimates of DER capacity from the unregistered DP, the data shall be forwarded to the responsible PC and TP so they can assess if the DER capacity on the unregistered DP's distribution system represents a material impact on the BPS.

2.3.1.1 If the PC & TP determines a material impact exists, their findings shall be reported to the ERO for further actions.

2.3.1.2 If the PC & TP determine there is not a material impact, no further actions are required by the responsible TO, unless further actions are requested by the PC & TP.

2.3.2 If the TO is unsuccessful in gathering aggregate estimates of DER capacity from the unregistered DP, they are to report their inability to collect the required data to both the responsible PC and TP, who will report the issue to NERC for further actions.

Attachment 1 Concerns:

EEI offers the following comments and edits (clean version) to Attachment 1 below:

Item 2 – It is unclear where large loads connected to transmission systems are accounted for in planning studies. While we agree that DPs are responsible for demand data on distribution systems, it is unclear where other demand data that the LSE previously reported is reported and accounted for in various modeling scenarios.

Item 9 – TOs are entirely dependent on responsible registered DPs and should therefore be removed from having direct responsibility for Aggregate DER data. Additionally, 9c should be deleted to better align with what DPs are capable of collecting (i.e., aggregate DER data by storage types).

Dynamics Concerns:

Item 5 - It is unclear where large loads connected to transmission systems are accounted for in planning studies. While we agree that DPs are responsible for demand data on distribution systems, it is unclear where other demand data that the LSE previously reported is reported and accounted for various modeling scenarios.

Item 7 – Item 7 should be made clear that TOs are only responsible for supplying Aggregate data for Unregistered IBR. To address our concerns, we offer the following changes (clean format):

7. Inverter-Based Resource

a. Registered IBR capabilities related to momentary cessation, tripping, Ride-through, and frequency control [GO]

b. Aggregated capability of non-registered IBRs connect to the BPS including estimates related to momentary cessation, tripping, Ride-through, and frequency control [TOs]

Item 10 – TOs should be removed from Item 10 because they are not the appropriate entity to collect DER data on distribution systems. EEI also notes that UFLS only DPs were not identified as having responsibilities for providing aggregated DER data on their systems or DER impacts to UFLS system they have installed. To address our concerns, we offer the following changes (clean version):

10. Aggregate Distributed Energy Resource (DER) data

a. Estimates of aggregated DER capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control or information that can be used to infer those capabilities for modeling purposes. [DP, UFLS only DPs]

b. Indication whether DERs are part of any UFLS or UVLS schemes and provide estimates of the affected aggregated capacity on those schemes. [DP, UFLS only DPs]

Footnote concerns:

Footnote 1: EEI does not agree with Footnote 1. Data requirement obligations should be clearly specified within each sub-bullet of each column for both steady-state and dynamics to ensure responsible entities understand their roles.

Footnote 2: EEI suggests the following change to footnote 2 (clean version):

For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 under Steady State Column that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. The Distribution Provider is the responsible entity for providing this information, through coordination with the Transmission Owner.

Footnote 4: EEI does not agree that IBRs should be generically identified as storage devices. Instead, Battery Energy Storage System (BESS) should replace IBR in footnote 4 as changed below (clean version):

This includes battery energy storage systems, synchronous condensers, and pumped storage.

Footnote 5: Ambiguous terms like typical should not be included in NERC Reliability Standard. We additionally feel that it should be made clear the limits of TO responsibilities regarding unregistered IBRs as changed below (clean version).

The transmission owner is the responsible entity for collecting and providing aggregate data for unregistered IBRs that are not DERs and directly connected to their portion of the BPS.

Footnote 6: TO and DP have no ability to collect or provide aggregate data for DERs that are not connected directly to their system. If DER data is needed from unregistered DPs to preserve the reliability of the BPS, then those entities should be registered. The following change (clean version) has been provided to clarify what registered DPs are capable of providing under MOD-032:

The Distribution Provider is the responsible entity for collecting and providing aggregate data for DER connected to their distribution system.

EEI does not agree that enforceable Reliability Standards should be reliant on external documents such as the document titled “ERO Approved Criteria for Acceptable Models” (FERC Order 901, P 125) for the establishment of enforceable and auditable compliance requirements. Moreover, the Commission directed NERC “to develop **new or modified Reliability Standards that require planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities to establish** for each interconnection a uniform framework with modeling criteria” (emphasis added; FERC Order 901, P161). To better align with FERC Order 901, we offer the following comments and suggested edits in boldface below:

Requirement R1

Our edits are limited to part 1.2 in boldface below:

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator’s planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1 The data listed in Attachment 1, including the responsible entity for each required item.

1.2 Specifications for the following items for dynamic models submitted in accordance with Attachment 1:

1.2.1 A list of unacceptable models1 which are not to be submitted unless there is no alternative model available;

1.2.2 Required submission of standard library model types provided with the software(s) utilized to create the interconnection-wide case(s), or a technical justification for the submission and use of user-written models if such models are permitted.

1.2.3 Criteria for any submitted user-written models including, at a minimum, documentation, and performance criteria to minimize the risk of non-convergence and other issues. The PC's user-written model criteria must be made available to all other TP/PCs within the Interconnection for review and comment, and approval where the usage of the user-written model represents a shared impact.

1.3 Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.3.1 Data format;

1.3.2 Level of detail to which equipment shall be modeled;

1.3.3 Case types or scenarios to be modeled; and

1.3.4 A schedule for submission of data at least once every 13 calendar months.

1.4 Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

Footnote 1: For example, the Unacceptable Model List included in NERC's Dynamic Modeling Recommendations and/or other lists maintained by the entities responsible for creating interconnection-wide base cases.

Requirement R2

EEI does not support Requirement R2, part 2.1 because this requirement places compliance obligations on the TO that they have no practical method of fulfilling without the support of the unregistered DPs. Moreover, the TOs played no part in interconnecting the DERs on unregistered DP systems, nor do they have any ability to compel those entities to provide the information needed. While it is unclear how DER data from unregistered entities might impact BPS reliability, TO will be limited in their ability to fulfill their compliance obligations without the direct assistance and participation for unregistered DPs. To address this concern, guidance could be developed to clarify exactly what must be provided by the TO, including the basis for DER estimates whenever an unregistered DP does not provide the data requested by the TO. However, if unregistered DPs are having a material impact on the Reliability of the BPS, consideration should be given to adjusting the registration criteria for DPs. We additionally offer some suggested boldface edits to Requirement R2 to add additional clarity:

R2. Each Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1 For unregistered Inverter-based Resource (IBR) data, the responsible TO, whose transmission system these resources are connected, shall develop estimates of the aggregated unregistered IBRs including estimated modeling data. The TO shall also include with the data an explanation of the limitations of the aggregated data, as provided, and the methods used to develop their estimations.

2.2 For Distributed Energy Resource (DER), the responsible registered DP, whose distribution system these resources are connected, shall develop estimates of the aggregated unregistered DERs including estimated modeling data. The DP shall also include with the data an explanation of the limitations of the aggregated data, as provided, and the methods used to develop their estimations. Upon completion, the data shall be sent to the responsible TO for collection and distribution to the responsible PC/TP.

2.3 For unregistered DPs the TO shall request DER data consistent with 2.2.

2.3.1 Where no data is provided by the unregistered DP, the TO shall develop an estimate of the DERs connected to the unregistered DP system. The TO shall also develop an explanation of the limitations of the aggregated data provided and the methods used for their estimations for distribution to the responsible PC/TP.

Attachment 1 Concerns: EEI offers the following comments and suggested edits (in boldface) to Attachment 1 below:

Item 2 – EEI requests clarification whether DPs are a suitable replacement for the LSE. While we agree that DPs are fully capable of providing demand data on distribution systems, they have no ability to provide load data on transmission systems.

Item 9 – EEI is of the opinion that 9c should be deleted because we do not agree that DER data by type is needed by the PC/TP. Additionally, given TOs can only supply DER rough estimate of aggregate DERs on unregistered systems, they have no ability to distinguish DERs by type.

Dynamics Concerns

Item 5 - EEI requests clarification whether DPs are a suitable replacement for the LSE. While we agree that DPs are fully capable of providing demand data on distribution systems, they have no ability to provide load data on transmission systems.

Item 7 – Item 7 should be made clear that TOs are only responsible for supplying Aggregate data for Unregistered IBR. To address our concerns, we offer the following boldface edits to Item 7:

7. Inverter-Based Resource

a. Registered IBR capabilities related to momentary cessation, tripping, Ride-through, and frequency control **[GO]**

b. **Aggregated capability of non-registered IBRs connect to the BPS including estimates related to momentary cessation, tripping, Ride-through, and frequency control [TOs]**

Item 10 –EEI suggests clarifying TOs are only responsible for Aggregated DER data when there is no registered DP and they have no ability to assess UFLS impact from DERs unless provided by the unregistered DP. Additionally, UFLS only DPs should be added to Item 10

10. Aggregate Distributed Energy Resource (DER) data

a. **Estimates of aggregated** DER capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control or information that can be used to infer those capabilities for modeling purposes. **[DP, UFLS only DPs, TO (for non-registered DPs)]**

b. **I**ndication whether DER**s are part of any** UFLS or UVLS **schemes and provide estimates of the affected aggregated capacity on those schemes**. **[DP, UFLS only DPs]**

Footnote concerns

Footnote 1: EEI does not agree with Footnote 1. Data requirement obligations should be clearly specified within each sub-bullet of each column for both steady-state and dynamics to ensure responsible entities understand their roles.

Footnote 4: EEI does not agree that IBRs should be generically identified as storage devices. Instead, Battery Energy Storage System (BESS) should replace IBR in footnote 4. Note the following boldface edits:

This includes **battery energy storage systems**, synchronous condensers, and pumped storage.

Footnote 5: Ambiguous terms like typical should not be included in NERC Reliability Standard. We additionally feel that it should be made clear the limits of TO responsibilities regarding unregistered IBRs.

The transmission owner is the responsible entity for collecting and providing **aggregate** data for unregistered IBRs that are not DERs **and directly connected to their portion of the BPS.**

Footnote 6: TO and DP have no ability to collect aggregate data for DERs that are not connected directly to their system. Where DER data is needed from unregistered DPs to preserve the reliability of the BPS, then the TO should provide an estimate of the DERs connected to the unregistered DP system based on information provided by the unregistered DP or consistent with aggregated DER levels provided by other DPs connected to their system. The following boldface edits have been provided to clarify what TO are capable of providing under MOD-032:

The Distribution Provider is the responsible entity for collecting and providing **aggregate** data for DER connected to **their distribution** system. **Where no registered DP exists, the TO shall develop estimates on aggregated DER levels based on information obtained from the unregistered DP or consistent with DER levels provided by other DPs connected to their system.**

No. *Reliability Standards to Address Inverter-Based Res.,* Order No. 901, 185 FERC ¶ 61,042 (2023) ("Order 901") calls for two different terms for purposes of determining the data and modeling of Inverter-Based Resources ("IBRs") whose owners are not registered and subject to compliance as Category 2 Generator Owners/Generator Operators (GO/GOPs): (1) "unregistered IBRs," whose data is to be reported individually and (2) IBR-Distributed Energy Resources ("IBR-DERs"), whose data is to be reported (or estimated) in the aggregate. Order 901 explicitly differentiates between "unregistered IBRs," which it describes as "IBRs connected directly to the Bulk-Power System but not registered with NERC and therefore not subject to the Reliability Standards," and "IBR-DERs," which it describes as "IBRs connected to the distribution system that in the aggregate have a material impact on the Bulk Power System." *Id.* P 4 n.14. The two draft standards address both types of IBRs but do so in ways that fail to achieve FERC's stated purpose of addressing the failure of existing standards to accurately account for the different way that IBRs respond to disturbances, as compared to synchronous generation. *Id.* P 37 (emphasis added) (footnotes omitted). *See also id.* PP 2-4, 50: Data that *accurately* represents IBRs is necessary to properly plan for, operate, and analyze IBR performance on the Bulk-Power System. Without data that accurately represents all IBRs, planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities are not able to develop system models that accurately account for the behavior of IBRs on their system, nor are they able to facilitate the analysis of Bulk-Power System disturbances. While there may be other issues with the proposed use of these terms, these comments focus on two flaws:	

(1) Defining the scope of the unregistered IBRs to be reported and modeled by use of a footnote referring to those IBRs connected to the Bulk-Power System ("BPS"), a vague term that is for FERC to define, rather than providing a clear cutoff consistent with the FERC-approved GO/GOP Category 2 registry criteria or the successfully balloted GO/GOP Category 2 Glossary definition. Such usage is not appropriate to determine the scope of what is to be covered by enforceable standards, and the resulting imprecision will invite double counts and gaps that will prevent the standards from achieving Order 901's reliability purposes.

(2) Instead of restricting the provision of data and modeling to IBR-DERs as Order 901 directs, relying on a DER definition that encompasses both IBR and non-IBR resources that are connected to the distribution system. This failure to have a definition focused solely on IBR-DERs threatens to undermine the express objective of Order 901 to accurately account for the behavior of IBRs. While the addition of Item 9.c under the "steady-state" column in MOD-032-2 Attachment 1 may somewhat mitigate the adverse impact of this combined IBR/non-IBR DER definition, the use of the DER definition without express restrictions to IBR-DERs elsewhere in the proposed draft standards (*see, e.g.,* Item 10 under "dynamics" of that same Attachment; footnote 1 of draft MOD-033-3) invites confusion that could also carry over to other standards that are intended to reflect and account for the particular characteristics of IBRs.

Further details on concerns regarding these two definitions are provided in Questions 4 and 7.

LCRA TSC supports the following comments submitted by EEI on behalf of its members:

Requirement 2
EEI does not support Requirement R2, Part 2.1 because this requirement places inappropriate compliance burdens on the TO that they have no practical method of fulfilling without the support of unregistered DPs. Moreover, the TOs played no part in interconnecting the DERs on unregistered DP systems, nor do they have any ability to compel those entities to provide the information needed. While EEI does not dispute that information from these unregistered entities may be needed and could impact BPS reliability, we do not agree that the answer is to place this compliance burden on TOs. Guidance could be developed to clarify exactly what must be provided by the TO, including the basis for DER estimates whenever an unregistered DPs does not provide the data requested by the TO. However, if unregistered DPs are having a material impact on the Reliability of the BPS, consideration should be given to adjusting the registration criteria for DP.

Attachment 1 concerns:
Steady State Item 9: TOs are entirely dependent on responsible registered DPs and should therefore be removed from having direct responsibility for Aggregate DER data.

Dynamics Item 7: Item 7 should be made clear that TOs are only responsible for supplying Aggregate data for Unregistered IBR.

Dynamic Item 10: TOs should be removed from Item 10 because they are not the appropriate entity to collect DER data on distribution systems. EEI also notes that UFLS only DPs were not identified as having responsibilities for providing aggregated DER data on their systems or DER impacts to UFLS system they have installed.

Comment

Constellation does not agree with the changes made and feels it creates ambiguity for Regional Entities on estimated unregistered IBR entities. Specifically, in 2.1 a caveat for data requirements for unregistered units is provided which allows Regional Entities to provide estimates of data. This is asking for data that would not be relevant for models if it is not accurate data and could call for ambiguity between regions on the amount of data required. Constellation suggests striking the term unregistered to reduce ambiguity.

Comment

LCRA supports the following comments submitted by EEI on behalf of its members:

Requirement 2

EEI does not support Requirement R2, Part 2.1 because this requirement places inappropriate compliance burdens on the TO that they have no practical method of fulfilling without the support of unregistered DPs. Moreover, the TOs played no part in interconnecting the DERs on unregistered DP systems, nor do they have any ability to compel those entities to provide the information needed. While EEI does not dispute that information from these unregistered entities may be needed and could impact BPS reliability, we do not agree that the answer is to place this compliance burden on TOs. Guidance could be developed to clarify exactly what must be provided by the TO, including the basis for DER estimates whenever an unregistered DPs does not provide the data requested by the TO. However, if unregistered DPs are having a material impact on the Reliability of the BPS, consideration should be given to adjusting the registration criteria for DP.

Attachment 1 concerns:

Steady State Item 9: TOs are entirely dependent on responsible registered DPs and should therefore be removed from having direct responsibility for Aggregate DER data.

Dynamics Item 7: Item 7 should be made clear that TOs are only responsible for supplying Aggregate data for Unregistered IBR.

Dynamic Item 10: TOs should be removed from Item 10 because they are not the appropriate entity to collect DER data on distribution systems. EEI also notes that UFLS only DPs were not identified as having responsibilities for providing aggregated DER data on their systems or DER impacts to UFLS system they have installed.

Answer	No
Document Name	
Comment	

Southern Company has voted “yes” on previous ballots related to MOD-032 modifications and supports most of the standard revisions. However, significant changes to NERC’s external document “ERO Approved Criteria for Acceptable Models document” since the last MOD-032 revision, specifically the inclusion of criteria modifications that could impact a Registered Entity’s compliance, highlight our significant concern with the new MOD-032 revisions.

There are simple changes that NERC can make to MOD-032 to garner our support, and specifically that includes moving any criteria in the “ERO Approved Criteria for Acceptable Models document” within the standard and converting the external model reference to a “ERO Approved Acceptable Models list” consistent with FERC 901 requirements. Additional comments are included in question 6.

Southern Company additionally recommends the minor revisions below for enhanced clarity:

- On Requirement 1 – add the word “Functional” in front of entities to make it clear the standard is referencing NERC Functional Entities.
- On Requirement 2 – add the word “Functional” in front of entities to make it clear the standard is referencing NERC Functional Entities.

The standard should also address data for DERs where there is no associated registered DP. P141 direct NERC to require the generator owners of registered IBRs and the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g., planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of registered and unregistered IBRs. Models created in MOD-032-2 must be provided to Transmission Operators to be utilized for Operations Planning and Real-time Assessments.

2 years implementation to collect all DERs on the distribution system is likely not feasible considering the standard includes rooftop solar and other types of DERs connected behind the meters. The standard further requires the dynamics modeling data that is often not available for DERs and it would likely take significant time for Distribution Providers to gather and develop these modeling data.

The NAGF would like to see MOD-032 modified to require the TP and PC to request data from those entities they want data from, rather than expect all other entities to track what the TP and PC are requiring. With the addition of Generator Owners that may or may not be interconnected to any NERC-registered entity, the TP and PC need to actively engage with these entities to ensure the TP and PC are able to get the best data possible and provide feedback as to what is needed/acceptable, etc. Additionally, the NAGF supports the comments by EEI.

• The proposed MOD-032-2 modifications do not address the FERC Order 901 directive on P78 and P161 regarding that the submitted model(s) should accurately reflect the IBR behaviors. The standard should explicitly require that submitted models be verified and validated to ensure they accurately reflect IBR behaviors, aligning with MOD-026 (ensuring that the approved industry IBR models accurately reflect the behavior of all IBRs). • The standard should also include a requirement to address data for DERs where there is no associated registered Distribution Provider (DP), rather than relying solely on a footnote. • P141 directs NERC to require the generator owners of registered IBRs and the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g., planning coordinators, transmission planners, reliability coordinators, transmission	

operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of registered and unregistered IBRs. Models created in MOD-032-2 must be provided to Transmission Operators to be utilized for Operations Planning and Real-time Assessments.

Jodirah Green - ACES Power Marketing - 1,3,4,5,6 - MRO,WECC,Texas RE,SERC,RF, Group Name ACES Collaborators

Answer	No
Document Name	

Comment

We at ACES appreciate the effort put forth by the SDT to address the directives of FERC Order 901; however, we have concerns with the data collection burden being placed on responsible entities (as identified in Requirement R1 Part 1.1). Much of the industry is already operating with limited resources, and many (if not most) entities are currently short-staffed. This is particularly true for smaller entities such as electric cooperatives. In short, we are not convinced that this level of data collection is a cost-effective approach to improving grid reliability and reducing risk.

Lastly, we would like to point out a minor discrepancy between the "redline" and "clean" versions of this draft of MOD-032-2. Requirement R2 Part 2.1 in the "clean" version is missing a portion of the language contained in the "redline" version. The phrase "…Energy Resource (DER) data, the responsible entity shall estimate the modeling…" do not appear in the "clean" version of Part 2.1.

Comment

No. *Reliability Standards to Address Inverter-Based Res.,* Order No. 901, 185 FERC ¶ 61,042 (2023) ("Order 901") calls for two different terms for purposes of determining the data and modeling of Inverter-Based Resources ("IBRs") whose owners are not registered and subject to compliance as Category 2 Generator Owners/Generator Operators (GO/GOPs): (1) "unregistered IBRs," whose data is to be reported individually and (2) IBR-Distributed Energy Resources ("IBR-DERs"), whose data is to be reported (or estimated) in the aggregate. Order 901 explicitly differentiates between "unregistered IBRs," which it describes as "IBRs connected directly to the Bulk-Power System but not registered with NERC and therefore not subject to the Reliability Standards," and "IBR-DERs," which it describes as "IBRs connected to the distribution system that in the aggregate have a material impact on the Bulk Power System." *Id.* P 4 n.14. The two draft standards address both types of IBRs but do so in ways that fail to achieve FERC's stated purpose of addressing the failure of existing standards to accurately account for the different way that IBRs respond to disturbances, as compared to synchronous generation. *Id.* P 37 (emphasis added) (footnotes omitted). *See also id.* PP 2-4, 50:

Data that *accurately* represents IBRs is necessary to properly plan for, operate, and analyze IBR performance on the Bulk-Power System. Without data that accurately represents all IBRs, planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities are not able to develop system models that accurately account for the behavior of IBRs on their system, nor are they able to facilitate the analysis of Bulk-Power System disturbances.

While there may be other issues with the proposed use of these terms, these comments focus on two flaws:

(1) Defining the scope of the unregistered IBRs to be reported and modeled by use of a footnote referring to those IBRs connected to the Bulk-Power System ("BPS"), a vague term that is for FERC to define, rather than providing a clear cutoff consistent with the FERC-approved GO/GOP Category 2 registry criteria or the successfully balloted GO/GOP Category 2 Glossary definition. Such usage is not appropriate to determine the scope of what is to be covered by enforceable standards, and the resulting imprecision will invite double counts and gaps that will prevent the standards from achieving Order 901's reliability purposes.

(2) Instead of restricting the provision of data and modeling to IBR-DERs as Order 901 directs, relying on a DER definition that encompasses both IBR and non-IBR resources that are connected to the distribution system. This failure to have a definition focused solely on IBR-DERs threatens to

undermine the express objective of Order 901 to accurately account for the behavior of IBRs. While the addition of Item 9.c under the “steady-state” column in MOD-032-2 Attachment 1 may somewhat mitigate the adverse impact of this combined IBR/non-IBR DER definition, the use of the DER definition without express restrictions to IBR-DERs elsewhere in the proposed draft standards (*see, e.g.,* Item 10 under “dynamics” of that same Attachment; footnote 1 of draft MOD-033-3) invites confusion that could also carry over to other standards that are intended to reflect and account for the particular characteristics of IBRs.

Further details on concerns regarding these two definitions are provided in Questions 4 and 7.

Comment

Southwest Power Pool abstains from the response to this question.

The ERO Approved Criteria for Acceptable Models document referenced in the proposed Requirement R1, Part 1.2 establishes some common-sense usability requirements, but it is unclear how it might be interpreted and enforced. For example, if an auditor determines a model manual is unacceptable in the course of a compliance engagement, it is unclear which entity would be considered to have violated the standard: the model submitter, or the planner that accepted the model. If a model and its associated documentation are deemed acceptable by the PC and TP, the model should be considered acceptable.

Furthermore, the usability requirements identified under Chapter 2 within the Usability Requirements section (pgs. 3-4) of the document are mostly administrative requirements that address model documentation. The usability requirements identified in Chapter 5 within the Technical Rationale section (pg. 8) are arguably more important for actually being able to perform simulations, but it is not clear how enforceable they would be. Ultimately, it seems like a violation of the Criteria for Acceptable Models document could be better addressed as an identified technical concern under Requirement R3 and most of the substantive parts of the criteria document could be consolidated into the existing, separate Technical Rationale to detail examples of

issues that would need to be addressed under Requirement R3. Thus, the ISO/RTO Council (IRC) Standards Review Committee (SRC) suggests that the proposed Requirement R1, Part 1.2 be deleted and a new Part 1.4 be added that reads as follows:

"1.4. Specifications of the following items for dynamic model submissions:

1.4.1. A list of unacceptable models[1], which are not to be submitted unless no alternative model is available;

1.4.2. Required submission of standard library models recognized by the software utilized to create the interconnection-wide case(s) and/or user-written models; and

1.4.3. Criteria for any submitted user-written models, including, at a minimum, model documentation and instructions for model setup and use to minimize the risk of non-convergence and other issues.

Footnote 1: For example, data requirements and reporting procedures may point to the Unacceptable Model List included in NERC's Dynamic Modeling Recommendations and/or other lists maintained by the entities responsible for creating interconnection-wide base cases."

The proposed language above provides explicit flexibility for PC/TP to require generic models, user-defined models, or both. In conjunction with Requirement R3, this addresses the FERC directives in a more enforceable and easily understood manner than the currently proposed use of a separate ERO criteria document.

Additionally, proposed footnote 1 (which would become footnote 2 if the Part 1.4 language proposed above is adopted) within Requirement R2, Part 2.1 should be modified to read as follows: *"As used in this standard, the phrase 'unregistered IBR' refers to an IBR that is not a DER and does not meet mandatory NERC registration criteria."* The drafting team has already acknowledged the ambiguities associated with attempting to define DER based on "connection to the BPS." Using the concept of BPS connection here introduces those same ambiguities.

Finally, Requirement R3, Part 3.1 should be modified to read as follows: *"Provide either updated data or an explanation with a technical basis for maintaining the current data that resolves the technical concern."*

This added language is necessary to ensure technical concerns are adequately addressed. For example, if the technical concern is suspicious data, a technical basis for maintaining current data may be acceptable in some circumstances but would not resolve the underlying issue if the model crashes or does not initialize.

The use of aggregated, generic data to model IBR's may do more harm than good. Accurate data is required to reliably meet the FERC order. Perhaps generic data is the first step but caution must be taken to avoid consequential, incorrect analysis.

As noted by IRC, SPP supports the following portion of the response:

The ERO Approved Criteria for Acceptable Models document referenced in the proposed Requirement R1, Part 1.2 establishes some common-sense usability requirements, but it is unclear how it might be interpreted and enforced. For example, if an auditor determines a model manual is unacceptable in the course of a compliance engagement, it is unclear which entity would be considered to have violated the standard: the model submitter, or the planner that accepted the model. If a model and its associated documentation are deemed acceptable by the PC and TP, the model should be considered acceptable.

Furthermore, the usability requirements identified under Chapter 2 within the Usability Requirements section (pgs. 3-4) of the document are mostly administrative requirements that address model documentation. The usability requirements identified in Chapter 5 within the Technical Rationale section (pg. 8) are arguably more important for actually being able to perform simulations, but it is not clear how enforceable they would be. Ultimately, it seems like a violation of the Criteria for Acceptable Models document could be better addressed as an identified technical concern under Requirement R3 and most of the substantive parts of the criteria document could be consolidated into the existing, separate Technical Rationale to detail examples of issues that would need to be addressed under Requirement R3. Thus, the ISO/RTO Council (IRC) Standards Review Committee (SRC) suggests that the proposed Requirement R1, Part 1.2 be deleted and a new Part 1.4 be added that reads as follows:

"1.4. Specifications of the following items for dynamic model submissions:

1.4.1. A list of unacceptable models{C}[1], which are not to be submitted unless no alternative model is available;

1.4.2. Required submission of standard library models recognized by the software utilized to create the interconnection-wide case(s) and/or user-written models; and

1.4.3. Criteria for any submitted user-written models, including, at a minimum, model documentation and instructions for model setup and use to minimize the risk of non-convergence and other issues.

Footnote 1: For example, data requirements and reporting procedures may point to the Unacceptable Model List included in NERC's Dynamic Modeling Recommendations and/or other lists maintained by the entities responsible for creating interconnection-wide base cases."

The proposed language above provides explicit flexibility for PC/TP to require generic models, user-defined models, or both. In conjunction with Requirement R3, this addresses the FERC directives in a more enforceable and easily understood manner than the currently proposed use of a separate ERO criteria document.

Additionally, proposed footnote 1 (which would become footnote 2 if the Part 1.4 language proposed above is adopted) within Requirement R2, Part 2.1 should be modified to read as follows: *"As used in this standard, the phrase 'unregistered IBR' refers to an IBR that is not a DER and does not meet mandatory NERC registration criteria."* The drafting team has already acknowledged the ambiguities associated with attempting to define DER based on "connection to the BPS." Using the concept of BPS connection here introduces those same ambiguities.

Response

Scott Thompson - TXNM Energy - 3

Answer	No
Document Name	

Comment

TXNM agrees with the comments made by EEI, in addition:

1. The proposed MOD-032-2 modifications do not to address the FERC Order 901 directive on P78 and P161 regarding that the submitted model(s) should accurately reflect the IBR behaviors. The standard should explicitly require that submitted models be verified and validated to ensure they accurately reflect IBR behaviors, aligning with MOD-026 (ensuring that the approved industry IBR models that accurately reflect the behavior of all IBRs).
2. The standard should also include a requirement to address data for DERs where there is no associated registered Distribution Provider (DP), rather than relying solely on a footnote. There is disagreement regarding the enforceability of footnotes, which may leave certain entities vulnerable.
3. P141 direct NERC to require the generator owners of registered IBRs and the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g., planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of registered and unregistered IBRs. Models created in MOD-032-2 must be provided to Transmission Operators to be utilized for Operations Planning and Real-time Assessments.

Response

Michael Goggin - Grid Strategies LLC - 5

Answer	No
Document Name	

Comment

Consistent with FERC's Order 901 directive to consider data sharing requirements for transmission owners to provide data to generators, MOD-032-2 should include a requirement for transmission owners to provide data to generator owners and operators to support accurate modeling and performance, e.g., short circuit data, grid data for offshore wind, information on other power electronic devices around the IBR plant, and voltage harmonics. In many cases this transmission provider data is necessary for generator owners to be able to determine generator settings and comply with

MOD-032-2. The Consideration of FERC Order 901 Directives document argues that such a requirement is unnecessary as processes exist for obtaining that data, though in many regions they do not or are inadequate.

EPRI agrees with the intent of the proposed MOD-032-2 modifications but abstains from answering with "Yes" or "No" to this question.

EPRI research informs the potential need and feasibility of changes to MOD-032-2, see for example:

- *Transmission Planning Considerations for DER Wholesale Market Participation: An EPRI FO2222 Phase 1 Collaborative Report.* EPRI. Palo Alto, CA: 2022. 3002020592.
- *EPRI Technology Transfer to NERC SPIDER Working Group: Informing NERC Stakeholder Discussions and Publications on System Planning Impacts of Distributed Energy Resources in the Years 2022-2024.* EPRI. Palo Alto, CA: 2025. 3002031525.
    - Including the reports listed under “Related Material” on that page.

EPRI worked with vendors of fundamental-frequency phasor-domain transient (PDT) modeling domain transmission planning software since 2019 and all of them have implemented the so-called *Aggregate DER (DER_A) Model* in their positive-sequence phasor domain tools:

- *The New Aggregated Distributed Energy Resources (der_a) Model for Transmission Planning Studies: 2019 Update.* EPRI. Palo Alto, CA: 2019. 3002015320.

EPRI (and other entities) have tested and applied the DER_A model extensively, and we published the following report in 2021:

- Analyzing the Impact of Aggregated DER Behavior on Bulk Power System Performance – A Summary of Three Case Studies. EPRI. Palo Alto, CA: 2021. 3002019445.

2. Do you agree that the Transmission Owner (TO) is typically the appropriate responsible entity for collecting and providing data for DER where there is no associated registered DP between the DER connection point and the TO's system? If not, what entity would be in a better position to provide that data and add justification?

Scott Thompson - TXNM Energy - 3	
Answer	No
Document Name	
Comment	
TXNM Energy feels that the Resource Planner is in a better position to aggregate DER information than the transmission owner. The TO may not have participated in the DER interconnection process and may lack visibility into the DER systems, including specific inverter details and settings. Consequently, the TO may not have access to accurate DER/IBR modeling parameters unless it was directly involved in the interconnection agreements. If unregistered DER data is critical to the reliability of the BPS, then unregistered DPs that have interconnected DERs that have a material impact on the BPS should be registered through NERC registration criteria.

The unregistered entity is the best entity to request data from, and there is no prohibition to requesting data from unregistered entities. The NAGF notes this language in TOP-003-5 "…including non-BES data and external network data as deemed necessary by the Transmission Operator." This does not appear to limit the TOP to only information from registered entities. It appears to say that the TOP should ask for the data it needs, even if the data is not BES data. The TP and PC should be expected to do the same, however, they should not be held accountable for the accuracy of estimates provided whenever the unregistered DPs decline a request for data.

EEI does not dispute that TOs are the only registered entity available to provide data from unregistered DPs. However, they are limited in their ability to obtain and provide this data because they have no ability to compel unregistered DPs to provide such data. Moreover, the TO should be viewed simply as a conduit for DER data provided by the unregistered DPs and should not be held accountable for the accuracy of estimates provided whenever the unregistered DPs decline a TO's request for data.

No, we do not agree that the TO is the appropriate entity for collecting and providing data for DER where there is no associated registered DP between the DER connection point and the TO's system. In the NY area, the most appropriate entity would be the NYISO; this requirement should be moved to the BA/PC. The NYISO is in a better position to require entities to submit the required data when they join the market; individual TOs cannot. The NYISO has processes for maintaining the necessary system representation data to comply with FERC, NERC, NPCC, and NYSRC requirements.

The Transmission Owner (TO) is not always the most suitable entity to collect and provide data for Distributed Energy Resources (DER), particularly in instances where there is no registered Distribution Provider (DP) between the DER interconnection point and the TO's system. The TO may not have participated in the DER interconnection process and may lack visibility into the DER systems, including specific inverter details and settings. Consequently, the TO may not have access to accurate DER/IBR modeling parameters unless it was directly involved in the interconnection agreements. The Transmission Owner is not involved in the connection process for DER, and therefore does not have the data necessary for DER modelling. If there are reliability impact to the BPS due to DER connected where there are no DP, it is suggested that the registration criteria for DP be updated to ensure that all applicable entities that could have BPS impact are registed with NERC. This could be done as an initiative similar to what was done for IBR registration.

The revised standard seeks to capture 'unregistered IBR' and 'aggregate DER' steady state and dynamics data for various planning horizons. Unregistered IBR is defined only in this standard. It may be more reasonable for the Planning Coordinator to require various data from 'unregistered IBR's' through existing interconnection requirements rather than to require that all unregistered IBR's provide this data to the PC as a compliance requirement. Alternatively, GO/Gop Category 2 or a new Registration should hold that responsibility.

Thomas Foltz - AEP - 5	
Answer	No
Document Name	

Comment
AEP continues to believe that the most efficient and technically appropriate path for implementing this proposed standard is to align with existing registration and data provision frameworks. Specifically, where Distributed Energy Resources (DERs) interconnect and provide data relevant to MOD-032 Attachment One, the entities possessing that data should be properly registered and held accountable under the NERC Functional Model. As with existing standards requiring Generator Owners (GOs) or Distribution Providers (DPs) to provide planning and modeling data, those entities who control or aggregate DER fleets and are capable of furnishing the required information should be registered accordingly. While it remains unclear whether existing Functional Entities are universally sufficient, or whether a new DER-specific Functional Entity class may be warranted, the need for

clear accountability is critical.

To clarify, AEP does not support requiring every individual rooftop solar customer to register as a Functional Entity. Instead, FERC Order No. 2222 Aggregators of DERs (DER Aggregators) could be envisioned as the appropriate responsible parties. These entities are well-positioned to coordinate with their constituent DERs, consolidate the necessary modeling and planning data, and meet compliance obligations.

In our view, the responsibility for MOD-032 data collection and compliance could rest with the DER aggregator, who in turn must coordinate with the Distribution Provider and Transmission Owner for appropriate data sharing and validation. This structure promotes scalability, efficiency, and consistency across jurisdictions, especially considering that DER participation can span both Federal and State regulatory boundaries.

NERC should consider how this evolving aggregator model intersects with the Functional Model and explore registration or oversight pathways that ensure these entities are held accountable without placing undue burdens on small-scale DER owners.

The appropriate party would be the entity that worked with the DER to create the interconnection agreement. This would include preliminary modeling and verification of performance. The SDT's question is unclear; if the TO worked to interconnect the DER it would be the correct responsible entity, however if the LSE, GO or DP was responsible for the interconnection of the DER they would be the most responsible entity. The SDT also fails to state the voltage level of the interconnection. If the voltage level is above the 100kV threshold, the TO would be responsible, however below that voltage the LSE or DP would most likely be the appropriate entity. Since LSEs are no longer part of the NERC registry, the SDT should submit a SAR requesting that LSEs are once again required to be responsible entities. This may better align the standards with the responsible entities in practice.

Gul Khan - Gul Khan On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Oncor Electric Delivery - 1 - Texas RE	
Answer	Yes
Document Name	
Comment	
While Oncor Electric Delivery Company LLC (“Oncor”) agrees with the question as phrased, Oncor would like to note that ideally the DER owner would maintain responsibility for adhering to data-sharing requirements. Oncor recognizes, however, that this may not be a practical solution given the broad applicability of the DER definition proposed in the standard. Oncor would also like to propose an alternative approach for the SDT’s consideration – in the event that an unregistered DP is between the DER connection point and the TO’s system, instead of placing the data collection responsibility on the TO, there could instead be a mandate for any such DPs to register. This would keep the data sharing requirements with the DP who may be better positioned to provide more accurate data than the TO.

Robert Jones - Seattle City Light - 4	
Answer	

Document Name	
Comment	
No, the Transmission Owner (TO) is not always the most appropriate entity to collect and provide data for Distributed Energy Resources (DER) in cases where there is no registered Distribution Provider (DP) between the DER interconnection point and the TO's system. The TO may not have been involved in the DER interconnection process and may lack visibility into the DER systems, including specific inverter details and settings. As a result, the TO may not have access to accurate DER/IBR modeling parameters unless it was directly involved in the interconnection agreements. For example, while Seattle City Light functions as both a TO and a distribution load-serving entity, it still may not have access to detailed inverter information for DERs that are already installed. In such cases, significant assumptions and estimations would be required to model these resources accurately.

3. Do you agree with the proposed IRO-010-5 and TOP-003-8 modifications to address the FERC Order 901 directives? Please reference the technical rationale and consideration of FERC directives. If you do not support the modifications made, please provide rationale and proposed language on how you would address the FERC Order 901 directives.

FirstEnergy supports EEI comments which state:

Consistent with EEI concerns as stated in our response to question 1, we do not agree that enforceable Reliability Standards should be reliant on external documents such as the document titled “ERO Approved Criteria for Acceptable Models” (FERC Order 901, P 125) for the establishment of enforceable and auditable compliance requirements. To address our concerns with this issue in both IRO-010-6 and TOP-003-8 we offer the following comments and edits in boldface:

IRO-010-6 Concerns

Requirement R1: The following suggested changes to IRO-010-6, Requirement R1, part 1.5.3 (in boldface) align with our proposed changes to MOD-032 and provide RCs with similar capabilities as provided to PCs in that standard. We believe these changes will satisfy FERC Order 901 directives, place the criteria within the requirements of the Reliability Standard, allow the use of user-defined models when needed and ensure sharing and coordination across the interconnection.

R1. The Reliability Coordinator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include but not be limited to: *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification as deemed necessary by the Reliability Coordinator.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1 Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints.

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide data and information that includes, but is not limited to.:

1.5.1 Specific deadlines or periodicity in which data and information is to be provided;

1.5.2 Performance criteria for the availability and accuracy of data and information, as applicable;

1.5.3 Requirements for model submissions in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization; Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data. for the following items for dynamic models submitted in accordance with Attachment 1:

1.5.3.1. A list of unacceptable models1 which are not to be submitted unless there is no alternative model available;

1.5.3.2. Required submission of standard library model types provided with the software(s) utilized to create the interconnection-wide case(s) and/or user-written models along with an explanation of the use case(s) for each model type.

Criteria for any submitted user-written models including, at a minimum, documentation and performance criteria to minimize the risk of non-convergence and other issues. The RC's user-written model criteria must be made available to all other RCs within the Interconnection for review and comment, and approval where the user-written model represents a shared impact.

Jennie Wike - Jennie Wike On Behalf of: Hien Ho, Tacoma Public Utilities (Tacoma, WA), 1, 4, 5, 6, 3; John Merrell, Tacoma Public Utilities (Tacoma, WA), 1, 4, 5, 6, 3; John Nierenberg, Tacoma Public Utilities (Tacoma, WA), 1, 4, 5, 6, 3; Ozan Ferrin, Tacoma Public Utilities (Tacoma, WA), 1, 4, 5, 6, 3; Terry Gifford, Tacoma Public Utilities (Tacoma, WA), 1, 4, 5, 6, 3; - Jennie Wike, Group Name Tacoma Power

Answer	No
Document Name	

Comment
Tacoma Power does not agree that TOP-003-8 R1.5.3 and R2.5.3 are necessary to “further enhance real-time visibility of Bulk-Power System operations” (FERC Directive p 86). The changes to TOP-003-8 R1.1 and R2.1 adequately address this FERC directive. The proposed new sub-Requirements R1.5.3 and R2.5.3 are not related to this directive, as the data collected for the Criteria for Acceptable Models is for modeling and not for real-time visibility. Tacoma Power does not agree with expanding the scope of TOP-003-8 to include model submissions and requesting modeling data. TOP-003 should continue to focus on the data needed for real-time operations (e.g. RTAs and OPAs). The TOP-003 sub-Requirements related to requesting modeling data in R1.5.3 and R2.5.3 should be removed from TOP-003-8. Additionally, TOP-003-8 R2.5.3 is redundant to MOD-032-2 R2. If a Requirement is needed to ensure the TOP is capable of requesting modeling data, then Tacoma Power recommends modifying MOD-032 and add the TOP as a functional entity in this Standard. If the SDT determines that the scope of TOP-003-8 should be expanded to include modeling data, then Tacoma Power recommends modifying TOP-003-8 R1.5.3 to clarify that the TO is the appropriate responsible entity for collecting and providing modeling data for DERs where there is no associated registered DP (and not the TOP or BA), similar to the approach taken in the MOD-032-2 redline. TOP-003-8 would then need to be modified to include the TO as a functional entity.

Adrian Andreoiu - BC Hydro and Power Authority - 1, Group Name BC Hydro

Answer	No
Document Name	

Comment

Requirement R1 Part 1.1 of the draft IRO-010-6 and TOP-003-8 now specifies IBR-specific “data and parameters”. It is not clear if the drafting team identified a material difference that would mandate IBR-specific data **and** IBR-specific parameters as necessary condition for compliance. The addition in Part 1.5.3 clarifies that the data specification must include methods to provide data that include requirements for model submissions in accordance with the Criteria for Acceptable Models.

BC Hydro suggests that using “IBR-specific data” in Part 1.1. in conjunction with the additional Part 1.5.3 is sufficient; otherwise, we request that the drafting team provides additional clarity on what would constitute adequate and sufficient evidence to demonstrate compliance for IBR data and IBR parameters.

Requirement R1 Part 1.5.3 of the draft IRO-010-6 and TOP-003-8 (as well as R2 Part 2.5.3 of TOP-003-8) mandates that the data spec must include methods to provide data that include “requirements for model submissions in accordance with the Criteria for Acceptable Models”. BC Hydro’s understanding (supported by the Technical Rationale) is that the intent here is to mandate that data models must be in accordance with the Criteria for Acceptable Models, rather than their submission, which must be in accordance with the method specified pursuant to Part 1.5. Revised wording for clarity is provided below:

1.5.3 Requirements that data models are in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization.

(1) The added sub-requirement 1.5.3 should be removed from this standard as it pertains to data and information collection, not model submissions. The data collected for the Criteria for Acceptable Models is for modeling and not for real-time visibility This requirement is already addressed in MOD-032-2 R1 (sub-requirement 1.2). (2) The statement “Inverter-based Resource (IBR)-specific data and parameters” added to section 1.1 should be removed or more inclusive of including all other facilities, of which IBR’s are a subset. It is suggested that the statement be augmented to the following, “including Generator, FACTS, aggregate DER and Inverter-based Resource (IBR)-specific data and parameters”.

Consistent with EEI concerns as stated in our response to question 1, we do not agree that enforceable Reliability Standards should be reliant on external documents such as the document titled “ERO Approved Criteria for Acceptable Models” (FERC Order 901, P 125) for the establishment of enforceable and auditable compliance requirements. To address our concerns with this issue in both IRO-010-6 and TOP-003-8 we offer the following comments and edits in boldface:

IRO-010-6 Concerns

Requirement R1: The following suggested changes to IRO-010-6, Requirement R1, part 1.5.3 (in boldface) align with our proposed changes to MOD-032 and provide RCs with similar capabilities as provided to PCs in that standard. We believe these changes will satisfy FERC Order 901 directives, place the criteria within the requirements of the Reliability Standard, allow the use of user-defined models when needed and ensure sharing and coordination across the interconnection.

R1. The Reliability Coordinator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include but not be limited to: *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification as deemed necessary by the Reliability Coordinator.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1 Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints.

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

{**1.3.2.2.** historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide data and information that includes, but is not limited to.:

1.5.1 Specific deadlines or periodicity in which data and information is to be provided;

1.5.2 Performance criteria for the availability and accuracy of data and information, as applicable;

1.5.3 Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data. for the following items for dynamic models submitted in accordance with Attachment 1:

1.5.3.1. A list of unacceptable models1 which are not to be submitted unless there is no alternative model available;

1.5.3.2. Required submission of standard library model types provided with the software(s) utilized to create the interconnection-wide case(s) and/or user-written models along with an explanation of the use case(s) for each model type.

1.5.3.3. Criteria for any submitted user-written models including, at a minimum, documentation and performance criteria to minimize the risk of non-convergence and other issues. The RC's user-written model criteria must be made available to all other RCs within the Interconnection for review and comment, and approval where the user-written model represents a shared impact.

1.5.4 Provisions to update or correct data and information, as applicable or necessary.;

1.5.5 A mutually agreeable format; and

1.5.6 A mutually agreeable method(s) for securely transferring data and information.

TOP-003-8 Concerns

Requirement R1: The following suggested changes to TOP-003-8, Requirement R1, part 1.5.3 (in boldface) align with our proposed changes to MOD-032 and provide RCs with similar capabilities as provided to PCs in that standard. We believe these changes will satisfy FERC Order 901 directives,

place the criteria within the requirements of the Reliability Standard, allow the use of user-defined models when needed and ensure sharing and coordination across the interconnection.

R1. Each Transmission Operator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1 A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification as deemed necessary by the Transmission Operator.

1.2 Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3 Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1 Operating limitations based on:

1.3.1.1 capability and availability;

1.3.1.2 fuel supply and inventory concerns;

1.3.1.3 fuel switching capability; and

1.3.1.4 environmental constraints

1.3.2 Generating unit(s) minimum:

1**.3.2.1** design temperature; or

1.3.2.2 historical operating temperature; or

1.3.2.3 current cold weather performance temperature determined by an engineering analysis.

1.4 Identification of a mutually agreeable process for resolving conflicts.

1.5 Method(s) for the entity identified in Part 1.1 to provide the data and information that includes, at a minimum, the following:

1.5.1 Specified deadlines or periodicity in which data and information is to be provided;

1.5.2 Performance criteria for the availability and accuracy of data and information as applicable;

1.5.3 Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data for the following items for dynamic models submitted in accordance with Attachment 1:

1.5.3.1 A list of unacceptable models1 which are not to be submitted unless there is no alternative model available;

1.5.3.2 Required submission of standard library model types provided with the software(s) utilized to create the interconnection-wide case(s) and/or user-written models along with an explanation of the use case(s) for each model type.

1.5.3.3 Criteria for any submitted user-written models including, at a minimum, documentation, and performance criteria to minimize the risk of non-convergence and other issues.

1.5.4 Provisions to update or correct data and information, as applicable or necessary;

Footnote 1: For example, the Unacceptable Model List included in NERC's Dynamic Modeling Recommendations and/or other lists maintained by the entities responsible for creating interconnection-wide base cases.

Requirement 2: EEI is of the opinion that Requirement R2, subpart 2.54 was added in error and should be removed. It is our understanding that the BA is not responsible for Steady State, Dynamic or Short Circuit modeling and therefore has not useful utility.

NIPSCO also supports MISO's comments referenced below: "NERC Standards often default to the lowest common denominator in terms of data quality, which can compromise model accuracy. To ensure more reliable and representative system models, NERC should strengthen data submission requirements. Specifically, MOD-032 should explicitly state that submitted data must accurately reflect how equipment is configured and operates in the field." And, "Consistent with the response to Q1 above providing a superior alternative to the separate ERO criteria document, the language in IRO-010-6 Requirement R1, Part 1.5.3; TOP-003-8 Requirement R1, Part 1.5.3; and TOP-003-8 Requirement R2, Part 2.5.3 should be changed to read as follows: Requirements for model submissions consistent with the model submitted for planning purposes in accordance with MOD-032; Referencing MOD-032 instead of a separate ERO criteria document satisfies FERC's directives in Order No. 901 by ensuring consistency between operations models and planning models, while also leveraging model quality and accuracy requirements associated with MOD-032 submissions."

Answer	No
Document Name	
Comment	

SMUD and BANC believe that the new sub-Requirements R1.5.3 and R2.5.3 in TOP-003-8 are not necessary to enhance "***real-time visibility***" [emphasis added] of Bulk Power System operations as outlined in the FERC Directive (p. 86). We feel that the changes made to Requirements R1.1 and R2.1 adequately address this FERC directive.

The proposed new sub-Requirements R1.5.3 and R2.5.3 appear to focus on data collected for modeling purposes, specifically in relation to the "ERO Approved Criteria for Acceptable Models" document, rather than contributing to real-time visibility. Additionally, sub-Requirement R2.5.3 seems to duplicate Requirement R2 of MOD-032-2.

We suggest that the scope of TOP-003-8 remains focused specifically on the data required for real-time operations, such as Real-Time Assessments and Operational Planning Analyses. To that end, we recommend the removal of the sub-Requirements R1.5.3 and R2.5.3, as they involve requests for modeling data which do not align with the purpose of TOP-003-8.

Comment	
It is the opinion of ACES that NERC registered entities should not be subjected to potential violations of multiple NERC Reliability Standards Requirements for a single action. In other words, we contend that by including requirements for model submissions in both MOD-032-2 and in a documented data specification(s), responsible entities will now be subject to a form of double jeopardy (i.e., claim preclusion). ACES recommends only requiring model submissions under MOD-032-2 and subsequently striking the following newly proposed requirement parts: IRO-010-6 Requirement R1 Part 1.5.3, TOP-003-8 Requirement R1 Part 1.5.3, and TOP-003-8 Requirement R2 Part 2.5.3.

California ISO abstains from the response to this question.

Consistent with the response to Q1 above providing a superior alternative to the separate ERO criteria document, the language in IRO-010-6 Requirement R1, Part 1.5.3; TOP-003-8 Requirement R1, Part 1.5.3; and TOP-003-8 Requirement R2, Part 2.5.3 should be changed to read as follows:

"Requirements for model submissions consistent with the model submitted for planning purposes in accordance with MOD-032;"

Referencing MOD-032 instead of a separate ERO criteria document satisfies FERC's directives in Order No. 901 by ensuring consistency between operations models and planning models, while also leveraging model quality and accuracy requirements associated with MOD-032 submissions.

Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer	
Document Name	

Comment

Southern Company supports most of the standard revisions to IRO-010 and TOP-003. However, significant changes to NERC's external document "ERO Approved Criteria for Acceptable Models document" since the last IRO-010 and TOP-003 revisions, specifically the inclusion of criteria modifications that could impact a Registered Entities compliance, highlight our significant concern with the proposed IRO-010 and TOP-003 revisions.

There are simple changes that NERC can make IRO-010 and TOP-003 revisions a success. This includes:

1. Moving any criteria in the "ERO Approved Criteria for Acceptable Models document" within the standard, and converting the external model reference to a "ERO Approved Acceptable Models list" consistent with FERC 901 requirements. Additional comments are included in question 6.
2. TOP-003 R2 should not apply to BAs as they do not use steady state, short circuit, and dynamic modeling data as part of their responsibilities.
3. The following requirement needs to be explicitly added to the standard:
    - "Requirements for model submissions in accordance with the Criteria for Acceptable Models maintained by the ERO; unless it shall otherwise reduce the viability of the [RC, BA, TOP] ability to perform their analysis functions in a timely manner."
    - In the ERO document, Item #4 must be removed. It is unnecessary, not applicable to operational models, and impractical.
    - In the ERO document, Item #5 must include clarifications similar to previous versions. For example:
        - *"Models shall not reduce the viability of a Registered Entity's ability to perform their OPAs and RTAs in a timely manner. This may require uses of models listed on the Unacceptable Model List provided the model is accompanied by sufficient documentation to explain the parameters, states, and usability of the model to simulate small signal and large disturbance behavior for the scope of responsibility of the NERC Registered Entity."*

ERCOT abstains from the response to this question. The proposed definition does not explicitly include demand reduction in the DER definition. For a complete definition, this should be more clearly indicated whether it is or is not included.	

Distributed Energy Resources (DER): Generators and energy storage technologies connected to a distribution system that are capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including those connected behind the meter of an end-use customer that is supplied from a distribution system.

No. Both proposed standards (MOD-032-2; MOD-033-3) rely on the proposed DER definition to describe the IBR-DERs that Order 901 directs these standards to address, in aggregate, for purposes of data reporting and modeling. *See, e.g.*, proposed MOD-032-2, R2.2.1 & n.1; proposed MOD-033-3, R1.1.2. A key problem with the proposed use of the DER definition is that it is inconsistent with Order 901's express intent and directives, and therefore will undermine FERC's objectives, described above, to accurately represent IBRs, which is needed because such generation responds differently to system disturbances than synchronous generation.

Although Order 901 expressly directs the development of standards requiring the provision of data and modeling of aggregate IBR-DERs, the proposed draft standards use a generalized DER definition, which includes both IBRs and non-IBR generation. *See, e.g.*, Order 901, PP 7, 53. *See also* MOD-032-2 Technical Rationale Figure 2 (at 5). While the MOD-032-2 Technical Rationale, at 7, found it practical to have a consistent estimation framework for all DERs regardless of technology, the proposed DER definition fails to isolate IBR-DERs so that their impacts can be analyzed and appropriately accounted for in modeling, operations, and planning. The addition of Item 9.c under the "steady-state" column in MOD-032-2 Attachment 1 may somewhat mitigate the adverse impact of this combined IBR/non-IBR DER definition, but the use of the DER definition without express restrictions to IBR-DERs elsewhere in the proposed draft standards invites confusion that could also carry over to other standards that are intended to account for the particular characteristics of IBRs. For example, Item 10 under "dynamics" of MOD-032-2 Attachment 1 fails to make the distinction captured in Item 9.c. *Compare* Order 901, PP 37-39, 50-56. MOD-033-3 footnote 1 likewise refers to the DER definition without focusing on those DERs that are IBRs.

Thus, the proposed homogenized DER definition may impede the ability of these standards, and other IBR-related standards, to achieve Order 901's reliability objectives. Steps should be taken to more clearly define IBR-DERs or otherwise further mitigate the potential adverse impacts of use of the proposed DER definition.

Context for and a summary of all concerns with proposed MOD-032-2 are provided in Question 1; further concerns with regard to the unregistered IBR definition are provided in Question 7.

Gul Khan - Gul Khan On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Oncor Electric Delivery - 1 - Texas RE

Answer	No
Document Name	

Comment

Oncor Electric Delivery Company LLC ("Oncor") considers the "Distributed Energy Resource" ("DER") definition used in the Technical Rationale for Reliability Standard MOD-032-2 too vague because it does not contain a voltage class threshold for an energy resource to be considered a DER.

Oncor's view of DER is consistent with ERCOT's definition of DER, which is: "An electrical generating facility consisting of one or more on-site distributed generation units connected at a voltage less than or equal to 60 kilovolts (kV), which may be connected in parallel operation to the utility system." This definition can be found here: https://www.ercot.com/files/docs/2017/03/24/DER_OnePager_FINAL.pdf

From Oncor's experience, the total capacity of the installation's on-site distributed generation units, a type of distributed energy resource, may exceed ten megawatts (MW).

Is there any MW size threshold for Generator and energy storage technologies to be taken into account when the end-use customer is served at transmission voltage? Oncor would prefer a MW size threshold be specified in the definition.

Response	
Julie Hall - Entergy - 6	

Answer	No
Document Name	
Comment	

Entergy is concerned that the clause "*behind the meter of an end-use customer that is supplied from a distribution system*." will require modeling legacy industrial generation behind the meter on distribution where data is not available because of the age of the units, whereas much larger industrial generation behind the meter on the transmission system is not required to be modeled. Entergy has concerns that it will not be practical to model all unregistered DER facilities on the Distribution system without some type of DER unit/system MW threshold or aggregated generation MW threshold.

Answer	No
Document Name	
Comment	

Tacoma Power requests clarity from the SDT as to whether the changes to MOD-032-2 apply to small generation plants connected to the transmission system. The proposed DER definition does not include a threshold or criteria for what is considered "distribution". As a result of not defining this threshold, there is confusion as to what could be considered DER generation. For example, Tacoma Power owns a 4 MW hydro plant connected at 115 kV. Tacoma Power recommends adding clarity in the technical rationale as to whether this revision applies to non-BES synchronous generation connected to the transmission system.

If the intent of the SDT is to include an aggregate of all generating resources in MOD-032-2, then Tacoma Power proposes replacing the word "distribution" with the word "power" in the DER definition. This change would clarify that any non-BES generation must be included within interconnection models, regardless of whether it is connected to transmission or distribution. Alternatively, the SDT could describe in the technical rationale how non-BES synchronous resources connected to the transmission system should be handled under MOD-032.

James Merlo - NAGF - NA - Not Applicable - NA - Not Applicable

Answer	Yes
Document Name	

Comment

However, the proposed term is not clear enough. Does it intend to call a 15MVa generator connected at 60 kV a DER? Or since it is connected at 60 kV, it is considered a non-BES, unregistered Transmission Line-connected generator and therefore, not covered by the definition? It appears that the SDT has structured the requirement to have two different terms that must be used in tandem to ensure all desired resources are addressed. This could lead to the potential for missing entities in future standards that only use the DER definition without the unregistered IBR Resources.

The STD has come up with reasonable definition for DERs, however the use of the abbreviation is very limited to The Technical Document and MOD-032, Attachment 1. Rather than adding a definition to the NERC Glossary, perhaps the definition would be better as an addition to the footnotes for Attachment 1 and a definition paragraph in the Technical Document.

EPRI agrees with the intent of the proposed DER definition but abstains from answering with "Yes" or "No" to this question. We note that the SDT considered existing definitions from NERC SPIDERWG & DERTF, IEEE 1547-2018, FERC, CPUC, NYISO, and decided to not align their proposed DER definition with any of these existing definitions.

EPRI research informs the potential need and feasibility of changes to IRO-010-5 and TOP-003-8, see for example the references listed in response to Q1.

5. Do you agree that the modifications for the proposed reliability standards (MOD-032-2, IRO-010-5, and TOP-003-8) address the scope of the standard authorization request (SAR) in a cost-effective manner? If you do not agree, please provide alternatives that would address the SAR scope in a more cost-effective manner.

Ronald Hoover - Bonneville Power Administration - 1,3,5,6 - WECC

Answer	No
Document Name	

Comment

BPA believes the resources required is only cost effective if the modeling data estimation is useful and backed by actual data. BPA does not support an uninformed modeling data and parameters estimation, as it has no reliability benefit.

Answer	No
Document Name	

Comment

Tacoma Power agrees that the proposed MOD-032-2 and IRO-010-5 Standards are cost effective. However, Tacoma Power does not agree that the new TOP-003-8 sub-Requirements R1.5.3 and R2.5.3 are cost effective. TOP-003-8 R2.5.3 is redundant to MOD-032-2 R2. The BA collects the relevant modeling data for the Criteria for Acceptable Models guidance via MOD-032-2 R2. It is not cost effective to perform duplicative work.

Additionally, the TOP does not have a role in requesting modeling data in the current TOP-003-8. It is not cost effective to require the TOP to collect modeling data under TOP-003-8 R1.5.3. This scope of work should be added to MOD-032-2, if the intent of the SDT is to require the TOP to request modeling submissions.

TVA believes that the costs associated with gathering unregistered IBR and aggregate DER data, which will undoubtedly consist of a large percentage of estimated data, do not prove cost-effective as the result may negatively affect model accuracy and provide little, to no, reliability benefit. We also expect there will be unforeseen costs associated with this effort.

Response

Mohamad Elhusseini - DTE Energy - Detroit Edison Company - 5

Answer	No
Document Name	

Comment

For MOD-32 it is a heavy lift for the DP to provide the additional data requested. Even if an estimate is utilized it takes time to document the methods used for the estimate. Additional time to implement the changes and a gradual approach (i.e prioritizing larger size DER's) could be an approach.

Since the TO has no ability to force unregistered entities to provide necessary data, delays in modeling are possible, even with a TO's established estimation methodology. The cost will be affected by the time and additional effort needed by the TO to coordinate with unregistered entities.

The MOD-032 standard continues to expect all other entities to track the needs of the TP and PC rather than having the TP and PC actually ask entities for data they want. This is extremely inefficient for newly registered GOs/GOPs and will likely lead to even larger issues with the registration of entities not connected to the companies that are registered as TPs and PCs.

The proposed revisions involve a wide range of modeling variances leading to significant costs and time. Additionally, implementation costs analysis becomes challenging also due to insufficient clarity at this time on Acceptable Models (currently there is a list of Unacceptable Models that may be enforceable). Currently, PCs and TPs have limited ability to collect data from non-registered entities. There does not seem to be a reliability benefit that could be realized before additional mechanisms to collect adequate modeling data on all DERs (including non-registered IBRs and other DER entities), including additional or revised mandatory requirements to provide sufficiently accurate data to TPs and PCs become enforceable

Regarding the aggregated DER dynamic model, NERC should define a methodology that utilities can follow to derive such an aggregated DER dynamic model before the change is implemented. The methodology must be practical and easy to follow.

Response

Greg Sorenson - ReliabilityFirst - 10 - RF

Answer	No
Document Name	

Comment

The document does not seem to be written to address both equipment specific and aggregate models. In fact, it seems like the concept of modeling an aggregate IBR-DER or even aggregate dynamic loads may contradict Item #1 under "Usability Requirements"...1) A model manual, or other documentation, with a description of all model parameters, variables, and states. The manual or other documentation shall also describe the range of validity of the model and valid use cases or studies for which the model has sufficient fidelity.

The proposed ERO Approved Criteria for Acceptable Models document suggests that the plant may require two sets of models: operational models and planning models. FERC Order 901 P141 directs NERC to mandate that generator owners of registered IBRs and transmission owners with unregistered IBRs on their system provide Bulk-Power System planners and operators (including planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) with dynamic models that accurately represent the dynamic performance of both registered and unregistered IBRs. This directive appears to aim at ensuring the availability of dynamic models that accurately reflect performance for use in planning and operational studies.

ATC agrees that NERC is responsible for the NERC-Approved Model Library and the associated processes that go along with both maintaining and updating that library. However, we do not agree that Model Criteria should be maintained and modified outside of the Approved Reliability Standards. Model Criteria should not be a moving target. For this reason, we believe that the Model Criteria should be included in the affected Reliability Standards and only changed when those Standards are modified. To address our concerns, we ask that the model criteria be removed from this document and	

rewrite the document to focus on both the Approved and Unapproved Model Library and associated processes for updating and approving models for industry use.

The ERO Approved Criteria for Acceptable Models document should also make clear and define in the document that it applies to generator models, not system models.

Comment

The ERO document goes beyond an Acceptable Model List and includes criteria that must be included in NERC standards. This is in violation of NERC standard development guidance, FERC 901 requirements, and bypasses the NERC Rules of Procedure for future modifications that can impact entities' compliance with the affected NERC standards.

- In order to comply with the NERC's Acceptance Criteria of a Reliability Standard Item #6 Completeness, "Each Reliability Standard should be complete and self-contained. A standard should not depend on external information to determine the required level of performance." As proposed, the revised standards do not conform to this requirement.
  - The "Criteria for Acceptable Models maintained by the ERO" goes well beyond a library of models as specified by FERC 901, but instead includes compliance criteria for use, interpretation, and adherence of these models.
  - This is of significant concern, as an entity's compliance would become dependent on an external set of criteria not vetted through the NERC standard process.
  - Furthermore, the approval process for changes to the document – which could cause an entity to become non-compliant – would not be subject to NERC standard modifications (essentially bypassing NERC ROP).
- FERC 901 requirements that specify the development of new standards and using the ***standard development process*** to refer to a model library – not an external set of criteria. Therefore, the "Criteria for Acceptable Models maintained by the ERO" should be replaced with a version that is solely focused on a library list of acceptable models.
  - P122 "direct NERC to develop new or modified reliability standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady-state, short-circuit, and dynamic conditions when developing planning, operations, and interconnection-wide models"
  - P124 "direct NERC to determine through its standards development process which nation-wide approved component models are needed to build IBR plant models for steady state, short-circuit, and dynamic studies" [as proposed, it is outside the ***standards development process*** with a separate ERO/RSTC process]
  - P125 "direct NERC to develop new or modified Reliability Standards that require the sole use of nation-wide approved component generic library models for system models"
- Southern Company acknowledges there is a desire to be agile with the Library – but this agility should not bypass NERC Rules of Procedure
  - If the Acceptable Models truly becomes a library only list, it can include a process by which models can be ***added*** to the list by the ERO and RSTC, but models should not be removed from the list without going through the full industry standard review process as it could significantly modify an entities compliance. Alternatively, a clear implementation schedule not to be less than 2+ years for the removal of any model could be established.
  - If there are critical criteria that must be adhered to from a compliance perspective, these should be incorporated into the specific standards as requirements – not within an external document.

        - For example, it is imperative the RC and TOP retain the flexibility to utilize models needed to meet its OPA and RTA requirements – both for timing, accuracy, and availability. This may require utilizing models that have been reviewed and verified by the entity to perform accurate representation within those operational assessment constraints (e.g., different for remote external areas afar from the scope of responsibility that accurately simulate dynamic response). These criteria and recognition should be embedded in the standard, not an external document.
        - The acceptability criteria for allowance and submission of user-written models should be clear, including coordination for use across interconnection-wide cases.
- The revised NERC Acceptable Models list needs to ensure there are appropriate exceptions, particularly for modeling of neighboring utilities in remote external areas. Specifically:
    - Exceptions must be granted for use of models on the Unacceptable list if the annual NERC MMWG dynamics data library contains these models, since no other source exists for most entities to procure dynamics data for systems beyond their own boundaries.
    - Additionally, for operational models that must meet availability and timing requirements to perform operational-related assessments - constraints that long-term planning analyses do not face – there needs to be accommodations for remote external area modeling outside the scope of the BA, TOP, and RC footprint. For example, the GENCLS model is introduced by the DYNRED program into appropriate system equivalent models which have been verified to accurately represent the dynamic behavior of external generation beyond Tier 1 neighbors of an RC and TOP. This model represents the dynamic behavior of the coherent group as if it were a single generator – substantially reducing computer run-time while maintaining all necessary accuracy. Such models must be allowed by the RC and TOP when determined by the RC or TOP to accurately model to simulate small signal and large disturbance behavior for the scope of responsibility of the NERC Registered Entity.

EEI does not support or see a need for the proposed document titled ERO Approved Criteria for Acceptable Models for the reasons provided below. However, we do support the continued use of the NERC document titled “Dynamic Modeling Recommendations”, which we believe provides useful guidance to the industry while also containing the Unacceptable Model list. This document would also provide a familiar reference document for the Industry that could be relied upon to provide clarity on unacceptable models and a trusted source of useful recommendations to planners.

1. FERC Order 901 directives clearly “require the sole use of nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities’ respective planning and operation models and to build interconnection-wide models.” (see FERC Order 901, P125). While the proposed document does not identify any approved component generic library models to be used when creating interconnection-wide system models.

2. Planning software used by PC and TPs already utilize generic library models that are widely and consistently available through industry planning software, negating the need for NERC to do anything relative to the development of an approved component generic library model list beyond maintaining the existing NERC Unacceptable Model list.

3. We additionally disagree that model criteria should be contained in a standalone document outside of approved Reliability Standards. However, we agree with FERC that model criteria should be uniformly established and shared by PCs, TPs, RCs, TOPs and BAs through the enforceable Requirements contained in the Reliability Standards for each interconnection. (See FERC Order 901, P161)

4. Moreover, the document contains language within the proposed criteria that is far too ambiguous to be enforceable or auditable within a NERC Reliability Standard. (For example: “negligible error(s)”, “sufficient fidelity”, “robustly initialize”, “reasonable initial conditions”, or “simulation solution challenges”.)

5. We also do not agree that the “Usability Requirements” that cite “simulation crashes” or “solution challenges” as justifications for deeming a model unacceptable. While in some cases, this may be justification for deeming a model unacceptable, such events can be caused by other factors beyond the model and therefore such an arbitrary determination without consideration of other factors may disqualify the best or in some case the only available model.

For these reasons, we ask that the proposed document be abandoned because it provides no useful direction to planners and modelers as originally intended.

Comment	

Black Hills Corporation agrees with EEI's conclusion that the "ERO Approved Criteria for Acceptable Models" document may not align with FERC order 901 directives. We agree this document could be responsible for the Model Library and processes needed to submit proposed additions, however the model criteria should be controlled through enforceable requirements within each Reliability Standard.

Black Hills Corporation also agrees with EEI's comments about the ambiguous language and lack of an Accepted Models list. Also, that the citing of "simulation crashes" or "Solution challenges" may result in a model being deemed unacceptable due to outside factors, even if it is the best or possibly only model available.

R1 reference the ERO maintained Approved Criteria for Acceptable Models. However, this document is not part of the Standard and may pose compliance challenges if updated outside of the Standard Development Process. The process to maintain the list of models (e.g. Unacceptable Model List) relies on NERC determination of the effective date of a change.

For example, if the ERO added a new model to the List of Unacceptable Models in the ERO maintained document without allowing for an adequate implementation timeline, entities may be in noncompliance on the effective date of the revised ERO document.

As drafted the Approved Criteria for Acceptable Models is not clear how and by whom the determination on models that may be acceptable for Planning but not acceptable for Operations is made and documented. It would also be helpful if the Unacceptable Model List includes another column to differentiate between models appropriate for Planning purposes but not appropriate for Operational purposes.

Comment

The ERO Criteria for Acceptable Models does not have industry consensus and was not established through the standards process. TVA does not believe it should be referenced in a compliance standard. In its place, TVA recommends specifications for standard models (where appropriate and available), user-written models (where appropriate and with adequate documentation), and other models (when no alternative is available and requiring justification for use).

FirstEnergy supports EEI comments which state:

EEI does not support the document titled ERO Approved Criteria for Acceptable Models because it appears that it does not align with FERC Order 901 directives which “require the sole use of nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities’ respective planning and operation models and to build interconnection-wide models.” (see FERC Order 901, P125) While we recognize that the FERC Order 901 may be too restrictive and agree some use of user-defined models is needed, it remains unclear whether NERC has obtained FERC approval to deviate from the Order. Moreover, while we support some use of user-defined models, that usage should be limited and validated across each interconnection with clear enforceable requirements that limit the use of user-defined models except when such usage has been coordination between responsible entities across each interconnection. In addition to this core concern, we offer the following additional comments and concerns with this document below:

1. EEI supports the ERO plan to be responsible for the Model Library and the processes needed for responsible entities to submit for approval proposed additions to that library. We do not agree that this document should contain the model criteria itself. While the model library will be a dynamic document, the model criteria should not be dynamic and is most effectively controlled through enforceable requirements within each Reliability Standard.

2. While this document contains a list of Unacceptable Models, it fails to identify any Acceptable Models for use in Interconnection-wide models as required in FERC Order 901.

3.We are also concerned that the document contains language within the proposed criteria that is far to ambiguous to be enforceable or auditable within a NERC Reliability Standard. (For example: “negligible error(s)”, “sufficient fidelity”, “robustly initialize”, “reasonable initial conditions”, or “simulation solution challenges”.)

4.EEI does not agree that the “Usability Requirements” that cite “simulation crashes” or “solution challenges” as justifications for deeming a model unacceptable. While in some cases, this may be justification for deeming a model unacceptable, such events can be caused by other factors beyond the model and therefore such an arbitrary determination without consideration of other factors may disqualify the best or in some case the only available model

EPRI agrees with the intent of the proposed ERO Approved Criteria for Acceptable Models but abstains from answering with "Yes" or "No" to this question.

We share the following observations with the SDT for consideration in future drafts:

–The new terms for the NERC Glossary of Terms proposed by Project 2020-06 for MOD 026/027 etc., i.e., “model validation” and “model verification” are not used in the Criteria for Acceptable Models document.

–In addition to “expected or as-built facilities”, consider adding "as-left" or "as-configured”

–Consider distinguishing between “parameter names” and “parameter values”

–Are standardized tests for “model validation” defined somewhere?

–Consider adding requirements to explicitly document known use cases for which a model shall *not* be used

–Consider changing the term “initial value” to “default value”

–Add a requirement that triggers more thorough model validation whenever models are provided with “default values”

–The term “model adequacy” is used but not defined in the NERC Glossary of Terms as of Feb 26, 2025.

–How would the “explanation of the model’s adequacy” look like? Could it be a "model validation report" for equipment-level models and a "model verification report" for plant-level models, similar to the procedures proposed in IEEE P2800.2 which is currently open for SA initial ballot and public review at https://publicreview.standards.ieee.org/public-review-web/public-app

–Consider clarifying whether "a list of commonly tuned parameters" refers to "parameter values" that are site-specific or the subset of "parameter names" that shall be used to tuned the model to site-specific settings.

–Consider correcting a reference given that Table 1 is now "above".

Answer	
Document Name	
Comment	

For the implementation plan for MOD-032-2, AES does not agree with the proposed 12 month time frame after the effective date for MOD-032-2 for requirements R2-R4.

Some TPs and PCs may elect to postpone development and publishing of their revised data requirements and reporting procedures until the end of the two-year implementation period for the standard leaving only the 12-month time frame to respond. AES has over 400 unregistered IBRs and DERs in which model information should be provided to the responsible entity. While it could be said that unregistered IBRs and DERs are not required to comply with the standard, it is AES's responsibility to help ensure reliability and provide the requested information in the intended manner. With limited modeling resources, AES requests a longer implementation plan for R2-R4 of at least 24 calendar months following the effective date of the standard.

Jennie Wike - Jennie Wike On Behalf of: Hien Ho, Tacoma Public Utilities (Tacoma, WA), 1, 4, 5, 6, 3; John Merrell, Tacoma Public Utilities (Tacoma, WA), 1, 4, 5, 6, 3; John Nierenberg, Tacoma Public Utilities (Tacoma, WA), 1, 4, 5, 6, 3; Ozan Ferrin, Tacoma Public Utilities (Tacoma, WA), 1, 4, 5, 6, 3; Terry Gifford, Tacoma Public Utilities (Tacoma, WA), 1, 4, 5, 6, 3; - Jennie Wike, Group Name Tacoma Power

Answer	
Document Name	
Comment	

Tacoma Power is concerned that the term "unregistered IBR" is not well understood in the industry. Without a formal definition in the Glossary of Terms, it will be difficult for entities to look up the scope of resources that fall under this currently undefined category. Additionally, the term "unregistered IBR" will be used in potentially several Standards, so it would be more efficient to have this term formally defined in the glossary. Defining this term in a footnote of several Standards opens the possibility of the definition being inconsistent between Standards, and would require revising multiple Standards if the definition needs to be updated in the future. In order to ensure efficiency and make it easier to lookup the definition, Tacoma Power recommends using the definition in the MOD-032 footnote to create a NERC glossary definition for Unregistered IBR.

Tacoma Power proposes separate implementation phased dates for MOD-032 compliance for Steady-State versus Dynamics data. The proposed timeline in the implementation plan appears adequate for entering the steady-state data into the interconnection model. The timeline for modeling aggregated DER dynamics data should be extended by an additional 12 months. The modeling tools and base case building process within WECC does not currently have the capability to include multiple different IBR resources within the composite load model. In order to accommodate data for several different IBRs types connected to a single substation transformer, there will need to be extensive collaboration between utilities within WECC. There will also need to be updates by power flow software vendors to implement new composite load models that call for multiple IBR types within a single composite load model. The proposed timeline is vastly too short for WECC utilities to reach agreement on the updates to the WECC Data Preparation Manual, much less for software developers to be able to provide adequate software implementation once the new requirements are defined.

Seattle City Light has concerns regarding the proposed implementation timeline for modeling dynamic data for Distributed Energy Resources (DER). While the timeline for steady-state DER modeling appears reasonable, dynamic model data for many existing DERs and inverter-based resources (IBRs) is currently unavailable. Additionally, if it is determined that multiple types of IBRs are served by the same substation, utilities like Seattle City Light must ensure that their power system analysis software can accommodate this complexity. Given these challenges, Seattle City Light requests additional time to implement dynamic modeling, particularly for unregistered IBRs. The term “Unregistered IBR” is not clearly defined in the current revision of the standard. Seattle City Light recommends that a formal definition be added to the NERC Glossary of Terms to promote consistent understanding and interpretation across all applicable entities. Additional Comments – Support TPU Comments re: TOP-003-8

TVA appreciates the efforts by the standard draft team. In addition to the comments provided above, TVA believes that an effort of this magnitude in acquiring model data for unregistered IBRs and aggregate DERs will likely take considerable time and iterations. The implementation plan only allows 12 months after the effective date of the Reliability Standard. That is not sufficient time to attempt to acquire modeling data and parameters, fail to do so, and then develop estimated values with technical justifications. TVA recommends extending the implementation of R2, R3, and R4 to 36 months.

(1) Attachment 1; Column #2 recommend adding the following (For the in-service item provide verified and validated dynamics model(s)). (2) In the “Short Circuit” column of MOD-032-2 attachment 1, perhaps “transformer winding connection information” should be added as another data requirement? (3) TOP-003 and IRO-010 standards pertain to the data specification and exchange requirements for Transmission Operators, Balancing Authorities and Reliability Coordinators to perform their Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. Time Horizons for requirements within MOD-032-2 [Long-Term Planning] and TOP-003-8/IRO-010-7 [Operations Planning] should align with each other. Models created in MOD-032-2 will be utilized for Operations Planning and Real-time Assessments. As such, data exchange requirements in the form of “model submissions” should reflect all valid time frames, including entities that need to receive this data as part of their required assessments. (4) Attachment 1, Column #2 (item 7(a)) IBR behaviors [remove "capabilities"] related to momentary cessation, tripping, Ride-through, and frequency control	

(5) Attachment 1, Column #2 (items 7(a) and 10(a)). Although there are provisions for representing voltage and frequency protection settings in positive sequence simulations, the terms “momentary cessation, tripping, and ride-through” are too ambiguous. These concepts may not be fully representable in positive sequence phasor domain simulations and lack the necessary clarity to ensure compliance.

(6) Attachment 1, Column #2, Item 10: The MRO NRFS recommends establishing a MW threshold level for requiring unregistered IBRs, as determined by the Planning Coordinator (PC) and Transmission Planner (TP) in R1. Additionally, due to the lack of standardized distribution DER performance requirements, accurately representing the behaviors of unregistered Aggregate Distributed Energy Resources (DER) in sections 10(a) and 10(b) may be challenging. We recommend including “estimated, assumed, or typical DER behaviors related to momentary cessation, tripping, ride-through, voltage control, frequency control, and voltage and frequency protection settings.”

Both proposed standards (MOD-032-2; MOD-033-3) purport to define unregistered IBRs in a footnote (i.e., footnote 1 of each), with draft MOD-032-2 limiting its applicability with the phrase “as used in this standard.” Footnote treatment seems ill-suited to a definition that must be used consistently in a set of Milestone 3 and 4 standards to enable the data, modeling, planning and operational studies that are intended to be developed on a consistent basis to produce the reliability benefits Order 901 expressly contemplated. *See, e.g.,* Order 901, P 53. To better ensure consistent usage throughout the relevant standards, an appropriate unregistered IBR definition should be added to the Glossary. Indeed, inclusion of the unregistered IBR definition in a footnote is inconsistent with the proposal to include the DER definition in the Glossary.

In addition, the proposed footnote explanations of unregistered IBRs improperly use the term “Bulk-Power System connected” to delineate the IBRs to be covered. That term lacks the precision necessary for the registered entities (i.e., Transmission Owners and Distribution Providers) that are required to provide individualized data on such entities (proposed MOD-032-2, R2), and PCs, RCs, and TOPs that are required to validate system models using

this data “to facilitate achieving and maintaining adequate model accuracy” (proposed MOD-033-3, Purpose), or to provide confidence that the resulting reporting will consistently produce results that do not reflect gaps or double counting of IBRs. While the MOD-032-2 Technical Rationale, at 4, suggests that “bulk system-connected” can be shorthand for resources connected to the transmission system, it does not provide a controlling interpretation of the term “Bulk-Power System connected,” as used in the proposed standard, that can be consistently applied and relied upon.

Moreover, to the extent the MOD-032-2 Technical Rationale explanation is meant to inform the “unregistered IBRs” footnote, it fails to remedy the concern that there is no precise definition of Bulk-Power System that would enable a clean delineation of the IBR resources whose data is to be provided. The statutory term “bulk-power system,” like “local distribution,” is pertinent to the boundaries of FERC’s jurisdiction, and as stated in Order No. 773, “[t]he determination whether an element or facility is ‘used in local distribution,’ as the phrase is used in the FPA, requires a jurisdictional analysis that is more appropriately performed by the Commission.” *Revisions to Elec. Reliability Org. Definition of Bulk Elec. Sys. & Rules of Proc.,* Order No. 773, 141 FERC ¶ 61,236, P 69 (2012), *clarified on reh’g,* Order No. 773-A, 143 FERC ¶ 61,053, *compliance deadline extended,* 143 FERC ¶ 61,231, *clarified,* 144 FERC ¶ 61,174 (2013), *review denied sub nom. New York v. FERC*, 783 F.3d 946 (2d Cir. 2015).

In approving NERC’s criteria for fulfilling the directives to register IBRs that are “connected to the Bulk-Power System and that have an aggregate material impact on the reliable operation of the Bulk-Power System,” FERC found it reasonable for NERC to use “non-BES Inverter-Based Resource(s) that either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV.” *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61,196, PP 10, 36-39 (2024). At the same time, FERC reiterated that determining the scope of the BPS is its call to make. *Id.* P 54 n.127. *See also id.* P 44.

Given FERC’s acceptance of the 60 kV cutoff as described above for Category 2 GO/GOP registration purposes as sufficient to meet its “connected to the BPS” directive, and Project 2024-01’s use of that same cut off for purposes of the GO/GOP Category 2 Glossary definitions (which recently received more than the requisite votes needed for approval), there is no reason for the proposed MOD-032-2 and MOD-033-3 footnotes to use vague BPS terminology. Instead, “unregistered IBR” should be added to the Glossary and defined using the already approved proxies for “BPS-connected,” *e.g.*: “non-BES Inverter-Based Resource(s) that do not either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV.”

Context for and a summary of all concerns with the proposed MOD-032-2 definitions are provided in Question 1; additional concerns are provided in response to Questions 4 and 5.

NIPSCO supports MISO's comments below: "For short-circuit modeling under Item 3 of Attachment 1, Generator Owners (GOs) should be required to submit models that reflect their specific resource type, for example, synchronous generators versus inverter-based resources. Relying solely on positive, negative, and zero sequence data may be insufficient for accurately representing inverter-based resources, which often require more detailed modeling parameters." "Regarding steady-state generation (Item 3), there is no need to distinguish between generating units and storage resources, as batteries and pumped storage units are already categorized as generators. If the drafting team wishes to explicitly include storage resources, this clarification would be better suited as a footnote rather than a separate classification."

Comment
SMUD and BANC feel that the implementation plan for MOD-032-2 is too restrictive when it comes to implementing new dynamic data for the many new generation assets being added to the scope of MOD-032-2 (e.g. aggregate DER and unregistered IBR). We support the comments submitted by Tacoma Power that justify more time being added for entities to meet compliance and suggest that a 24-to-36-month implementation plan is appropriate. Lastly, we encourage the standards drafting team (SDT) to refrain from creating a definition in a footnote. The changes proposed in MOD-032-2 and the initial ballot of MOD-033-3 both define the term “unregistered IBR” in a footnote. This important term could very well be used in additional Standards when the Milestone 4 directives are addressed and, therefore, should be defined in a formal definition included in the Glossary of Terms Used in the NERC Reliability Standards (NERC Glossary). A Standards Authorization Request was drafted to create a formal definition for “unregistered IBR”. The SDT should work with NERC and the SDT for MOD-033-3 to ensure the same definition is being used for this term and that it is formally included in the NERC Glossary.

Texas RE noticed the implementation plan could provide more clarity on the retirement dates, initial performance dates, and phased-in compliance dates. First, Texas RE noticed the retirement date for MOD-032-2 is “immediately prior” to the effective date of the standard. The initial performance and compliance dates, however, are 12 months after the effective date of the standard. Texas RE is concerned this could be interpreted to leave a gap in compliance for 12 months. The drafting team may be attempting to address this in the last paragraph of page 3, “Entities shall continue to comply with Requirements R2, R3, and R4 related to Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under MOD-032-1 Requirement R1 and Attachment 1 during the phased-in compliance period for MOD-032- 2”, although it is not clear that verbiage is referring to that potential gap between the effective date of the standard and the phased-in compliance dates.

Texas RE also inquires as to the difference in initial performance dates and compliance dates. This implementation plan seems to describe them in the same way. It is Texas RE's understanding, however, that the initial performance date is for periodic requirements, so registered entities (and auditors) know when the first time the action is to take place, and thus start the periodic tracking of the activity. Compliance dates, on the other hand, refer to phased-in dates after the effective date of the standard so registered entities have time to complete certain activities. Is the intent of the initial performance date to refer to the periodicity in Requirement Part 1.3? There do not appear to be periodic activities in Requirements R2, R3, and R4, and thus a compliance date (phased-in dates) would be appropriate for those requirements.

Additionally, Texas RE noticed that the VRFs are included in the VSL table for IRO-010-6, but are not in the VSL tables for MOD-032-2 and TOP-003-8. The VRFs do appear to be in the requirements for all proposed standards.

Lastly, Texas RE requests the SDT consider adding the "ERO Approved Criteria for Acceptable Models" to the Associated Documents section of each standard (Section E for MOD-032-2, Section F for IRO-010-6 and TOP-003-8).

M3: Reliability Coordinator is listed twice in the measure.

C1.2: Suggest adding “and information” to the 2nd bullet to better reflect R2 and M2. As posted, it currently reads “The Reliability Coordinator shall keep evidence for three calendar years that it has distributed its specification(s) to entities that have data required by the Reliability Coordinator’s Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R2, Measure M2”. Suggest changing to “The Reliability Coordinator shall keep evidence for three calendar years that it has distributed its specification(s) to entities that have data and information required by the Reliability Coordinator’s Operational Planning Analyses, Real-time monitoring, and Real-time Assessments for Requirement R2, Measure M2”.

Comment

1. Attachment 1; Column #2 recommend adding the following (For the in-service item provide verified and validated dynamics model(s)).

2. In the “Short Circuit” column of MOD-032-2 attachment 1, perhaps “transformer winding connection information” should be added as another data requirement?

3. TOP-003 and IRO-010 standards pertain to the data specification and exchange requirements for Transmission Operators, Balancing Authorities and Reliability Coordinators to perform their Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. Time Horizons for requirements within MOD-032-2 [Long-Term Planning] and TOP-003-8/IRO-010-7 [Operations Planning] should align with each other. Models created in MOD-032-2 will be utilized for Operations Planning and Real-time Assessments. As such, data exchange requirements in the form of “model submissions” should reflect the valid time frames, including entities that need to receive this data as part of their required assessments.

4. Add the following in **bold**, and remove the following in *italics:*

Attachment 1, Column #2 (item 7(a)) IBR **behaviors** *capabilities* related to momentary cessation, tripping, Ride-through, and frequency control.

5. Attachment 1, Column #2 (items 7(a) and 10(a)). Although there are provisions for representing voltage and frequency protection settings in positive sequence simulations, the terms “momentary cessation, tripping, and ride-through” are too ambiguous. These concepts may not be fully representable in positive sequence phasor domain simulations and lack the necessary clarity to ensure compliance.

6. Attachment 1, Column #2, Item 10: ITC recommends establishing a MW threshold level for requiring unregistered IBRs, as determined by the Planning Coordinator (PC) and Transmission Planner (TP) in R1. Additionally, due to the lack of standardized distribution DER performance requirements, accurately representing the behaviors of unregistered Aggregate Distributed Energy Resources (DER) in sections 10(a) and 10(b) may be challenging. We recommend including “estimated, assumed, or typical DER behaviors related to momentary cessation, tripping, ride-through, voltage control, frequency control, and voltage and frequency protection settings.”

Document Name	2022-02_Unofficial_Comment_Form_Initial_Posting_April_17_2025_SRC Final Draft.docx
Comment	

ERCOT, Midcontinent ISO, Southwest Power Pool, and California ISO abstain from the response to this question.

For short-circuit in Attachment 1 under item 3, the GO should be required to submit a model based on their resource type i.e. synchronous generator versus inverter based. Positive, negative and zero sequence data may not cover all required modeling data for inverter-based resources.

For Steady State generation (item #3), there is no need to separate between generating units and storage units as battery and pumped storage resources are considered generators. If the drafting team wants to clarify that storage units are included, then that should be a footnote.

Comment	

Both proposed standards (MOD-032-2; MOD-033-3) purport to define unregistered IBRs in a footnote (i.e., footnote 1 of each), with draft MOD-032-2 limiting its applicability with the phrase “as used in this standard.” Footnote treatment seems ill-suited to a definition that must be used consistently in a set of Milestone 3 and 4 standards to enable the data, modeling, planning and operational studies that are intended to be developed on a consistent

basis to produce the reliability benefits Order 901 expressly contemplated. *See, e.g.,* Order 901, P 53. To better ensure consistent usage throughout the relevant standards, an appropriate unregistered IBR definition should be added to the Glossary. Indeed, inclusion of the unregistered IBR definition in a footnote is inconsistent with the proposal to include the DER definition in the Glossary.

In addition, the proposed footnote explanations of unregistered IBRs improperly use the term "Bulk-Power System connected" to delineate the IBRs to be covered. That term lacks the precision necessary for the registered entities (i.e., Transmission Owners and Distribution Providers) that are required to provide individualized data on such entities (proposed MOD-032-2, R2), and PCs, RCs, and TOPs that are required to validate system models using this data "to facilitate achieving and maintaining adequate model accuracy" (proposed MOD-033-3, Purpose), or to provide confidence that the resulting reporting will consistently produce results that do not reflect gaps or double counting of IBRs. While the MOD-032-2 Technical Rationale, at 4, suggests that "bulk system-connected" can be shorthand for resources connected to the transmission system, it does not provide a controlling interpretation of the term "Bulk-Power System connected," as used in the proposed standard, that can be consistently applied and relied upon.

Moreover, to the extent the MOD-032-2 Technical Rationale explanation is meant to inform the "unregistered IBRs" footnote, it fails to remedy the concern that there is no precise definition of Bulk-Power System that would enable a clean delineation of the IBR resources whose data is to be provided. The statutory term "bulk-power system," like "local distribution," is pertinent to the boundaries of FERC's jurisdiction, and as stated in Order No. 773, "[t]he determination whether an element or facility is 'used in local distribution,' as the phrase is used in the FPA, requires a jurisdictional analysis that is more appropriately performed by the Commission." *Revisions to Elec. Reliability Org. Definition of Bulk Elec. Sys. & Rules of Proc.,* Order No. 773, 141 FERC ¶ 61,236, P 69 (2012), *clarified on reh'g,* Order No. 773-A, 143 FERC ¶ 61,053, *compliance deadline extended,* 143 FERC ¶ 61,231, *clarified,* 144 FERC ¶ 61,174 (2013), *review denied sub nom. New York v. FERC*, 783 F.3d 946 (2d Cir. 2015).

In approving NERC's criteria for fulfilling the directives to register IBRs that are "connected to the Bulk-Power System and that have an aggregate material impact on the reliable operation of the Bulk-Power System," FERC found it reasonable for NERC to use "non-BES Inverter-Based Resource(s) that either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV." *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61,196, PP 10, 36-39 (2024). At the same time, FERC reiterated that determining the scope of the BPS is its call to make. *Id.* P 54 n.127. *See also id.* P 44.

Given FERC's acceptance of the 60 kV cutoff as described above for Category 2 GO/GOP registration purposes as sufficient to meet its "connected to the BPS" directive, and Project 2024-01's use of that same cut off for purposes of the GO/GOP Category 2 Glossary definitions (which recently received more than the requisite votes needed for approval), there is no reason for the proposed MOD-032-2 and MOD-033-3 footnotes to use vague BPS terminology. Instead, "unregistered IBR" should be added to the Glossary and defined using the already approved proxies for "BPS-connected," *e.g.*: "non-BES Inverter-Based Resource(s) that do not either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV."

Context for and a summary of all concerns with the proposed MOD-032-2 definitions are provided in Question 1; additional concerns are provided in response to Questions 4 and 5.

Jodirah Green - ACES Power Marketing - 1,3,4,5,6 - MRO,WECC,Texas RE,SERC,RF, Group Name ACES Collaborators

Answer	
Document Name	

Comment

Several ACES Members have expressed their concerns regarding their ability to collect and submit all of the information identified in the proposed draft of MOD-032-2, particularly the proposed dynamic data. Therefore, ACES suggests that the drafting team should consider a minimum threshold value for dynamic DER data. In our opinion, such a threshold would be consistent with NERC's precedent for developing risk-based Reliability Standards and would prevent an insurmountably large compliance being placed upon the applicable registered entities.

PPI generally agrees with these comments, with one exception. In regard to question 2, we believe the TP, not the TO, should be the entity responsible for estimating DER data, as the TP is currently responsible for submitting load forecasts and similar data. DER's are essentially negative load.

Thank you for the opportunity to comment.

This project incoporates many definitions or soon to be definitions that have been or will be changed. It would be nice if all of the SDT's from all of the FERC order 901 projects would get together and form a concise voice and vision on how to incorporate those new definitions into these new and modified standards.

It will likely require industry more than three years to comply with MOD-032-2, so the three year timeline proposed in the Implementation Plan should be extended. The Consideration of FERC Order 901 Directives document notes: "It is understood that based on what is being required via MOD-032, industry would need at least one year to gather data, hold meetings with respective OEM or developers to gather models needed, and then an additional two years to update models based on the ERO Approved Criteria for Acceptable Models document, etc." As was established at length in the September 2024 PRC-029 technical workshop and recent industry comments on FERC's Notice of Proposed Rulemaking to approve PRC-029, coordination with OEMs is challenging and time consuming, particularly for vintage generator technology that is no longer supported. The Consideration of FERC Order 901 Directives document notes the uncertainty in the timeline for that process, noting that initial OEM coordination may take "at least one year." Extending the effective date should still allow NERC to meet the 2030 deadline FERC suggested in Order 901. This will ensure model development is not rushed, which could potentially endanger reliability if models are not adequately vetted.

Comment

I. Introduction

1. The Electric Power Research Institute (EPRI)[1] respectfully submits these comments (This Response) in response to North American Electric Reliability Corporation (NERC)'s request for formal comment on Project 2022-02 Uniform Modeling Framework for IBR, issued April 17, 2025.

2. EPRI closely collaborates with its members inclusive of electric power utilities, Independent System Operators (ISOs), and Regional Transmission Organizations (RTOs), as well as numerous other stakeholders, domestically and internationally. In its role, EPRI conducts independent research and development relating to the generation, delivery, and use of electricity for public benefit by working to help make electricity more reliable, affordable and environmentally safe. EPRI's comments on this topic are technical in nature based upon EPRI's research, development, and demonstration experience over the last 50 years in planning, analyzing, and developing technologies for electric power.

3. EPRI research and technology transfer deliverables are generally accessible on its website to the public, either for free or for purchase, and occasionally subject to licensing, export control, and other requirements.[2] The publicly available and free-of-charge milestone reports from a U.S. Department of Energy (DOE)- and EPRI member-funded research project, Adaptive Protection and Validated Models to Enable Deployment of High Penetrations of Solar PV ("PV-MOD"), [3] and other research deliverables substantiate many of the comments made in This Response.

4. While not a standards development organization (SDO), EPRI conducts research and demonstration projects in relevant areas as well as facilitates knowledge transfer and collaboration that SDOs may, at times, use to inform technical and regulatory standards development, such as in Institute of Electrical and Electronics Engineers (IEEE), International Electrotechnical Commission (IEC), International Council on Large Electric Systems (CIGRE), and NERC.[4]

II. Conclusion

5. EPRI appreciates the opportunity to provide NERC with its technical recommendations and comments on these important topics related to Reliability Standards for IBRs. EPRI looks forward to working with its members, NERC, and other stakeholders on providing further independent technical information on these important questions.

III. Contact Information

Jens C. Boemer, Technical Executive

Email: JBoemer@epri.com

[1] EPRI is a nonprofit corporation organized under the laws of the District of Columbia Nonprofit Corporation Act and recognized as a tax-exempt organization under Section 501(c)(3) of the U.S. Internal Revenue Code of 1996, as amended, and acts in furtherance of its public benefit mission. EPRI was established in 1972 and has principal offices and laboratories located in Palo Alto, Calif.; Charlotte, N.C.; Knoxville, Tenn.; and Lenox, Mass. EPRI conducts research and development relating to the generation, delivery, and use of electricity for the benefit of the public. An independent, nonprofit organization, EPRI brings together its scientists and engineers as well as experts from academia and industry to help address challenges in electricity, including reliability, efficiency, health, safety, and the environment. EPRI also provides technology, policy and economic analyses to inform long-range research and development planning, as well as supports research in emerging technologies.

There were 82 sets of responses, including comments from approximately 174 different people from approximately 105 companies representing 8 of the Industry Segments as shown in the table on the following pages.

All comments submitted can be reviewed in their original format on the project page.

If you feel that your comment has been overlooked, let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, contact Manager of Standards Information, Nasheema Santos (via email) or at (404) 290-6796.

Questions

1. Do you agree with the proposed MOD-032-2 modifications to address the FERC Order 901 directives? Please reference the technical rationale and consideration of FERC directives. If you do not support the modifications made, please provide rationale and proposed language on how you would address the FERC Order 901 directives.

2. Do you agree that the Transmission Owner (TO) is typically the appropriate responsible entity for collecting and providing data for DER where there is no associated registered DP between the DER connection point and the TO's system? If not, what entity would be in a better position to provide that data and add justification?

3. Do you agree with the proposed IRO-010-5 and TOP-003-8 modifications to address the FERC Order 901 directives? Please reference the technical rationale and consideration of FERC directives. If you do not support the modifications made, please provide rationale and proposed language on how you would address the FERC Order 901 directives.

4. Do you agree with the proposed DER definition? Please refer to the technical rationale, which provides rationale behind the drafting team's intent and previous definitions proposed. If you do not support the definition as proposed, please explain the changes that, if made, would result in your support.

5. Do you agree that the modifications for the proposed reliability standards (MOD-032-2, IRO-010-5, and TOP-003-8) address the scope of the standard authorization request (SAR) in a cost-effective manner? If you do not agree, please provide alternatives that would address the SAR scope in a more cost-effective manner.

6. Do you agree with the proposed ERO Approved Criteria for Acceptable Models document? If you do not agree, please provide alternative language and explain the rationale that, if made, would result in your support.

7. Provide any additional comments for the drafting team to consider, if desired.

The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

Comment	
BPA does not support the proposed revisions in MOD-032-2, specifically, R2.1. BPA believes the TO is not the appropriate registered entity to be responsible for providing estimations of unregistered load. BPA has 133 load modeling entities within its footprint, with a combined winter peak load of 12.2 GW. 110 of these entities are unregistered, which accounts for 6.4 GW of the total load. BPA, as a TO, does not have visibility into an unregistered entity's systems to provide an estimate of the data at any level of accuracy. BPA believes an uninformed estimate could negatively impact system reliability. BPA advocates that the best way to close the data gap is to close the registration gap. BPA recommends unregistered DPs become registered if only to supply IBR and DER data. BPA suggests a new compliance registry "DP-DER" registration.

Response	
Thank you for your comment. FERC Order No. 901 P104 states "Recognizing that there may be instances in which transmission owners are unable to gather adequate unregistered IBR modeling data and parameters to create and maintain unregistered IBR models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation." Please see the updated TR, which provides some examples of methods on how to complete estimations	

with little data or no data. While the team understands the importance of accuracy, it is important to have an allowance for estimation when data is not available. The DT updated MOD-032 to better align in having the TP and PC identify the appropriate entity responsible for providing data associated with unregistered IBR and DER. As discussed in the TR, modifying NERC registration criteria is not a feasible option for addressing FERC 901 directives within the required timelines.

Comment	

FirstEnergy asks for clarification on the following:
Footnote 1 states:
As used in this standard, the phrase “unregistered IBR” refers to a Bulk-Power System connected IBR that does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.

Footnote 1 introduces the term “unregistered IBR” but does not adequately define it. Does the term “Unregistered IBR” only refer to IBRs that meet Category 2 criteria? This is not clear in the footnote as written.

Also, Project 2024-01 passed on May 7, 2025, which adds “Category 2” IBRs to the Generator Owner definition. Does that change the meaning of Footnote 1 since Generator Owner now includes both Categories 1 and 2? Would this change the meaning of the footnote 1 to include unregistered IBRs not already applicable under Categories 1 and 2?

In addition, FirstEnergy supports EEI’s comments which state:

EEI does not agree that enforceable Reliability Standards should be reliant on external documents such as the document titled “ERO Approved Criteria for Acceptable Models” (FERC Order 901, P 125) for the establishment of enforceable and auditable compliance requirements. Moreover, the Commission did not direct NERC to develop such a document but instead directed NERC “to develop new or modified Reliability Standards that require planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities to establish for each interconnection a uniform framework with modeling criteria” (emphasis added; FERC Order 901, P161).). To better align with FERC Order 901, we offer the following comments and suggested edits in boldface below:

Requirement R1

EEI does not support maintaining model criteria within ERO document titled ERO Approved Criteria for Acceptable Models for the reasons detailed in our response to Question 6 below. To address this concern, we offer the following modifications to requirement R1 below, which we believe would satisfy FERC Order 901 directives, place the criteria back within the requirements of the Reliability Standard, allow the use of user-defined models when needed and ensure sharing and coordination across the interconnection. These edits are limited to part 1.2 in boldface below:

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1 The data listed in Attachment 1, including the responsible entity for each required item.

1.2 Requirements for model submissions in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization (ERO) Specifications for the following items for dynamic models submitted in accordance with Attachment 1:

1.2.1 A list of unacceptable models1 which are not to be submitted unless there is no alternative model available;

1.2.2 Required submission of standard library model types provided with the software(s) utilized to create the interconnection-wide case(s), or a technical justification for the submission and use of user-written models if such models are permitted.

1.2.3 Criteria for any submitted user-written models including, at a minimum, documentation, and performance criteria to minimize the risk of non-convergence and other issues. The PC's user-written model criteria must be made available to all other TP/PC's within the Interconnection for review and comment, and approval where the usage of the user-written model represents a shared impact.

1.3 Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.3.1 **D**ata format;

1.3.2 Level of detail to which equipment shall be modeled;

1.3.3 Case types or scenarios to be modeled; and

1.3.4 A schedule for submission of data at least once every 13 calendar months.

1.4 Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

Footnote 1: For example, the Unacceptable Model List included in NERC's Dynamic Modeling Recommendations and/or other lists maintained by the entities responsible for creating interconnection-wide base cases.

Requirement R2

EEI does not support Requirement R2, part 2.1 because this requirement places compliance obligations on the TO that they have no practical method of fulfilling without the support of the unregistered DPs. Moreover, the TOs played no part in interconnecting the DERs on unregistered DP systems, nor do they have any ability to compel those entities to provide the information needed. While it is unclear how DER data from unregistered entities might impact BPS reliability, TO will be limited in their ability to fulfill their compliance obligations without the direct assistance and participation for unregistered DPs. To address this concern, guidance could be developed to clarify exactly what must be provided by the TO, including the basis for DER estimates whenever an unregistered DPs does not provide the data requested by the TO. However, if unregistered DPs are having a material impact on the Reliability of the BPS, consideration should be given to adjusting the registration criteria for DPs. We additionally offer some suggested boldface edits to Requirement R2 to add additional clarity:

R2. Each Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]

2.1 For unregistered Inverter-based Resource (IBR) data, the responsible TO, whose transmission system these resources are connected, shall develop estimates of the aggregated unregistered IBRs including estimated modeling data. The TO shall also include with the data an explanation of the limitations of the aggregated data, as provided, and the methods used to develop their estimations.

2.2 For Distributed Energy Resource (DER) data the responsible DP shall develop estimates of the aggregated DER connected to their distribution systems including aggregated modeling data. The DP shall also include an explanation of the limitations of the aggregated data as provided and the methods used for their estimations.

2.3 For distribution systems that are interconnected to a responsible TO system, where no registered DP exists, the TO shall document all attempts to gather aggregate estimates of DER capacity from the unregistered DP.

2.3.1 If the TO is success in gathering aggregate estimates of DER capacity from the unregistered DP, the data shall be forwarded to the responsible PC and TP so they can assess if the DER capacity on the unregistered DP's distribution system represents a material impact on the BPS.

2.3.1.1 If the PC & TP determines a material impact exists, their findings shall be reported to the ERO for further actions.

2.3.1.2 If the PC & TP determine there is not a material impact, no further actions are required by the responsible TO, unless further actions are requested by the PC & TP.

2.3.2 If the TO is unsuccessful in gathering aggregate estimates of DER capacity from the unregistered DP, they are to report their inability to collect the required data to both the responsible PC and TP, who will report the issue to NERC for further actions.

Attachment 1 Concerns: EEI offers the following comments and suggested edits (in boldface) to Attachment 1 below:

Item 2 – It is unclear where large loads connected to transmission systems are accounted for in planning studies. While we agree that DPs are responsible for demand data on distribution systems, it is unclear where other demand data that the LSE previously reported is reported and accounted for in various modeling scenarios.

Item 9 – TOs are entirely dependent on responsible **registered** DPs and should therefore be removed from having direct responsibility for Aggregate DER data. Additionally, 9c should be edited (see boldface edit below) to better align with what DP are capable of collecting (i.e., aggregate DER data by storage types).

Dynamics Concerns

Item 5 - It is unclear where large loads connected to transmission systems are accounted for in planning studies. While we agree that DPs are responsible for demand data on distribution systems, it is unclear where other demand data that the LSE previously reported is reported and accounted for various modeling scenarios.

Item 7 – Item 7 should be made clear that TOs are only responsible for supplying Aggregate data for Unregistered IBR. To address our concerns, we offer the following boldface edits to Item 7:

7. Inverter-Based Resource **[GO, TO]**

a. Registered IBR capabilities related to momentary cessation, tripping, Ride-through, and frequency control **[GO]**

b. **Aggregated capability of non-registered IBRs connect to the BPS including estimates related to momentary cessation, tripping, Ride-through, and frequency control [TOs]**

Item 10 – TOs should be removed from Item 10 because they are not the appropriate entity to collect DER data on distribution systems. EEI also notes that UFLS only DPs were not identified as having responsibilities for providing aggregated DER data on their systems or DER impacts to UFLS system they have installed. To address our concerns, we offer the following boldface edits:

10. Aggregate Distributed Energy Resource (DER) data

a. **Estimates of aggregated** DER capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control or information that can be used to infer those capabilities for modeling purposes. **[DP, UFLS only DPs]**

b. **I**ndication whether DER**s is subject to tripping in conjunction with are part of any** UFLS or UVLS **schemes and provide estimates of the affected aggregated capacity on those schemes**. **[DP, UFLS only DPs]**

Footnote concerns

Footnote 1: EEI does not agree with Footnote 1. Data requirement obligations should be clearly specified within each sub-bullet of each column for both steady-state and dynamics to ensure responsible entities understand their roles.

Footnote 2: EEI suggests the following clarifying edits to footnote 2 in boldface:

For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 under Steady State Column that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. **A The** Distribution Provider is the **typical** responsible entity for providing this information, **generally** through coordination with the Transmission Owner.

Footnote 4: EEI does not agree that IBRs should be generically identified as storage devices. Instead, Battery Energy Storage System (BESS) should replace IBR in footnote 4. Note the following boldface edits:

This includes **IBR battery energy storage systems**, synchronous condensers, and pumped storage.

Footnote 5: Ambiguous terms like typical should not be included in NERC Reliability Standard. We additionally feel that it should be made clear the limits of TO responsibilities regarding unregistered IBRs.

The transmission owner is the **typical** responsible entity for collecting and providing **aggregate** data for unregistered IBRs that are not DERs **and directly connected to their portion of the BPS.**

Footnote 6: TO and DP have no ability to collect or provide aggregate data for DERs that are not connected directly to their system. If DER data is needed from unregistered DP to preserve the reliability of the BPS, then those entities should be registered. The following boldface edits have been provided to clarify what registered DP are capable of providing under MOD-032:

The Distribution Provider is the responsible entity for collecting and providing **aggregate** data for DER connected to **their distribution** system.

Response

Thank you for your comment. The drafting team received multiple comments expressing concern with the criteria for acceptable models being maintained as a separate document by the ERO. Concerns were raised with both the proposal to maintain the criteria according to a process separate from the standards development process, as well as with the proposed criteria themselves.

Consistent with multiple commenter suggestions, the drafting team incorporated elements for what constitutes an acceptable model into Requirement R1, relating to the requirements and specifications developed by the PC/TP, and has removed reference to a separately maintained ERO Criteria for Acceptable Models document.

In making these changes, the drafting team considered the comments, feedback received on previous drafts, and the FERC Order No. 901 directives. While FERC Order No. 901 directed NERC to “develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions” (P 108), the drafting team determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their interconnection-wide models and subsequently their planning cases.

The drafting team considered that many entities have a different understanding for what is a "generic model", and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The drafting team further considered that NERC, as the ERO does not presently maintain an "acceptable model library", but rather an "unacceptable model library", and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion. Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

To bookend these criteria for acceptable models, proposed Requirement R1 would also require the PC/TOP to include provisions specifying that any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The drafting team included this provision after considering feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The drafting team believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns.

The drafting team debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the drafting team ultimately decided to include this requirement in Requirement R1, addressing PC/TP data specification requirements, to create one self-contained requirement for data submissions.

The drafting team has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the drafting team has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. This process is moved in substantial part from the draft ERO Approved Criteria for Acceptable Models (chapter 1) included in the last posting to the Supporting Document to the draft MOD-032 standard. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be

considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for Reliability Standards compliance purposes.

As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the Reliability and Security Technical Committee. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations would then be considered by the ERO and published on the NERC website. NERC Staff is currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing.

In addition, multiple commenters submitted comments about the phrase "unregistered IBR" as it is used in proposed MOD-032 as well as other proposed Reliability Standards addressing the FERC Order No. 901 Milestone 3 directives. The drafting team has revised footnote 1 to more clearly refer to the resources that are intended to be captured in this phrase and provides the following additional explanation in response to the comments.

In summary, the phrase "unregistered IBR" has been revised to refer to IBRs that are not Distributed Energy Resources, as the drafting team proposes to define that term, and that would not meet the criteria in the NERC Rules of Procedure to register the owner of the IBR for the Generator Owner functional entity registration (as either category 1 or category 2). As suggested by commenters, the drafting team has removed the phrase "Bulk-Power System" from this description to remove any potential for ambiguity in application.

The drafting team has been advised that, as footnote 1 is explaining a phrase used in the requirement text, the footnote is properly used in the standard and is considered a mandatory and enforceable part of the standard.

The drafting team chose to use the phrase "unregistered IBR" in proposed MOD-032 to establish consistency with FERC Order No. 901, which used the shorthand phrases "registered IBR", "unregistered IBR", and "IBR-DER" to define the scope of its directives. Relevant to this discussion, Order No. 901 used the phrase "registered IBR" to refer to IBRs registered with NERC (or which would be registered pursuant to the Commission's directives in Registration of Inverter-based Resources, 181 FERC ¶ 61,124 (2022) and therefore, subject to the Reliability Standards, and the phrase "unregistered IBR" to refer to IBRs connected directly to the Bulk-Power System but not registered with NERC, and therefore, not subject to the Reliability Standards (i.e., unregistered IBRs).

It is important to note that Order No. 901 predated the changes NERC made to the Rules of Procedure to ensure that the owners and operators of such IBR resources would be registered with NERC for mandatory compliance purposes. NERC does not register IBRs as resources, but rather the owners of such resources based on the registry criteria for Generator Owner and Generator Operator. There are two categories of each: owners and operators of BES Facilities (category 1 GOs/GOPs); and owners and operators of non-BES inverter based generating resources that either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV (category 2 GOs/GOPs).

In Order No. 901 parlance, ownership or operation of IBR resources meeting these criteria would require owner/operator registration, and therefore would be considered "registered IBRs".

In Order No. 901 parlance, ownership or operation of IBR resources that do not meet these criteria, but are connected to a transmission system (i.e., are not Distributed Energy Resources), would not require owner/operator registration, and therefore would be considered "unregistered IBR."

The drafting team appreciates the suggested alternatives to the use of the Order No. 901 phrase "unregistered IBR" to describe the resources that are intended to be covered. It has considered establishing a defined Glossary term (Unregistered IBR), as well as explicitly defining in the above-the-text requirement language what is an unregistered IBR based on the NERC compliance registry criteria.

The drafting team believes that, with the revised clarification, there is no need to create an additional defined term for "unregistered IBR." Such a term is not likely to aid in understanding, as the definition would be defining the term in the negative relative to other defined terms (i.e., an IBR for which the owner/operator would not be required to register with NERC as a Generator Owner/Generator Operator).
The drafting team also determined that replacing the phrase "unregistered IBR" in the requirement text with a more detailed description of what is an "unregistered IBR" that draws from the GO/GOP registry criteria (e.g., "not an IBR BES Facility, not a non-BES inverter based generating resource that either has or contributes to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV, and not a DER") would lead to lengthier requirements that are less readable without providing additional clarity.

The drafting team believes that the revised footnote is clearer as to the scope of the IBR intended to be covered while maintaining readability.

Comment	
Attachment One's 7a and 10a are both concerning. While there are provisions for representing voltage and frequency protection settings in positive sequence simulations, "momentary cessation, tripping, and ride-through" are too open-ended, may not be able to be represented completely in positive sequence phasor domain simulations, and lack the clarity needed to be certain of compliance. AEP suggests the following be used instead: 7a. "In the absence of project specific data, include estimated, assumed, or typical voltage and frequency protection settings." 10a. "Include estimated, assumed, or typical aggregate voltage and frequency protection settings." AEP recommends that a MW threshold level be established for requiring unregistered IBRs. AEP suggests 10 MW and above or as otherwise determined by the PC and TP in R1. In addition, there should also be a threshold level for requiring aggregate DER (affecting steady-state	

items 2 and 9, dynamics items 5 and 10) so as not to be found non-compliant for trivial amounts. AEP suggests 5 percent or greater of a TO's or DP's peak load or as determined by the PC and TP in R1.

Response	
Thank you for your comment. Attachment 1 does not create obligations for entities to provide data, but specifies the data items that need to be covered by the PC/TP data reporting procedures and requirements. For DER, the aggregated nature means some level of estimate or assumption is inherent (just like load data). Requirement R2, Part 2.1 specifically allows estimations when the responsible entity as identified by the PC/TP is unable to gather unregistered IBR or DER data. The TR information about Inferring DER Capabilities and the new section on estimation speaks more clearly to that concept. The proposed footnote 7 is intended to allow the PC/TP to define DER thresholds for a local area if appropriate.	
Julie Hall - Entergy - 6	
Answer	No
Document Name	
Comment	
Entergy has concerns about relying on "estimation of modeling data and parameters" required by R2.1 and introducing unverified DER model information into planning models and demonstrating compliance based on those estimations. **Footnote 3 in Attachment 1 – requires DPs make assumptions about generation output of behind the meter DER facilities to provide a gross demand number. Entergy proposes that R2.1 DER data be modeled as an aggregate MW generation as a percentage of the feeder, substation transformer, or substation load. To optimize attaining meaningful results considering the proposed intense data demands set forth, Entergy recommends inclusion of a penetration threshold (ex: 20% of a substation gross load) for which these new modeling requirements become applicable.**

Response

Thank you for your comment. Given the FERC Order requirement to account for aggregate IBR-DER, the aggregate demand must be the gross value to avoid double counting the DER impact. Estimation options could include an aggregate capacity if no better information is available. Thresholds may be addressed by footnote 7.

Comment

TVA does not support the proposed revisions in MOD-032-2.

Regarding R1.2, the ERO Criteria for Acceptable Models does not have industry consensus and was not established through the standards process. TVA does not believe it should be referenced in a compliance standard. In its place, TVA recommends specifications for standard models (where appropriate and available), user-written models (where appropriate and with adequate documentation), and other models (when no alternative is available and requiring justification for use).
R2.1 asks entities that can't gather IBR/DER data to estimate the data. The model data that will be gathered with this provision is likely of low value and will potentially lead to more inaccurate models or models that have different issues. TVA does not believe the modeling responsibility for unregistered IBRs and aggregate DERs belongs with the TO and DP when that data, or lack there-of, must be estimated. Estimations of data without adequate information could negatively affect modeling. It is not uncommon for the TO and DP to lack visibility of unregistered IBRs and aggregate DERs. TVA recommends expanding the requirement to include “or justification on why unregistered IBR and/or aggregate DER was not modeled or estimated” to account for these circumstances.

Regarding Attachment 1 Dynamics 10.b, this data could be difficult to accurately model for situations where the DP will often reconfigure their systems and move DERs between feeders. TVA recommends removing 10.b.

Response

Thank you for your comment. The drafting team received multiple comments expressing concern with the criteria for acceptable models being maintained as a separate document by the ERO. Concerns were raised with both the proposal to maintain the criteria according to a process separate from the standards development process, as well as with the proposed criteria themselves.

Consistent with multiple commenter suggestions, the drafting team incorporated elements for what constitutes an acceptable model to Requirement R1, relating to the requirements and specifications developed by the PC/TP, and has removed reference to a separately maintained ERO Criteria for Acceptable Models document. Entities are not permitted to submit models listed on a separately maintained Unacceptable Models List without justification that supports their use.

In making these changes, the drafting team considered the comments, feedback received on previous drafts, and the FERC Order No. 901 directives. While FERC Order No. 901 directed NERC to "develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions" (P 108), the drafting team determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their interconnection-wide models and subsequently their planning cases.

The drafting team considered that many entities have a different understanding for what is a "generic model", and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The drafting team further considered that NERC, as the ERO, does not presently maintain an "acceptable model library", but rather an "unacceptable model library", and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion.

Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

To bookend these criteria for acceptable models, proposed Requirement R1 would also require the PC/TOP to include provisions specifying that any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The drafting team included this provision after considering feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The drafting team believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns.

The drafting team debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the drafting team ultimately decided to include this requirement in Requirement R1, addressing PC/TP data specification requirements, to create one self-contained requirement for data submissions.

The drafting team has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the drafting team has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. This process is moved in substantial part from the draft ERO Approved Criteria for Acceptable Models (chapter 1) included in the last posting to the Attachment 2 in the draft MOD-032 standard. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for Reliability Standards compliance purposes.

As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the RSTC. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations would then be considered by the ERO and published on the NERC website. NERC staff is currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing.

In addition, Representing the impact of UVLS and UFLS on DER (i.e., tripping DER along with the load that is tripped) is essential to designing effective UVLS and UFLS programs. Further details are included in the published Reliability Guideline and White Paper that are referenced in the Technical Rationale. If this item is excluded from MOD-032, industry will eventually need to grapple with modifying processes for gathering DER data to address this issue (a draft SAR to modify PRC-006 to address DER impacts on UFLS program design is being considered under the RSTC and points to addressing this issue if not addressed under Project 2022-02). The DT believes that establishing processes for developing and collecting this information in conjunction with other DER data under MOD-032 is the most efficient approach.	
Adrian Andreoiu - BC Hydro and Power Authority - 1, Group Name BC Hydro	
Answer	No
Document Name	
Comment	
BC Hydro appreciates the drafting team's efforts and opportunity to review, and offers the following comments and suggestions. Requirement R1 references the ERO-maintained Approved Criteria for Acceptable Models document. This document is not part of the Standard and may pose compliance challenges if updated outside of the Standard Development Process. The process to maintain the list of models (e.g. Unacceptable Model List) relies on NERC's determination on what would constitute an acceptable change implementation timeline, i.e. effective date. For example, if the ERO added an existing data model to the List of Unacceptable Models in the ERO-maintained document without accounting for an adequate implementation timeline, entities may be in noncompliance on the effective date of the revised ERO document even though Standard had not been revised. BC Hydro recommends that this document be included in the Standard, or otherwise provide for a change management process aligned with the Standard Development Procedures.

Response	

Thank you for your comment. The drafting team received multiple comments expressing concern with the criteria for acceptable models being maintained as a separate document by the ERO. Concerns were raised with both the proposal to maintain the criteria according to a process separate from the standards development process, as well as with the proposed criteria themselves.

Consistent with multiple commenter suggestions, the drafting team incorporated elements for what constitutes an acceptable model to Requirement R1, relating to the requirements and specifications developed by the PC/TP, and has removed reference to a separately maintained ERO Criteria for Acceptable Models document. Entities are not permitted to submit models listed on a separately maintained Unacceptable Models List without justification that supports their use.

In making these changes, the drafting team considered the comments, feedback received on previous drafts, and the FERC Order No. 901 directives. While FERC Order No. 901 directed NERC to "develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions" (P 108), the drafting team determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their interconnection-wide models and subsequently their planning cases.

The drafting team considered that many entities have a different understanding for what is a "generic model", and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The drafting team further considered that NERC, as the ERO, does not presently maintain an "acceptable model library", but rather an "unacceptable model library", and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion. Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

To bookend these criteria for acceptable models, proposed Requirement R1 would also require the PC/TOP to include provisions specifying that any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The drafting team included this provision after considering feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The drafting team believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among

generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns.

The drafting team debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the drafting team ultimately decided to include this requirement in Requirement R1, addressing PC/TP data specification requirements, to create one self-contained requirement for data submissions.

The drafting team has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the drafting team has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. This process is moved in substantial part from the draft ERO Approved Criteria for Acceptable Models (chapter 1) included in the last posting to the Attachment 2 in the draft MOD-032 standard. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for Reliability Standards compliance purposes.

As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the Reliability and Security Technical Committee. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations would then be considered by the ERO and published on the NERC website. NERC staff is currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing.

Comment	

While the modifications are an improvement there are still areas that need to be addressed. For example, assigning the DP the burden to provide data on behalf of not registered DER's will add compliance obligations and will not provide the accurate data needed for an improved system model. A better approach is to provide a mechanism for the unregistered DER"s to become registered and therefore subjected to the same compliance obligations as registered DER's.

Thank you for your comment. FERC Order No. 901 P 102 "directs NERC to submit to the Commission for approval one or more new or modified Reliability Standards that require: (1) transmission owners to provide to Bulk-Power System planners and operators modeling data and parameters for unregistered IBRs in their transmission owner areas that, individually or in the aggregate, materially affect the reliable operation of the Bulk-Power System and (2) distribution providers to provide to Bulk-Power System planners and operators modeling data and parameters for IBR-DERs in the aggregate in their distribution provider areas where the IBR-DERs in the aggregate materially affect the reliable operation of the Bulk-Power System." In addition, FERC Order P157and P161 identify a responsible entity for DER data in cases where there is no registered DP. P157 states: "We believe the development of new or modified Reliability Standards is an important corollary to NERC's ongoing effort to identify and register generator owners and operators of IBRs. Although NERC's registration changes will not at this time address IBR-DERs that in the aggregate have a material impact on the Bulk-Power System, we believe APS's concerns regarding system-wide model validation is addressed in NERC's Reliability Guidelines[1] and through the use of the EPRI DER Settings Database. We recognize that some distribution providers may not be able to provide a precise set of modeling data and parameters that accurately represent IBR-DERs in the aggregate. For these situations, NERC has provided a technical means to estimate in aggregate the needed IBR-DER modeling data and parameters (i.e., for the DER_A model) in the IBR-DER Data Collection Guideline.[2] Further, NERC's 2021 Aggregate DER Model Verification Guideline provides transmission planners and planning coordinators with tools and techniques that can be adapted for their specific systems to verify that aggregate DER models (i.e. DER_A models) are a suitable representation of these resources in planning	

[1] *See generally* IBR-DER Data Collection Guideline; Aggregate DER Model Verification Guideline.

[2] *See generally* IBR-DER Data Collection Guideline.

assessments.[3] Furthermore, for those areas with IBR-DERs in the aggregate that materially impact the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we modify the NOPR proposal to direct NERC to determine the appropriate registered entity responsible for the data and parameters of IBR-DERs in the aggregate and to establish a process that requires identified registered entities to coordinate, validate, and keep up to date the system models." And P161 states: "Pursuant to section 215(d)(5) of the FPA, we modify the NOPR proposal to provide additional specificity to explain coordination and keep up to date in a timely manner the verified data and models of registered IBRs, unregistered IBRs, and IBR-DERs in the aggregate in the system models.[4] Specifically, we direct NERC to develop new or modified Reliability Standards that require planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities to establish for each interconnection a uniform framework with modeling criteria, a registered modeling designee, and necessary data exchange requirements both between themselves and with the generator owners, transmission owners, and distribution providers to coordinate the creation of transmission planning, operations, and interconnection-wide models (i.e., system models) and the validation of each respective system model. Further, we direct NERC to include in the new or modified Reliability Standards a requirement for generator owners, transmission owners, and distribution providers to regularly update and communicate the verified data and models of registered IBRs, unregistered IBRs, and IBR-DERs by comparing their resulting models against actual operational behavior to achieve and maintain necessary modeling accuracy for inclusion of these resources in the system models. For those areas with IBR-DERs in the aggregate that have a material impact on the reliable operation of the Bulk-Power System but do not have an associated registered distribution provider, we modify the NOPR proposal to direct NERC to determine the appropriate registered entity responsible for the models of those IBR-DERs and to determine the registered entities responsible for updating, verifying, and coordinating models for IBR-DERs in the aggregate to meet the system models directives. NERC may implement this directive by modifying Reliability Standards MOD-032-1 and MOD-033-2 or by developing new Reliability Standards to establish requirements mandating an annual[5] process to coordinate, validate, and keep up-to-date the transmission planning, operations, and interconnection-wide models." As discussed in the TR, modifying NERC registration criteria is not a feasible option for addressing FERC 901 directives within the required timelines. Attachment 1 does not create obligations for entities to provide data but specifies that data items that need to be covered by the PC/TP data reporting procedures and requirements. Thus, DT proposal allows the PC/TP flexibility to identify the best responsible entity for their area (though

Under R1 the ERO-maintained Criteria for Acceptable Models is referenced. This document was not developed under the standard process and therefore does not have industry consensus. Tri-State is concerned that changes to this document outside of the standard could pose a potential problem.

Thank you for your comment. The drafting team received multiple comments expressing concern with the criteria for acceptable models being maintained as a separate document by the ERO. Concerns were raised with both the proposal to maintain the criteria according to a process separate from the standards development process, as well as with the proposed criteria themselves. Consistent with multiple commenter suggestions, the drafting team incorporated elements for what constitutes an acceptable model to Requirement R1, relating to the requirements and specifications developed by the PC/TP, and has removed reference to a separately maintained ERO Criteria for Acceptable Models document. Entities are not permitted to submit models listed on a separately maintained Unacceptable Models List without justification that supports their use. In making these changes, the drafting team considered the comments, feedback received on previous drafts, and the FERC Order No. 901 directives. While FERC Order No. 901 directed NERC to “develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions” (P 108), the drafting team determined to pursue an equally effective and efficient method for addressing what it believes is the overarching	

goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their interconnection-wide models and subsequently their planning cases.

The drafting team considered that many entities have a different understanding for what is a "generic model", and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The drafting team further considered that NERC, as the ERO, does not presently maintain an "acceptable model library", but rather an "unacceptable model library", and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion. Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

To bookend these criteria for acceptable models, proposed Requirement R1 would also require the PC/TOP to include provisions specifying that any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The drafting team included this provision after considering feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The drafting team believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns.

The drafting team debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the drafting team ultimately decided to include this requirement in Requirement R1, addressing PC/TP data specification requirements, to create one self-contained requirement for data submissions.

The drafting team has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the drafting team has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. This process is moved in substantial part from

the draft ERO Approved Criteria for Acceptable Models (chapter 1) included in the last posting to the Supporting Document to the draft MOD-032 standard. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for Reliability Standards compliance purposes. As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the RSTC. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations would then be considered by the ERO and published on the NERC website. NERC staff is currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing.

Black Hills Corporation agrees with EEI's comments regarding the modifications to MOD-032-2. The first issue of concern being the use of the external document "ERO Approved Criteria for Acceptable Models" to establish enforceable compliance requirements. We agree with EEI's suggestion that this be put back into the standard itself as part of Attachment 1. Black Hills Corporation also agrees with the EEI's conclusion that Section R2 places inappropriate burdens on the TO to gather information on installations they may have had no part in interconnecting and have no ability to compel those entities to provide information. We agree with their modifications to this section as well as attachment 1 that clarify which entities should typically be responsible for collecting data on these devices.

Thank you for your comment. Multiple commenters submitted comments about the phrase "unregistered IBR" as it used in proposed MOD-032 as well as other proposed Reliability Standards addressing the FERC Order No. 901 Milestone 3 directives. The drafting team has revised footnote 1 to more clearly refer to the resources that are intended to be captured in this phrase and provides the following additional explanation in response to the comments. In summary, the phrase "unregistered IBR" has been revised to refer to IBRs that are not Distributed Energy Resources, as the drafting team proposes to define that term, and that would not meet the criteria in the NERC Rules of Procedure to register the owner of the IBR for the Generator Owner functional entity registration (as either category 1 or category 2). As suggested by commenters, the drafting team has removed the phrase "Bulk-Power System" from this description to remove any potential for ambiguity in application.	

The drafting team has been advised that, as footnote 1 is explaining a phrase used in the requirement text, the footnote is properly used in the standard and is considered a mandatory and enforceable part of the standard.

The drafting team chose to use the phrase "unregistered IBR" in proposed MOD-032 to establish consistency with FERC Order No. 901, which used the shorthand phrases "registered IBR", "unregistered IBR", and "IBR-DER" to define the scope of its directives.
Relevant to this discussion, Order No. 901 used the phrase "registered IBR" to refer to IBRs registered with NERC (or which would be registered pursuant to the Commission's directives in Registration of Inverter-based Resources, 181 FERC ¶ 61,124 (2022) and therefore subject to the Reliability Standards, and the phrase "unregistered IBR" to refer to IBRs connected directly to the Bulk-Power System but not registered with NERC and therefore not subject to the Reliability Standards (i.e., unregistered IBRs).

It is important to note that Order No. 901 predated the changes NERC made to the Rules of Procedure to ensure that the owners and operators of such IBR resources would be registered with NERC for mandatory compliance purposes. NERC does not register IBRs as resources, but rather the owners of such resources based on the registry criteria for Generator Owner and Generator Operator. There are two categories of each: owners and operators of BES Facilities (category 1 GOs/GOPs); and owners and operators of non-BES inverter based generating resources that either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV (category 2 GOs/GOPs).

In Order No. 901 parlance, ownership or operation of IBR resources meeting these criteria would require owner/operator registration, and therefore would be considered "registered IBRs".

In Order No. 901 parlance, ownership or operation of IBR resources that do not meet these criteria but are connected to a transmission system (i.e., are not Distributed Energy Resources) would not require owner/operator registration, and therefore would be considered "unregistered IBR."

The drafting team appreciates the suggested alternatives to the use of the Order No. 901 phrase "unregistered IBR" to describe the resources that are intended to be covered. It has considered establishing a defined Glossary term (Unregistered IBR), as well as explicitly defining in the above-the-text requirement language what is an unregistered IBR based on the NERC compliance registry criteria.

The drafting team believes that, with the revised clarification, there is no need to create an additional defined term for "unregistered IBR." Such a term is not likely to aid in understanding, as the definition would be defining the term in the negative relative to other defined terms (i.e., an IBR for which the owner/operator would not be required to register with NERC as a Generator Owner/Generator Operator). The drafting team also determined that replacing the phrase "unregistered IBR" in the requirement text with a more detailed description of what is an "unregistered IBR" that draws from the GO/GOP registry criteria (e.g., "not an IBR BES Facility, not a non-BES inverter based generating resource that either has or contributes to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV, and not a DER") would lead to lengthier requirements that are less readable without providing additional clarity. The drafting team believes that the revised footnote is clearer as to the scope of the IBR intended to be covered while maintaining readability.

(1) The proposed MOD-032-2 modifications do not to address the FERC Order 901 directive on P78 and P161 regarding that the submitted model(s) should accurately reflect the IBR behaviors. The standard should explicitly require that submitted models be verified and validated to ensure they accurately reflect IBR behaviors, aligning with MOD-026 (ensuring that the approved industry IBR models that accurately reflect the behavior of all IBRs).

(2) The standard should also include a requirement to address data for DERs where there is no associated registered Distribution Provider (DP), rather than relying solely on a footnote. There is disagreement regarding the enforceability of footnotes, which may leave certain entities vulnerable.

(3) P141 direct NERC to require the generator owners of registered IBRs and the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g., planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of registered and unregistered IBRs. Models created in MOD-032-2 must be provided to Transmission Operators to be utilized for Operations Planning and Real-time Assessments.

Response

Thank you for your comment.

(1) Milestone 3 has been split into three separate projects. Project 2022-02 focuses on MOD-032, which is the uniform framework, Project 2020-06 focuses on the validation and verification of models, and 2021-01 focuses on the system level performance. Some of the FERC directives, while one paragraph, have been split into two projects. The validated and verified directive will be addressed by the 2020-06 MOD-026 drafting team.

(2) Attachment 1 does not create obligations for entities to provide data, but specifies the data items that need to be covered by the PC/TP data reporting procedures and requirements. This includes DER data for situations described in the footnote where there is no registered DP (and NERC has always been very clear the footnotes are part of the standards and fully enforceable). The DT proposal allows the PC/TP flexibility to identify the best responsible entity for their area. R2.1 specifically allows estimations when the responsible entity as identified by the PC/TP is unable to gather DER data.

(3) Provision of models consistent with the uniform model framework to Transmission Operators to be utilized for Operations Planning and Real-time Assessments is addressed by the proposed modifications to IRO-010 and TOP-003.

AZPS supports the following comments submitted by EEI on behalf of its members:	

Requirement 2

EEI does not support Requirement R2, Part 2.1 because this requirement places inappropriate compliance burdens on the TO that they have no practical method of fulfilling without the support of unregistered DPs. Moreover, the TOs played no part in interconnecting the DERs on unregistered DP systems, nor do they have any ability to compel those entities to provide the information needed. While EEI does not dispute that information from these unregistered entities may be needed and could impact BPS reliability, we do not agree that the answer is to place this compliance burden on TOs. Guidance could be developed to clarify exactly what must be provided by the TO, including the basis for DER estimates whenever an unregistered DPs does not provide the data requested by the TO. However, if unregistered DPs are having a material impact on the Reliability of the BPS, consideration should be given to adjusting the registration criteria for DPs. We additionally offer some suggested changes (clean version) to Requirement R2 to add additional clarity:

R2. Each Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1 For unregistered Inverter-based Resource (IBR) data, the responsible TO, whose transmission system these resources are connected, shall develop estimates of the aggregated unregistered IBRs including estimated modeling data. The TO shall also include with the data an explanation of the limitations of the aggregated data, as provided, and the methods used to develop their estimations.

2.2 For Distributed Energy Resource (DER) data the responsible DP shall develop estimates of the aggregated DER connected to their distribution systems including aggregated modeling data. The DP shall also include an explanation of the limitations of the aggregated data as provided and the methods used for their estimations.

2.3 For distribution systems that are interconnected to a responsible TO system, where no registered DP exists, the TO shall document all attempts to gather aggregate estimates of DER capacity from the unregistered DP.

2.3.1 If the TO is success in gathering aggregate estimates of DER capacity from the unregistered DP, the data shall be forwarded to the responsible PC and TP so they can assess if the DER capacity on the unregistered DP's distribution system represents a material impact on the BPS.

2.3.1.1 If the PC & TP determines a material impact exists, their findings shall be reported to the ERO for further actions.

2.3.1.2 If the PC & TP determine there is not a material impact, no further actions are required by the responsible TO, unless further actions are requested by the PC & TP.

2.3.2 If the TO is unsuccessful in gathering aggregate estimates of DER capacity from the unregistered DP, they are to report their inability to collect the required data to both the responsible PC and TP, who will report the issue to NERC for further actions.

Attachment 1 Concerns:

EEI offers the following comments and edits (clean version) to Attachment 1 below:

Item 2 – It is unclear where large loads connected to transmission systems are accounted for in planning studies. While we agree that DPs are responsible for demand data on distribution systems, it is unclear where other demand data that the LSE previously reported is reported and accounted for in various modeling scenarios.

Item 9 – TOs are entirely dependent on responsible registered DPs and should therefore be removed from having direct responsibility for Aggregate DER data. Additionally, 9c should be deleted to better align with what DPs are capable of collecting (i.e., aggregate DER data by storage types).

Dynamics Concerns:

Item 5 - It is unclear where large loads connected to transmission systems are accounted for in planning studies. While we agree that DPs are responsible for demand data on distribution systems, it is unclear where other demand data that the LSE previously reported is reported and accounted for various modeling scenarios.

Item 7 – Item 7 should be made clear that TOs are only responsible for supplying Aggregate data for Unregistered IBR. To address our concerns, we offer the following changes (clean format):

7. Inverter-Based Resource

a. Registered IBR capabilities related to momentary cessation, tripping, Ride-through, and frequency control [GO]

b. Aggregated capability of non-registered IBRs connect to the BPS including estimates related to momentary cessation, tripping, Ride-through, and frequency control [TOs]

Item 10 – TOs should be removed from Item 10 because they are not the appropriate entity to collect DER data on distribution systems. EEI also notes that UFLS only DPs were not identified as having responsibilities for providing aggregated DER data on their systems or DER impacts to UFLS system they have installed. To address our concerns, we offer the following changes (clean version):

10. Aggregate Distributed Energy Resource (DER) data

a. Estimates of aggregated DER capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control or information that can be used to infer those capabilities for modeling purposes. [DP, UFLS only DPs]

b. Indication whether DERs are part of any UFLS or UVLS schemes and provide estimates of the affected aggregated capacity on those schemes. [DP, UFLS only DPs]

Footnote concerns:

Footnote 1: EEI does not agree with Footnote 1. Data requirement obligations should be clearly specified within each sub-bullet of each column for both steady-state and dynamics to ensure responsible entities understand their roles.

Footnote 2: EEI suggests the following change to footnote 2 (clean version):

For purposes of this item, aggregate Demand is the gross Demand aggregated at each bus under item 1 under Steady State Column that is identified by a Transmission Owner as a load serving bus rather than the net Demand that incorporates offsets due to output from Distributed Energy Resources. The Distribution Provider is the responsible entity for providing this information, through coordination with the Transmission Owner.

Footnote 4: EEI does not agree that IBRs should be generically identified as storage devices. Instead, Battery Energy Storage System (BESS) should replace IBR in footnote 4 as changed below (clean version):

This includes battery energy storage systems, synchronous condensers, and pumped storage.

Footnote 5: Ambiguous terms like typical should not be included in NERC Reliability Standard. We additionally feel that it should be made clear the limits of TO responsibilities regarding unregistered IBRs as changed below (clean version).

The transmission owner is the responsible entity for collecting and providing aggregate data for unregistered IBRs that are not DERs and directly connected to their portion of the BPS.

Footnote 6: TO and DP have no ability to collect or provide aggregate data for DERs that are not connected directly to their system. If DER data is needed from unregistered DPs to preserve the reliability of the BPS, then those entities should be registered. The following change (clean version) has been provided to clarify what registered DPs are capable of providing under MOD-032:

The Distribution Provider is the responsible entity for collecting and providing aggregate data for DER connected to their distribution system.

We do not agree with R2.1; estimating parameters is not something we feel is appropriate. If additional data is needed, then it should be required for those GO/GOP entities to submit it to the applicable authority.

Thank you for your comment. FERC Order No. 901 P104 states "Recognizing that there may be instances in which transmission owners are unable to gather adequate unregistered IBR modeling data and parameters to create and maintain unregistered IBR models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation." Please see the updated TR, which provides some examples of methods on how to complete estimations with little data or no data. While the team understands the importance of accuracy, it is important to have an allowance for estimation when data is not available.

· The proposed MOD-032-2 modifications do not to address the FERC Order 901 directive on P78 and P161 regarding that the submitted model(s) should accurately reflect the IBR behaviors. The standard should explicitly require that submitted models be verified and validated to ensure they accurately reflect IBR behaviors, aligning with MOD-026 (ensuring that the approved industry IBR models that accurately reflect the behavior of all IBRs).

· The standard should also include a requirement to address data for DERs where there is no associated registered Distribution Provider (DP), rather than relying solely on a footnote. There is disagreement regarding the enforceability of footnotes, which may leave certain entities vulnerable.

· P141 direct NERC to require the generator owners of registered IBRs and the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g., planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of registered and unregistered IBRs. Models created in MOD-032-2 must be provided to Transmission Operators to be utilized for Operations Planning and Real-time Assessments.

Response

Thank you for your comment.

Milestone 3 has been split into three separate projects. Project 2022-02 focuses on MOD-032, which is the uniform framework, Project 2020-06 focuses on the validation and verification of models, and 2021-01 focuses on the system level performance. Some of the FERC directives, while one paragraph, have been split into two projects. The validated and verified directive will be addressed by the 2020-06 MOD-026 drafting team.

Attachment 1 does not create obligations for entities to provide data, but specifies the data items that need to be covered by the PC/TP data reporting procedures and requirements. This includes DER data for situations described in the footnote where there is no registered DP (and NERC has always been very clear the footnotes are part of the standards and fully enforceable). The DT proposal allows the PC/TP flexibility to identify the best responsible entity for their area. R2.1 specifically allows estimations when the responsible entity as identified by the PC/TP is unable to gather DER data.

Provision of models consistent with the uniform model framework to Transmission Operators to be utilized for Operations Planning and Real-time Assessments is addressed by the proposed modifications to IRO-010 and TOP-003.

The drafting team received multiple comments expressing concern with the criteria for acceptable models being maintained as a separate document by the ERO. Concerns were raised with both the proposal to maintain the criteria according to a process separate from the standards development process, as well as with the proposed criteria themselves.

Consistent with multiple commenter suggestions, the drafting team incorporated elements for what constitutes an acceptable model to Requirement R1, relating to the requirements and specifications developed by the PC/TP, and has removed reference to a separately maintained ERO Criteria for Acceptable Models document. Entities are not permitted to submit models listed on a separately maintained Unacceptable Models List without justification that supports their use.

In making these changes, the drafting team considered the comments, feedback received on previous drafts, and the FERC Order No. 901 directives. While FERC Order No. 901 directed NERC to “develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions” (P 108), the drafting team determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their interconnection-wide models and subsequently their planning cases.

The drafting team considered that many entities have a different understanding for what is a “generic model”, and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The drafting team further considered that NERC, as the ERO, does not presently maintain an “acceptable model library”, but rather an “unacceptable model library”, and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion.

Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

To bookend these criteria for acceptable models, proposed Requirement R1 would also require the PC/TOP to include provisions specifying that any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The drafting team included this provision after considering feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The drafting team believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns.

The drafting team debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the drafting team ultimately decided to include this requirement in Requirement R1, addressing PC/TP data specification requirements, to create one self-contained requirement for data submissions.

The drafting team has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the drafting team has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. This process is moved in substantial part from the draft ERO Approved Criteria for Acceptable Models (chapter 1) included in the last posting to the Supporting Document to the draft MOD-032 standard. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for Reliability Standards compliance purposes.

As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the RSTC. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations

would then be considered by the ERO and published on the NERC website. NERC staff is currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing.

CenterPoint Energy Houston Electric, LLC (CEHE) does not support the proposed revisions in MOD-032-2, specifically, R2.1. CEHE believes the Transmission Owner (TO) is not the appropriate registered entity to be responsible for providing estimations of unregistered load.

Response	
Thank you for your comment. The DT is addressing FERC Order 901 that directives "Recognizing that there may be instances in which transmission owners are unable to gather adequate unregistered IBR modeling data and parameters to create and maintain unregistered IBR models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation. We believe that this directive appropriately balances commenters' concerns about data accessibility and burden with the established need for transmission owners to provide unregistered IBR modeling data and parameters to Bulk-Power System planners and operators in their transmission owner area. We recognize that estimated modeling data and parameters are approximations of actual modeling data and parameters. We further acknowledge that there is some degree of error in estimated modeling data and parameters. However, on balance we believe that requiring such estimates with explanation of any limitations is an improvement from not having any data at all; and that even estimates will increase the overall adequacy of models and improve the	

reliability of the Bulk-Power System. To support this data collection, we further direct NERC to consider commenters suggestions to implement a process or mechanism by which transmission owners would receive modeling data and parameters."

Attachment 1 does not create obligations for entities to provide data but specifies that data items that need to be covered by the PC/TP data reporting procedures and requirements (and typical functional entities for providing such data). Thus, the DT proposal allows the PC/TP flexibility to identify the best responsible entity for their area rather than mandating a specific functional entity to provide data across the continent. R2.1 specifically allows estimations when the responsible entity as identified by the PC/TP is unable to gather DER data.

EEI does not agree that enforceable Reliability Standards should be reliant on external documents such as the document titled "ERO Approved Criteria for Acceptable Models" (FERC Order 901, P 125) for the establishment of enforceable and auditable compliance requirements. Moreover, the Commission directed NERC "to develop **new or modified Reliability Standards that require planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities to establish** for each interconnection a uniform framework with modeling criteria" (emphasis added; FERC Order 901, P161). To better align with FERC Order 901, we offer the following comments and suggested edits in boldface below:

Requirement R1

Our edits are limited to part 1.2 in boldface below:

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1 The data listed in Attachment 1, including the responsible entity for each required item.

1.2 Specifications for the following items for dynamic models submitted in accordance with Attachment 1:

1.2.1 A list of unacceptable models1 which are not to be submitted unless there is no alternative model available;

1.2.2 Required submission of standard library model types provided with the software(s) utilized to create the interconnection-wide case(s), or a technical justification for the submission and use of user-written models if such models are permitted.

1.2.3 Criteria for any submitted user-written models including, at a minimum, documentation, and performance criteria to minimize the risk of non-convergence and other issues. The PC's user-written model criteria must be made available to all other TP/PCs within the Interconnection for review and comment, and approval where the usage of the user-written model represents a shared impact.

1.3 Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.3.1 Data format;

1.3.2 Level of detail to which equipment shall be modeled;

1.3.3 Case types or scenarios to be modeled; and

1.3.4 A schedule for submission of data at least once every 13 calendar months.

1.4 Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

Footnote 1: For example, the Unacceptable Model List included in NERC's Dynamic Modeling Recommendations and/or other lists maintained by the entities responsible for creating interconnection-wide base cases.

Requirement R2

EEI does not support Requirement R2, part 2.1 because this requirement places compliance obligations on the TO that they have no practical method of fulfilling without the support of the unregistered DPs. Moreover, the TOs played no part in interconnecting the DERs on unregistered DP systems, nor do they have any ability to compel those entities to provide the information needed. While it is unclear how DER data from unregistered entities might impact BPS reliability, TO will be limited in their ability to fulfill their compliance obligations without the direct assistance and participation for unregistered DPs. To address this concern, guidance could be developed to clarify exactly what must be provided by the TO, including the basis for DER estimates whenever an unregistered DP does not provide the data requested by

the TO. However, if unregistered DPs are having a material impact on the Reliability of the BPS, consideration should be given to adjusting the registration criteria for DPs. We additionally offer some suggested boldface edits to Requirement R2 to add additional clarity:

R2. Each Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1 For unregistered Inverter-based Resource (IBR) data, the responsible TO, whose transmission system these resources are connected, shall develop estimates of the aggregated unregistered IBRs including estimated modeling data. The TO shall also include with the data an explanation of the limitations of the aggregated data, as provided, and the methods used to develop their estimations.

2.2 For Distributed Energy Resource (DER), the responsible registered DP, whose distribution system these resources are connected, shall develop estimates of the aggregated unregistered DERs including estimated modeling data. The DP shall also include with the data an explanation of the limitations of the aggregated data, as provided, and the methods used to develop their estimations. Upon completion, the data shall be sent to the responsible TO for collection and distribution to the responsible PC/TP.

2.3 For unregistered DPs the TO shall request DER data consistent with 2.2.

2.3.1 Where no data is provided by the unregistered DP, the TO shall develop an estimate of the DERs connected to the unregistered DP system. The TO shall also develop an explanation of the limitations of the aggregated data provided and the methods used for their estimations for distribution to the responsible PC/TP.

Attachment 1 Concerns: EEI offers the following comments and suggested edits (in boldface) to Attachment 1 below:

Item 2 – EEI requests clarification whether DPs are a suitable replacement for the LSE. While we agree that DPs are fully capable of providing demand data on distribution systems, they have no ability to provide load data on transmission systems.

Item 9 – EEI is of the opinion that 9c should be deleted because we do not agree that DER data by type is needed by the PC/TP. Additionally, given TOs can only supply DER rough estimate of aggregate DERs on unregistered systems, they have no ability to distinguish DERs by type.

Dynamics Concerns

Item 5 - EEI requests clarification whether DPs are a suitable replacement for the LSE. While we agree that DPs are fully capable of providing demand data on distribution systems, they have no ability to provide load data on transmission systems.

Item 7 – Item 7 should be made clear that TOs are only responsible for supplying Aggregate data for Unregistered IBR. To address our concerns, we offer the following boldface edits to Item 7:

7. Inverter-Based Resource

a. Registered IBR capabilities related to momentary cessation, tripping, Ride-through, and frequency control **[GO]**

b. **Aggregated capability of non-registered IBRs connect to the BPS including estimates related to momentary cessation, tripping, Ride-through, and frequency control [TOs]**

Item 10 –EEI suggests clarifying TOs are only responsible for Aggregated DER data when there is no registered DP and they have no ability to assess UFLS impact from DERs unless provided by the unregistered DP. Additionally, UFLS only DPs should be added to Item 10

10. Aggregate Distributed Energy Resource (DER) data

a. **Estimates of aggregated** DER capabilities related to momentary cessation, tripping, Ride-through, voltage control, and frequency control or information that can be used to infer those capabilities for modeling purposes. **[DP, UFLS only DPs, TO (for non-registered DPs)]**

b. **I**ndication whether DER**s are part of any** UFLS or UVLS **schemes and provide estimates of the affected aggregated capacity on those schemes**. **[DP, UFLS only DPs]**

Footnote concerns

Footnote 1: EEI does not agree with Footnote 1. Data requirement obligations should be clearly specified within each sub-bullet of each column for both steady-state and dynamics to ensure responsible entities understand their roles.

Footnote 4: EEI does not agree that IBRs should be generically identified as storage devices. Instead, Battery Energy Storage System (BESS) should replace IBR in footnote 4. Note the following boldface edits:

This includes **battery energy storage systems**, synchronous condensers, and pumped storage.

Footnote 5: Ambiguous terms like typical should not be included in NERC Reliability Standard. We additionally feel that it should be made clear the limits of TO responsibilities regarding unregistered IBRs.

The transmission owner is the responsible entity for collecting and providing **aggregate** data for unregistered IBRs that are not DERs **and directly connected to their portion of the BPS.**

Footnote 6: TO and DP have no ability to collect aggregate data for DERs that are not connected directly to their system. Where DER data is needed from unregistered DPs to preserve the reliability of the BPS, then the TO should provide an estimate of the DERs connected to the unregistered DP system based on information provided by the unregistered DP or consistent with aggregated DER levels provided by other DPs connected to their system. The following boldface edits have been provided to clarify what TO are capable of providing under MOD-032:

The Distribution Provider is the responsible entity for collecting and providing **aggregate** data for DER connected to **their distribution** system. **Where no registered DP exists, the TO shall develop estimates on aggregated DER levels based on information obtained from the unregistered DP or consistent with DER levels provided by other DPs connected to their system.**

Response

Thank you for your comment. Please see the DTs updated edits to MOD-032-2.

The drafting team received multiple comments expressing concern with the criteria for acceptable models being maintained as a separate document by the ERO. Concerns were raised with both the proposal to maintain the criteria according to a process separate from the standards development process, as well as with the proposed criteria themselves.

Consistent with multiple commenter suggestions, the drafting team incorporated elements for what constitutes an acceptable model to Requirement R1, relating to the requirements and specifications developed by the PC/TP, and has removed reference to a separately maintained ERO Criteria for Acceptable Models document. Entities are not permitted to submit models listed on a separately maintained Unacceptable Models List without justification that supports their use.

In making these changes, the drafting team considered the comments, feedback received on previous drafts, and the FERC Order No. 901 directives. While FERC Order No. 901 directed NERC to "develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions" (P 108), the drafting team determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their interconnection-wide models and subsequently their planning cases.

The drafting team considered that many entities have a different understanding for what is a "generic model", and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The drafting team further considered that NERC as the ERO does not presently maintain an "acceptable model library", but rather an "unacceptable model library", and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion.

Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

To bookend these criteria for acceptable models, proposed Requirement R1 would also require the PC/TOP to include provisions specifying that any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The drafting team included this provision after considering feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The drafting team believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns.

The drafting team debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the drafting team ultimately decided to include

this requirement in Requirement R1, addressing PC/TP data specification requirements, to create one self-contained requirement for data submissions. The drafting team has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the drafting team has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. This process is moved in substantial part from the draft ERO Approved Criteria for Acceptable Models (chapter 1) included in the last posting to the Supporting Document to the draft MOD-032 standard. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for Reliability Standards compliance purposes. As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the RSTC. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations would then be considered by the ERO and published on the NERC website. NERC staff is currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing.

No. *Reliability Standards to Address Inverter-Based Res.,* Order No. 901, 185 FERC ¶ 61,042 (2023) ("Order 901") calls for two different terms for purposes of determining the data and modeling of Inverter-Based Resources ("IBRs") whose owners are not registered and subject to compliance as Category 2 Generator Owners/Generator Operators (GO/GOPs): (1) "unregistered IBRs," whose data is to be reported individually and (2) IBR-Distributed Energy Resources ("IBR-DERs"), whose data is to be reported (or estimated) in the aggregate. Order 901 explicitly differentiates between "unregistered IBRs," which it describes as "IBRs connected directly to the Bulk-Power System but not registered with NERC and therefore not subject to the Reliability Standards," and "IBR-DERs," which it describes as "IBRs connected to the distribution system that in the aggregate have a material impact on the Bulk Power System." *Id.* P 4 n.14. The two draft standards address both types of IBRs but do so in ways that fail to achieve FERC's stated purpose of addressing the failure of existing standards to accurately account for the different way that IBRs respond to disturbances, as compared to synchronous generation. *Id.* P 37 (emphasis added) (footnotes omitted). *See also id.* PP 2-4, 50:

Data that *accurately* represents IBRs is necessary to properly plan for, operate, and analyze IBR performance on the Bulk-Power System. Without data that accurately represents all IBRs, planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities are not able to develop system models that accurately account for the behavior of IBRs on their system, nor are they able to facilitate the analysis of Bulk-Power System disturbances.

While there may be other issues with the proposed use of these terms, these comments focus on two flaws:

(1) Defining the scope of the unregistered IBRs to be reported and modeled by use of a footnote referring to those IBRs connected to the Bulk-Power System ("BPS"), a vague term that is for FERC to define, rather than providing a clear cutoff consistent with the FERC-approved GO/GOP Category 2 registry criteria or the successfully balloted GO/GOP Category 2 Glossary definition. Such usage is not appropriate to determine the scope of what is to be covered by enforceable standards, and the resulting imprecision will invite double counts and gaps that will prevent the standards from achieving Order 901's reliability purposes.

(2) Instead of restricting the provision of data and modeling to IBR-DERs as Order 901 directs, relying on a DER definition that encompasses both IBR and non-IBR resources that are connected to the distribution system. This failure to have a definition focused solely on IBR-DERs threatens to undermine the express objective of Order 901 to accurately account for the behavior of IBRs. While the addition of Item 9.c under the "steady-state" column in MOD-032-2 Attachment 1 may somewhat mitigate the adverse impact of this combined IBR/non-IBR DER definition, the use of the DER definition without express restrictions to IBR-DERs elsewhere in the proposed draft standards (*see, e.g.,* Item 10 under "dynamics" of that same Attachment; footnote 1 of draft MOD-033-3) invites confusion that could also carry over to other standards that are intended to reflect and account for the particular characteristics of IBRs.

Further details on concerns regarding these two definitions are provided in Questions 4 and 7.

Response

Thank you for your comment. Please see the DTs updated edits to MOD-032-2.

The drafting team received multiple comments expressing concern with the criteria for acceptable models being maintained as a separate document by the ERO. Concerns were raised with both the proposal to maintain the criteria according to a process separate from the standards development process, as well as with the proposed criteria themselves.

Consistent with multiple commenter suggestions, the drafting team incorporated elements for what constitutes an acceptable model to Requirement R1, relating to the requirements and specifications developed by the PC/TP, and has removed reference to a separately maintained ERO Criteria for Acceptable Models document. Entities are not permitted to submit models listed on a separately maintained Unacceptable Models List without justification that supports their use.

In making these changes, the drafting team considered the comments, feedback received on previous drafts, and the FERC Order No. 901 directives. While FERC Order No. 901 directed NERC to "develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions" (P 108), the drafting team determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their interconnection-wide models and subsequently their planning cases.

The drafting team considered that many entities have a different understanding for what is a "generic model", and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The drafting team further considered that NERC, as the ERO, does not presently maintain an "acceptable model library", but rather an "unacceptable model library", and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion.

Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

To bookend these criteria for acceptable models, proposed Requirement R1 would also require the PC/TOP to include provisions specifying that any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The drafting team included this provision after considering feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The drafting team believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns.

The drafting team debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the drafting team ultimately decided to include this requirement in Requirement R1, addressing PC/TP data specification requirements, to create one self-contained requirement for data submissions.

The drafting team has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the drafting team has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. This process is moved in substantial part from the draft ERO Approved Criteria for Acceptable Models (chapter 1) included in the last posting to the Supporting Document to the draft MOD-

032 standard. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for Reliability Standards compliance purposes. As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the RSTC. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations would then be considered by the ERO and published on the NERC website. NERC staff is currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing.

LCRA TSC supports the following comments submitted by EEI on behalf of its members:

Requirement 2
EEI does not support Requirement R2, Part 2.1 because this requirement places inappropriate compliance burdens on the TO that they have no practical method of fulfilling without the support of unregistered DPs. Moreover, the TOs played no part in interconnecting the DERs on unregistered DP systems, nor do they have any ability to compel those entities to provide the information needed. While EEI does not dispute that information from these unregistered entities may be needed and could impact BPS reliability, we do not agree that the answer is to place this compliance burden on TOs. Guidance could be developed to clarify exactly what must be provided by the TO, including the basis for DER estimates whenever an unregistered DPs does not provide the data requested by the TO. However, if unregistered DPs are having a material impact on the Reliability of the BPS, consideration should be given to adjusting the registration criteria for DP.

Attachment 1 concerns:
Steady State Item 9: TOs are entirely dependent on responsible registered DPs and should therefore be removed from having direct responsibility for Aggregate DER data.

Dynamics Item 7: Item 7 should be made clear that TOs are only responsible for supplying Aggregate data for Unregistered IBR.

Dynamic Item 10: TOs should be removed from Item 10 because they are not the appropriate entity to collect DER data on distribution systems. EEI also notes that UFLS only DPs were not identified as having responsibilities for providing aggregated DER data on their systems or DER impacts to UFLS system they have installed.

Constellation does not agree with the changes made and feels it creates ambiguity for Regional Entities on estimated unregistered IBR entities. Specifically, in 2.1 a caveat for data requirements for unregistered units is provided which allows Regional Entities to provide estimates of data. This is asking for data that would not be relevant for models if it is not accurate data and could call for ambiguity between regions on the amount of data required. Constellation suggests striking the term unregistered to reduce ambiguity. Kimberly Turco on behalf of Constellation Segments 5 and 6

Thank you for your comment. The DT is addressing FERC Order 901 that directives "Recognizing that there may be instances in which transmission owners are unable to gather adequate unregistered IBR modeling data and parameters to create and maintain unregistered IBR models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation. We believe that this directive appropriately balances commenters' concerns about data accessibility and burden with the established need for transmission owners to provide unregistered IBR modeling data and parameters to Bulk-Power System planners and operators in their transmission owner area. We recognize that estimated modeling data and parameters are approximations of actual modeling data and parameters. We further acknowledge that there is some degree of error in estimated modeling data and parameters. However, on balance we believe that requiring such estimates with explanation of any limitations is an improvement from not having any data at all; and that even estimates will increase the overall adequacy of models and improve the reliability of the Bulk-Power System. To support this data collection, we further direct NERC to consider commenters suggestions to implement a process or mechanism by which transmission owners would receive modeling data and parameters."

Comment	
Southern Company has voted "yes" on previous ballots related to MOD-032 modifications and supports most of the standard revisions. However, significant changes to NERC's external document "ERO Approved Criteria for Acceptable Models document" since the last MOD-032 revision, specifically the inclusion of criteria modifications that could impact a Registered Entity's compliance, highlight our significant concern with the new MOD-032 revisions.	

There are simple changes that NERC can make to MOD-032 to garner our support, and specifically that includes moving any criteria in the "ERO Approved Criteria for Acceptable Models document" within the standard and converting the external model reference to a "ERO Approved Acceptable Models list" consistent with FERC 901 requirements. Additional comments are included in question 6.

Southern Company additionally recommends the minor revisions below for enhanced clarity:

- On Requirement 1 – add the word "Functional" in front of entities to make it clear the standard is referencing NERC Functional Entities.
- On Requirement 2 – add the word "Functional" in front of entities to make it clear the standard is referencing NERC Functional Entities.

Response

Thank you for your comments. The DT added functional in front of entities through MOD-032 where appropriate.

The drafting team received multiple comments expressing concern with the criteria for acceptable models being maintained as a separate document by the ERO. Concerns were raised with both the proposal to maintain the criteria according to a process separate from the standards development process, as well as with the proposed criteria themselves.

Consistent with multiple commenter suggestions, the drafting team incorporated elements for what constitutes an acceptable model to Requirement R1, relating to the requirements and specifications developed by the PC/TP, and has removed reference to a separately maintained ERO Criteria for Acceptable Models document. Entities are not permitted to submit models listed on a separately maintained Unacceptable Models List without justification that supports their use.

In making these changes, the drafting team considered the comments, feedback received on previous drafts, and the FERC Order No. 901 directives. While FERC Order No. 901 directed NERC to "develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions" (P 108), the drafting team determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their interconnection-wide models and subsequently their planning cases.

The drafting team considered that many entities have a different understanding for what is a “generic model”, and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The drafting team further considered that NERC as the ERO does not presently maintain an “acceptable model library”, but rather an “unacceptable model library”, and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion. Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

To bookend these criteria for acceptable models, proposed Requirement R1 would also require the PC/TOP to include provisions specifying that any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The drafting team included this provision after considering feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The drafting team believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns.

The drafting team debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the drafting team ultimately decided to include this requirement in Requirement R1, addressing PC/TP data specification requirements, to create one self-contained requirement for data submissions.

The drafting team has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the drafting team has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. This process is moved in substantial part from the draft ERO Approved Criteria for Acceptable Models (chapter 1) included in the last posting to the Supporting Document to the draft MOD-032 standard. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be considered

part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for Reliability Standards compliance purposes. As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the RSTC. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations would then be considered by the ERO and published on the NERC website. NERC staff is currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing.

The standard should also address data for DERs where there is no associated registered DP. P141 direct NERC to require the generator owners of registered IBRs and the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g., planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of registered and unregistered IBRs. Models created in MOD-032-2 must be provided to Transmission Operators to be utilized for Operations Planning and Real-time Assessments.

2 years implementation to collect all DERs on the distribution system is likely not feasible considering the standard includes rooftop solar and other types of DERs connected behind the meters. The standard further requires the dynamics modeling data that is often not available for DERs and it would likely take significant time for Distribution Providers to gather and develop these modeling data.

Thank you for your comments. MOD-032 is in alignment with project 2024-01. GO/GOP category 1 and 2 will be in effect by the time MOD-032-2 becomes effective, and therefore, nothing additional is needed to be added to the applicability section of MOD-032.	

The drafting team received multiple comments expressing concern with the criteria for acceptable models being maintained as a separate document by the ERO. Concerns were raised with both the proposal to maintain the criteria according to a process separate from the standards development process, as well as with the proposed criteria themselves.

Consistent with multiple commenter suggestions, the drafting team incorporated elements for what constitutes an acceptable model to Requirement R1, relating to the requirements and specifications developed by the PC/TP, and has removed reference to a separately maintained ERO Criteria for Acceptable Models document. Entities are not permitted to submit models listed on a separately maintained Unacceptable Models List without justification that supports their use.

In making these changes, the drafting team considered the comments, feedback received on previous drafts, and the FERC Order No. 901 directives. While FERC Order No. 901 directed NERC to "develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions" (P 108), the drafting team determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their interconnection-wide models and subsequently their planning cases.

The drafting team considered that many entities have a different understanding for what is a "generic model", and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The drafting team further considered that NERC, as the ERO, does not presently maintain an "acceptable model library", but rather an "unacceptable model library", and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion.

Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

To bookend these criteria for acceptable models, proposed Requirement R1 would also require the PC/TOP to include provisions specifying that any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The drafting team included this provision after considering feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The drafting team believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would

advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns.

The drafting team debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the drafting team ultimately decided to include this requirement in Requirement R1, addressing PC/TP data specification requirements, to create one self-contained requirement for data submissions.

The drafting team has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the drafting team has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. The NAGF would like to see MOD-032 modified to require the TP and PC to request data from those entities they want data from, rather than expect all other entities to track what the TP and PC are requiring. With the addition of Generator Owners that may or may not be interconnected to any NERC-registered entity, the TP and PC need to actively engage with these entities to ensure the TP and PC are able to get the best data possible and provide feedback as to what is needed/acceptable, etc. Additionally, the NAGF supports the comments by EEI.

• The proposed MOD-032-2 modifications do not address the FERC Order 901 directive on P78 and P161 regarding that the submitted model(s) should accurately reflect the IBR behaviors. The standard should explicitly require that submitted models be verified and validated to ensure they accurately reflect IBR behaviors, aligning with MOD-026 (ensuring that the approved industry IBR models accurately reflect the behavior of all IBRs). • The standard should also include a requirement to address data for DERs where there is no associated registered Distribution Provider (DP), rather than relying solely on a footnote. • P141 directs NERC to require the generator owners of registered IBRs and the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g., planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of registered and unregistered IBRs. Models created in MOD-032-2 must be provided to Transmission Operators to be utilized for Operations Planning and Real-time Assessments.

Response

Thank you for your comment.

(1) Milestone 3 has been split into three separate projects. Project 2022-02 focuses on MOD-032, which is the uniform framework, Project 2020-06 focuses on the validation and verification of models, and 2021-01 focuses on the system level performance. Some of the FERC directives, while one paragraph, have been split into two projects. The validated and verified directive will be addressed by the 2020-06 MOD-026 drafting team.
(2) Attachment 1 does not create obligations for entities to provide data but specifies the data items that need to be covered by the PC/TP data reporting procedures and requirements. This includes DER data for situations described in the footnote where there is no registered DP (and NERC has always been very clear the footnotes are part of the standards and fully enforceable). The DT proposal allows the PC/TP flexibility to identify the best responsible entity for their area. R2.1 specifically allows estimations when the responsible entity as identified by the PC/TP is unable to gather DER data.
(3) Provision of models consistent with the uniform model framework to Transmission Operators to be utilized for Operations Planning and Real-time Assessments is addressed by the proposed modifications to IRO-010 and TOP-003.

Colin Chilcoat - Invenergy LLC - 6

Document Name	

Comment

Invenergy does not agree with the revisions to MOD-032-2. Specifically, MOD-032-2 is not self-contained and requires entities to reference external information, developed and updated outside of the standards balloting process and not contained within the standard, to determine the required level of performance. Invenergy recommends that the "ERO Approved Criteria for Acceptable Models" be included within MOD-032-2.

Consistent with multiple commenter suggestions, the drafting team incorporated elements for what constitutes an acceptable model to Requirement R1, relating to the requirements and specifications developed by the PC/TP, and has removed reference to a separately maintained ERO Criteria for Acceptable Models document. Entities are not permitted to submit models listed on a separately maintained Unacceptable Models List without justification that supports their use. In making these changes, the drafting team considered the comments, feedback received on previous drafts, and the FERC Order No. 901 directives. While FERC Order No. 901 directed NERC to "develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions" (P 108), the drafting team determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their interconnection-wide models and subsequently their planning cases. The drafting team considered that many entities have a different understanding for what is a "generic model", and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The drafting team further considered that NERC, as the ERO, does not presently maintain an "acceptable model library", but rather an "unacceptable model library", and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion. Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901. To bookend these criteria for acceptable models, proposed Requirement R1 would also require the PC/TOP to include provisions specifying that any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The drafting team included this provision after considering feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The drafting team

believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns. The drafting team debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the drafting team ultimately decided to include this requirement in Requirement R1, addressing PC/TP data specification requirements, to create one self-contained requirement for data submissions. The drafting team has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the drafting team has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. This process is moved in substantial part from the draft ERO Approved Criteria for Acceptable Models (chapter 1) included in the last posting to the Supporting Document to the draft MOD-032 standard. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for Reliability Standards compliance purposes. As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the RSTC. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations would then be considered by the ERO and published on the NERC website. NERC staff is currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing.

Comment
Invenergy does not agree with the revisions to MOD-032-2. Specifically, MOD-032-2 is not self-contained and requires entities to reference external information, developed and updated outside of the standards balloting process and not contained within the standard, to determine the required level of performance. Invenergy recommends that the "ERO Approved Criteria for Acceptable Models" be included within MOD-032-2.

Response
Thank you for your comment. The drafting team received multiple comments expressing concern with the criteria for acceptable models being maintained as a separate document by the ERO. Concerns were raised with both the proposal to maintain the criteria according to a process separate from the standards development process, as well as with the proposed criteria themselves. Consistent with multiple commenter suggestions, the drafting team incorporated elements for what constitutes an acceptable model to Requirement R1, relating to the requirements and specifications developed by the PC/TP, and has removed reference to a separately maintained ERO Criteria for Acceptable Models document. Entities are not permitted to submit models listed on a separately maintained Unacceptable Models List without justification that supports their use. In making these changes, the drafting team considered the comments, feedback received on previous drafts, and the FERC Order No. 901 directives. While FERC Order No. 901 directed NERC to “develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions” (P 108), the drafting team determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their interconnection-wide models and subsequently their planning cases. The drafting team considered that many entities have a different understanding for what is a “generic model”, and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The drafting team further considered that NERC as the ERO does not presently maintain an “acceptable model library”, but rather an “unacceptable model library”, and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion.

Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

To bookend these criteria for acceptable models, proposed Requirement R1 would also require the PC/TOP to include provisions specifying that any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The drafting team included this provision after considering feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The drafting team believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns.

The drafting team debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the drafting team ultimately decided to include this requirement in Requirement R1, addressing PC/TP data specification requirements, to create one self-contained requirement for data submissions.

The drafting team has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the drafting team has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. This process is moved in substantial part from the draft ERO Approved Criteria for Acceptable Models (chapter 1) included in the last posting to the Supporting Document to the draft MOD-032 standard. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for Reliability Standards compliance purposes.

As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the RSTC. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations

would then be considered by the ERO and published on the NERC website. NERC staff is currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing.

We at ACES appreciate the effort put forth by the SDT to address the directives of FERC Order 901; however, we have concerns with the data collection burden being placed on responsible entities (as identified in Requirement R1 Part 1.1). Much of the industry is already operating with limited resources, and many (if not most) entities are currently short-staffed. This is particularly true for smaller entities such as electric cooperatives. In short, we are not convinced that this level of data collection is a cost-effective approach to improving grid reliability and reducing risk. Lastly, we would like to point out a minor discrepancy between the “redline” and “clean” versions of this draft of MOD-032-2. Requirement R2 Part 2.1 in the “clean” version is missing a portion of the language contained in the “redline” version. The phrase “…Energy Resource (DER) data, the responsible entity shall estimate the modeling…” do not appear in the “clean” version of Part 2.1.

Thank you for your comment. The DT is addressing FERC Order No. 901 P104 states "Recognizing that there may be instances in which transmission owners are unable to gather adequate unregistered IBR modeling data and parameters to create and maintain unregistered IBR models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation.” Please see the updated TR, which provides some examples of methods on how to	

complete estimations with little data or no data. While the team understands the importance of accuracy, it is important to have an allowance for estimation when data is not available. Without entities providing equally effective and efficient method proposals, this is where the team landed as the best option to address the FERC directives.

The DT will ensure the next versions posted line up correctly. Thank you for bringing this to our attention.

No. *Reliability Standards to Inverter-Based Res.,* Order No. 901, 185 FERC ¶ 61,042 (2023) ("Order 901") calls for two different terms for purposes of determining the data and modeling of Inverter-Based Resources ("IBRs") whose owners are not registered and subject to compliance as Category 2 Generator Owners/Generator Operators (GO/GOPs): (1) "unregistered IBRs," whose data is to be reported individually and (2) IBR-Distributed Energy Resources ("IBR-DERs"), whose data is to be reported (or estimated) in the aggregate. Order 901 explicitly differentiates between "unregistered IBRs," which it describes as "IBRs connected directly to the Bulk-Power System but not registered with NERC and therefore not subject to the Reliability Standards," and "IBR-DERs," which it describes as "IBRs connected to the distribution system that in the aggregate have a material impact on the Bulk Power System." *Id.* P 4 n.14. The two draft standards address both types of IBRs but do so in ways that fail to achieve FERC's stated purpose of addressing the failure of existing standards to accurately account for the different way that IBRs respond to disturbances, as compared to synchronous generation. *Id.* P 37 (emphasis added) (footnotes omitted). *See also id.* PP 2-4, 50:

Data that *accurately* represents IBRs is necessary to properly plan for, operate, and analyze IBR performance on the Bulk-Power System. Without data that accurately represents all IBRs, planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities are not able to develop system models that accurately account for the behavior of IBRs on their system, nor are they able to facilitate the analysis of Bulk-Power System disturbances.

While there may be other issues with the proposed use of these terms, these comments focus on two flaws:

(1) Defining the scope of the unregistered IBRs to be reported and modeled by use of a footnote referring to those IBRs connected to the Bulk-Power System ("BPS"), a vague term that is for FERC to define, rather than providing a clear cutoff consistent with the FERC-approved

GO/GOP Category 2 registry criteria or the successfully balloted GO/GOP Category 2 Glossary definition. Such usage is not appropriate to determine the scope of what is to be covered by enforceable standards, and the resulting imprecision will invite double counts and gaps that will prevent the standards from achieving Order 901's reliability purposes.

(2) Instead of restricting the provision of data and modeling to IBR-DERs as Order 901 directs, relying on a DER definition that encompasses both IBR and non-IBR resources that are connected to the distribution system. This failure to have a definition focused solely on IBR-DERs threatens to undermine the express objective of Order 901 to accurately account for the behavior of IBRs. While the addition of Item 9.c under the "steady-state" column in MOD-032-2 Attachment 1 may somewhat mitigate the adverse impact of this combined IBR/non-IBR DER definition, the use of the DER definition without express restrictions to IBR-DERs elsewhere in the proposed draft standards (*see, e.g.,* Item 10 under "dynamics" of that same Attachment; footnote 1 of draft MOD-033-3) invites confusion that could also carry over to other standards that are intended to reflect and account for the particular characteristics of IBRs.

Further details on concerns regarding these two definitions are provided in Questions 4 and 7.

Southwest Power Pool abstains from the response to this question. The ERO Approved Criteria for Acceptable Models document referenced in the proposed Requirement R1, Part 1.2 establishes some common-sense usability requirements, but it is unclear how it might be interpreted and enforced. For example, if an auditor determines a model manual is unacceptable in the course of a compliance engagement, it is unclear which entity would be considered to have violated the	

standard: the model submitter, or the planner that accepted the model. If a model and its associated documentation are deemed acceptable by the PC and TP, the model should be considered acceptable.

Furthermore, the usability requirements identified under Chapter 2 within the Usability Requirements section (pgs. 3-4) of the document are mostly administrative requirements that address model documentation. The usability requirements identified in Chapter 5 within the Technical Rationale section (pg. 8) are arguably more important for actually being able to perform simulations, but it is not clear how enforceable they would be. Ultimately, it seems like a violation of the Criteria for Acceptable Models document could be better addressed as an identified technical concern under Requirement R3 and most of the substantive parts of the criteria document could be consolidated into the existing, separate Technical Rationale to detail examples of issues that would need to be addressed under Requirement R3. Thus, the ISO/RTO Council (IRC) Standards Review Committee (SRC) suggests that the proposed Requirement R1, Part 1.2 be deleted and a new Part 1.4 be added that reads as follows:

"1.4. Specifications of the following items for dynamic model submissions:

1.4.1. A list of unacceptable models[1], which are not to be submitted unless no alternative model is available;

1.4.2. Required submission of standard library models recognized by the software utilized to create the interconnection-wide case(s) and/or user-written models; and

1.4.3. Criteria for any submitted user-written models, including, at a minimum, model documentation and instructions for model setup and use to minimize the risk of non-convergence and other issues.

Footnote 1: For example, data requirements and reporting procedures may point to the Unacceptable Model List included in NERC's Dynamic Modeling Recommendations and/or other lists maintained by the entities responsible for creating interconnection-wide base cases."

The proposed language above provides explicit flexibility for PC/TP to require generic models, user-defined models, or both. In conjunction with Requirement R3, this addresses the FERC directives in a more enforceable and easily understood manner than the currently proposed use of a separate ERO criteria document.

Additionally, proposed footnote 1 (which would become footnote 2 if the Part 1.4 language proposed above is adopted) within Requirement R2, Part 2.1 should be modified to read as follows: *"As used in this standard, the phrase 'unregistered IBR' refers to an IBR that is not a DER*

and does not meet mandatory NERC registration criteria." The drafting team has already acknowledged the ambiguities associated with attempting to define DER based on "connection to the BPS." Using the concept of BPS connection here introduces those same ambiguities.

Finally, Requirement R3, Part 3.1 should be modified to read as follows: *"Provide either updated data or an explanation with a technical basis for maintaining the current data that resolves the technical concern."*

This added language is necessary to ensure technical concerns are adequately addressed. For example, if the technical concern is suspicious data, a technical basis for maintaining current data may be acceptable in some circumstances but would not resolve the underlying issue if the model crashes or does not initialize.

Thank you for your comment. The drafting team received multiple comments expressing concern with the criteria for acceptable models being maintained as a separate document by the ERO. Concerns were raised with both the proposal to maintain the criteria according to a process separate from the standards development process, as well as with the proposed criteria themselves.

Consistent with multiple commenter suggestions, the drafting team incorporated elements for what constitutes an acceptable model to Requirement R1, relating to the requirements and specifications developed by the PC/TP, and has removed reference to a separately maintained ERO Criteria for Acceptable Models document. Entities are not permitted to submit models listed on a separately maintained Unacceptable Models List without justification that supports their use.

In making these changes, the drafting team considered the comments, feedback received on previous drafts, and the FERC Order No. 901 directives. While FERC Order No. 901 directed NERC to "develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions" (P 108), the drafting team determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their interconnection-wide models and subsequently their planning cases.

The drafting team considered that many entities have a different understanding for what is a "generic model", and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The drafting team further considered that NERC as the ERO does not presently maintain an "acceptable model library", but rather an "unacceptable model library", and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion.

Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

To bookend these criteria for acceptable models, proposed Requirement R1 would also require the PC/TOP to include provisions specifying that any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The drafting team included this provision after considering feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The drafting team believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns.

The drafting team debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the drafting team ultimately decided to include this requirement in Requirement R1, addressing PC/TP data specification requirements, to create one self-contained requirement for data submissions.

The drafting team has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the drafting team has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. This process is moved in substantial part from the draft ERO Approved Criteria for Acceptable Models (chapter 1) included in the last posting to the Supporting Document to the draft MOD-

032 standard. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for Reliability Standards compliance purposes. As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the RSTC. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations would then be considered by the ERO and published on the NERC website. NERC staff is currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing.

The use of aggregated, generic data to model IBR's may do more harm than good. Accurate data is required to reliably meet the FERC order. Perhaps generic data is the first step but caution must be taken to avoid consequential, incorrect analysis.

Response	
Thank you for your comment. FERC Order 901 requires in P104 "[r]ecognizing that there may be instances in which transmission owners are unable to gather adequate unregistered IBR modeling data and parameters to create and maintain unregistered IBR models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation. We believe that this directive appropriately balances commenters' concerns about data accessibility and burden with the established need for transmission owners to provide unregistered IBR modeling data and parameters to Bulk-Power System planners and operators in their transmission owner area. We recognize that estimated modeling data and parameters are approximations of actual modeling data and parameters. We further acknowledge that there is some degree of error in estimated modeling data and parameters. However, on balance we believe that requiring such estimates with explanation of any limitations is an improvement from not having any data at all; and that even estimates will increase the overall adequacy of models and improve the reliability of the Bulk-Power System. To support this data collection, we further direct NERC to consider commenters suggestions to implement a process or mechanism by which transmission owners would receive modeling data and parameters." Based on the directive to provide estimates if are unable to gather data, the team added a requirement to ensure an estimation is completed should the respective entity not be able to gather data needed.

As noted by IRC, SPP supports the following portion of the response:	

The ERO Approved Criteria for Acceptable Models document referenced in the proposed Requirement R1, Part 1.2 establishes some common-sense usability requirements, but it is unclear how it might be interpreted and enforced. For example, if an auditor determines a model manual is unacceptable in the course of a compliance engagement, it is unclear which entity would be considered to have violated the standard: the model submitter, or the planner that accepted the model. If a model and its associated documentation are deemed acceptable by the PC and TP, the model should be considered acceptable.

Furthermore, the usability requirements identified under Chapter 2 within the Usability Requirements section (pgs. 3-4) of the document are mostly administrative requirements that address model documentation. The usability requirements identified in Chapter 5 within the Technical Rationale section (pg. 8) are arguably more important for actually being able to perform simulations, but it is not clear how enforceable they would be. Ultimately, it seems like a violation of the Criteria for Acceptable Models document could be better addressed as an identified technical concern under Requirement R3 and most of the substantive parts of the criteria document could be consolidated into the existing, separate Technical Rationale to detail examples of issues that would need to be addressed under Requirement R3. Thus, the ISO/RTO Council (IRC) Standards Review Committee (SRC) suggests that the proposed Requirement R1, Part 1.2 be deleted and a new Part 1.4 be added that reads as follows:

"1.4. Specifications of the following items for dynamic model submissions:

*1.4.1. A list of unacceptable models{C}**[1]**, which are not to be submitted unless no alternative model is available;*

1.4.2. Required submission of standard library models recognized by the software utilized to create the interconnection-wide case(s) and/or user-written models; and

1.4.3. Criteria for any submitted user-written models, including, at a minimum, model documentation and instructions for model setup and use to minimize the risk of non-convergence and other issues.

Footnote 1: For example, data requirements and reporting procedures may point to the Unacceptable Model List included in NERC's Dynamic Modeling Recommendations and/or other lists maintained by the entities responsible for creating interconnection-wide base cases."

The proposed language above provides explicit flexibility for PC/TP to require generic models, user-defined models, or both. In conjunction with Requirement R3, this addresses the FERC directives in a more enforceable and easily understood manner than the currently proposed use of a separate ERO criteria document.

Additionally, proposed footnote 1 (which would become footnote 2 if the Part 1.4 language proposed above is adopted) within Requirement R2, Part 2.1 should be modified to read as follows: *"As used in this standard, the phrase 'unregistered IBR' refers to an IBR that is not a DER and does not meet mandatory NERC registration criteria."* The drafting team has already acknowledged the ambiguities associated with attempting to define DER based on "connection to the BPS." Using the concept of BPS connection here introduces those same ambiguities.

Comment	

TXNM agrees with the comments made by EEI, in addition:

1. The proposed MOD-032-2 modifications do not to address the FERC Order 901 directive on P78 and P161 regarding that the submitted model(s) should accurately reflect the IBR behaviors. The standard should explicitly require that submitted models be verified and validated to ensure they accurately reflect IBR behaviors, aligning with MOD-026 (ensuring that the approved industry IBR models that accurately reflect the behavior of all IBRs).
2. The standard should also include a requirement to address data for DERs where there is no associated registered Distribution Provider (DP), rather than relying solely on a footnote. There is disagreement regarding the enforceability of footnotes, which may leave certain entities vulnerable.
3. P141 direct NERC to require the generator owners of registered IBRs and the transmission owners that have unregistered IBRs on their system to provide to the Bulk-Power System planners and operators (e.g., planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) dynamic models that accurately represent the dynamic performance of registered and unregistered IBRs. Models created in MOD-032-2 must be provided to Transmission Operators to be utilized for Operations Planning and Real-time Assessments.

Response

Thank you for your comment.

(1) Milestone 3 has been split into three separate projects. Project 2022-02 focuses on MOD-032, which is the uniform framework, Project 2020-06 focuses on the validation and verification of models, and 2021-01 focuses on the system level performance. Some of the FERC directives, while one paragraph, have been split into two projects. The validated and verified directive will be addressed by the 2020-06 MOD-026 drafting team.
(2) the TP/PC will create their process that requires DER data and will confirm the appropriate entity when no associated registered DP is available per R1. The footnote is not attempting to create a requirement in this case, but provide guidance on what entity should typically be considered responsible.
(3) Provision of models consistent with the uniform model framework to Transmission Operators to be utilized for Operations Planning and Real-time Assessments is addressed by the proposed modifications to IRO-010 and TOP-003.

Michael Goggin - Grid Strategies LLC - 5

Answer	No

Comment

Consistent with FERC's Order 901 directive to consider data sharing requirements for transmission owners to provide data to generators, MOD-032-2 should include a requirement for transmission owners to provide data to generator owners and operators to support accurate modeling and performance, e.g., short circuit data, grid data for offshore wind, information on other power electronic devices around the IBR plant, and voltage harmonics. In many cases this transmission provider data is necessary for generator owners to be able to determine generator settings and comply with MOD-032-2. The Consideration of FERC Order 901 Directives document argues that such a requirement is unnecessary as processes exist for obtaining that data, though in many regions they do not or are inadequate.

Thank you for your comment. The DT discussed and carefully considered P77 from the FERC Order 901. Ultimately, the team concluded that this issue is most appropriately addressed through processes that exist outside of NERC reliability standards and concurs with the suggestion in P77 that these processes are largely already in place. Transmission Owners, bound by confidentiality restrictions, may be unable to share certain information, such as details about nearby facilities (complicating development and enforcement of a NERC requirement and likely reducing the envisioned effectiveness for such a requirement). Further, adding a requirement within MOD-032 for data flows to the Generator Owner does not seem aligned with the purpose of MOD-032 since Generator Owners are not the entities developing interconnection base cases and the absence of this specific requirement does not prevent facility owners from providing models in accordance with MOD-032.

Tacoma Power concurs that the proposed MOD-032 modifications address FERC Order 901 and appreciates the explanation provided in the technical rationale as to when the SDT decided to expand beyond the FERC directive. This additional explanation helped explain what changes directly supported the directives versus those changes that were added as improvements. For example, explaining why both synchronous and asynchronous resources were included in the DER definition, even though the FERC directive only mentioned IBR-DERs.

MRO recommends revising R2.1 to avoid use of the term "unregistered Inverter-based Resource" in R2, part 2.1. The current wording is inconsistent with the ERO's current practice of using "registered" to refer to entities and not equipment, Facilities, or resources owned by entities.

Response

Thank you for your comment. Requirement R2 Part 2.1 is addressing FERC Order 901 P104, which states: "Recognizing that there may be instances in which transmission owners are unable to gather adequate unregistered IBR modeling data and parameters to create and maintain unregistered IBR models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation. We believe that this directive appropriately balances commenters' concerns about data accessibility and burden with the established need for transmission owners to provide unregistered IBR modeling data and parameters to Bulk-Power System planners and operators in their transmission owner area. We recognize that estimated modeling data and parameters are approximations of actual modeling data and parameters. We further acknowledge that there is some degree of error in estimated modeling data and parameters. However, on balance we believe that requiring such estimates with explanation of any limitations is an improvement from not having any data at all; and that even estimates will increase the overall adequacy of models and improve the reliability of the Bulk-Power System. To support this data collection, we further direct NERC to consider commenters suggestions to implement a process or mechanism by which transmission owners would receive modeling data and parameters." FERC continues to explain in P 107: "We believe that requiring transmission owners and distribution providers to collect required data for unregistered IBRs, and IBR-DERs in the aggregate, will result in greater consistency than the piecemeal approach proposed by Indicated Trade Associations, in which some data for unregistered IBRs and IBR-DERs in the aggregate would also be provided by registered generator owners and operators. Further, we believe that transmission owners and distribution providers are in a better position to collect and estimate required data for unregistered IBRs and IBR-DERs in the aggregate that are directly connected to their respective areas than balancing authorities. We anticipate that the need for estimated data for unregistered IBRs connected to the Bulk-Power System, as opposed to actual data, and thus the burden of collecting such data, will decrease over time due to the model provision requirements in the pro forma LGIP and pro forma SGIP, as adopted in Order No. 2023,6 and the ongoing NERC activities to register IBR generator owners and operators. As transmission providers modify their interconnection agreements in compliance with Order No. 2023, we expect that the need to estimate

[6] Order No. 2023, 184 FERC ¶ 61,054 at P 1659 (revising Attachment A to Appendix 1 of the *pro forma* LGIP and Attachment 2 of the *pro forma* SGIP to require each interconnection customer requesting to interconnect a non-synchronous generating facility to submit to the transmission provider specified modeling information).

data will decrease because validated models for smaller sized resources will begin to be submitted to transmission providers with interconnection requests under the Commission's pro forma SGIP. NERC's registration of previously unregistered IBRs should result in more IBRs providing data and validated models pursuant to applicable Reliability Standards." It is the DT's understanding that entities at a minimum can request data for unregistered IBRs, and if nothing is provided, the respective entity, identified by the PC and TP, can estimate.

EPRI agrees with the intent of the proposed MOD-032-2 modifications but abstains from answering with "Yes" or "No" to this question.

EPRI research informs the potential need and feasibility of changes to MOD-032-2, see for example:

- *Transmission Planning Considerations for DER Wholesale Market Participation: An EPRI FO2222 Phase 1 Collaborative Report.* EPRI. Palo Alto, CA: 2022. 3002020592.
- *EPRI Technology Transfer to NERC SPIDER Working Group: Informing NERC Stakeholder Discussions and Publications on System Planning Impacts of Distributed Energy Resources in the Years 2022-2024.* EPRI. Palo Alto, CA: 2025. 3002031525.
    - Including the reports listed under “Related Material” on that page.

EPRI worked with vendors of fundamental-frequency phasor-domain transient (PDT) modeling domain transmission planning software since 2019 and all of them have implemented the so-called *Aggregate DER (DER_A) Model* in their positive-sequence phasor domain tools:

- *The New Aggregated Distributed Energy Resources (der_a) Model for Transmission Planning Studies: 2019 Update.* EPRI. Palo Alto, CA: 2019. 3002015320.

EPRI (and other entities) have tested and applied the DER_A model extensively, and we published the following report in 2021:

- Analyzing the Impact of Aggregated DER Behavior on Bulk Power System Performance – A Summary of Three Case Studies. EPRI. Palo Alto, CA: 2021. 3002019445.

Thank you for your comments and additional information.

2. Do you agree that the Transmission Owner (TO) is typically the appropriate responsible entity for collecting and providing data for DER where there is no associated registered DP between the DER connection point and the TO's system? If not, what entity would be in a better position to provide that data and add justification?	
Scott Thompson - TXNM Energy - 3	
Answer	No
Document Name	
Comment	
TXNM Energy feels that the Resource Planner is in a better position to aggregate DER information than the transmission owner. The TO may not have participated in the DER interconnection process and may lack visibility into the DER systems, including specific inverter details and settings. Consequently, the TO may not have access to accurate DER/IBR modeling parameters unless it was directly involved in the interconnection agreements. If unregistered DER data is critical to the reliability of the BPS, then unregistered DPs that have interconnected DERs that have a material impact on the BPS should be registered through NERC registration criteria.

Response	
Thank you for your comment. The DT received an overwhelming response from industry stating that there are different functional entities who could collect and provide data for DER where there is no associated registered DP between the DER connection point. It was pointed out that this could be the Transmission Owner, Distribution Provider, Generator Owner, Balancing Authority, Resource Planner, etc. Based on this information, MOD-032 has been updated to require the Planning Coordinator with its respective Transmission Planner to identify the correct entity to collect and provided data for DER where there is no associated registered DP between the DER connection point. It is understood through the stakeholder processes in place, entities will be able to work through mutual agreements and any disagreements that need to be resolved.	
Mike Magruder - Avista - Avista Corporation - 1	
Answer	No

Document Name	
Comment	
The responsibility of TOs to gather DER data from unregistered DP's places a compliance risk on them. Unregistered entities have no compliance obligation to provide the necessary data, making it challenging for TOs to fulfill their responsibilities.

Response	
Thank you for your comment. In response to comments, the drafting team has removed reference to the phrase "unregistered IBR" and replaced it with the descriptive text formerly in the footnote. Former references to "unregistered IBR" now refer to IBRs that are not Distributed Energy Resources, as the drafting team proposes to define that term, and that would not meet the criteria in the NERC Rules of Procedure to register the owner of the IBR for the Generator Owner functional entity registration (as either category 1 or category 2). As suggested by commenters, the drafting team has removed the phrase "Bulk-Power System" from this description to remove any potential for ambiguity in application. Relevant to this discussion, Order No. 901 used the phrase "registered IBR" to refer to IBRs registered with NERC (or which would be registered pursuant to the Commission's directives in Registration of Inverter-based Resources, 181 FERC ¶ 61,124 (2022) and therefore subject to the Reliability Standards, and the phrase "unregistered IBR" to refer to IBRs connected directly to the Bulk-Power System, but not registered with NERC, and therefore not subject to the Reliability Standards (i.e., unregistered IBRs). It is important to note that Order No. 901 predated the changes NERC made to the Rules of Procedure to ensure that the owners and operators of such IBR resources would be registered with NERC for mandatory compliance purposes. NERC does not register IBRs as resources, but rather the owners of such resources based on the registry criteria for Generator Owner and Generator Operator. There are two categories of each: owners and operators of BES Facilities (category 1 GOs/GOPs); and owners and operators of non-BES inverter based generating resources that either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV (category 2 GOs/GOPs).	

In Order No. 901 parlance, ownership or operation of IBR resources meeting these criteria would require owner/operator registration, and therefore would be considered “registered IBRs”.

In Order No. 901 parlance, ownership or operation of IBR resources that do not meet these criteria but are connected to a transmission system (i.e., are not Distributed Energy Resources) would not require owner/operator registration, and therefore would be considered “unregistered IBR.”

The drafting team appreciates the suggested alternatives to the use of the Order No. 901 phrase “unregistered IBR” to describe the resources that are intended to be covered. It has considered establishing a defined Glossary term (Unregistered IBR), as well as explicitly defining in the above-the-text requirement language what is an unregistered IBR based on the NERC compliance registry criteria.

The drafting team believes that, with the revised clarification, there is no need to create an additional defined term for “unregistered IBR.” Such a term is not likely to aid in understanding, as the definition would be defining the term in the negative relative to other defined terms (i.e., an IBR for which the owner/operator would not be required to register with NERC as a Generator Owner/Generator Operator).
The drafting team also determined that replacing the phrase “unregistered IBR” in the requirement text with a more detailed description of what is an “unregistered IBR” that draws from the GO/GOP registry criteria (e.g., “not an IBR BES Facility, not a non-BES inverter based generating resource that either has or contributes to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV, and not a DER”) would lead to lengthier requirements that are less readable without providing additional clarity.

The drafting team believes that the revised footnote is clearer as to the scope of the IBR intended to be covered while maintaining readability.

The Transmission Owner (TO) is not always the most suitable entity to collect and provide data for Distributed Energy Resources (DER), particularly in instances where there is no registered Distribution Provider (DP) between the DER interconnection point and the TO's system. The TO may not have participated in the DER interconnection process and may lack visibility into the DER systems, including specific inverter details and settings. Consequently, the TO may not have access to accurate DER/IBR modeling parameters unless it was directly involved in the interconnection agreements. If unregistered DER data is critical to the reliability of the BPS, then unregistered DPs that	

have interconnected DERs that have a material impact on the BPS should be registered through NERC registration criteria such as DP – DER, similar to DP-UFLS.

The unregistered entity is the best entity to request data from, and there is no prohibition to requesting data from unregistered entities. The NAGF notes this language in TOP-003-5 "…including non-BES data and external network data as deemed necessary by the Transmission Operator." This does not appear to limit the TOP to only information from registered entities. It appears to say that the TOP should ask for the	

data it needs, even if the data is not BES data. The TP and PC should be expected to do the same, however, they should not be held accountable for the accuracy of estimates provided whenever the unregistered DPs decline a request for data.

EEI does not dispute that TOs are the only registered entity available to provide data from unregistered DPs. However, they are limited in their ability to obtain and provide this data because they have no ability to compel unregistered DPs to provide such data. Moreover, the TO should be viewed simply as a conduit for DER data provided by the unregistered DPs and should not be held accountable for the accuracy of estimates provided whenever the unregistered DPs decline a TO's request for data.

Thank you for your comment. The DT received an overwhelming response from industry stating that there are different functional entities who could collect and provide data for DER where there is no associated registered DP between the DER connection point. It was pointed out that this could be the Transmission Owner, Distribution Provider, Generator Owner, Balancing Authority, Resource Planner, etc. Based on this information, MOD-032 has been updated to require the Planning Coordinator with its respective Transmission Planner to identify the correct entity to collect and provided data for DER where there is no associated registered between the DER connection point. It is understood through the stakeholder processes in place, entities will be able to work through mutual agreements and any disagreements that need to be resolved.	

In addition, the Commission acknowledged in FERC order 901 P103: “we find persuasive the comments explaining that certain data may be challenging or infeasible for the transmission owner or distribution provider to obtain. We recognize that there may be limitations on the ability of certain transmission owners to provide all data about unregistered IBRs that Bulk-Power System transmission planners and operators may need for the reliable operation of the Bulk-Power System. Likewise, there may be limitations on the ability of certain distribution providers to provide all data about IBR-DERs in the aggregate that Bulk-Power System transmission planners and operators may need for the reliable operation of the Bulk-Power System. We therefore modify the NOPR proposal, as discussed below.” The Commission Provides a resolution on how to gather the data should it not be received through P 104 stating: “Recognizing that there may be instances in which transmission owners are unable to gather adequate unregistered IBR modeling data and parameters to create and maintain unregistered IBR models in their transmission owner areas, we modify the NOPR proposal and direct NERC to develop new or modified Reliability Standards that require each transmission owner, if unable to gather accurate unregistered IBR data or unable to gather unregistered IBR data at all, to provide instead to the Bulk-Power System planners and operators in their areas: (1) an estimate of the unregistered IBR modeling data and parameters, (2) an explanation of the limitations of the availability of data, (3) an explanation of the limitations of any data provided by unregistered IBRs, and (4) the method used for estimation. We believe that this directive appropriately balances commenters’ concerns about data accessibility and burden with the established need for transmission owners to provide unregistered IBR modeling data and parameters to Bulk-Power System planners and operators in their transmission owner area. We recognize that estimated modeling data and parameters are approximations of actual modeling data and parameters. We further acknowledge that there is some degree of error in estimated modeling data and parameters. However, on balance we believe that requiring such estimates with explanation of any limitations is an improvement from not having any data at all; and that even estimates will increase the overall adequacy of models and improve the reliability of the Bulk-Power System. To support this data collection, we further direct NERC to consider commenters suggestions to implement a process or mechanism by which transmission owners would receive modeling data and parameters.” This expresses the importance that entities should be aware of unregistered IBR connected to the grid for reliability purposes.

CEHE believes the TO is not the appropriate registered entity to be responsible for providing estimations of unregistered load. CEHE, as a TO, does not have visibility into an unregistered entity’s systems to provide an estimate of the data at any level of accuracy.

Response

Thank you for your comment. The DT received an overwhelming response from industry stating that there are different functional entities who could collect and provide data for DER where there is no associated registered DP between the DER connection point. It was pointed out that this could be the Transmission Owner, Distribution Provider, Generator Owner, Balancing Authority, Resource Planner, etc. Based on this information, MOD-032 has been updated to require the Planning Coordinator with its respective Transmission Planner to identify the correct entity to collect and provided data for DER where there is no associated registered between the DER connection point. It is understood through the stakeholder processes in place, entities will be able to work through mutual agreements and any disagreements that need to be resolved.

The Transmission Owner (TO) is not always the most suitable entity to collect and provide data for Distributed Energy Resources (DER), particularly in instances where there is no registered Distribution Provider (DP) between the DER interconnection point and the TO's system. The TO may not have participated in the DER interconnection process and may lack visibility into the DER systems, including specific inverter details and settings. Consequently, the TO may not have access to accurate DER/IBR modeling parameters unless it was directly involved in the interconnection agreements. If unregistered DER data is critical to the reliability of the BPS, then unregistered DPs that have interconnected DERs that have a material impact on the BPS should be registered through NERC registration criteria.

The Transmission Owner (TO) is not always the most appropriate entity to collect and provide data for Distributed Energy Resources (DER) in cases where there is no registered Distribution Provider (DP) between the DER interconnection point and the TO's system. The TO may not have been involved in the DER interconnection process and may lack visibility into the DER systems, including specific inverter details and settings. As a result, the TO may not have access to accurate DER/IBR modeling parameters unless it was directly involved in the interconnection agreements. For example, while Seattle City Light functions as both a TO and a distribution load-serving entity, it still may not have access to detailed inverter information for DERs that are already installed. In such cases, significant assumptions and estimations would be required to model these resources accurately.

No, we do not agree that the TO is the appropriate entity for collecting and providing data for DER where there is no associated registered DP between the DER connection point and the TO's system. In the NY area, the most appropriate entity would be the NYISO; this requirement should be moved to the BA/PC. The NYISO is in a better position to require entities to submit the required data when they join the market; individual TOs cannot. The NYISO has processes for maintaining the necessary system representation data to comply with FERC, NERC, NPCC, and NYSRC requirements.

The Transmission Owner (TO) is not always the most suitable entity to collect and provide data for Distributed Energy Resources (DER), particularly in instances where there is no registered Distribution Provider (DP) between the DER interconnection point and the TO's system. The TO may not have participated in the DER interconnection process and may lack visibility into the DER systems, including specific inverter details and settings. Consequently, the TO may not have access to accurate DER/IBR modeling parameters unless it was directly involved in the interconnection agreements. The Transmission Owner is not involved in the connection process for DER, and therefore does not have the data necessary for DER modelling. If there are reliability impact to the BPS due to DER connected where there are no DP, it is suggested that the registration criteria for DP be updated to ensure that all applicable entities that could have BPS impact are registed with NERC. This could be done as an initiative similar to what was done for IBR registration.

The revised standard seeks to capture 'unregistered IBR' and 'aggregate DER' steady state and dynamics data for various planning horizons. Unregistered IBR is defined only in this standard. It may be more reasonable for the Planning Coordinator to require various data from 'unregistered IBR's' through existing interconnection requirements rather than to require that all unregistered IBR's provide this data to the PC as a compliance requirement. Alternatively, GO/Gop Category 2 or a new Registration should hold that responsibility.

Thomas Foltz - AEP - 5	
Answer	No
Document Name	
Comment	

AEP continues to believe that the most efficient and technically appropriate path for implementing this proposed standard is to align with existing registration and data provision frameworks. Specifically, where Distributed Energy Resources (DERs) interconnect and provide data relevant to MOD-032 Attachment One, the entities possessing that data should be properly registered and held accountable under the NERC Functional Model.

As with existing standards requiring Generator Owners (GOs) or Distribution Providers (DPs) to provide planning and modeling data, those entities who control or aggregate DER fleets and are capable of furnishing the required information should be registered accordingly. While it remains unclear whether existing Functional Entities are universally sufficient, or whether a new DER-specific Functional Entity class may be warranted, the need for clear accountability is critical.

To clarify, AEP does not support requiring every individual rooftop solar customer to register as a Functional Entity. Instead, FERC Order No. 2222 Aggregators of DERs (DER Aggregators) could be envisioned as the appropriate responsible parties. These entities are well-positioned to coordinate with their constituent DERs, consolidate the necessary modeling and planning data, and meet compliance obligations.

In our view, the responsibility for MOD-032 data collection and compliance could rest with the DER aggregator, who in turn must coordinate with the Distribution Provider and Transmission Owner for appropriate data sharing and validation. This structure promotes scalability, efficiency, and consistency across jurisdictions, especially considering that DER participation can span both Federal and State regulatory boundaries.

NERC should consider how this evolving aggregator model intersects with the Functional Model and explore registration or oversight pathways that ensure these entities are held accountable without placing undue burdens on small-scale DER owners.

The appropriate party would be the entity that worked with the DER to create the interconnection agreement. This would include preliminary modeling and verification of performance. The SDT's question is unclear; if the TO worked to interconnect the DER it would be the correct responsible entity, however if the LSE, GO or DP was responsible for the interconnection of the DER they would be the most responsible entity. The SDT also fails to state the voltage level of the interconnection. If the voltage level is above the 100kV threshold, the TO would be responsible, however below that voltage the LSE or DP would most likely be the appropriate entity. Since LSEs are no longer part of the NERC registry, the SDT should submit a SAR requesting that LSEs are once again required to be responsible entities. This may better align the standards with the responsible entities in practice.

The best long-term solution would be for NERC to expand DP registration criteria (or create DER-only DP registration criteria) such that no DER would be connected to the distribution system without being associated with a registered DP.

Gul Khan - Gul Khan On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Oncor Electric Delivery - 1 - Texas RE	
Answer	Yes
Document Name	
Comment	

While Oncor Electric Delivery Company LLC ("Oncor") agrees with the question as phrased, Oncor would like to note that ideally the DER owner would maintain responsibility for adhering to data-sharing requirements. Oncor recognizes, however, that this may not be a practical solution given the broad applicability of the DER definition proposed in the standard. Oncor would also like to propose an alternative approach for the SDT's consideration – in the event that an unregistered DP is between the DER connection point and the TO's system, instead of placing the data collection responsibility on the TO, there could instead be a mandate for any such DPs to register. This would keep the data sharing requirements with the DP who may be better positioned to provide more accurate data than the TO.

Thank you for your comment. The DT received an overwhelming response from industry stating that there are different functional entities who could collect and provide data for DER where there is no associated registered DP between the DER connection point. It was pointed out that this could be the Transmission Owner, Distribution Provided, Generator Owner, Balancing Authority, Resource Planner, etc. Based on this information, MOD-032 has been updated to require the Planning Coordinator with its respective Transmission Planner to identify the correct entity to collect and provided data for DER where there is no associated registered between the DER connection point. It is understood that through the stakeholder processes in place, entities will be able to work through mutual agreements and any disagreements that need to be resolved.

Comment	
No, the Transmission Owner (TO) is not always the most appropriate entity to collect and provide data for Distributed Energy Resources (DER) in cases where there is no registered Distribution Provider (DP) between the DER interconnection point and the TO's system. The TO may not have been involved in the DER interconnection process and may lack visibility into the DER systems, including specific inverter details and settings. As a result, the TO may not have access to accurate DER/IBR modeling parameters unless it was directly involved in the interconnection agreements. For example, while Seattle City Light functions as both a TO and a distribution load-serving entity, it still may not have access to detailed inverter information for DERs that are already installed. In such cases, significant assumptions and estimations would be required to model these resources accurately.

FirstEnergy supports EEI comments which state:

Consistent with EEI concerns as stated in our response to question 1, we do not agree that enforceable Reliability Standards should be reliant on external documents such as the document titled "ERO Approved Criteria for Acceptable Models" (FERC Order 901, P 125) for the establishment of enforceable and auditable compliance requirements. To address our concerns with this issue in both IRO-010-6 and TOP-003-8 we offer the following comments and edits in boldface:

IRO-010-6 Concerns

Requirement R1: The following suggested changes to IRO-010-6, Requirement R1, part 1.5.3 (in boldface) align with our proposed changes to MOD-032 and provide RCs with similar capabilities as provided to PCs in that standard. We believe these changes will satisfy FERC Order 901 directives, place the criteria within the requirements of the Reliability Standard, allow the use of user-defined models when needed and ensure sharing and coordination across the interconnection.

R1. The Reliability Coordinator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include but not be limited to: *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-

specific data and parameters, and identification of the entities responsible for responding to the specification as deemed necessary by the Reliability Coordinator.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1 Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints.

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

1.3.2.2. historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide data and information that includes, but is not limited to.:

1.5.1 Specific deadlines or periodicity in which data and information is to be provided;

1.5.2 Performance criteria for the availability and accuracy of data and information, as applicable;

1.5.3 Requirements for model submissions in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization; Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data. for the following items for dynamic models submitted in accordance with Attachment 1: **1.5.3.1. A list of unacceptable models1 which are not to be submitted unless there is no alternative model available;** **1.5.3.2. Required submission of standard library model types provided with the software(s) utilized to create the interconnection-wide case(s) and/or user-written models along with an explanation of the use case(s) for each model type.** **Criteria for any submitted user-written models including, at a minimum, documentation and performance criteria to minimize the risk of non-convergence and other issues. The RC's user-written model criteria must be made available to all other RCs within the Interconnection for review and comment, and approval where the user-written model represents a shared impact.**

Tacoma Power does not agree that TOP-003-8 R1.5.3 and R2.5.3 are necessary to "further enhance real-time visibility of Bulk-Power System operations" (FERC Directive p 86). The changes to TOP-003-8 R1.1 and R2.1 adequately address this FERC directive. The proposed new sub-Requirements R1.5.3 and R25.3 are not. related to this directive, as the data collected for the Criteria for Acceptable Models is for modeling and not for real-time visibility.

Tacoma Power does not agree with expanding the scope of TOP-003-8 to include model submissions and requesting modeling data. TOP-003 should continue to focus on the data needed for real-time operations (e.g. RTAs and OPAs). The TOP-003 sub-Requirements related to requesting modeling data in R1.5.3 and R2.5.3 should be removed from TOP-003-8. Additionally, TOP-003-8 R2.5.3 is redundant to MOD-032-2 R2.

If a Requirement is needed to ensure the TOP is capable of requesting modeling data, then Tacoma Power recommends modifying MOD-032 and add the TOP as a functional entity in this Standard. If the SDT determines that the scope of TOP-003-8 should be expanded to include modeling data, then Tacoma Power recommends modifying TOP-003-8 R1.5.3 to clarify that the TO is the appropriate responsible entity for collecting and providing modeling data for DERs where there is no associated registered DP (and not the TOP or BA), similar to the approach taken in the MOD-032-2 redline. TOP-003-8 would then need to be modified to include the TO as a functional entity.

Response

Thank you for your comment. The proposed new TOP-003 sub-Requirements R1.5.3 and R2.5.3 do not impose requirements for the TOP or BA to obtain or utilize data not needed for real-time operations (such as Real-Time Assessments and Operational Planning Analyses). Data "deemed necessary" by the TOP or BA is required in accordance with R1 Part 1.1 or R2, Part 2.1. However, to the extent the TOP or BA needs

modeling data, it should be consistent with modeling data provided under MOD-032. Both BAs and TOPs are specifically called out in FERC Order No. 901 as entities that should be receiving IBR data within a uniform framework (p76, p141, p161). Thus, the drafting team contends that the proposed modifications to TOP-003 are necessary and aligned with the FERC 901 directives.

Comment
Requirement R1 Part 1.1 of the draft IRO-010-6 and TOP-003-8 now specifies IBR-specific "data and parameters". It is not clear if the drafting team identified a material difference that would mandate IBR-specific data **and** IBR-specific parameters as necessary condition for compliance. The addition in Part 1.5.3 clarifies that the data specification must include methods to provide data that include requirements for model submissions in accordance with the Criteria for Acceptable Models. BC Hydro suggests that using "IBR-specific data" in Part 1.1. in conjunction with the additional Part 1.5.3 is sufficient; otherwise, we request that the drafting team provides additional clarity on what would constitute adequate and sufficient evidence to demonstrate compliance for IBR data and IBR parameters. Requirement R1 Part 1.5.3 of the draft IRO-010-6 and TOP-003-8 (as well as R2 Part 2.5.3 of TOP-003-8) mandates that the data spec must include methods to provide data that include "requirements for model submissions in accordance with the Criteria for Acceptable Models". BC Hydro's understanding (supported by the Technical Rationale) is that the intent here is to mandate that data models must be in accordance with the Criteria for Acceptable Models, rather than their submission, which must be in accordance with the method specified pursuant to Part 1.5. Revised wording for clarity is provided below:

1.5.3 Requirements that data models are in accordance with the Criteria for Acceptable Models maintained by the Electric Reliability Organization.

Response	
Thank you for your comment. 1. Yes, the team intended for the language to read IBR-specific data and IBR specific parameters. 2. Please see the updated IRO and TOP standard language. In response to comments, the drafting team has removed reference to the phrase "unregistered IBR" and replaced it with the descriptive text formerly in the footnote. Former references to "unregistered IBR" now refer to IBRs that are not Distributed Energy Resources, as the drafting team proposes to define that term, and that would not meet the criteria in the NERC Rules of Procedure to register the owner of the IBR for the Generator Owner functional entity registration (as either category 1 or category 2). As suggested by commenters, the drafting team has removed the phrase “Bulk-Power System” from this description to remove any potential for ambiguity in application.

(1) The added sub-requirement 1.5.3 should be removed from this standard as it pertains to data and information collection, not model submissions. The data collected for the Criteria for Acceptable Models is for modeling and not for real-time visibility. This requirement is already addressed in MOD-032-2 R1 (sub-requirement 1.2). (2) The statement "Inverter-based Resource (IBR)-specific data and parameters" added to section 1.1 should be removed or more inclusive of including all other facilities, of which IBR's are a subset. It is suggested that the statement be augmented to the following, "including Generator, FACTS, aggregate DER and Inverter-based Resource (IBR)-specific data and parameters".

Response
Thank you for your comments.

The DT feels the TOP-003 and IRO-010 Reliability Standards can stand on its own for any data to be requested by entities; however, the DT felt it was appropriate to add the new sub-requirement to ensure entities are aware that this type of data can be requested by entities who need to be compliant with MOD-032. Requirement R1 of MOD-032 identifies the procedures, and the data needed. The proposed new TOP-003 sub-Requirements Requirement R1, Part 1.5.3 and Requirement R2, Part R2.5.3 do not impose requirements for the TOP or BA to obtain or utilize data not needed for real-time operations (such as Real-Time Assessments and Operational Planning Analyses). Data "deemed necessary" by the TOP or BA is required in accordance with R1.1 or R2.1. However, to the extent the TOP or BA needs modeling data, it should be consistent with modeling data provided under MOD-032. Both BAs and TOPs are specifically called out in FERC Order N0. 901 as entities that should be receiving IBR data within a uniform framework (p76, p141, p161). Thus, the drafting team contends that the proposed modifications to TOP-003 are necessary and aligned with the FERC 901 directives.

Consistent with EEI concerns as stated in our response to question 1, we do not agree that enforceable Reliability Standards should be reliant on external documents such as the document titled "ERO Approved Criteria for Acceptable Models" (FERC Order 901, P 125) for the establishment of enforceable and auditable compliance requirements. To address our concerns with this issue in both IRO-010-6 and TOP-003-8 we offer the following comments and edits in boldface:
IRO-010-6 Concerns
Requirement R1: The following suggested changes to IRO-010-6, Requirement R1, part 1.5.3 (in boldface) align with our proposed changes to MOD-032 and provide RCs with similar capabilities as provided to PCs in that standard. We believe these changes will satisfy FERC Order 901 directives, place the criteria within the requirements of the Reliability Standard, allow the use of user-defined models when needed and ensure sharing and coordination across the interconnection.
R1. The Reliability Coordinator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. The specification shall include but not be limited to: *(Violation Risk Factor: Low) (Time Horizon: Operations Planning)*

1.1. A list of data and information needed by the Reliability Coordinator to support its Operational Planning Analyses, Real-time monitoring, and Real- time Assessments including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification as deemed necessary by the Reliability Coordinator.

1.2. Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3. Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1 Operating limitations based on:

1.3.1.1. capability and availability;

1.3.1.2. fuel supply and inventory concerns;

1.3.1.3. fuel switching capabilities; and

1.3.1.4. environmental constraints.

1.3.2. Generating unit(s) minimum:

1.3.2.1. design temperature; or

{**1.3.2.2.** historical operating temperature; or

1.3.2.3. current cold weather performance temperature determined by an engineering analysis.

1.4. Identification of a mutually agreeable process for resolving conflicts.

1.5. Method(s) for the entity identified in Part 1.1 to provide data and information that includes, but is not limited to.:

1.5.1 Specific deadlines or periodicity in which data and information is to be provided;

1.5.2 Performance criteria for the availability and accuracy of data and information, as applicable;

1.5.3 Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data. for the following items for dynamic models submitted in accordance with Attachment 1:

1.5.3.1. A list of unacceptable models1 which are not to be submitted unless there is no alternative model available;

1.5.3.2. Required submission of standard library model types provided with the software(s) utilized to create the interconnection-wide case(s) and/or user-written models along with an explanation of the use case(s) for each model type.

1.5.3.3. Criteria for any submitted user-written models including, at a minimum, documentation and performance criteria to minimize the risk of non-convergence and other issues. The RC's user-written model criteria must be made available to all other RCs within the Interconnection for review and comment, and approval where the user-written model represents a shared impact.

1.5.4 Provisions to update or correct data and information, as applicable or necessary.;

1.5.5 A mutually agreeable format; and

1.5.6 A mutually agreeable method(s) for securely transferring data and information.

TOP-003-8 Concerns

Requirement R1: The following suggested changes to TOP-003-8, Requirement R1, part 1.5.3 (in boldface) align with our proposed changes to MOD-032 and provide RCs with similar capabilities as provided to PCs in that standard. We believe these changes will satisfy FERC Order 901 directives, place the criteria within the requirements of the Reliability Standard, allow the use of user-defined models when needed and ensure sharing and coordination across the interconnection.

R1. Each Transmission Operator shall maintain documented specification(s) for the data and information necessary for it to perform its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1 A list of data and information needed by the Transmission Operator to support its Operational Planning Analyses, Real-time monitoring, and Real-time Assessments including non-BES data and information, external network data and information, Inverter-based Resource (IBR)-specific data and parameters, and identification of the entities responsible for responding to the specification as deemed necessary by the Transmission Operator.

1.2 Provisions for notification of current Protection System and Remedial Action Scheme (RAS) status or degradation that impacts System reliability.

1.3 Provisions for notification of BES generating unit(s) during local forecasted cold weather to include:

1.3.1 Operating limitations based on:

1.3.1.1 capability and availability;

1.3.1.2 fuel supply and inventory concerns;

1.3.1.3 fuel switching capability; and

1.3.1.4 environmental constraints

1.3.2 Generating unit(s) minimum:

1**.3.2.1** design temperature; or

1.3.2.2 historical operating temperature; or

1.3.2.3 current cold weather performance temperature determined by an engineering analysis.

1.4 Identification of a mutually agreeable process for resolving conflicts.

1.5 Method(s) for the entity identified in Part 1.1 to provide the data and information that includes, at a minimum, the following:

1.5.1 Specified deadlines or periodicity in which data and information is to be provided;

1.5.2 Performance criteria for the availability and accuracy of data and information as applicable;

1.5.3 Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data for the following items for dynamic models submitted in accordance with Attachment 1:

1.5.3.1 A list of unacceptable models1 which are not to be submitted unless there is no alternative model available;

1.5.3.2 Required submission of standard library model types provided with the software(s) utilized to create the interconnection-wide case(s) and/or user-written models along with an explanation of the use case(s) for each model type.

1.5.3.3 Criteria for any submitted user-written models including, at a minimum, documentation, and performance criteria to minimize the risk of non-convergence and other issues.

1.5.4 Provisions to update or correct data and information, as applicable or necessary;

Footnote 1: For example, the Unacceptable Model List included in NERC's Dynamic Modeling Recommendations and/or other lists maintained by the entities responsible for creating interconnection-wide base cases.

Requirement 2: EEI is of the opinion that Requirement R2, subpart 2.54 was added in error and should be removed. It is our understanding that the BA is not responsible for Steady State, Dynamic or Short Circuit modeling and therefore has not useful utility.

NIPSCO also supports MISO's comments referenced below:

"NERC Standards often default to the lowest common denominator in terms of data quality, which can compromise model accuracy. To ensure more reliable and representative system models, NERC should strengthen data submission requirements. Specifically, MOD-032 should explicitly state that submitted data must accurately reflect how equipment is configured and operates in the field."

And,

"Consistent with the response to Q1 above providing a superior alternative to the separate ERO criteria document, the language in IRO-010-6 Requirement R1, Part 1.5.3; TOP-003-8 Requirement R1, Part 1.5.3; and TOP-003-8 Requirement R2, Part 2.5.3 should be changed to read as follows:

Requirements for model submissions consistent with the model submitted for planning purposes in accordance with MOD-032;

Referencing MOD-032 instead of a separate ERO criteria document satisfies FERC's directives in Order No. 901 by ensuring consistency between operations models and planning models, while also leveraging model quality and accuracy requirements associated with MOD-032 submissions."

Tim Kelley - Tim Kelley On Behalf of: Charles Norton, Sacramento Municipal Utility District, 3, 6, 4, 1, 5; Foung Mua, Sacramento Municipal Utility District, 3, 6, 4, 1, 5; Kris Kirkegaard, Balancing Authority of Northern California, 1; Nicole Looney, Sacramento Municipal Utility District, 3, 6, 4, 1, 5; Ryder Couch, Sacramento Municipal Utility District, 3, 6, 4, 1, 5; Wei Shao, Sacramento Municipal Utility District, 3, 6, 4, 1, 5; - Tim Kelley, Group Name SMUD and BANC

Answer	No
Document Name	
Comment	

SMUD and BANC believe that the new sub-Requirements R1.5.3 and R2.5.3 in TOP-003-8 are not necessary to enhance "***real-time visibility***" [emphasis added] of Bulk Power System operations as outlined in the FERC Directive (p. 86). We feel that the changes made to Requirements R1.1 and R2.1 adequately address this FERC directive.

The proposed new sub-Requirements R1.5.3 and R2.5.3 appear to focus on data collected for modeling purposes, specifically in relation to the "ERO Approved Criteria for Acceptable Models" document, rather than contributing to real-time visibility. Additionally, sub-Requirement R2.5.3 seems to duplicate Requirement R2 of MOD-032-2.

We suggest that the scope of TOP-003-8 remains focused specifically on the data required for real-time operations, such as Real-Time Assessments and Operational Planning Analyses. To that end, we recommend the removal of the sub-Requirements R1.5.3 and R2.5.3, as they involve requests for modeling data which do not align with the purpose of TOP-003-8.

Dislikes 0	

Response

Thank you for your comment. The proposed new TOP-003 sub-Requirements R1.5.3 and R2.5.3 do not impose requirements for the TOP or BA to obtain or utilize data not needed for real-time operations (such as Real-Time Assessments and Operational Planning Analyses). Data "deemed necessary" by the TOP or BA is required in accordance with R1.1 or R2.1. However, to the extent the TOP or BA needs modeling data, it should be consistent with modeling data provided under MOD-032. Both BAs and TOPs are specifically called out in FERC Order N0. 901 as entities that should be receiving IBR data within a uniform framework (p76, p141, p161). Thus, the drafting team contends that the proposed modifications to TOP-003 are necessary and aligned with the FERC 901 directives.

Comment	
The added sub-requirement 1.5.3 should be removed from this standard as it pertains to data and information collection, not model submissions. This requirement is already addressed in MOD-032-2 R1 (sub-requirement 1.2).

Thank you for your comment. Data will need to be collected to allow for an accurate model to be completed in submitted through MOD-032. In addition, Transmission Operators are not an applicable entity of MOD-032, and per the FERC Order 901, this allows those entities to gather data needed in order to accurately complete its model.

It is the opinion of ACES that NERC registered entities should not be subjected to potential violations of multiple NERC Reliability Standards Requirements for a single action. In other words, we contend that by including requirements for model submissions in both MOD-032-2 and in a documented data specification(s), responsible entities will now be subject to a form of double jeopardy (i.e., claim preclusion). ACES recommends only requiring model submissions under MOD-032-2 and subsequently striking the following newly proposed requirement parts: IRO-010-6 Requirement R1 Part 1.5.3, TOP-003-8 Requirement R1 Part 1.5.3, and TOP-003-8 Requirement R2 Part 2.5.3.

Thank you for your comments. The team does not agree that there is double jeopardy at play. Entities will request data needed from the respective IRO-010 or TOP-003 standard to complete the model required from MOD-032. Requirement R1 in MOD-032 is where the PC and its TP will draft out the procedures needed to complete the requirements following R1.

Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company	

Answer	
Document Name	
Comment	

Southern Company supports most of the standard revisions to IRO-010 and TOP-003. However, significant changes to NERC's external document "ERO Approved Criteria for Acceptable Models document" since the last IRO-010 and TOP-003 revisions, specifically the inclusion of criteria modifications that could impact a Registered Entities compliance, highlight our significant concern with the proposed IRO-010 and TOP-003 revisions.

There are simple changes that NERC can make IRO-010 and TOP-003 revisions a success. This includes:

1. Moving any criteria in the "ERO Approved Criteria for Acceptable Models document" within the standard, and converting the external model reference to a "ERO Approved Acceptable Models list" consistent with FERC 901 requirements. Additional comments are included in question 6.
2. TOP-003 R2 should not apply to BAs as they do not use steady state, short circuit, and dynamic modeling data as part of their responsibilities.
3. The following requirement needs to be explicitly added to the standard:
    - "Requirements for model submissions in accordance with the Criteria for Acceptable Models maintained by the ERO; unless it shall otherwise reduce the viability of the [RC, BA, TOP] ability to perform their analysis functions in a timely manner."
    - In the ERO document, Item #4 must be removed. It is unnecessary, not applicable to operational models, and impractical.
    - In the ERO document, Item #5 must include clarifications similar to previous versions. For example:
        - *"Models shall not reduce the viability of a Registered Entity's ability to perform their OPAs and RTAs in a timely manner. This may require uses of models listed on the Unacceptable Model List provided the model is accompanied by sufficient documentation to explain the parameters, states, and usability of the model to simulate small signal and large disturbance behavior for the scope of responsibility of the NERC Registered Entity."*

Thank you for your comments. Please see the updated standards modifications. The proposed new TOP-003 sub-Requirements R1 Part 1.5.3 and R2 Part 2.5.3 do not impose requirements for the TOP or BA to obtain or utilize data not needed for real-time operations (such as Real-Time Assessments and Operational Planning Analyses). Data “deemed necessary” by the TOP or BA is required in accordance with Requirement R1, Part 1.1 or R2, Part 2.1. However, to the extent the TOP or BA needs modeling data, it should be consistent with modeling data provided under MOD-032. Both BAs and TOPs are specifically called out in FERC Order No. 901 as entities that should be receiving IBR data within a uniform framework (p76, p141, p161). Thus, the drafting team contends that the proposed modifications to TOP-003 are necessary and aligned with the FERC 901 directives. Please see the updated ERO Unacceptable Models List Document.

Comment	

ERCOT abstains from the response to this question.

The proposed definition does not explicitly include demand reduction in the DER definition. For a complete definition, this should be more clearly indicated whether it is or is not included.

Distributed Energy Resources (DER): Generators and energy storage technologies connected to a distribution system that are capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including those connected behind the meter of an end-use customer that is supplied from a distribution system.

Likes 0	
Dislikes 0	

Response

Thank you for your comment. Demand reduction is not considered DER unless that demand reduction is due to a generator or storage technology. As explained in the Technical Rationale:

Additionally, the DT intention was to ensure that the scope included facilities “connected behind the meter of an end use customer” that may export Real Power to the power system **or offset Real Power** load (e.g., residential solar or commercial rooftop solar). This would exclude technologies such as charging-only electric vehicle (EV) installations and controllable load.

Colten Mitchell - Indiana Municipal Power Agency - 4	
Answer	No
Document Name	

Comment
No. Both proposed standards (MOD-032-2; MOD-033-3) rely on the proposed DER definition to describe the IBR-DERs that Order 901 directs these standards to address, in aggregate, for purposes of data reporting and modeling. *See, e.g.*, proposed MOD-032-2, R2.2.1 & n.1; proposed MOD-033-3, R1.1.2. A key problem with the proposed use of the DER definition is that it is inconsistent with Order 901's express intent and directives, and therefore will undermine FERC's objectives, described above, to accurately represent IBRs, which is needed because such generation responds differently to system disturbances than synchronous generation. Although Order 901 expressly directs the development of standards requiring the provision of data and modeling of aggregate IBR-DERs, the proposed draft standards use a generalized DER definition, which includes both IBRs and non-IBR generation. *See, e.g.*, Order 901, PP 7, 53. *See also* MOD-032-2 Technical Rationale Figure 2 (at 5). While the MOD-032-2 Technical Rationale, at 7, found it practical to have a consistent estimation framework for all DERs regardless of technology, the proposed DER definition fails to isolate IBR-DERs so that their impacts can be analyzed and appropriately accounted for in modeling, operations, and planning. The addition of Item 9.c under the "steady-state" column in MOD-032-2 Attachment 1 may somewhat mitigate the adverse impact of this combined IBR/non-IBR DER definition, but the use of the DER definition without express restrictions to IBR-DERs elsewhere in the proposed draft standards invites confusion that could also carry over to other standards that are intended to account for the particular characteristics of IBRs. For example, Item 10 under "dynamics" of MOD-032-2 Attachment 1 fails to make the distinction captured in Item 9.c. *Compare* Order 901, PP 37-39, 50-56. MOD-033-3 footnote 1 likewise refers to the DER definition without focusing on those DERs that are IBRs. Thus, the proposed homogenized DER definition may impede the ability of these standards, and other IBR-related standards, to achieve Order 901's reliability objectives. Steps should be taken to more clearly define IBR-DERs or otherwise further mitigate the potential adverse impacts of use of the proposed DER definition. Context for and a summary of all concerns with proposed MOD-032-2 are provided in Question 1; further concerns with regard to the unregistered IBR definition are provided in Question 7.

Response
Thank you for your comments. The DT, through the NERC standards development processes, found that the term DER aligns with the definition of IBR-DER in FERC Order 901 for assets that are IBRs connected through a distribution system. As such devices, both IBR and

synchronous (as in the Figure in the TR), connect through a distribution system, the local distribution regulator requires similar safety and performance standards, e.g., IEEE 1547 applies to both IBR and synchronous devices connecting through the distribution system. Thus, the team felt it appropriate to align the definition with the SPIDERWG working definition of DER which was developed with the concept of applicability within NERC reliability standards. When IBR-DER is the sole focus, that use of both terms can be used to clarify the subset of DER that is IBR.

Response	
Thank you for your comment. Some IBR's are generators, and some are storage devices. The DT wants to ensure that all generators and all storage devices are included within DER that are applicable. It is also not the case that all storage devices are IBR. Based on this reasoning, the DT believes that "generators and energy storage technologies" are the appropriate terms to be included in the DER definition.

Response
Thank you for your comment. The DT believes that a definition should not define a threshold but should simply explain what the term means. In addition, based on outreach with industry, the threshold is not the same answer across the board for various entities. If a threshold ever needs to be defined, it should be completed through the Facilities section of a standard or through requirement language. The DT added footnote 7 in the footnote table in Attachment 1 that allows the TP/PC to establish modeling thresholds through R1.

No. Both proposed standards (MOD-032-2; MOD-033-3) rely on the proposed DER definition to describe the IBR-DERs that Order 901 directs these standards to address, in aggregate, for purposes of data reporting and modeling. *See, e.g.*, proposed MOD-032-2, R2.2.1 & n.1; proposed MOD-033-3, R1.1.2. A key problem with the proposed use of the DER definition is that it is inconsistent with Order 901's express intent and directives, and therefore will undermine FERC's objectives, described above, to accurately represent IBRs, which is needed because such generation responds differently to system disturbances than synchronous generation.

Although Order 901 expressly directs the development of standards requiring the provision of data and modeling of aggregate IBR-DERs, the proposed draft standards use a generalized DER definition, which includes both IBRs and non-IBR generation. *See, e.g.*, Order 901, PP 7, 53. *See also* MOD-032-2 Technical Rationale Figure 2 (at 5). While the MOD-032-2 Technical Rationale, at 7, found it practical to have a consistent estimation framework for all DERs regardless of technology, the proposed DER definition fails to isolate IBR-DERs so that their impacts can be analyzed and appropriately accounted for in modeling, operations, and planning. The addition of Item 9.c under the "steady-state" column in MOD-032-2 Attachment 1 may somewhat mitigate the adverse impact of this combined IBR/non-IBR DER definition, but the use of the DER definition without express restrictions to IBR-DERs elsewhere in the proposed draft standards invites confusion that could also carry over to other standards that are intended to account for the particular characteristics of IBRs. For example, Item 10 under "dynamics" of MOD-032-2 Attachment 1 fails to make the distinction captured in Item 9.c. *Compare* Order 901, PP 37-39, 50-56. Thank you for your comments. The DT, through the NERC standards development processes, found that the term DER aligns with the definition of IBR-DER in FERC Order 901 for assets that are IBRs connected through a distribution system. As such devices, both IBR and synchronous (as in the Figure in the TR), connect through a distribution system and the local distribution regulator requires similar safety and performance standards, e.g., IEEE 1547 applies to both IBR and synchronous devices connecting through the distribution system. Thus, the team felt it appropriate to align the definition with the SPIDERWG working definition of DER which was developed with the concept of applicability within NERC reliability standards. In addition to FERC Order 901, Project 2022-02 has a separate SAR to address DER specifically. The team felt this was an appropriate time to develop a DER definition while IBR-DER is being captured per FERC Order 901.

Gul Khan - Gul Khan On Behalf of: Byron Booker, Oncor Electric Delivery, 1; - Oncor Electric Delivery - 1 - Texas RE

Answer	No
Document Name	

Comment

Oncor Electric Delivery Company LLC (“Oncor”) considers the “Distributed Energy Resource” (“DER”) definition used in the Technical Rationale for Reliability Standard MOD-032-2 too vague because it does not contain a voltage class threshold for an energy resource to be considered a DER.

Oncor’s view of DER is consistent with ERCOT’s definition of DER, which is: “An electrical generating facility consisting of one or more on-site distributed generation units connected at a voltage less than or equal to 60 kilovolts (kV), which may be connected in parallel operation to the utility system.” This definition can be found here: https://www.ercot.com/files/docs/2017/03/24/DER_OnePager_FINAL.pdf

From Oncor’s experience, the total capacity of the installation’s on-site distributed generation units, a type of distributed energy resource, may exceed ten megawatts (MW).

Is there any MW size threshold for Generator and energy storage technologies to be taken into account when the end-use customer is served at transmission voltage? Oncor would prefer a MW size threshold be specified in the definition.

Julie Hall - Entergy - 6	
Answer	No
Document Name	
Comment	
Entergy is concerned that the clause "*behind the meter of an end-use customer that is supplied from a distribution system*." will require modeling legacy industrial generation behind the meter on distribution where data is not available because of the age of the units, whereas much larger industrial generation behind the meter on the transmission system is not required to be modeled. Entergy has	

concerns that it will not be practical to model all unregistered DER facilities on the Distribution system without some type of DER unit/system MW threshold or aggregated generation MW threshold.

Tacoma Power requests clarity from the SDT as to whether the changes to MOD-032-2 apply to small generation plants connected to the transmission system. The proposed DER definition does not include a threshold or criteria for what is considered “distribution”. As a result of not defining this threshold, there is confusion as to what could be considered DER generation. For example, Tacoma Power owns a 4 MW hydro plant connected at 115 kV. Tacoma Power recommends adding clarity in the technical rationale as to whether this revision applies to non-BES synchronous generation connected to the transmission system. A If the intent of the SDT is to include an aggregate of all generating resources in MOD-032-2, then Tacoma Power proposes replacing the word “distribution” with the word “power” in the DER definition. This change would clarify that any non-BES generation must be included within interconnection models, regardless of whether it is connected to transmission or distribution. Alternatively, the SDT could describe in the technical rationale how non-BES synchronous resources connected to the transmission system should be handled under MOD-032.	
Likes 0	

Dislikes 0	
Response	
Thank you for your comment. Replacing “distribution” with “power” in the DER definition would not be appropriate because being connected to a distribution system is the defining characteristic of DER. The Technical Rationale includes a discussion related to the DT decision to use distribution system within the DER definition: “… defining electric facilities as either transmission or distribution is often based on State law or regulations, ISO/RTO tariff, and/or utility tariffs. The DT anticipates there are no conflicts in how applicable entities define distribution and transmission facilities for a given region, even if those definitions vary from region to region.” MOD-032-2 does not specifically address non-BES synchronous generation that is not DER – this was not within the scope of any of the SARs assigned to Project 2022-02 (or FERC 901). Planning Coordinators and Transmission Planners do have the authority to collect data for such facilities if deemed necessary, but there are no specific obligations to do so under MOD-032-2.

However, the proposed term is not clear enough. Does it intend to call a 15MVa generator connected at 60 kV a DER? Or since it is connected at 60 kV, it is considered a non-BES, unregistered Transmission Line-connected generator and therefore, not covered by the definition? It appears that the SDT has structured the requirement to have two different terms that must be used in tandem to ensure all desired resources are addressed. This could lead to the potential for missing entities in future standards that only use the DER definition without the unregistered IBR Resources.

The STD has come up with reasonable definition for DERs, however the use of the abbreviation is very limited to The Technical Document and MOD-032, Attachment 1. Rather than adding a definition to the NERC Glossary, perhaps the definition would be better as an addition to the footnotes for Attachment 1 and a definition paragraph in the Technical Document.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. The DT does not feel that a footnote is appropriate for the DER definition currently. Based on conversations with other DTs, this term may be used within other standards, and the DT feels it is important to have one definition for a term being used across other standards so this does not create confusion later.

EPRI agrees with the intent of the proposed DER definition but abstains from answering with "Yes" or "No" to this question. We note that the SDT considered existing definitions from NERC SPIDERWG & DERTF, IEEE 1547-2018, FERC, CPUC, NYISO, and decided to not align their proposed DER definition with any of these existing definitions. EPRI research informs the potential need and feasibility of changes to IRO-010-5 and TOP-003-8, see for example the references listed in response to Q1.

5. Do you agree that the modifications for the proposed reliability standards (MOD-032-2, IRO-010-5, and TOP-003-8) address the scope of the standard authorization request (SAR) in a cost-effective manner? If you do not agree, please provide alternatives that would address the SAR scope in a more cost-effective manner.	
Ronald Hoover - Bonneville Power Administration - 1,3,5,6 - WECC	
Answer	No

Thank you for your comment. Per FERC Order 901 P 103: "We recognize that there may be limitations on the ability of certain transmission owners to provide all data about unregistered IBRs that Bulk-Power System transmission planners and operators may need for the reliable operation of the Bulk-Power System. Likewise, there may be limitations on the ability of certain distribution providers to provide all data about IBR-DERs in the aggregate that Bulk-Power System transmission planners and operators may need for the reliable operation of the Bulk-Power System." Based on this information, it was determined that an estimation is better than nothing, and this is only needed if the functional entity is unable to gather data needed from the respective entity.

Comment	
Tacoma Power agrees that the proposed MOD-032-2 and IRO-010-5 Standards are cost effective. However, Tacoma Power does not agree that the new TOP-003-8 sub-Requirements R1.5.3 and R2.5.3 are cost effective. TOP-003-8 R2.5.3 is redundant to MOD-032-2 R2. The BA collects the relevant modeling data for the Criteria for Acceptable Models guidance via MOD-032-2 R2. It is not cost effective to perform duplicative work. Additionally, the TOP does not have a role in requesting modeling data in the current TOP-003-8. It is not cost effective to require the TOP to collect modeling data under TOP-003-8 R1.5.3. This scope of work should be added to MOD-032-2, if the intent of the SDT is to require the TOP to request modeling submissions.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. The DT does not see the modifications to TOP-003 duplicative of MOD-032. The TOP-003 standard allows entities to request the data, and Requirement R2 within the MOD-032 standard is where they input that data into play based on data requirements and reporting procedures developed by its Planning Coordinator.

Item 25 in the SAR states that a uniform framework among the three standards must be created, and these changes do not accomplish that.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. Item 25 in the SAR states: "Specifically, we direct NERC to develop new or modified Reliability Standards that require planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities to establish for each interconnection a uniform framework with modeling criteria, a registered modeling designee, and necessary data exchange requirements both between themselves and with the generator owners, transmission owners, and distribution providers to coordinate the creation of transmission planning, operations, and interconnection-wide models (i.e., system models) and the validation of each respective system model." Project 2022-02 addresses the unform framework, Project 2020-06 addresses the Generator model verification and validation, and Project 2021-01 addresses the system models. Project 2022-02 lays out the framework and the modifications made to the other project standards point back to MOD-032 where connection is needed.

TVA believes that the costs associated with gathering unregistered IBR and aggregate DER data, which will undoubtedly consist of a large percentage of estimated data, do not prove cost-effective as the result may negatively affect model accuracy and provide little, to no, reliability benefit. We also expect there will be unforeseen costs associated with this effort.

For MOD-32 it is a heavy lift for the DP to provide the additional data requested. Even if an estimate is utilized it takes time to document the methods used for the estimate. Additional time to implement the changes and a gradual approach (i.e prioritizing larger size DER's) could be an approach.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. The DT understands the concern about this new requirement on DPs. The FERC Order 901 makes it clear the importance of entities understanding what is connected via IBR-DER, aggregated DER, and unregistered DER to the BPS. The requirements have been drafted in ways to make it as easy as possible on DPs, but for reliability purposes, it is important that this data be collected.

Thank you for your comment. The DT received an overwhelming response from industry stating that there are different functional entities who could collect and provide data for DER where there is no associated registered DP between the DER connection point. It was pointed out that this could be the Transmission Owner, Distribution Provider, Generator Owner, Balancing Authority, Resource Planner, etc. Based on this information, MOD-032 has been updated to require the Planning Coordinator with its respective Transmission Planner to identify the correct entity to collect and provided data for DER where there is no associated registered DP between the DER connection point. It is understood through the stakeholder processes in place, entities will be able to work through mutual agreements and any disagreements that need to be resolved.

The MOD-032 standard continues to expect all other entities to track the needs of the TP and PC rather than having the TP and PC actually ask entities for data they want. This is extremely inefficient for newly registered GOs/GOPs and will likely lead to even larger issues with the registration of entities not connected to the companies that are registered as TPs and PCs.

The proposed revisions involve a wide range of modeling variances leading to significant costs and time. Additionally, implementation costs analysis becomes challenging also due to insufficient clarity at this time on Acceptable Models (currently there is a list of Unacceptable Models that may be enforceable). Currently, PCs and TPs have limited ability to collect data from non-registered entities. There does not seem to be a reliability benefit that could be realized before additional mechanisms to collect adequate modeling data on all DERs (including non-registered IBRs and other DER entities), including additional or revised mandatory requirements to provide sufficiently accurate data to TPs and PCs become enforceable

Thank you for your comments. Please see the updated modifications regarding the ERO Criteria document. FERC Order 901 P87 states: "currently effective Reliability Standards do not ensure that Bulk-Power System planners and operators receive modeling data and parameters regarding unregistered IBRs that, individually or in the aggregate, are capable of adversely affecting the reliable operation of the Bulk-Power System. The Commission also preliminarily found that the currently effective Reliability Standards do not require that Bulk-Power System planners and operators receive modeling data and parameters regarding IBR-DERs that in the aggregate are capable of adversely affecting the reliable operation of the Bulk-Power System. The Commission preliminarily determined that planning coordinators and other entities need modeling data and parameters for both unregistered IBRs and IBR-DERs in the aggregate to assure greater accuracy in modeling."

Thank you for your comment. Please see the updated information in the technical rationale. It is not the DT's place to tell people how to develop a methodology. However, the DT provided information in the TR to assist those who wish for additional information.	
Greg Sorenson - ReliabilityFirst - 10 - RF	
Answer	No
Document Name	
Comment	
The document does not seem to be written to address both equipment specific and aggregate models. In fact, it seems like the concept of modeling an aggregate IBR-DER or even aggregate dynamic loads may contradict Item #1 under "Usability Requirements"...1) A model	

manual, or other documentation, with a description of all model parameters, variables, and states. The manual or other documentation shall also describe the range of validity of the model and valid use cases or studies for which the model has sufficient fidelity.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. The ERO Approved Criteria for Acceptable Models content has been altered and moved to a supporting document attached to MOD-032. The information regarding aggregate models and equipment-specific models is not included in the supporting document outlining the process for a model to be added to a list of unacceptable models. Further, the comment claims a contradiction of the criteria for aggregate modeling versus equipment-specific modeling and provides the example of aggregate load component modeling as in conflict with the usability requirements to have a model manual detailing the valid use states of the supplied model. This is not a contradiction to have descriptions of the valid initialization of a dynamic model, whether that model is an aggregate representation of load components, or an equipment-specific model used to represent an individual generation plant.

Regarding the aggregated DER dynamic model, NERC should define a methodology that utilities can follow to derive such an aggregated DER dynamic model before the change is implemented. The methodology must be practical and easy to follow.

The proposed ERO Approved Criteria for Acceptable Models document suggests that the plant may require two sets of models: operational models and planning models. FERC Order 901 P141 directs NERC to mandate that generator owners of registered IBRs and transmission owners with unregistered IBRs on their system provide Bulk-Power System planners and operators (including planning coordinators, transmission planners, reliability coordinators, transmission operators, and balancing authorities) with dynamic models that accurately represent the dynamic performance of both registered and unregistered IBRs. This directive appears to aim at ensuring the availability of dynamic models that accurately reflect performance for use in planning and operational studies.

Thank you for your comments. The ERO Approved Criteria for Acceptable Models content has been altered and moved to a supporting document attached to MOD-032. The new revisions have focused on the transient dynamic nature of these models as the comment suggests. The revisions of MOD-032, TOP-003, and IRO-010 did not alter the obligation for the entity to provide data to the TOP or RC data	

specifications nor the TP or PC joint data requirements. In both the operational and planning models, it is expected that the dynamic model be representative of equipment and otherwise represent the dynamic performance of registered IBR, unregistered IBR, and aggregate DERs.

ATC agrees that NERC is responsible for the NERC-Approved Model Library and the associated processes that go along with both maintaining and updating that library. However, we do not agree that Model Criteria should be maintained and modified outside of the Approved Reliability Standards. Model Criteria should not be a moving target. For this reason, we believe that the Model Criteria should be included in the affected Reliability Standards and only changed when those Standards are modified. To address our concerns, we ask that the model criteria be removed from this document and rewrite the document to focus on both the Approved and Unapproved Model Library and associated processes for updating and approving models for industry use. The ERO Approved Criteria for Acceptable Models document should also make clear and define in the document that it applies to generator models, not system models.

Comment

The ERO document goes beyond an Acceptable Model List and includes criteria that must be included in NERC standards. This is in violation of NERC standard development guidance, FERC 901 requirements, and bypasses the NERC Rules of Procedure for future modifications that can impact entities' compliance with the affected NERC standards.

- In order to comply with the NERC's Acceptance Criteria of a Reliability Standard Item #6 Completeness, "Each Reliability Standard should be complete and self-contained. A standard should not depend on external information to determine the required level of performance." As proposed, the revised standards do not conform to this requirement.
  - The "Criteria for Acceptable Models maintained by the ERO" goes well beyond a library of models as specified by FERC 901, but instead includes compliance criteria for use, interpretation, and adherence of these models.
  - This is of significant concern, as an entity's compliance would become dependent on an external set of criteria not vetted through the NERC standard process.
  - Furthermore, the approval process for changes to the document – which could cause an entity to become non-compliant – would not be subject to NERC standard modifications (essentially bypassing NERC ROP).
- FERC 901 requirements that specify the development of new standards and using the ***standard development process*** to refer to a model library – not an external set of criteria. Therefore, the "Criteria for Acceptable Models maintained by the ERO" should be replaced with a version that is solely focused on a library list of acceptable models.
  - P122 "direct NERC to develop new or modified reliability standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of IBRs during steady-state, short-circuit, and dynamic conditions when developing planning, operations, and interconnection-wide models"

  - P124 “direct NERC to determine through its standards development process which nation-wide approved component models are needed to build IBR plant models for steady state, short-circuit, and dynamic studies” [as proposed, it is outside the ***standards development process*** with a separate ERO/RSTC process]
  - P125 “direct NERC to develop new or modified Reliability Standards that require the sole use of nation-wide approved component generic library models for system models”
- Southern Company acknowledges there is a desire to be agile with the Library – but this agility should not bypass NERC Rules of Procedure
  - If the Acceptable Models truly becomes a library only list, it can include a process by which models can be ***added*** to the list by the ERO and RSTC, but models should not be removed from the list without going through the full industry standard review process as it could significantly modify an entities compliance. Alternatively, a clear implementation schedule not to be less than 2+ years for the removal of any model could be established.
  - If there are critical criteria that must be adhered to from a compliance perspective, these should be incorporated into the specific standards as requirements – not within an external document.
    - For example, it is imperative the RC and TOP retain the flexibility to utilize models needed to meet its OPA and RTA requirements – both for timing, accuracy, and availability. This may require utilizing models that have been reviewed and verified by the entity to perform accurate representation within those operational assessment constraints (e.g., different for remote external areas afar from the scope of responsibility that accurately simulate dynamic response). These criteria and recognition should be embedded in the standard, not an external document.
    - The acceptability criteria for allowance and submission of user-written models should be clear, including coordination for use across interconnection-wide cases.
- The revised NERC Acceptable Models list needs to ensure there are appropriate exceptions, particularly for modeling of neighboring utilities in remote external areas. Specifically:
  - Exceptions must be granted for use of models on the Unacceptable list if the annual NERC MMWG dynamics data library contains these models, since no other source exists for most entities to procure dynamics data for systems beyond their own boundaries.
  - Additionally, for operational models that must meet availability and timing requirements to perform operational-related assessments - constraints that long-term planning analyses do not face – there needs to be accommodations for remote external area modeling outside the scope of the BA, TOP, and RC footprint. For example, the GENCLS model is introduced by the DYNRED program into appropriate system equivalent models which have been verified to accurately represent the dynamic behavior of external generation beyond Tier 1 neighbors of an RC and TOP. This model represents the dynamic behavior of the coherent group as if it were a single generator – substantially reducing computer run-time while maintaining

	all necessary accuracy. Such models must be allowed by the RC and TOP when determined by the RC or TOP to accurately model to simulate small signal and large disturbance behavior for the scope of responsibility of the NERC Registered Entity.

Thank you for your comment. It is assumed that the OEM would recommend use of an UDM when they feel no standard library model can adequately reflect their equipment. MOD-032-2 is flexible enough to allow this, but it doesn't mandate the PC/TP to accept UDM and they could require only standard library models – this is usually driven by requirement of the model designee when building Interconnection-wide cases that need to work across multiple software vendors (but there are other options such as requiring the UDMs to be developed for all of the software platforms that are used).

EEI does not support or see a need for the proposed document titled ERO Approved Criteria for Acceptable Models for the reasons provided below. However, we do support the continued use of the NERC document titled "Dynamic Modeling Recommendations", which we believe provides useful guidance to the industry while also containing the Unacceptable Model list. This document would also provide a familiar reference document for the Industry that could be relied upon to provide clarity on unacceptable models and a trusted source of useful recommendations to planners.

1. FERC Order 901 directives clearly "require the sole use of nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build interconnection-wide models." (see FERC Order 901, P125). While the proposed document does not identify any approved component generic library models to be used when creating interconnection-wide system models.

2. Planning software used by PC and TPs already utilize generic library models that are widely and consistently available through industry planning software, negating the need for NERC to do anything relative to the development of an approved component generic library model list beyond maintaining the existing NERC Unacceptable Model list.

3. We additionally disagree that model criteria should be contained in a standalone document outside of approved Reliability Standards. However, we agree with FERC that model criteria should be uniformly established and shared by PCs, TPs, RCs, TOPs and BAs through the enforceable Requirements contained in the Reliability Standards for each interconnection. (See FERC Order 901, P161)

4. Moreover, the document contains language within the proposed criteria that is far too ambiguous to be enforceable or auditable within a NERC Reliability Standard. (For example: "negligible error(s)", "sufficient fidelity", "robustly initialize", "reasonable initial conditions", or "simulation solution challenges".)

5. We also do not agree that the "Usability Requirements" that cite "simulation crashes" or "solution challenges" as justifications for deeming a model unacceptable. While in some cases, this may be justification for deeming a model unacceptable, such events can be caused by other factors beyond the model and therefore such an arbitrary determination without consideration of other factors may disqualify the best or in some case the only available model.

For these reasons, we ask that the proposed document be abandoned because it provides no useful direction to planners and modelers as originally intended.

Response

Thank you for your comment. The drafting team received multiple comments expressing concern with the criteria for acceptable models being maintained as a separate document by the ERO. Concerns were raised with both the proposal to maintain the criteria according to a process separate from the standards development process, as well as with the proposed criteria themselves.

Consistent with multiple commenter suggestions, the drafting team incorporated elements for what constitutes an acceptable model to Requirement R1, relating to the requirements and specifications developed by the PC/TP, and has removed reference to a separately maintained ERO Criteria for Acceptable Models document. Entities are not permitted to submit models listed on a separately maintained Unacceptable Models List without justification that supports their use.

In making these changes, the drafting team considered the comments, feedback received on previous drafts, and the FERC Order No. 901 directives. While FERC Order No. 901 directed NERC to “develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions” (P 108), the drafting team determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their interconnection-wide models and subsequently their planning cases.

The drafting team considered that many entities have a different understanding for what is a “generic model”, and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The drafting team further considered that NERC as the ERO does not presently maintain an “acceptable model library”, but rather an “unacceptable model library”, and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion. Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

To bookend these criteria for acceptable models, proposed Requirement R1 would also require the PC/TOP to include provisions specifying that any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The drafting team included this provision after considering feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The drafting team believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns.

The drafting team debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the drafting team ultimately decided to include this requirement in Requirement R1, addressing PC/TP data specification requirements, to create one self-contained requirement for data submissions.

The drafting team has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the drafting team has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. This process is moved in substantial part from the draft ERO Approved Criteria for Acceptable Models (chapter 1) included in the last posting to the Attachment 2 to the draft MOD-032 standard. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for Reliability Standards compliance purposes.

As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the Reliability and Security Technical Committee. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations would then be considered by the ERO and published on the NERC website. NERC staff is currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models

added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing. In addition, Representing the impact of UVLS and UFLS on DER (i.e., tripping DER along with the load that is tripped) is essential to designing effective UVLS and UFLS programs. Further details are included in the published Reliability Guideline and White Paper that are referenced in the Technical Rationale. If this item is excluded from MOD-032, industry will eventually need to grapple with modifying processes for gathering DER data to address this issue (a draft SAR to modify PRC-006 to address DER impacts on UFLS program design is being considered under the RSTC and points to addressing this issue if not addressed under Project 2022-02). The DT believes that establishing processes for developing and collecting this information in conjunction with other DER data under MOD-032 is the most efficient approach.

Black Hills Corporation agrees with EEI's conclusion that the "ERO Approved Criteria for Acceptable Models" document may not align with FERC order 901 directives. We agree this document could be responsible for the Model Library and processes needed to submit proposed additions, however the model criteria should be controlled through enforceable requirements within each Reliability Standard.	

Black Hills Corporation also agrees with EEI's comments about the ambiguous language and lack of an Accepted Models list. Also, that the citing of "simulation crashes" or "Solution challenges" may result in a model being deemed unacceptable due to outside factors, even if it is the best or possibly only model available.

Thank you for your comment. The drafting team received multiple comments expressing concern with the criteria for acceptable models being maintained as a separate document by the ERO. Concerns were raised with both the proposal to maintain the criteria according to a process separate from the standards development process, as well as with the proposed criteria themselves. Consistent with multiple commenter suggestions, the drafting team incorporated elements for what constitutes an acceptable model to Requirement R1, relating to the requirements and specifications developed by the PC/TP, and has removed reference to a separately maintained ERO Criteria for Acceptable Models document. Entities are not permitted to submit models listed on a separately maintained Unacceptable Models List without justification that supports their use.	

In making these changes, the drafting team considered the comments, feedback received on previous drafts, and the FERC Order No. 901 directives. While FERC Order No. 901 directed NERC to "develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions" (P 108), the drafting team determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their interconnection-wide models and subsequently their planning cases.

The drafting team considered that many entities have a different understanding for what is a "generic model", and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The drafting team further considered that NERC as the ERO does not presently maintain an "acceptable model library", but rather an "unacceptable model library", and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion. Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

To bookend these criteria for acceptable models, proposed Requirement R1 would also require the PC/TOP to include provisions specifying that any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The drafting team included this provision after considering feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The drafting team believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns.

The drafting team debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the drafting team ultimately decided to include this requirement in Requirement R1, addressing PC/TP data specification requirements, to create one self-contained requirement for data submissions.

The drafting team has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the drafting team has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. This process is moved in substantial part from the draft ERO Approved Criteria for Acceptable Models (chapter 1) included in the last posting to the Attachment 2 to the draft MOD-032 standard. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for Reliability Standards compliance purposes. As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the Reliability and Security Technical Committee. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations would then be considered by the ERO and published on the NERC website. NERC staff is currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing. In addition, Representing the impact of UVLS and UFLS on DER (i.e,. tripping DER along with the load that is tripped) is essential to designing effective UVLS and UFLS programs. Further details are included in the published Reliability Guideline and White Paper that are referenced in the Technical Rationale. If this item is excluded from MOD-032, industry will eventually need to grapple with modifying processes for gathering DER data to address this issue (a draft SAR to modify PRC-006 to address DER impacts on UFLS program design is being considered under the RSTC and points to addressing this issue if not addressed under Project 2022-02). The DT believes that establishing processes for developing and collecting this information in conjunction with other DER data under MOD-032 is the most efficient approach.

R1 reference the ERO maintained Approved Criteria for Acceptable Models. However, this document is not part of the Standard and may pose compliance challenges if updated outside of the Standard Development Process. The process to maintain the list of models (e.g. Unacceptable Model List) relies on NERC determination of the effective date of a change.

For example, if the ERO added a new model to the List of Unacceptable Models in the ERO maintained document without allowing for an adequate implementation timeline, entities may be in noncompliance on the effective date of the revised ERO document.

As drafted the Approved Criteria for Acceptable Models is not clear how and by whom the determination on models that may be acceptable for Planning but not acceptable for Operations is made and documented. It would also be helpful if the Unacceptable Model List includes another column to differentiate between models appropriate for Planning purposes but not appropriate for Operational purposes.

Thank you for your comment. The drafting team received multiple comments expressing concern with the criteria for acceptable models being maintained as a separate document by the ERO. Concerns were raised with both the proposal to maintain the criteria according to a process separate from the standards development process, as well as with the proposed criteria themselves.

Consistent with multiple commenter suggestions, the drafting team incorporated elements for what constitutes an acceptable model to Requirement R1, relating to the requirements and specifications developed by the PC/TP, and has removed reference to a separately maintained ERO Criteria for Acceptable Models document. Entities are not permitted to submit models listed on a separately maintained Unacceptable Models List without justification that supports their use.

In making these changes, the drafting team considered the comments, feedback received on previous drafts, and the FERC Order No. 901 directives. While FERC Order No. 901 directed NERC to “develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions” (P 108), the drafting team determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their interconnection-wide models and subsequently their planning cases.

The drafting team considered that many entities have a different understanding for what is a “generic model”, and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The drafting team further considered that NERC as the ERO does not presently maintain an “acceptable model library”, but rather an “unacceptable model library”, and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion.

Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

To bookend these criteria for acceptable models, proposed Requirement R1 would also require the PC/TOP to include provisions specifying that any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The drafting team included this provision after considering feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The drafting team believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns.

The drafting team debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the drafting team ultimately decided to include this requirement in Requirement R1, addressing PC/TP data specification requirements, to create one self-contained requirement for data submissions.

The drafting team has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the drafting team has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. This process is moved in substantial part from the draft ERO Approved Criteria for Acceptable Models (chapter 1) included in the last posting to the Attachment 2 to the draft MOD-032 standard. While the Unacceptable Models List will be maintained separately from the standard, the process itself would

be considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for Reliability Standards compliance purposes. As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the Reliability and Security Technical Committee. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations would then be considered by the ERO and published on the NERC website. NERC staff is currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing. In addition, Representing the impact of UVLS and UFLS on DER (i.e., tripping DER along with the load that is tripped) is essential to designing effective UVLS and UFLS programs. Further details are included in the published Reliability Guideline and White Paper that are referenced in the Technical Rationale. If this item is excluded from MOD-032, industry will eventually need to grapple with modifying processes for gathering DER data to address this issue (a draft SAR to modify PRC-006 to address DER impacts on UFLS program design is being considered under the RSTC and points to addressing this issue if not addressed under Project 2022-02). The DT believes that establishing processes for developing and collecting this information in conjunction with other DER data under MOD-032 is the most efficient approach.

The ERO Criteria for Acceptable Models does not have industry consensus and was not established through the standards process. TVA does not believe it should be referenced in a compliance standard. In its place, TVA recommends specifications for standard models (where appropriate and available), user-written models (where appropriate and with adequate documentation), and other models (when no alternative is available and requiring justification for use).

FirstEnergy supports EEI comments which state: EEI does not support the document titled ERO Approved Criteria for Acceptable Models because it appears that it does not align with FERC Order 901 directives which "require the sole use of nation-wide approved component generic library models for system models to facilitate the exchange of neighboring entities' respective planning and operation models and to build interconnection-wide models." (see FERC Order 901, P125) While we recognize that the FERC Order 901 may be too restrictive and agree some use of user-defined models is needed, it remains unclear whether NERC has obtained FERC approval to deviate from the Order. Moreover, while we support some use of user-defined models, that usage should be limited and validated across each interconnection with clear enforceable requirements that limit the	

use of user-defined models except when such usage has been coordination between responsible entities across each interconnection. In addition to this core concern, we offer the following additional comments and concerns with this document below:

1. EEI supports the ERO plan to be responsible for the Model Library and the processes needed for responsible entities to submit for approval proposed additions to that library. We do not agree that this document should contain the model criteria itself. While the model library will be a dynamic document, the model criteria should not be dynamic and is most effectively controlled through enforceable requirements within each Reliability Standard.

2. While this document contains a list of Unacceptable Models, it fails to identify any Acceptable Models for use in Interconnection-wide models as required in FERC Order 901.

3.We are also concerned that the document contains language within the proposed criteria that is far to ambiguous to be enforceable or auditable within a NERC Reliability Standard. (For example: “negligible error(s)”, “sufficient fidelity”, “robustly initialize”, “reasonable initial conditions”, or “simulation solution challenges”.)

4.EEI does not agree that the “Usability Requirements” that cite “simulation crashes” or “solution challenges” as justifications for deeming a model unacceptable. While in some cases, this may be justification for deeming a model unacceptable, such events can be caused by other factors beyond the model and therefore such an arbitrary determination without consideration of other factors may disqualify the best or in some case the only available model advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns.

The drafting team debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the drafting team ultimately decided to include this requirement in Requirement R1, addressing PC/TP data specification requirements, to create one self-contained requirement for data submissions.

The drafting team has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or remove models in a faster manner than may be feasible under the NERC standard development process. Thank you for your comment. The drafting team received multiple comments expressing concern with the criteria for acceptable models being maintained as a separate document by the ERO. Concerns were raised with both the proposal to maintain the criteria according to a process separate from the standards development process, as well as with the proposed criteria themselves.

Consistent with multiple commenter suggestions, the drafting team incorporated elements for what constitutes an acceptable model to Requirement R1, relating to the requirements and specifications developed by the PC/TP, and has removed reference to a separately maintained ERO Criteria for Acceptable Models document. Entities are not permitted to submit models listed on a separately maintained Unacceptable Models List without justification that supports their use.

In making these changes, the drafting team considered the comments, feedback received on previous drafts, and the FERC Order No. 901 directives. While FERC Order No. 901 directed NERC to “develop new or modified Reliability Standards that require the use of approved industry generic library IBR models that accurately reflect the behavior of all IBRs during steady-state, short-circuit, and dynamic conditions” (P 108), the drafting team determined to pursue an equally effective and efficient method for addressing what it believes is the overarching goal of this directive, which is to obtain IBR models that are accurate and usable by PCs/TPs for building their interconnection-wide models and subsequently their planning cases.

The drafting team considered that many entities have a different understanding for what is a “generic model”, and that advancements in user-defined models have reduced some of the concerns identified by FERC in Order No. 901 and can be more accurate in representing the IBR. The drafting team further considered that NERC as the ERO does not presently maintain an “acceptable model library”, but rather an “unacceptable model library”, and it may prove practically difficult to keep an acceptable model library up to date in a timely fashion.

Considering these factors, and the comments received, the proposed Requirement R1 revisions would allow flexibility to the PC/TP to define requirements for the submission of standard library models, user-defined models, or both. Where user-defined models are accepted, the

TP/PC would need to include, at a minimum, requirements to provide documentation and instructions for model set up and use; these items would help minimize the risk of non-convergence, a concern identified by FERC for such models in Order No. 901.

To bookend these criteria for acceptable models, proposed Requirement R1 would also require the PC/TOP to include provisions specifying that any entity submitting a model on the Unacceptable Models List maintained by the ERO include a technical rationale supporting its use. The drafting team included this provision after considering feedback that some of the models included on the present Unacceptable Models List may be the best or only option for representing certain legacy equipment, particularly synchronous equipment. The drafting team believes that requiring a technical rationale for using such models, while presenting some administrative burden to submitters, would advance the state of modeling overall consistent with the intent of Order No. 901 and would help ensure parity of requirements among generation types. Further, it would help ensure models with identified, known deficiencies are not being submitted without good reason. It is important to note that this requirement to submit a technical rationale for such models is not intended to supplant the process described in Requirement R3 for addressing model quality concerns.

The drafting team debated the proper placement of this requirement at length, whether in Requirement R1 addressing TP/PC data specifications or Requirement R2, addressing how entities respond. After much discussion, the drafting team ultimately decided to include this requirement in Requirement R1, addressing PC/TP data specification requirements, to create one self-contained requirement for data submissions.

The drafting team has elected to maintain the Unacceptable Model List separately from the MOD-032, due to the need to maintain flexibility to add or remove models in a faster manner than may be feasible under the NERC standard development process. To balance concerns about due process for mandatory and enforceable elements of standards, the drafting team has included in the MOD-032 standard a supporting document that describes the process that will be used to update the Unacceptable Model List. This process is moved in substantial part from the draft ERO Approved Criteria for Acceptable Models (chapter 1) included in the last posting to the Attachment 2 to the draft MOD-032 standard. While the Unacceptable Models List will be maintained separately from the standard, the process itself would be considered part of the standard and subject to revision through the standard development process; however, the specific process steps would not be considered mandatory and enforceable requirements for Reliability Standards compliance purposes.

As described in that process, there are opportunities for public comment and technical vetting of specific model add/remove requests through the Reliability and Security Technical Committee. As part of this process, the RSTC would recommend an effective date for any changes, and the final recommendations would then be considered by the ERO and published on the NERC website. NERC staff is currently examining avenues for ensuring accessibility of this document as NERC transitions to a new website design in 2026. Any changes to the

Unacceptable Models List would be communicated to industry and to the applicable governmental authorities so that entities using models added to/removed from the list would have multiple avenues to be made aware of their updated obligations and the relevant timing. In addition, Representing the impact of UVLS and UFLS on DER (i.e., tripping DER along with the load that is tripped) is essential to designing effective UVLS and UFLS programs. Further details are included in the published Reliability Guideline and White Paper that are referenced in the Technical Rationale. If this item is excluded from MOD-032, industry will eventually need to grapple with modifying processes for gathering DER data to address this issue (a draft SAR to modify PRC-006 to address DER impacts on UFLS program design is being considered under the RSTC and points to addressing this issue if not addressed under Project 2022-02). The DT believes that establishing processes for developing and collecting this information in conjunction with other DER data under MOD-032 is the most efficient approach.

EPRI agrees with the intent of the proposed ERO Approved Criteria for Acceptable Models but abstains from answering with "Yes" or "No" to this question.

We share the following observations with the SDT for consideration in future drafts:

–The new terms for the NERC Glossary of Terms proposed by Project 2020-06 for MOD 026/027 etc., i.e., “model validation” and “model verification” are not used in the Criteria for Acceptable Models document.

–In addition to “expected or as-built facilities”, consider adding "as-left" or "as-configured”

–Consider distinguishing between “parameter names” and “parameter values”

–Are standardized tests for “model validation” defined somewhere?

–Consider adding requirements to explicitly document known use cases for which a model shall *not* be used

–Consider changing the term “initial value” to “default value”

–Add a requirement that triggers more thorough model validation whenever models are provided with “default values”

–The term “model adequacy” is used but not defined in the NERC Glossary of Terms as of Feb 26, 2025.

–How would the “explanation of the model’s adequacy” look like? Could it be a "model validation report" for equipment-level models and a "model verification report" for plant-level models, similar to the procedures proposed in IEEE P2800.2 which is currently open for SA initial ballot and public review at https://publicreview.standards.ieee.org/public-review-web/public-app

–Consider clarifying whether "a list of commonly tuned parameters" refers to "parameter values" that are site-specific or the subset of "parameter names" that shall be used to tuned the model to site-specific settings.

–Consider correcting a reference given that Table 1 is now "above".

Thank you for your comments. The determination of usability ultimately relies on a high degree of engineering judgment. The DT agrees that it is challenging to effectively define usability with precise criteria that can be objectively applied. Please see the proposed modifications made to incorporate the most basic elements of usability (previously described in the ERO criteria document) into the MOD-032. Specific requirements related to model verification and validation are beyond the scope of this project. However, R2.2 was added to require that facility owners provide models that have been verified and validated in accordance with MOD-026 if available.

Comment	
For the implementation plan for MOD-032-2, AES does not agree with the proposed 12 month time frame after the effective date for MOD-032-2 for requirements R2-R4. Some TPs and PCs may elect to postpone development and publishing of their revised data requirements and reporting procedures until the end of the two-year implementation period for the standard leaving only the 12-month time frame to respond. AES has over 400 unregistered IBRs and DERs in which model information should be provided to the responsible entity. While it could be said that unregistered IBRs and DERs are not required to comply with the standard, it is AES's responsibility to help ensure reliability and provide the requested information in the intended manner. With limited modeling resources, AES requests a longer implementation plan for R2-R4 of at least 24 calendar months following the effective date of the standard.

Comment

Tacoma Power is concerned that the term "unregistered IBR" is not well understood in the industry. Without a formal definition in the Glossary of Terms, it will be difficult for entities to look up the scope of resources that fall under this currently undefined category. Additionally, the term "unregistered IBR" will be used in potentially several Standards, so it would be more efficient to have this term formally defined in the glossary. Defining this term in a footnote of several Standards opens the possibility of the definition being inconsistent between Standards, and would require revising multiple Standards if the definition needs to be updated in the future. In order to ensure efficiency and make it easier to lookup the definition, Tacoma Power recommends using the definition in the MOD-032 footnote to create a NERC glossary definition for Unregistered IBR.

Tacoma Power proposes separate implementation phased dates for MOD-032 compliance for Steady-State versus Dynamics data. The proposed timeline in the implementation plan appears adequate for entering the steady-state data into the interconnection model. The timeline for modeling aggregated DER dynamics data should be extended by an additional 12 months. The modeling tools and base case building process within WECC does not currently have the capability to include multiple different IBR resources within the composite load model. In order to accommodate data for several different IBRs types connected to a single substation transformer, there will need to be extensive collaboration between utilities within WECC. There will also need to be updates by power flow software vendors to implement new composite load models that call for multiple IBR types within a single composite load model. The proposed timeline is vastly too short for

WECC utilities to reach agreement on the updates to the WECC Data Preparation Manual, much less for software developers to be able to provide adequate software implementation once the new requirements are defined.

Response

Thank you for your comments. In response to comments, the drafting team has removed reference to the phrase "unregistered IBR" from the requirement text and replaced it with the descriptive text formerly in the footnote. Former references to "unregistered IBR" now refer to IBRs that are not Distributed Energy Resources, as the drafting team proposes to define that term, and that would not meet the criteria in the NERC Rules of Procedure to register the owner of the IBR for the Generator Owner functional entity registration (as either category 1 or category 2). As suggested by commenters, the drafting team has removed the phrase “Bulk-Power System” from this description to remove any potential for ambiguity in application.

Per Order 901, P 226, “[w]e believe that there is a need to have all of the directed Reliability Standards effective and enforceable well in advance of 2030 and direct NERC to ensure that the associated implementation plans sequentially stagger the effective and enforceable dates to ensure an orderly industry transition for complying with the IBR directives in this final rule prior to that date.” The DT has provided industry with the best time available to allow for the Milestone 4 project implementation time to be implemented by 2030..

Comment

Seattle City Light has concerns regarding the proposed implementation timeline for modeling dynamic data for Distributed Energy Resources (DER). While the timeline for steady-state DER modeling appears reasonable, dynamic model data for many existing DERs and inverter-based resources (IBRs) is currently unavailable. Additionally, if it is determined that multiple types of IBRs are served by the same substation, utilities like Seattle City Light must ensure that their power system analysis software can accommodate this complexity. Given these challenges, Seattle City Light requests additional time to implement dynamic modeling, particularly for unregistered IBRs.

The term “Unregistered IBR” is not clearly defined in the current revision of the standard. Seattle City Light recommends that a formal definition be added to the NERC Glossary of Terms to promote consistent understanding and interpretation across all applicable entities. Additional Comments – Support TPU Comments re: TOP-003-8

TVA appreciates the efforts by the standard draft team. In addition to the comments provided above, TVA believes that an effort of this magnitude in acquiring model data for unregistered IBRs and aggregate DERs will likely take considerable time and iterations. The implementation plan only allows 12 months after the effective date of the Reliability Standard. That is not sufficient time to attempt to acquire modeling data and parameters, fail to do so, and then develop estimated values with technical justifications. TVA recommends extending the implementation of R2, R3, and R4 to 36 months.

We would want to inquire how power limited and inadvertant export capabilities would be captured. For example if the aggregate DER was 5 MW but 4 MW was power limited it implies that we would need to do gross load and name plate of DER, but how would power controlled systems be reported, especially for dynamic behavior where most distribution or rooftop systems may inadvertanekty export for up to 30 seconds or create load swings for that period of time

(1) Attachment 1; Column #2 recommend adding the following (For the in-service item provide verified and validated dynamics model(s)).

(2) In the “Short Circuit” column of MOD-032-2 attachment 1, perhaps “transformer winding connection information” should be added as another data requirement?

(3) TOP-003 and IRO-010 standards pertain to the data specification and exchange requirements for Transmission Operators, Balancing Authorities and Reliability Coordinators to perform their Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. Time Horizons for requirements within MOD-032-2 [Long-Term Planning] and TOP-003-8/IRO-010-7 [Operations Planning] should align with each other. Models created in MOD-032-2 will be utilized for Operations Planning and Real-time Assessments. As such, data exchange requirements in the form of “model submissions” should reflect all valid time frames, including entities that need to receive this data as part of their required assessments.

(4) Attachment 1, Column #2 (item 7(a)) IBR behaviors [remove "capabilities"] related to momentary cessation, tripping, Ride-through, and frequency control

(5) Attachment 1, Column #2 (items 7(a) and 10(a)). Although there are provisions for representing voltage and frequency protection settings in positive sequence simulations, the terms “momentary cessation, tripping, and ride-through” are too ambiguous. These concepts may not be fully representable in positive sequence phasor domain simulations and lack the necessary clarity to ensure compliance.

(6) Attachment 1, Column #2, Item 10: The MRO NRFS recommends establishing a MW threshold level for requiring unregistered IBRs, as determined by the Planning Coordinator (PC) and Transmission Planner (TP) in R1. Additionally, due to the lack of standardized distribution

DER performance requirements, accurately representing the behaviors of unregistered Aggregate Distributed Energy Resources (DER) in sections 10(a) and 10(b) may be challenging. We recommend including “estimated, assumed, or typical DER behaviors related to momentary cessation, tripping, ride-through, voltage control, frequency control, and voltage and frequency protection settings.”

Thank you for your comments. 1. R2.2 was added to require that facility owners provide models that have been verified and validated in accordance with MOD-026 if available. 2. The DT views this information as included in the sequence data already required under the Short Circuit column. The PC/TP can request this additional detail if deemed necessary, but such specific additions to the Short Circuit column are not within the scope of any of the SARs assigned to Project 2022-02. 3. Models used in operations should be consistent with those used in planning as applicable. The inclusion of “as applicable” allows for variation as necessary for application in the operations horizon. One example where consistent models would not be appropriate is an update made to a planning model for known pending changes, which should not be reflected in the operations models prior to implementation. 4. The DT views the two terms as nearly synonymous within the context of Attachment 1, so the DT did not see a compelling reason to make the proposed change. 5. The terms “momentary cessation, tripping, and ride-through” are specifically used in FERC Order 901; the DT felt it was important to mirror the FERC 901 language where possible. 6. The proposed footnote 7 is intended to allow the PC/TP to define DER thresholds for a local area if appropriate. R2.1 specifically allows estimations when the responsible entity as identified by the PC/TP is unable to gather unregistered IBR or DER data.

In MOD-032-2 Attachment 1, Data Reporting Requirements, item #10 under steady-state requirements (see below) should be removed. It is an open and unrestricted invitation to request data which has no practical value in assessing transmission system performance. As a result, time and resources will be wasted for no benefit. "10. Other information requested by the Planning Coordinator or Transmission Planner necessary for modeling purposes. [BA, GO, DP, TO, TSP]"

Likes 0

Both proposed standards (MOD-032-2; MOD-033-3) purport to define unregistered IBRs in a footnote (i.e., footnote 1 of each), with draft MOD-032-2 limiting its applicability with the phrase "as used in this standard." Footnote treatment seems ill-suited to a definition that must be used consistently in a set of Milestone 3 and 4 standards to enable the data, modeling, planning and operational studies that are intended to be developed on a consistent basis to produce the reliability benefits Order 901 expressly contemplated. *See, e.g.,* Order 901, P 53. To better ensure consistent usage throughout the relevant standards, an appropriate unregistered IBR definition should be added to the Glossary. Indeed, inclusion of the unregistered IBR definition in a footnote is inconsistent with the proposal to include the DER definition in the Glossary.

In response to comments, the drafting team has removed reference to the phrase "unregistered IBR" from the requirement text and replaced it with the descriptive text formerly in the footnote. Former references to "unregistered IBR" now refer to IBRs that are not Distributed Energy Resources, as the drafting team proposes to define that term, and that would not meet the criteria in the NERC Rules of Procedure to register the owner of the IBR for the Generator Owner functional entity registration (as either category 1 or category 2). As suggested by commenters, the drafting team has removed the phrase "Bulk-Power System" from this description to remove any potential for ambiguity in application.

Moreover, to the extent the MOD-032-2 Technical Rationale explanation is meant to inform the "unregistered IBRs" footnote, it fails to remedy the concern that there is no precise definition of Bulk-Power System that would enable a clean delineation of the IBR resources whose data is to be provided. The statutory term "bulk-power system," like "local distribution," is pertinent to the boundaries of FERC's jurisdiction, and as stated in Order No. 773, "[t]he determination whether an element or facility is 'used in local distribution,' as the phrase is used in the FPA, requires a jurisdictional analysis that is more appropriately performed by the Commission." *Revisions to Elec. Reliability Org.*

Definition of Bulk Elec. Sys. & Rules of Proc., Order No. 773, 141 FERC ¶ 61,236, P 69 (2012), *clarified on reh'g,* Order No. 773-A, 143 FERC ¶ 61,053, *compliance deadline extended,* 143 FERC ¶ 61,231, *clarified,* 144 FERC ¶ 61,174 (2013), *review denied sub nom. New York v. FERC*, 783 F.3d 946 (2d Cir. 2015).

In approving NERC's criteria for fulfilling the directives to register IBRs that are "connected to the Bulk-Power System and that have an aggregate material impact on the reliable operation of the Bulk-Power System," FERC found it reasonable for NERC to use "non-BES Inverter-Based Resource(s) that either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV." *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61,196, PP 10, 36-39 (2024). At the same time, FERC reiterated that determining the scope of the BPS is its call to make. *Id.* P 54 n.127. *See also id.* P 44.

Given FERC's acceptance of the 60 kV cutoff as described above for Category 2 GO/GOP registration purposes as sufficient to meet its "connected to the BPS" directive, and Project 2024-01's use of that same cut off for purposes of the GO/GOP Category 2 Glossary definitions (which recently received more than the requisite votes needed for approval), there is no reason for the proposed MOD-032-2 and MOD-033-3 footnotes to use vague BPS terminology. Instead, "unregistered IBR" should be added to the Glossary and defined using the already approved proxies for "BPS-connected," *e.g.*: "non-BES Inverter-Based Resource(s) that do not either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV."

Context for and a summary of all concerns with the proposed MOD-032-2 definitions are provided in Question 1; additional concerns are provided in response to Questions 4 and 5.

In MOD-032-2, Requirement 2.1 points to R1 part 1.1 which is attachment 1. Requirement 1 & 2 only mentions IBR but attachment 1 contains language about Wind plant type 1 & 2. From NERC definition Type 1 and 2 machines are not considered IBR. Therefore, this section needs to be carefully reworded to reduce ambiguity and confusion. Thank you for your comment. Requirement 2.1 was revised to eliminate a specific reference to Requirement 1.1 and only allows data estimations for unregistered IBR and DER. Project 2022-02 does not have any assigned SAR to address reliability issues associated with gathering data for type 1 and type 2 wind plants or synchronous machines that are not IBR or DER. The reference to type 1 and type 2 wind plants was added in Attachment 1 to maintain the status quo for such facilities with the addition of a specific line item for IBR to address FERC Order 901.

NIPSCO supports MISO's comments below: "For short-circuit modeling under Item 3 of Attachment 1, Generator Owners (GOs) should be required to submit models that reflect their specific resource type, for example, synchronous generators versus inverter-based resources. Relying solely on positive, negative, and zero sequence data may be insufficient for accurately representing inverter-based resources, which often require more detailed modeling parameters." "Regarding steady-state generation (Item 3), there is no need to distinguish between generating units and storage resources, as batteries and pumped storage units are already categorized as generators. If the drafting team wishes to explicitly include storage resources, this clarification would be better suited as a footnote rather than a separate classification."	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. Submission of resource type information is included under steady state item 3. The PC/TP can request additional detail if deemed necessary, but such specific additions to the Short Circuit column are not within the scope of any of the SARs assigned to Project 2022-02.	

Within industry, storage facilities with both real power injection and real power absorption capabilities are often considered distinct from generators that only have real power injection capabilities. Therefore, the DT believes it is appropriate to explicitly include both facilities in steady state item 3.

Comment
SMUD and BANC feel that the implementation plan for MOD-032-2 is too restrictive when it comes to implementing new dynamic data for the many new generation assets being added to the scope of MOD-032-2 (e.g. aggregate DER and unregistered IBR). We support the comments submitted by Tacoma Power that justify more time being added for entities to meet compliance and suggest that a 24-to-36-month implementation plan is appropriate. Lastly, we encourage the standards drafting team (SDT) to refrain from creating a definition in a footnote. The changes proposed in MOD-032-2 and the initial ballot of MOD-033-3 both define the term “unregistered IBR” in a footnote. This important term could very well be used in additional Standards when the Milestone 4 directives are addressed and, therefore, should be defined in a formal definition included in the Glossary of Terms Used in the NERC Reliability Standards (NERC Glossary). A Standards Authorization Request was drafted to create a formal definition for “unregistered IBR”. The SDT should work with NERC and the SDT for MOD-033-3 to ensure the same definition is being used for this term and that it is formally included in the NERC Glossary.

Response
Thank you for your comment. Per Order 901, P 226, “[w]e believe that there is a need to have all of the directed Reliability Standards effective and enforceable well in advance of 2030 and direct NERC to ensure that the associated implementation plans sequentially stagger the effective and enforceable dates to ensure an orderly industry transition for complying with the IBR directives in this final rule prior to that date.” The DT has provided industry with the best time available to allow for the Milestone 4 project implementation time to be implemented by 2030. In response to comments, the drafting team has removed reference to the phrase "unregistered IBR" from the requirement text and replaced it with the descriptive text formerly in the footnote. Former references to "unregistered IBR" now refer to IBRs that are not Distributed Energy Resources, as the drafting team proposes to define that term, and that would not meet the criteria in the NERC Rules of Procedure to register the owner of the IBR for the Generator Owner functional entity registration (as either category 1 or category 2). As suggested by commenters, the drafting team has removed the phrase “Bulk-Power System” from this description to remove any potential for ambiguity in application.

Attachment 1; Column #2 recommend adding the following (For the in-service item provide verified and validated dynamics model(s)).

In the “Short Circuit” column of MOD-032-2 attachment 1, perhaps “transformer winding connection information” should be added as another data requirement?

TOP-003 and IRO-010 standards pertain to the data specification and exchange requirements for Transmission Operators, Balancing Authorities and Reliability Coordinators to perform their Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. Time Horizons for requirements within MOD-032-2 [Long-Term Planning] and TOP-003-8/IRO-010-7 [Operations Planning] should align with each other. Models created in MOD-032-2 will be utilized for Operations Planning and Real-time Assessments. As such, data exchange requirements in the form of “model submissions” should reflect all valid time frames, including entities that need to receive this data as part of their required assessments.

Attachment 1, Column #2 (item 7(a)) IBR behaviors related to momentary cessation, tripping, Ride-through, and frequency control	
Likes 0	
Dislikes 0	

Response

Thank you for the comments.

R2.2 was added to require that facility owners provide models that have been verified and validated in accordance with MOD-026 if available.

The DT views this information as included in the sequence data already required under the Short Circuit column. The PC/TP can request this additional detail if deemed necessary, but such specific additions to the Short Circuit column are not within the scope of any of the SARs assigned to Project 2022-02.

Models used in operations should be consistent with those used in planning as applicable. The inclusion of "as applicable" allows for variation as necessary for application in the operations horizon. One example where consistent models would not be appropriate is an update made to a planning model for known pending changes, which should not be reflected in the operations models prior to implementation.

Pirouz Honarmand - Independent Electricity System Operator - 2

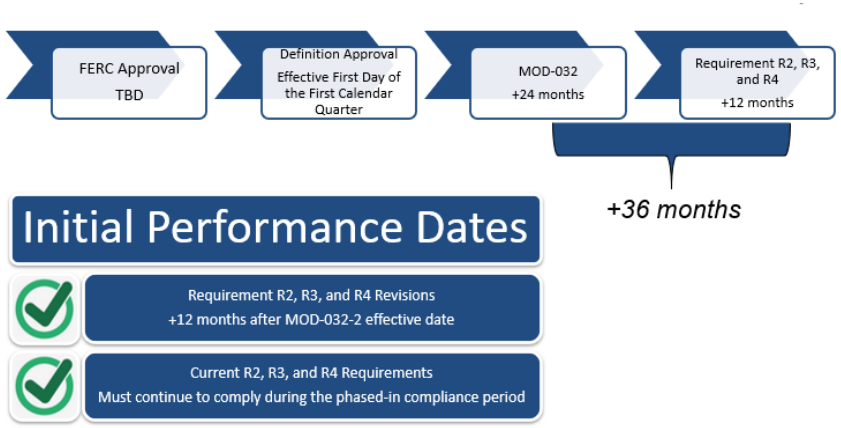
Texas RE noticed the implementation plan could provide more clarity on the retirement dates, initial performance dates, and phased-in compliance dates. First, Texas RE noticed the retirement date for MOD-032-2 is "immediately prior" to the effective date of the standard. The initial performance and compliance dates, however, are 12 months after the effective date of the standard. Texas RE is concerned this could be interpreted to leave a gap in compliance for 12 months. The drafting team may be attempting to address this in the last paragraph of page 3, "Entities shall continue to comply with Requirements R2, R3, and R4 related to Planning Coordinator/Transmission Planner data requirements and reporting procedures developed under MOD-032-1 Requirement R1 and Attachment 1 during the phased-in compliance period for MOD-032- 2", although it is not clear that verbiage is referring to that potential gap between the effective date of the standard and the phased-in compliance dates.

Texas RE also inquires as to the difference in initial performance dates and compliance dates. This implementation plan seems to describe them in the same way. It is Texas RE's understanding, however, that the initial performance date is for periodic requirements, so registered entities (and auditors) know when the first time the action is to take place, and thus start the periodic tracking of the activity. Compliance dates, on the other hand, refer to phased-in dates after the effective date of the standard so registered entities have time to complete certain activities. Is the intent of the initial performance date to refer to the periodicity in Requirement Part 1.3? There do not appear to be periodic activities in Requirements R2, R3, and R4, and thus a compliance date (phased-in dates) would be appropriate for those requirements.



Additionally, Texas RE noticed that the VRFs are included in the VSL table for IRO-010-6, but are not in the VSL tables for MOD-032-2 and TOP-003-8. The VRFs do appear to be in the requirements for all proposed standards.

Lastly, Texas RE requests the SDT consider adding the “ERO Approved Criteria for Acceptable Models” to the Associated Documents section of each standard (Section E for MOD-032-2, Section F for IRO-010-6 and TOP-003-8).

Response

Thank you for your comments.
MOD-032-2 will become effective 24 months after the effective date of the applicable governmental authority’s order approving the standard. This is the date by which Planning Coordinators and Transmission Planners must develop revised data requirements and reporting procedures that meet the revised requirements of MOD-032-2. The compliance date for Reliability Standard MOD-032-2 Requirements R2, R3, and R4 will be 12 months following the effective date (or 36 months following regulatory approval). This is to allow reporting entities sufficient time to respond to the revised data requirements and reporting procedures. Please see diagram below.

The VRFs have been removed from the VSL table in IRO-010-6 to reflect the correct updated template. The DT thanks you for identifying this update needed.

The process which must be followed to revise the Unacceptable Models List document is established and maintained in the MOD-032 supporting document.

1. Attachment 1; Column #2 recommend adding the following (For the in-service item provide verified and validated dynamics model(s)). 2. In the “Short Circuit” column of MOD-032-2 attachment 1, perhaps “transformer winding connection information” should be added as another data requirement? 3. TOP-003 and IRO-010 standards pertain to the data specification and exchange requirements for Transmission Operators, Balancing Authorities and Reliability Coordinators to perform their Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.	

Time Horizons for requirements within MOD-032-2 [Long-Term Planning] and TOP-003-8/IRO-010-7 [Operations Planning] should align with each other. Models created in MOD-032-2 will be utilized for Operations Planning and Real-time Assessments. As such, data exchange requirements in the form of "model submissions" should reflect the valid time frames, including entities that need to receive this data as part of their required assessments.

4. Add the following in **bold**, and remove the following in *italics:*

Attachment 1, Column #2 (item 7(a)) IBR **behaviors** *capabilities* related to momentary cessation, tripping, Ride-through, and frequency control.

5. Attachment 1, Column #2 (items 7(a) and 10(a)). Although there are provisions for representing voltage and frequency protection settings in positive sequence simulations, the terms "momentary cessation, tripping, and ride-through" are too ambiguous. These concepts may not be fully representable in positive sequence phasor domain simulations and lack the necessary clarity to ensure compliance.

6. Attachment 1, Column #2, Item 10: ITC recommends establishing a MW threshold level for requiring unregistered IBRs, as determined by the Planning Coordinator (PC) and Transmission Planner (TP) in R1. Additionally, due to the lack of standardized distribution DER performance requirements, accurately representing the behaviors of unregistered Aggregate Distributed Energy Resources (DER) in sections 10(a) and 10(b) may be challenging. We recommend including "estimated, assumed, or typical DER behaviors related to momentary cessation, tripping, ride-through, voltage control, frequency control, and voltage and frequency protection settings."

Response

1. R2.2 was added to require that facility owners provide models that have been verified and validated in accordance with MOD-026 if available.
2. The DT views this information as included in the sequence data already required under the Short Circuit column. The PC/TP can request this additional detail if deemed necessary, but such specific additions to the Short Circuit column are not within the scope of any of the SARs assigned to Project 2022-02.
3. Models used in operations should be consistent with those used in planning as applicable. The inclusion of "as applicable" allows for variation as necessary for application in the operations horizon. One example where consistent models would not be appropriate is an

update made to a planning model for known pending changes, which should not be reflected in the operations models prior to implementation.

4. The DT views the two terms as nearly synonymous within the context of Attachment 1, so the DT did not see a compelling reason to make the proposed change.
5. The terms “momentary cessation, tripping, and ride-through” are specifically used in FERC Order 901. The DT felt it was important to mirror the FERC 901 language where possible.
6. The proposed footnote 7 is intended to allow the PC/TP to define DER thresholds for a local area if appropriate. R2.1 specifically allows estimations when the responsible entity as identified by the PC/TP is unable to gather unregistered IBR or DER data.

Comment	
ERCOT, Midcontinent ISO, Southwest Power Pool, and California ISO abstain from the response to this question.	

For short-circuit in Attachment 1 under item 3, the GO should be required to submit a model based on their resource type i.e. synchronous generator versus inverter based. Positive, negative and zero sequence data may not cover all required modeling data for inverter-based resources. For Steady State generation (item #3), there is no need to separate between generating units and storage units as battery and pumped storage resources are considered generators. If the drafting team wants to clarify that storage units are included, then that should be a footnote.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. Submission of resource type information is included under steady state item 3. The PC/TP can request additional detail if deemed necessary, but such specific additions to the Short Circuit column are not within the scope of any of the SARs assigned to Project 2022-02. Within industry, storage facilities with both real power injection and real power absorption capabilities are often considered distinct from generators that only have real power injection capabilities. Therefore, the DT believes it is appropriate to explicitly include both facilities in steady state item 3.

Comment	
Both proposed standards (MOD-032-2; MOD-033-3) purport to define unregistered IBRs in a footnote (i.e., footnote 1 of each), with draft MOD-032-2 limiting its applicability with the phrase “as used in this standard.” Footnote treatment seems ill-suited to a definition that must be used consistently in a set of Milestone 3 and 4 standards to enable the data, modeling, planning and operational studies that are intended to be developed on a consistent basis to produce the reliability benefits Order 901 expressly contemplated. *See, e.g.,* Order 901, P 53. To better ensure consistent usage throughout the relevant standards, an appropriate unregistered IBR definition should be added to the	

Glossary. Indeed, inclusion of the unregistered IBR definition in a footnote is inconsistent with the proposal to include the DER definition in the Glossary.

In addition, the proposed footnote explanations of unregistered IBRs improperly use the term "Bulk-Power System connected" to delineate the IBRs to be covered. That term lacks the precision necessary for the registered entities (i.e., Transmission Owners and Distribution Providers) that are required to provide individualized data on such entities (proposed MOD-032-2, R2), and PCs, RCs, and TOPs that are required to validate system models using this data "to facilitate achieving and maintaining adequate model accuracy" (proposed MOD-033-3, Purpose), or to provide confidence that the resulting reporting will consistently produce results that do not reflect gaps or double counting of IBRs. While the MOD-032-2 Technical Rationale, at 4, suggests that "bulk system-connected" can be shorthand for resources connected to the transmission system, it does not provide a controlling interpretation of the term "Bulk-Power System connected," as used in the proposed standard, that can be consistently applied and relied upon.

Moreover, to the extent the MOD-032-2 Technical Rationale explanation is meant to inform the "unregistered IBRs" footnote, it fails to remedy the concern that there is no precise definition of Bulk-Power System that would enable a clean delineation of the IBR resources whose data is to be provided. The statutory term "bulk-power system," like "local distribution," is pertinent to the boundaries of FERC's jurisdiction, and as stated in Order No. 773, "[t]he determination whether an element or facility is 'used in local distribution,' as the phrase is used in the FPA, requires a jurisdictional analysis that is more appropriately performed by the Commission." *Revisions to Elec. Reliability Org. Definition of Bulk Elec. Sys. & Rules of Proc.,* Order No. 773, 141 FERC ¶ 61,236, P 69 (2012), *clarified on reh'g,* Order No. 773-A, 143 FERC ¶ 61,053, *compliance deadline extended,* 143 FERC ¶ 61,231, *clarified,* 144 FERC ¶ 61,174 (2013), *review denied sub nom. New York v. FERC*, 783 F.3d 946 (2d Cir. 2015).

In approving NERC's criteria for fulfilling the directives to register IBRs that are "connected to the Bulk-Power System and that have an aggregate material impact on the reliable operation of the Bulk-Power System," FERC found it reasonable for NERC to use "non-BES Inverter-Based Resource(s) that either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV." *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61,196, PP 10, 36-39 (2024). At the same time, FERC reiterated that determining the scope of the BPS is its call to make. *Id.* P 54 n.127. *See also id.* P 44.

Given FERC's acceptance of the 60 kV cutoff as described above for Category 2 GO/GOP registration purposes as sufficient to meet its "connected to the BPS" directive, and Project 2024-01's use of that same cut off for purposes of the GO/GOP Category 2 Glossary definitions (which recently received more than the requisite votes needed for approval), there is no reason for the proposed MOD-032-2 and MOD-033-3 footnotes to use vague BPS terminology. Instead, "unregistered IBR" should be added to the Glossary and defined using the already approved

proxies for “BPS-connected,” *e.g.*: “non-BES Inverter-Based Resource(s) that do not either have or contribute to an aggregate nameplate capacity of greater than or equal to 20 MVA, connected through a system designed primarily for delivering such capacity to a common point of connection at a voltage greater than or equal to 60 kV.” Context for and a summary of all concerns with the proposed MOD-032-2 definitions are provided in Question 1; additional concerns are provided in response to Questions 4 and 5.

Thank you for your comments. In response to comments, the drafting team has removed reference to the phrase "unregistered IBR" from the requirement text and replaced it with the descriptive text formerly in the footnote. Former references to "unregistered IBR" now refer to IBRs that are not Distributed Energy Resources, as the drafting team proposes to define that term, and that would not meet the criteria in the NERC Rules of Procedure to register the owner of the IBR for the Generator Owner functional entity registration (as either category 1 or category 2). As suggested by commenters, the drafting team has removed the phrase “Bulk-Power System” from this description to remove any potential for ambiguity in application. The proposed footnote 7 is intended to allow the PC/TP to define DER thresholds for a local area if appropriate. R2.1 specifically allows estimations when the responsible entity as identified by the PC/TP is unable to gather unregistered IBR or DER data.

Comment	
Several ACES Members have expressed their concerns regarding their ability to collect and submit all of the information identified in the proposed draft of MOD-032-2, particularly the proposed dynamic data. Therefore, ACES suggests that the drafting team should consider a minimum threshold value for dynamic DER data. In our opinion, such a threshold would be consistent with NERC’s precedent for developing risk-based Reliability Standards and would prevent an insurmountably large compliance being placed upon the applicable registered entities.	

PPI generally agrees with these comments, with one exception. In regard to question 2, we believe the TP, not the TO, should be the entity responsible for estimating DER data, as the TP is currently responsible for submitting load forecasts and similar data. DER's are essentially negative load. Thank you for the opportunity to comment.

It will likely require industry more than three years to comply with MOD-032-2, so the three year timeline proposed in the Implementation Plan should be extended. The Consideration of FERC Order 901 Directives document notes: "It is understood that based on what is being required via MOD-032, industry would need at least one year to gather data, hold meetings with respective OEM or developers to gather models needed, and then an additional two years to update models based on the ERO Approved Criteria for Acceptable Models document, etc." As was established at length in the September 2024 PRC-029 technical workshop and recent industry comments on FERC's Notice of Proposed Rulemaking to approve PRC-029, coordination with OEMs is challenging and time consuming, particularly for vintage generator technology that is no longer supported. The Consideration of FERC Order 901 Directives document notes the uncertainty in the timeline for that process, noting that initial OEM coordination may take "at least one year." Extending the effective date should still allow NERC to meet the 2030 deadline FERC suggested in Order 901. This will ensure model development is not rushed, which could potentially endanger reliability if models are not adequately vetted.

EPRI closely collaborates with its members inclusive of electric power utilities, Independent System Operators (ISOs), and Regional Transmission Organizations (RTOs), as well as numerous other stakeholders, domestically and internationally. In its role, EPRI conducts independent research and development relating to the generation, delivery, and use of electricity for public benefit by working to help make	

electricity more reliable, affordable and environmentally safe. EPRI's comments on this topic are technical in nature based upon EPRI's research, development, and demonstration experience over the last 50 years in planning, analyzing, and developing technologies for electric power.

3. EPRI research and technology transfer deliverables are generally accessible on its website to the public, either for free or for purchase, and occasionally subject to licensing, export control, and other requirements.[2] The publicly available and free-of-charge milestone reports from a U.S. Department of Energy (DOE)- and EPRI member-funded research project, Adaptive Protection and Validated Models to Enable Deployment of High Penetrations of Solar PV ("PV-MOD"), [3] and other research deliverables substantiate many of the comments made in This Response.

4. While not a standards development organization (SDO), EPRI conducts research and demonstration projects in relevant areas as well as facilitates knowledge transfer and collaboration that SDOs may, at times, use to inform technical and regulatory standards development, such as in Institute of Electrical and Electronics Engineers (IEEE), International Electrotechnical Commission (IEC), International Council on Large Electric Systems (CIGRE), and NERC.[4]

II. Conclusion

5. EPRI appreciates the opportunity to provide NERC with its technical recommendations and comments on these important topics related to Reliability Standards for IBRs. EPRI looks forward to working with its members, NERC, and other stakeholders on providing further independent technical information on these important questions.

III. Contact Information

Jens C. Boemer, Technical Executive

Email: JBoemer@epri.com

[1] EPRI is a nonprofit corporation organized under the laws of the District of Columbia Nonprofit Corporation Act and recognized as a tax-exempt organization under Section 501(c)(3) of the U.S. Internal Revenue Code of 1996, as amended, and acts in furtherance of its public benefit mission. EPRI was established in 1972 and has principal offices and laboratories located in Palo Alto, Calif.; Charlotte, N.C.; Knoxville, Tenn.; and Lenox, Mass. EPRI conducts research and development relating to the generation, delivery, and use of electricity for the benefit of the public. An independent, nonprofit organization, EPRI brings together its scientists and engineers as well as experts from academia and industry to help address challenges in electricity, including reliability, efficiency, health, safety, and the environment. EPRI also provides technology, policy and economic analyses to inform long-range research and development planning, as well as supports research in emerging technologies.

[3] PV-MOD Project Website. EPRI. Palo Alto, CA: 2024. [Online] https://www.epri.com/pvmod (last accessed, May 16, 2025)

[4] For transparency, we would like to disclose that EPRI collaborates with other organizations such as IEEE, IEC, CIGRE, and NERC; however, EPRI is not a regulatory- or standard-setting organization. EPRI research is often considered in the development of recommendations, guidelines, and best practices that are not determinative.

Reminder
Standards Announcement
Project 2022-02 Uniform Modeling Framework for IBR

Initial Ballots and Non-binding Polls Open through May 16, 2025

Now Available

Initial Ballots and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels are open through **8 p.m. Eastern, Friday, May 16, 2025** for the following standards and implementation plan:

- MOD-032-2 – Data for Power System Modeling and Analysis
- IRO-010-6 – Reliability Coordinator Data and information Specification and Collection
- TOP-003-8 – Transmission Operator and Balancing Authority Data and Information Specification and Collection
- Implementation Plan

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Balloting

Members of the ballot pools associated with this project can log in and submit their votes by accessing the Standards Balloting and Commenting System (SBS) here.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will review all responses received during the comment period and determine the next steps of the project.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Jordan Mallory (via email) or at 470-479-7538. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2022-02 Uniform Modeling Framework for IBR observer list” in the Description Box.

Standards Announcement

Project 2022-02 Uniform Modeling Framework for IBR

Formal Comment Period Open through May 16, 2025
Ballot Pools Forming April 17 – 28, 2025

Now Available

A formal comment period for **Project 2022-02 Uniform Modeling Framework for IBR**, is open through **8 p.m. Eastern, May 16, 2025** for the following standards and implementation plan:

- MOD-032-2 – Data for Power System Modeling and Analysis
- IRO-010-6 – Reliability Coordinator Data and information Specification and Collection
- TOP-003-8 – Transmission Operator and Balancing Authority Data and Information Specification and Collection
- Implementation Plan

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Ballot Pools

Ballot pools are being formed through **8 p.m. Eastern, Monday, April 28, 2025.** Registered Ballot Body members can join the ballot pools here.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*

- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Initial ballots for the standards and implementation plan, as well as the non-binding polls of the associated Violation Risk Factors and Violation Severity Levels will be conducted **May 7 – 16, 2025**.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Jordan Mallory (via email) or at 470-479-7538. Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

MOD-032-2 is posted for a 34-day formal comment period with ballot.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	January 19, 2022
SAR posted for comment	February 1 – March 2, 2022
45-day formal comment period with ballot	May 31, 2023 – July 14, 2023
45-day formal comment period with additional ballot	October 6 – November 20, 2023
45-day formal comment period with additional ballot	August 27 – October 10, 2024
(The above was Posted under IRPTF SAR pre–Order No. 901)	
30-day formal comment period with initial ballot	April 17 – May 16, 2025

Anticipated Actions	Date
34-day formal comment period with ballot	August 8 –September 10, 2025
5-day final ballot	September 29 – October 3, 2025
Board adoption	October 14, 2025

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Distributed Energy Resource (DER): A generator or energy storage technology connected to a distribution system that is capable of providing Real Power in non-isolated parallel operation with the Bulk-Power System, including one connected behind the meter of an end-use customer that is supplied from a distribution system.

A. Introduction

1. **Title:** Data for Power System Modeling and Analysis

2. **Number:** MOD-032-2

3. **Purpose:** To establish consistent modeling data requirements and reporting procedures for development of planning horizon cases necessary to support analysis of the reliability of the interconnected transmission system.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1 Balancing Authority

   4.1.2 Distribution Provider

   4.1.3 Generator Owner

   4.1.4 Planning Authority and Planning Coordinator (hereafter collectively referred to as “Planning Coordinator”)

   4.1.5 Resource Planner

   4.1.6 Transmission Owner

   4.1.7 Transmission Planner

   4.1.8 Transmission Service Provider

5. **Effective Date:** See Implementation Plan for Project 2022-02.

B. Requirements and Measures

R1. Each Planning Coordinator and each of its Transmission Planners shall jointly develop steady-state, dynamics, and short circuit modeling data requirements and reporting procedures for the Planning Coordinator's planning area that include: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. The data listed in Attachment 1, including the entity responsible for each required item.

1.2. Specifications of the following items consistent with procedures for building the Interconnection-wide case(s):

1.2.1. Data format;

1.2.2. Level of detail to which equipment shall be modeled;

1.2.3. Case types or scenarios to be modeled; and

1.2.4. A schedule for submission of data at least once every 13 calendar months.

1.3. Specifications for distribution or posting of the data requirements and reporting procedures so that they are available to those entities responsible for providing the data.

1.4. Specifications of the following items for dynamic model submissions:

1.4.1. Required submission of:

- standard library models incorporated within the software(s) utilized to create the Interconnection-wide case(s);
- user-defined models; or
- both standard library models and user-defined models.

1.4.2. Where user-defined models are accepted, usability requirements for any submitted user-defined models including, at a minimum, requirements to provide model documentation and instructions for model set up and use.

1.4.2.1. Each Planning Coordinator and Transmission Planner shall provide their user-defined model requirements within 90 calendar days of receiving a written request for such data from other Planning Coordinators and Transmission Planners within the Interconnection.

M1. Each Planning Coordinator and Transmission Planner shall provide evidence that it has jointly developed the required modeling data requirements and reporting procedures specified in Requirement R1.

R2. Each Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, and Transmission Service Provider shall provide steady-state, dynamics, and short circuit modeling data to its Transmission Planner(s) and Planning Coordinator(s) according to the data requirements and reporting procedures developed by its Planning Coordinator and Transmission Planner in Requirement R1. For data that has not changed since the last submission, a written confirmation that the data has not changed is sufficient. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. If a functional entity is required to provide data for one or more of the following and is unable to gather such data, the functional entity shall provide an estimate of the data, an explanation of the limitations of the estimated data, and the method used for estimation.

- Aggregate DER data; or
- Data for an IBR that is not a DER and does not meet the criteria that would require the owner to register with NERC for mandatory Reliability Standards compliance purposes.

2.2. If a functional entity is required to provide dynamic models, the functional entity shall provide the models accepted by the Transmission Planner under MOD-026, where such models are available.

2.3. If a functional entity provides a model that is included on the Unacceptable Models List maintained by the ERO in accordance with the process described in the MOD-032 Supporting Document, the functional entity shall also provide a technical rationale justifying the use of that model.

M2. Each functional entity identified in Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted the required modeling data to its Transmission Planner(s) and Planning Coordinator(s); or written confirmation that the data has not changed.

R3. Upon receipt of written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2, including the technical basis or reason for the technical concerns, each notified Balancing Authority, Distribution Provider, Generator Owner, Resource Planner, Transmission Owner, or Transmission Service Provider shall respond to the notifying Planning Coordinator or Transmission Planner as follows: *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. Provide either updated data or an explanation with a technical basis for maintaining the current data, that is responsive to the technical concern.

3.2. Provide the response within 90 calendar days of receipt, unless a longer time period is agreed upon by the notifying Planning Coordinator or Transmission Planner.

M3. Each functional entity identified in Requirement R3 that has received written notification from its Planning Coordinator or Transmission Planner regarding technical concerns with the data submitted under Requirement R2 shall provide evidence, such as email records or postal receipts showing recipient and date, that it has provided either updated data or an explanation with a technical basis for maintaining the current data to its Planning Coordinator or Transmission Planner within 90 calendar days of receipt (or within the longer time period agreed upon by the notifying Planning Coordinator or Transmission Planner), or a statement that it has not received written notification regarding technical concerns with the data submitted.

R4. Each Planning Coordinator shall make available models for its planning area reflecting data provided to it under Requirement R2 to the Electric Reliability Organization (ERO) or its designee to support creation of the Interconnection-wide case(s) that includes the Planning Coordinator's planning area. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Each Planning Coordinator shall provide evidence, such as email records or postal receipts showing recipient and date, that it has submitted models for its planning area reflecting data provided to it under Requirement R2 when requested by the ERO or its designee.

C. Compliance

1. **Compliance Monitoring Process**

   1.1. **Compliance Enforcement Authority:** "Compliance Enforcement Authority" means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

   1.2. **Evidence Retention:** The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

   The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

   - Requirements R1 through R4, and Measures M1 through M4, since the last audit, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

   If an applicable entity is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

   The Compliance Enforcement Authority shall keep the last audit records, and all requested and submitted subsequent audit records.
